Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

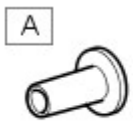
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

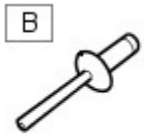
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

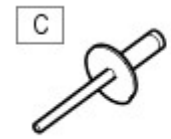
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

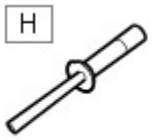
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

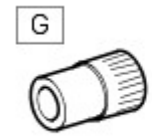
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

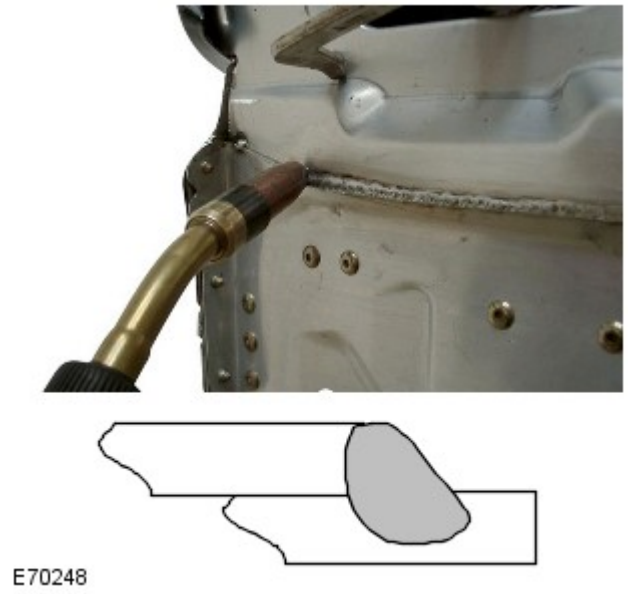
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

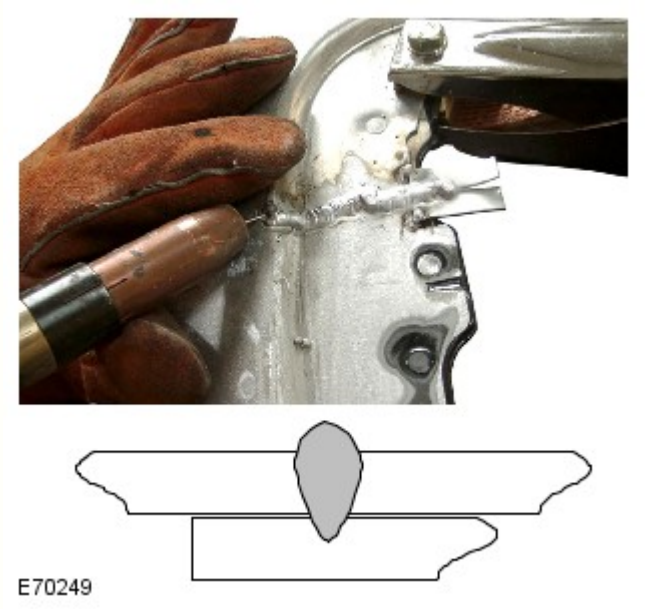
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

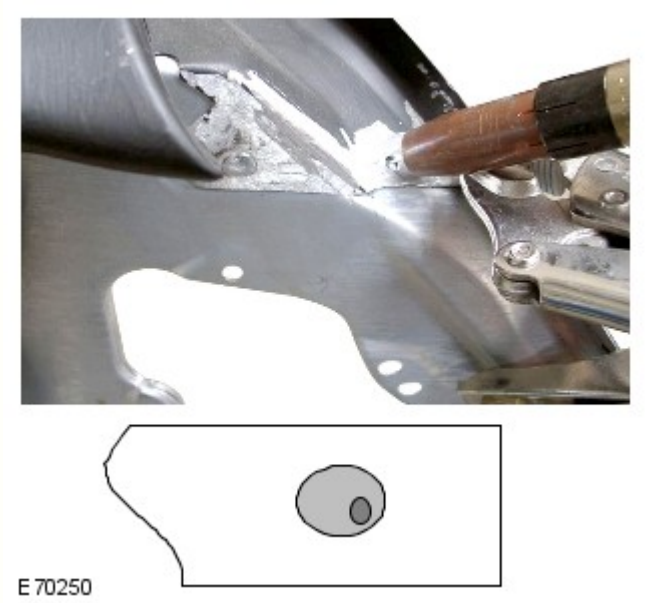
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

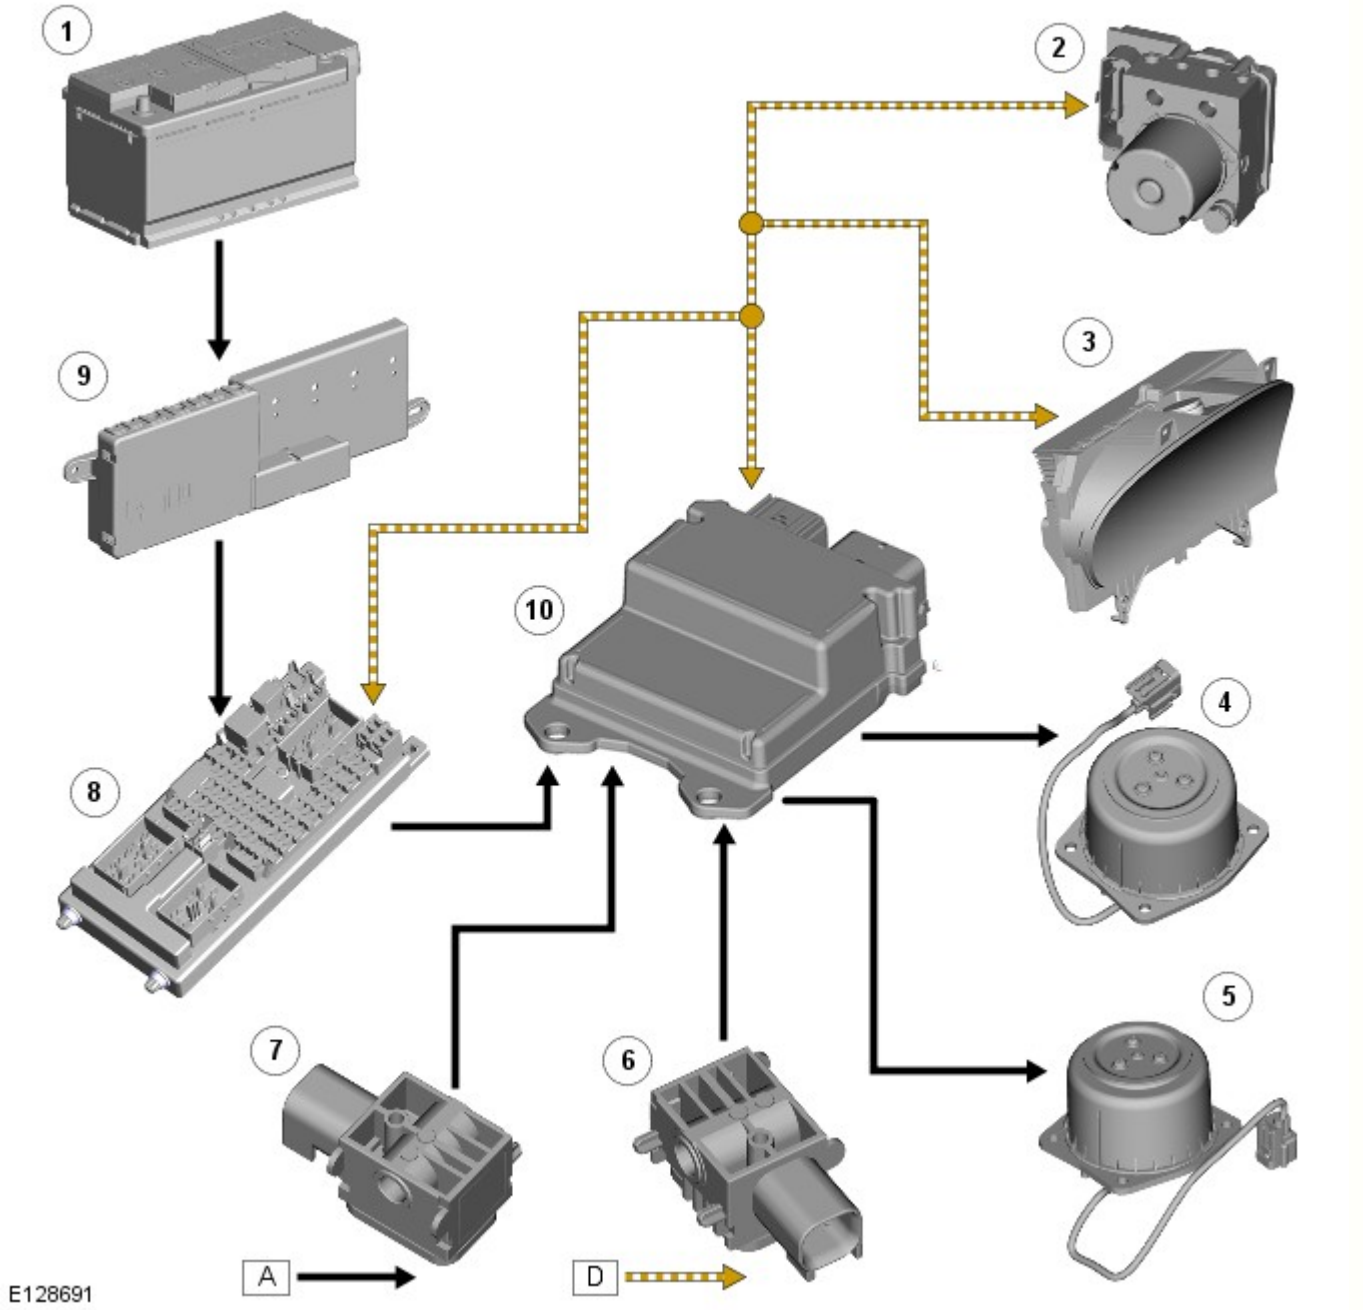
Pedestrian Protection System - Pedestrian Protection System - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: A = Hardwired; D = High speed CAN (controller area network) bus.



Item	Description
1	Battery
2	ABS (anti-lock brake system) module
3	Instrument cluster
4	LH (left-hand) hood actuator
5	RH (right-hand) hood actuator
6	RH pedestrian impact sensor

7	LH pedestrian impact sensor
8	CJB (central junction box)
9	BJB (battery junction box)
10	RCM (restraints control module)

System Operation

PRINCIPLES OF OPERATION

The pedestrian protection system is operational when the vehicle is traveling at speeds between approximately 20 and 45 km/h (12.4 and 28 mph). A vehicle speed signal is received by the RCM over the high speed CAN bus.

The system is able to determine if contact is made with a pedestrian or another object, such as a traffic cone, using signals from the pedestrian impact sensors. When the system determines contact is made with a pedestrian, it fires the hood actuators to lift the rear of the hood approximately 130 mm (5.2 in.) within 35 ms of the 'fire' signal.

When an impact condition is registered, the RCM outputs an impact signal on the high speed CAN bus. This signal is used by the CJB to initiate the hazard warning lamps. If this occurs, the hazard warning lamp switch is disabled for the remainder of the current ignition cycle.

If the RCM detects a fault with the system, it outputs a message on the high speed CAN bus to the instrument cluster message center. On receipt of this, the message center will display the message Check Pedestrian System.

When the vehicle is delivered from the factory the pedestrian protection system is in a safe 'plant' mode. Normal operating mode must be activated using Jaguar approved diagnostic equipment during the PDI (pre-delivery inspection) prior to delivery to the customer.

Failure Mode Detection

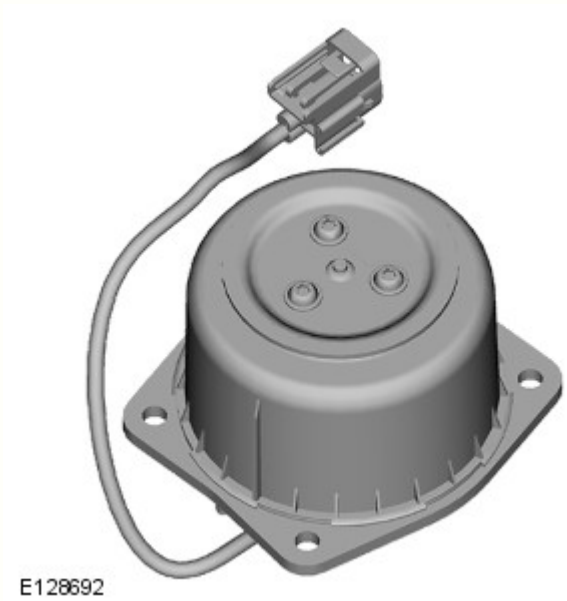
In service, if any fault is detected, the message center displays the warning Check Pedestrian System.

The hood deployment actuators are non-serviceable components. If they are replaced their bar code labels must be read and recorded in the service database against the VIN (vehicle identification number) for security purposes.

After deployment of the pedestrian protection system, the vehicle must be stopped as soon as it is safe to do so. The hazard warning lamps will be activated and can only be switched off by pressing the engine START/STOP button to turn the engine off and on again. A warning message Check Pedestrian System will appear in the message center and the vehicle should be transported to the nearest dealer/authorised repairer. The vehicle must not be driven when the hood has been deployed.

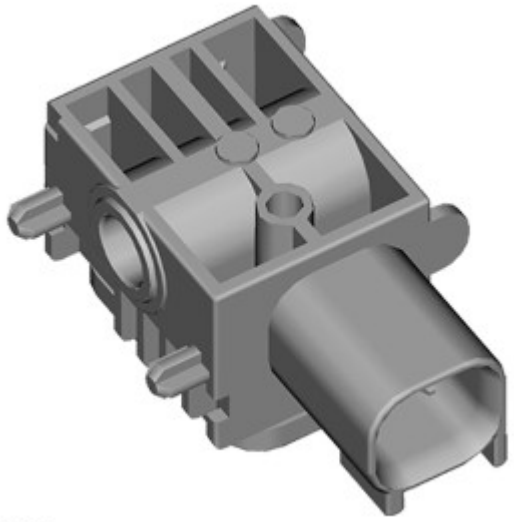
Component Description

HOOD ACTUATORS



The hood actuators are pyrotechnic air bags installed on mounting brackets next to the hood hinges. When the hood actuators are deployed, interface plates on the actuators contact reinforced areas on the hood, and raise the rear of the hood.

PEDESTRIAN IMPACT SENSORS



E128693

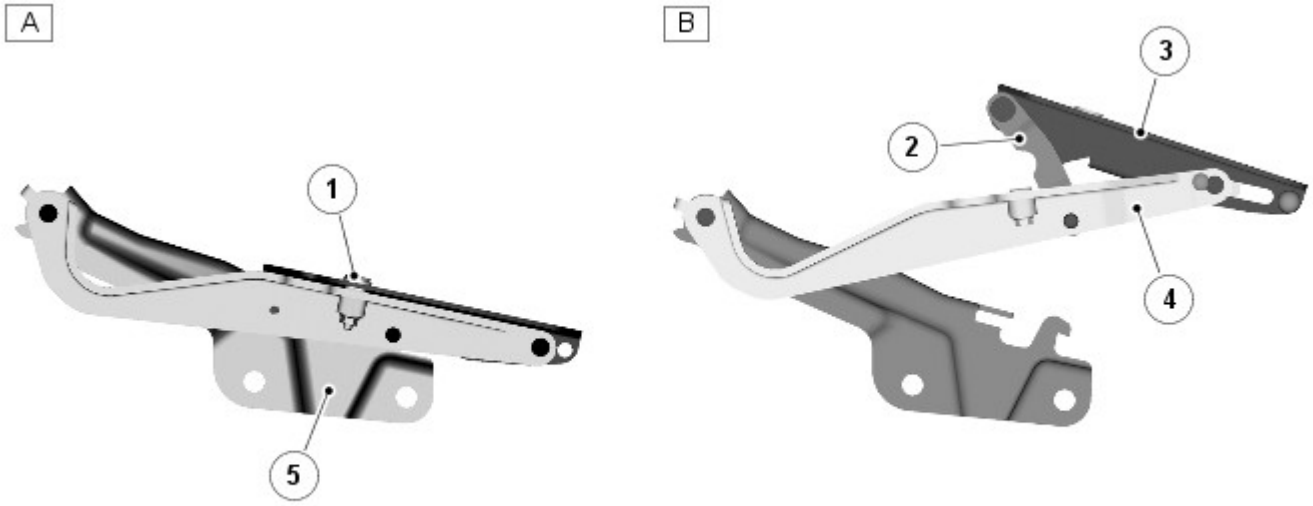
The pedestrian impact sensors are accelerometers mounted on the rear of the front bumper. The RCM uses the sensor inputs to monitor for low level impacts typical of pedestrian accidents.

HOOD

The two-piece hood is fabricated from aluminum. The inner panel has a hexagonal structure, which allows the energy from an impact to be absorbed effectively across the full area of the hood. The hood also has sufficient strength in the rear cross-beam to accept the forces from the actuators and maintain a stable condition.

When deployed, the front hood latches act as the pivot points and the rear hinges allow a controlled degree of upward movement before retaining the hood at the end of its deployment, thus limiting its total upward travel and stabilizing its position.

Hood Hinges



E95115

Item	Description
A	Non-deployed hinge
B	Deployed hinge
1	Firing pin
2	Stabilizing link
3	hood leaf
4	Intermediate leaf
5	Body leaf

The hood hinges incorporate a number of leaves. This includes a leaf attached to the body, an intermediate leaf and a leaf attached to the hood. During normal operation the hinge opens and closes using the hood and intermediate leaves. These are attached together by a firing pin. When the actuators are fired the firing pins fail. This allows the hood and intermediate leaves to separate and deploy the hood upwards.

The hinges deform during the deployment process and will need to be replaced.

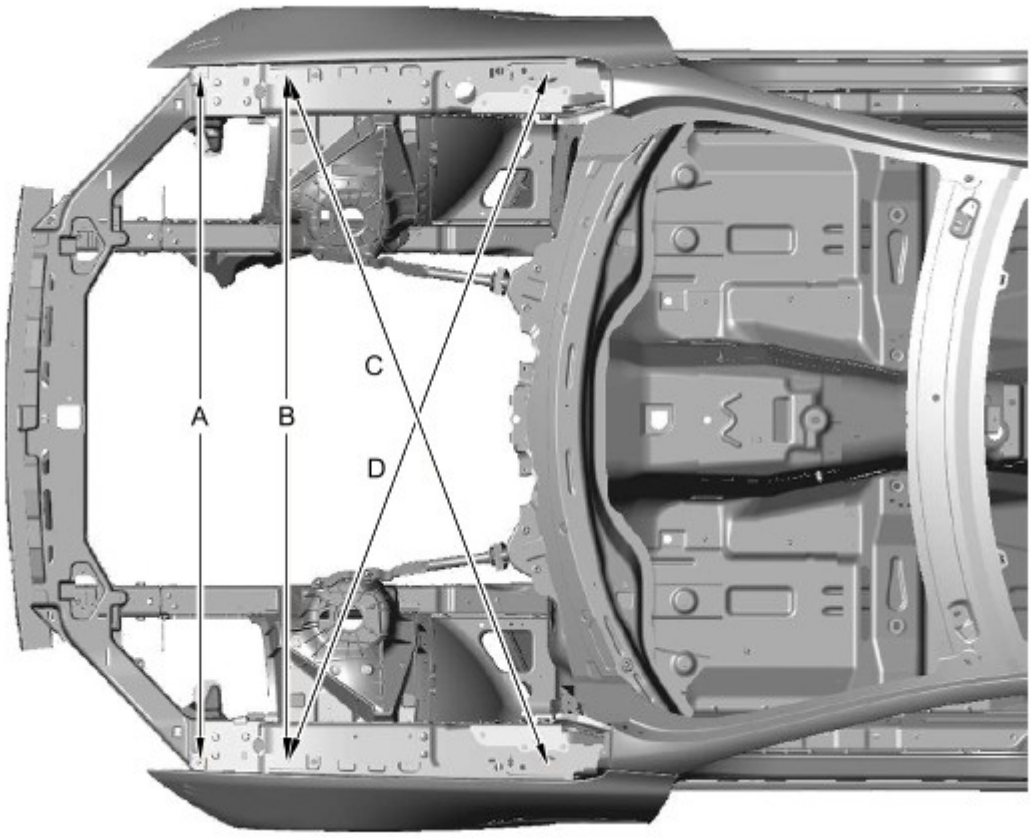
Description and Operation

Front End Body Dimensions

NOTES:

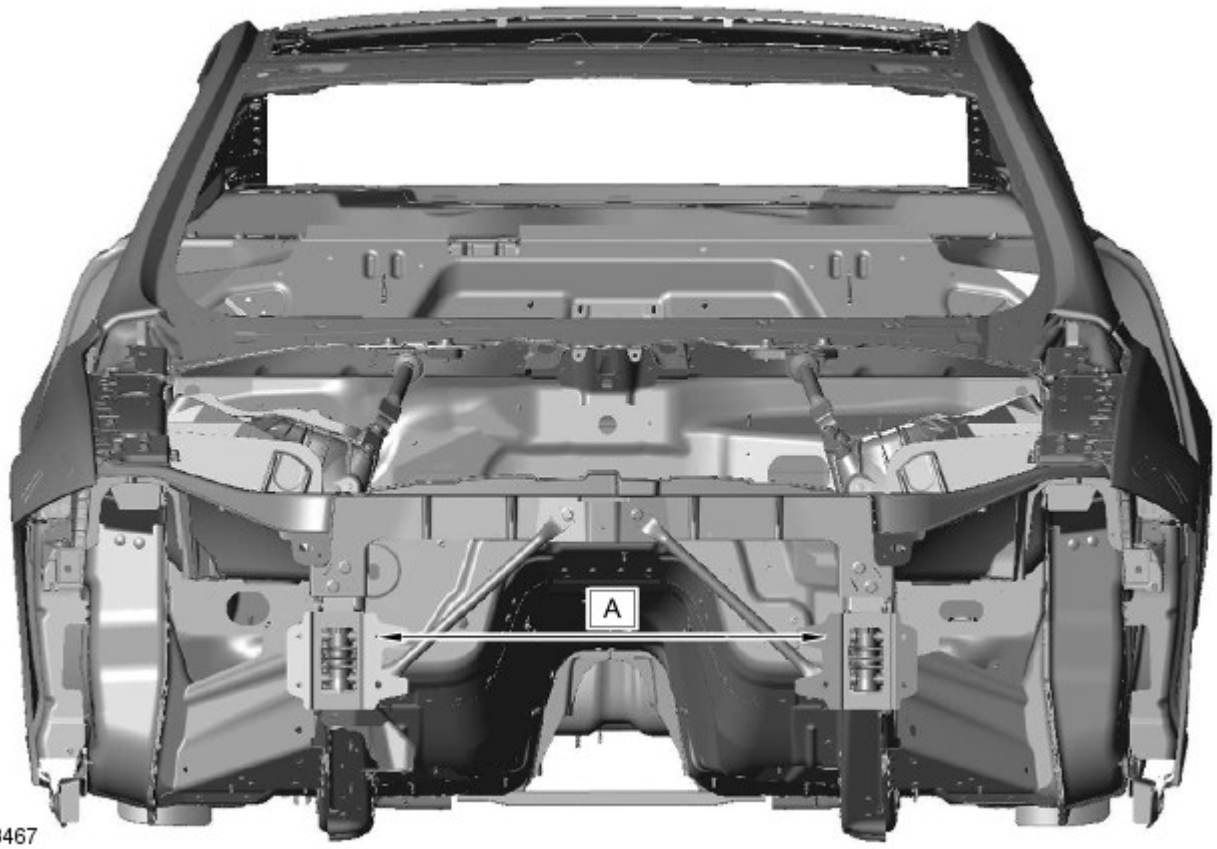
All dimensions shown are in millimetres (mm).

Dimensions shown to holes, are always taken from/to the hole centre. They are also always to the body panel surface, not to the top of bolts or components.



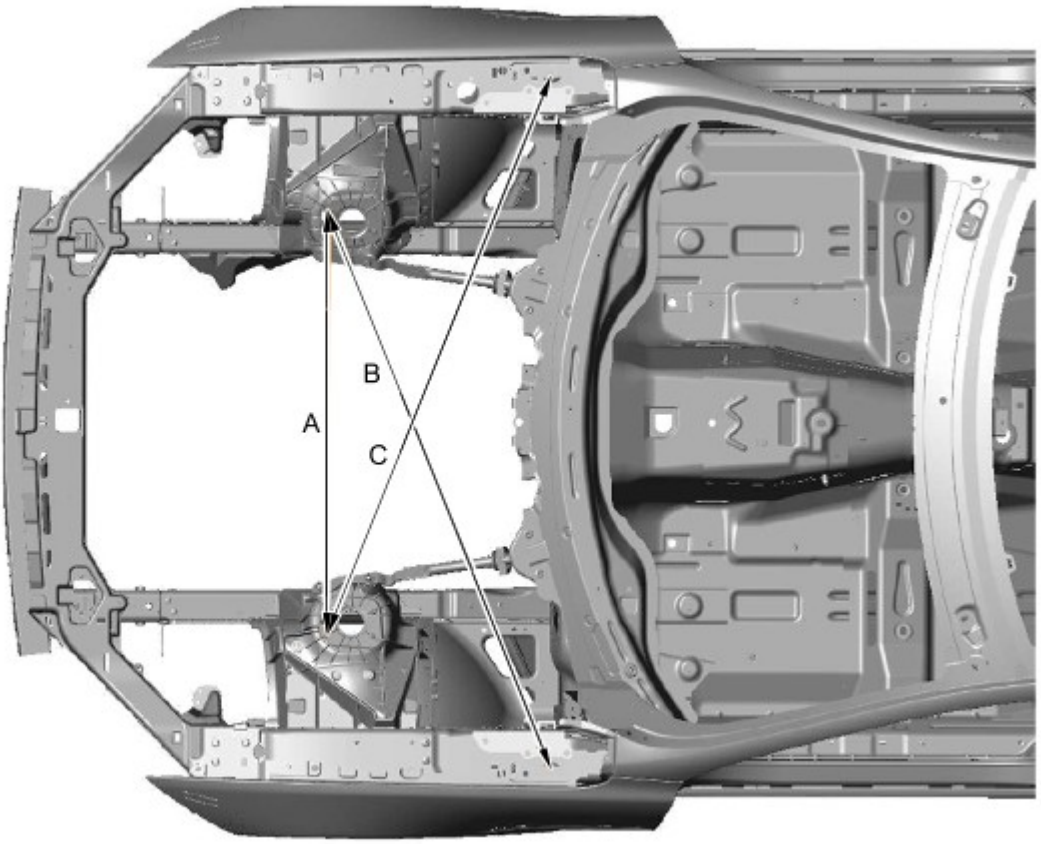
E133463

Item	From	To	Dimension
A	Front fender RH, front fixing hole	Front fender LH, front fixing hole	1580.0
B	Front fender RH, second front fixing hole	Front fender LH, second front fixing hole	1570.0
C	Front fender RH, second front fixing hole	Front fender LH, rear fixing hole	1689.4
D	Front fender LH, second front fixing hole	Front fender RH, rear fixing hole	1689.4



E133467

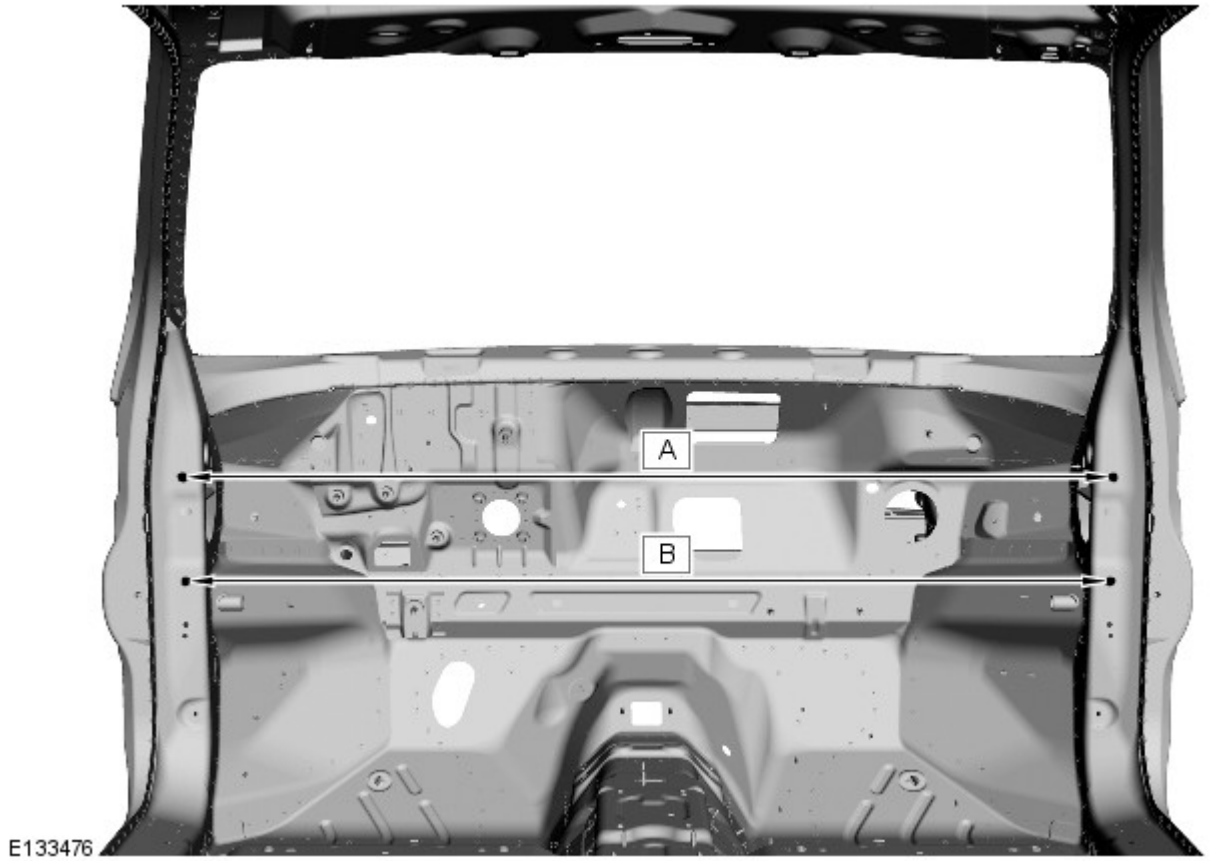
Item	From	To	Dimension
A	Side member deformation element RH, top inboard fixing hole	Side member deformation element LH, top inboard fixing hole	712.5



E133468

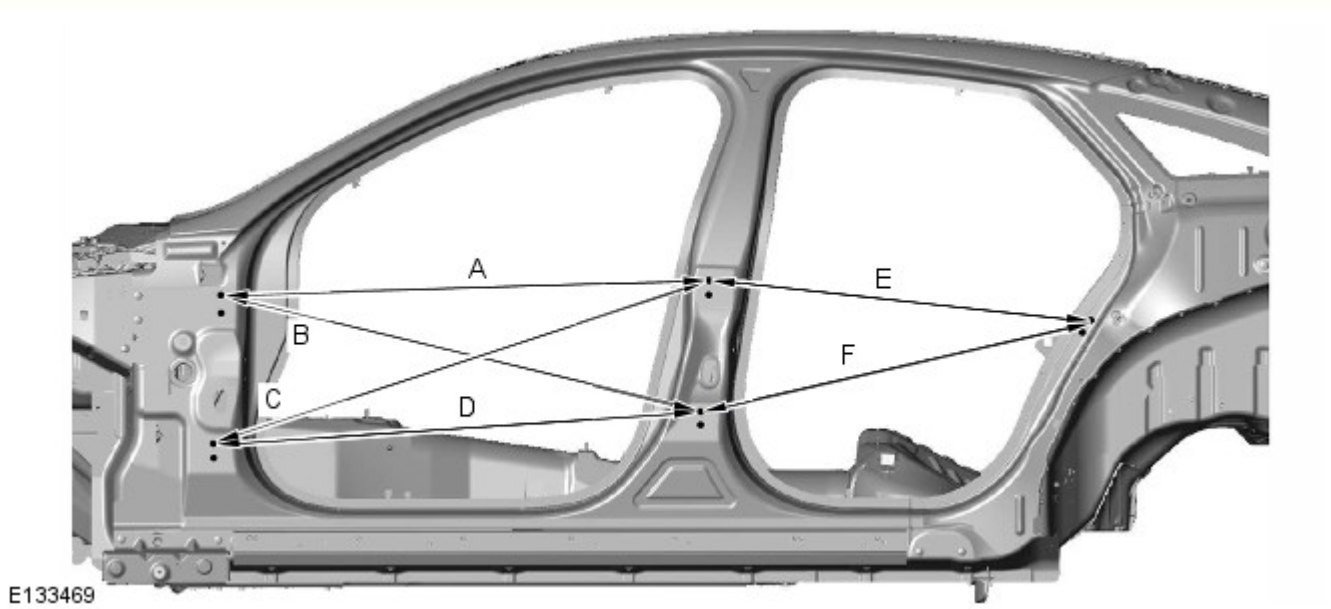
Item	From	To	Dimension
A	Suspension top mount RH, front outboard fixing	Suspension top mount LH, front outboard fixing	986.5
B	Suspension top mount RH, front outboard fixing	Front fender LH, rear fixing	1379.9

C	Suspension top mount LH, front outboard fixing	Front fender RH, rear fixing	1379.9



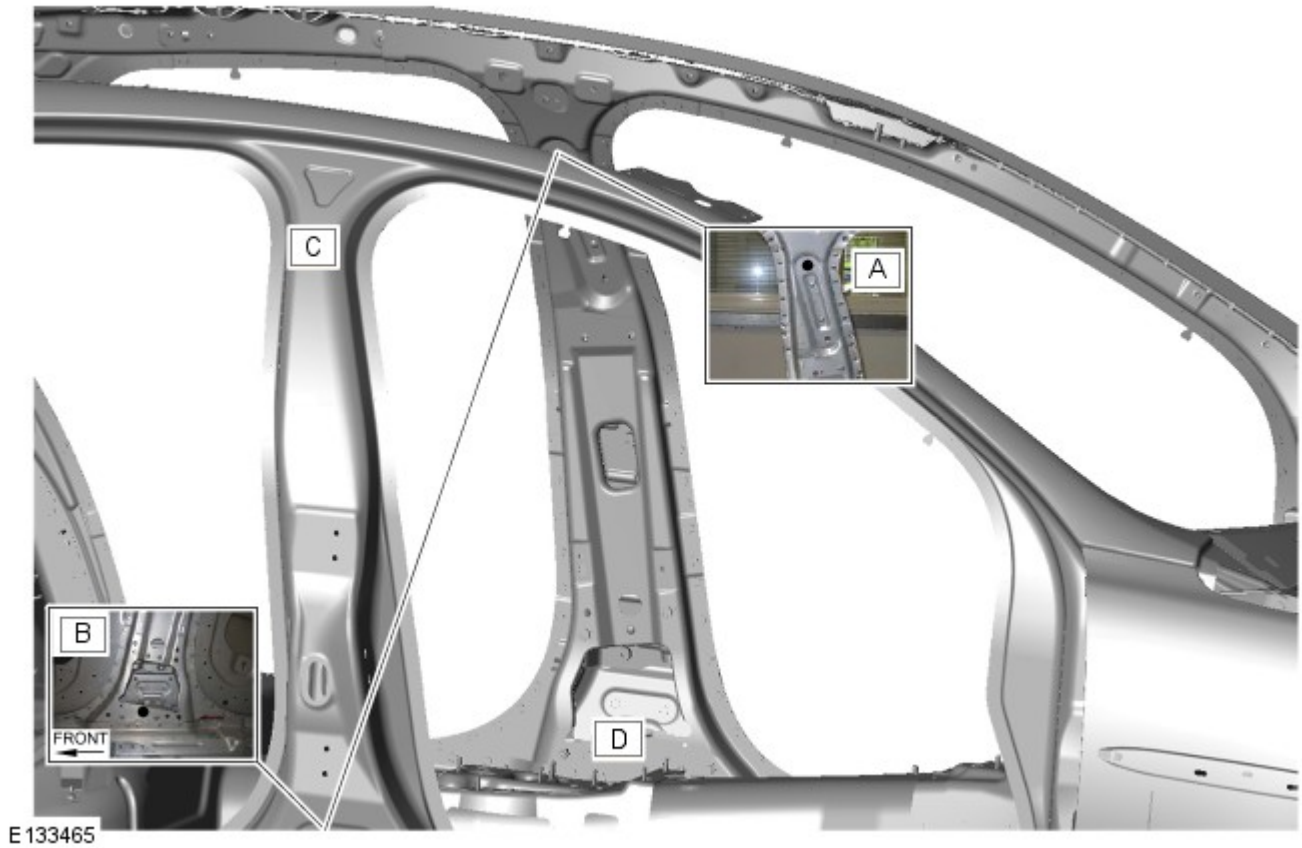
Item	From	To	Dimension
A	Instrument panel carrier RH top fixing hole	Instrument panel carrier LH top fixing hole	1416
B	Instrument panel carrier RH bottom fixing hole	Instrument panel carrier LH bottom fixing hole	1416

Side Panel Dimensions



Item	From	To	Dimension
A	Front door top hinge, top fixing hole	Rear door top hinge, top fixing hole	1109.1
B	Front door top hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1119.9
C	Front door bottom hinge, top fixing hole	Rear door top hinge, top fixing hole	1184.8
D	Front door bottom hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1108.9
E (short wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	885.6
E (long wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	1009.5
F (short wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	914.0

F (long wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	1036.8



E133465

Item	From	To	Dimension

B-G (long wheel base)	Front subframe, LH front fixing hole	Rear subframe, RH front fixing hole	3419.9

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

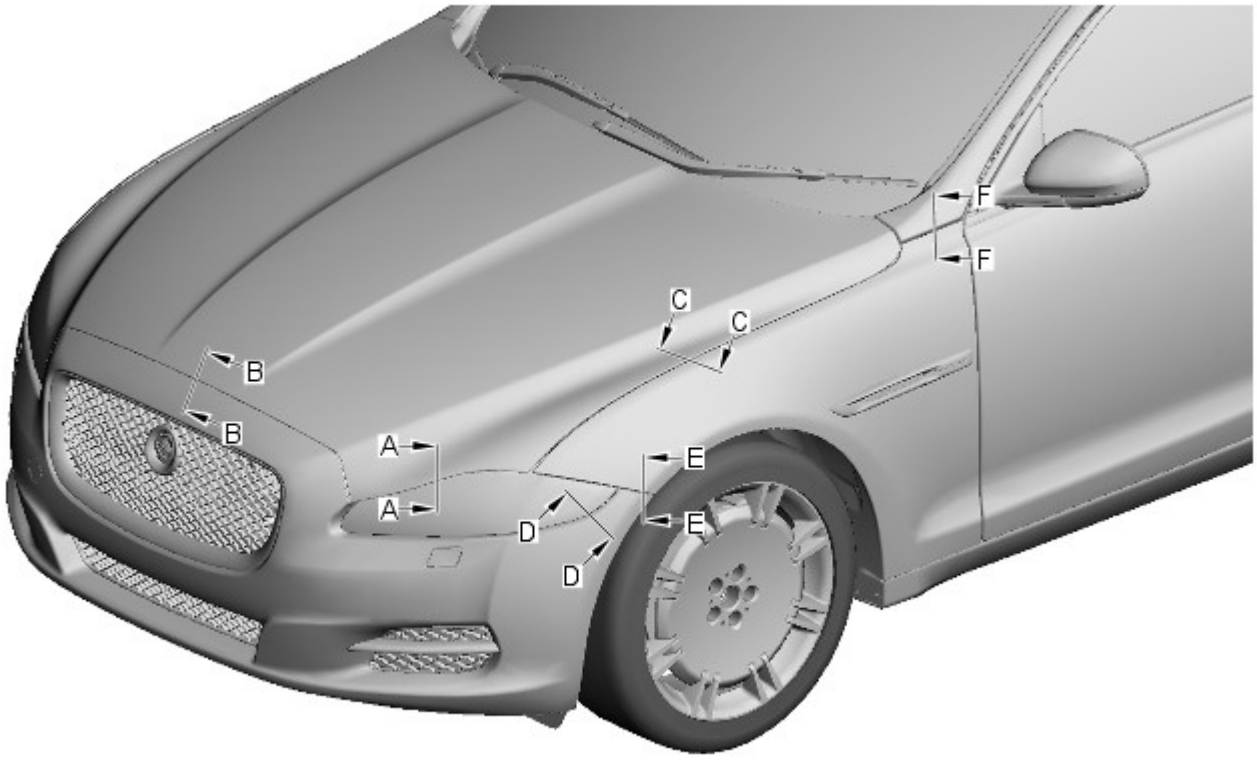
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

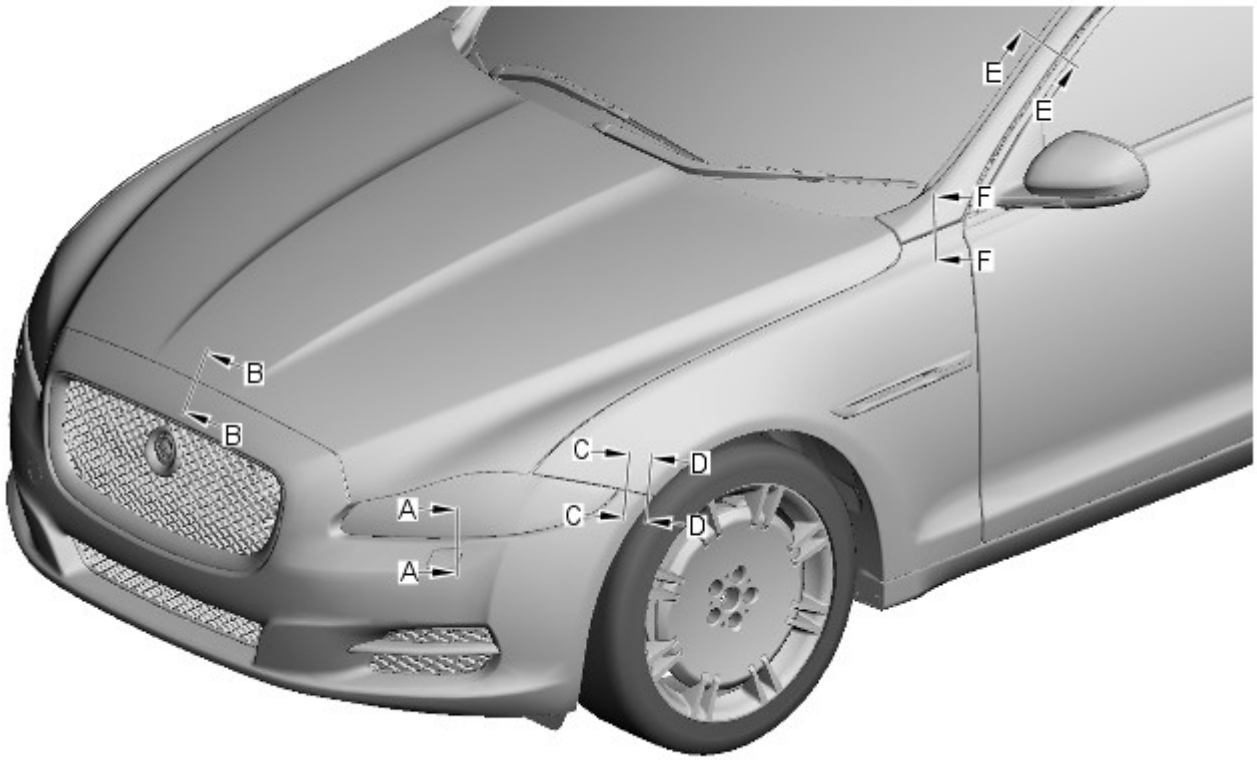
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



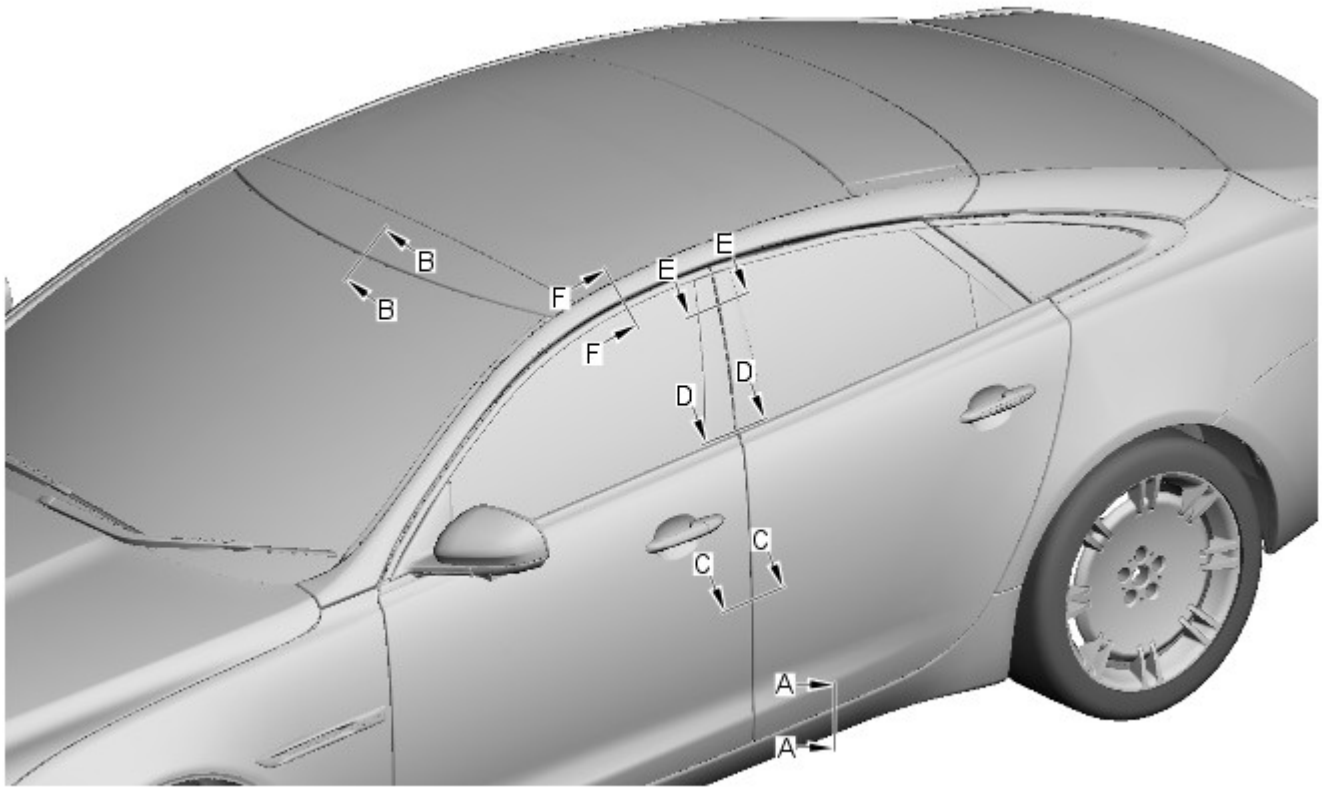
E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



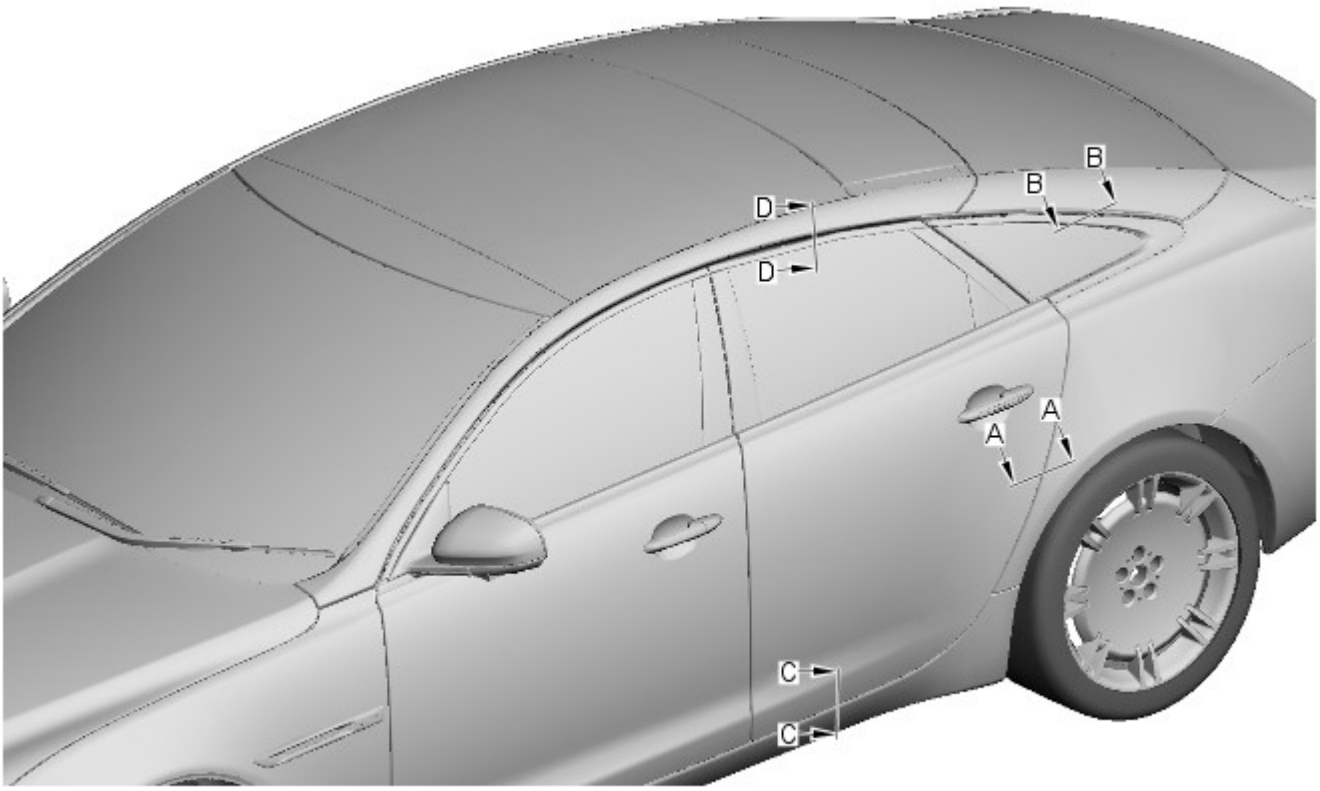
E133472

A-A	Front bumper cover to headlamp	1.0 ± 0.5
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Front bumper cover to front fender	0.0 + 1.0
D-D	Front bumper cover to front fender	0.0 + 1.0
E-E	Front door to A-pillar	4.0 ± 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



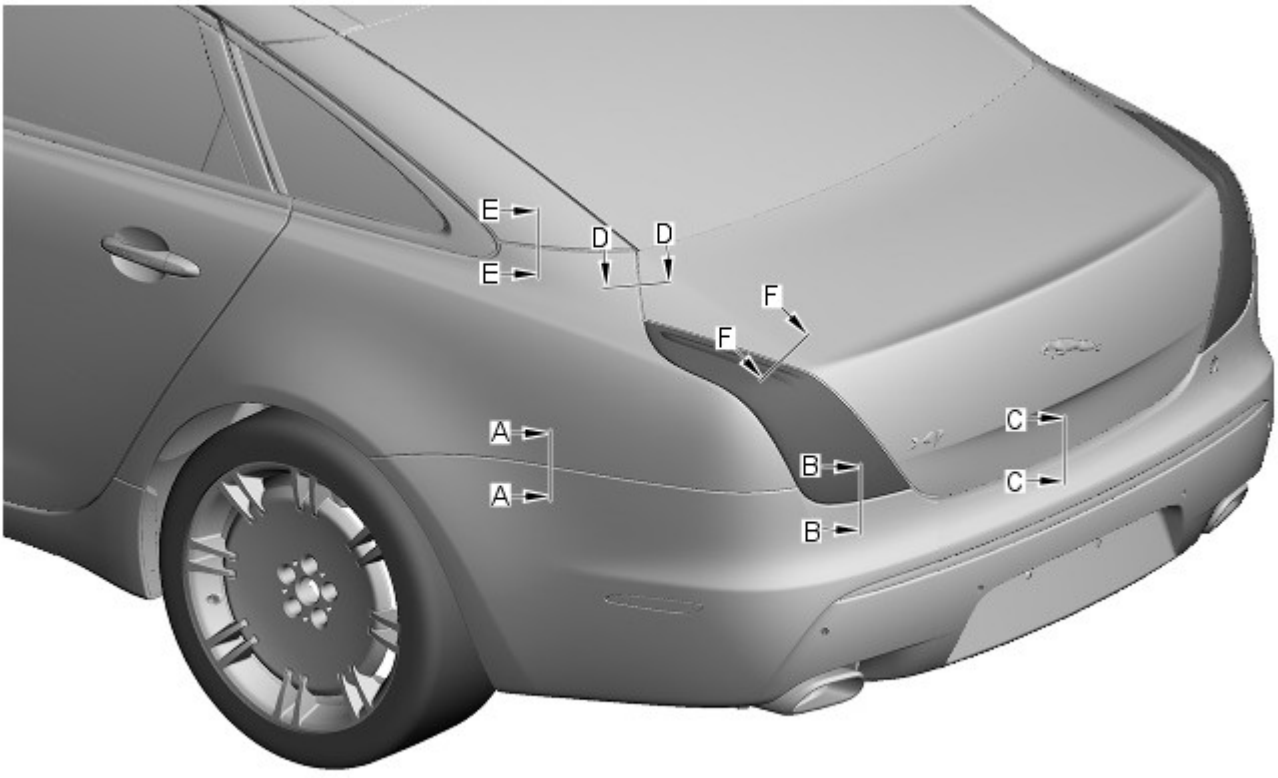
E133473

A-A	Rear door to rocker panel	5.0 ± 1.0
B-B	Windshield encapsulation to front glass roof panel encapsulation	0.0
C-C	Front door to rear door	4.0 ± 1.0
D-D	Front door to rear door	4.0 ± 1.0
E-E	Front door to rear door	4.0 ± 1.0
F-F	Front door to A-pillar / roof panel	6.5 ± 1.0



E133474

A-A	Rear door to quarter panel	4.0 ± 1.0
B-B	Rear quarter window glass encapsulation to quarter panel finisher	0.0
C-C	Rear door to rocker panel	5.0 ± 1.0
D-D	Rear door to roof panel	6.5 ± 1.0



E133475

A-A	Rear bumper cover to quarter panel	0.0 + 1.0
B-B	Rear bumper cover to rear lamp assembly	1.0 ± 0.5
C-C	Rear bumper cover to luggage compartment lid	6.0 ± 1.0
D-D	Quarter panel to luggage compartment lid	6.0 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

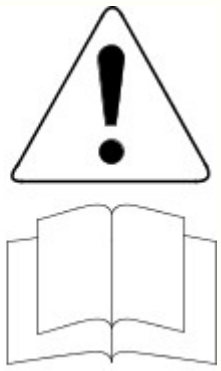
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

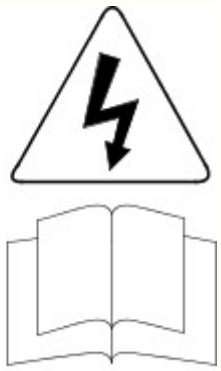
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



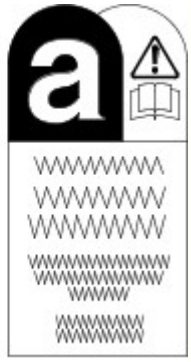
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



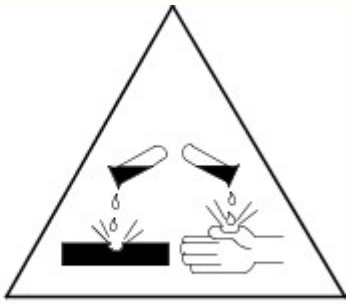
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

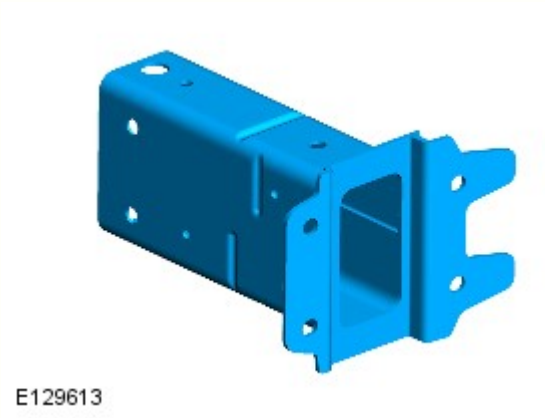
Front End Sheet Metal Repairs - Side Member Deformation Element

Removal and Installation

Removal



E129613

1. NOTE: The side member deformation element is manufactured from aluminium alloy 6014-T6/7

The side member deformation element is serviced as a separate bolt-on panel.

2. NOTE: Whenever there is damage to the side member deformation element, the front side member to deformation element bracket must always be checked for damage. Where damage is evident or suspected, a new bracket must be installed.

The side member deformation element is replaced in conjunction with:

- Front bumper cover
- Front bumper
- Hood latch panel
- Hood latch panel mounting bracket

3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. Remove the front bumper.
For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

5. Remove the hood latch panel mounting bracket.
For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

6. Remove the coolant expansion tank.
For additional information, refer to: Coolant Expansion Tank (303-03A, Removal and Installation) /
Coolant Expansion Tank (303-03A Engine Cooling - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

7. Remove the radiator.
For additional information, refer to: Radiator (303-03A, Removal and Installation) /
Radiator - V8 S/C 5.0L Petrol (303-03A Engine Cooling - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation) /
Radiator - V8 5.0L Petrol (303-03A Engine Cooling - V8 5.0L Petrol/V8

S/C 5.0L Petrol, Removal and Installation) /
Radiator (303-03B Supercharger Cooling, Removal and Installation).

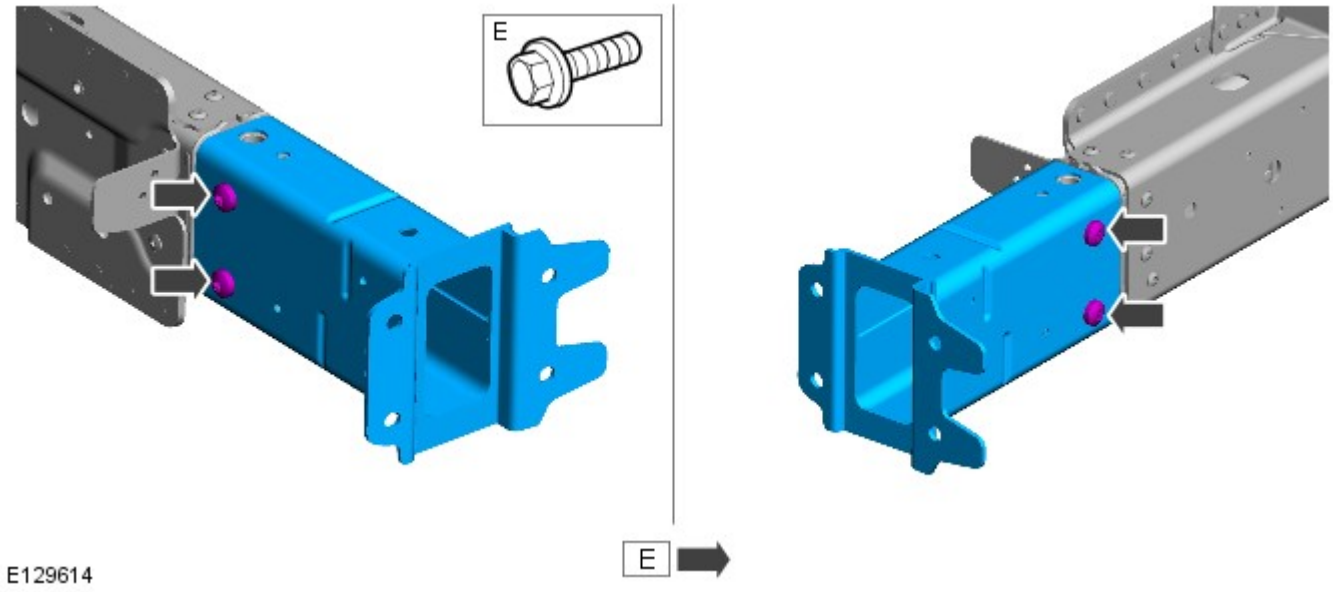
8. Remove the air cleaner(s).
For additional information, refer to: Air Cleaner (303-12A, Removal and Installation) /
Air Cleaner LH (303-12 Intake Air Distribution and Filtering - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation) /
Air Cleaner RH (303-12 Intake Air Distribution and Filtering - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

9. CAUTION: If both front subframe front retaining bolts are removed, the engine must be supported.

Remove the front subframe front retaining bolts.

10. Release the side member deformation element wiring harness and position to one side.

11. Remove the bolts from the side member deformation element bracket.

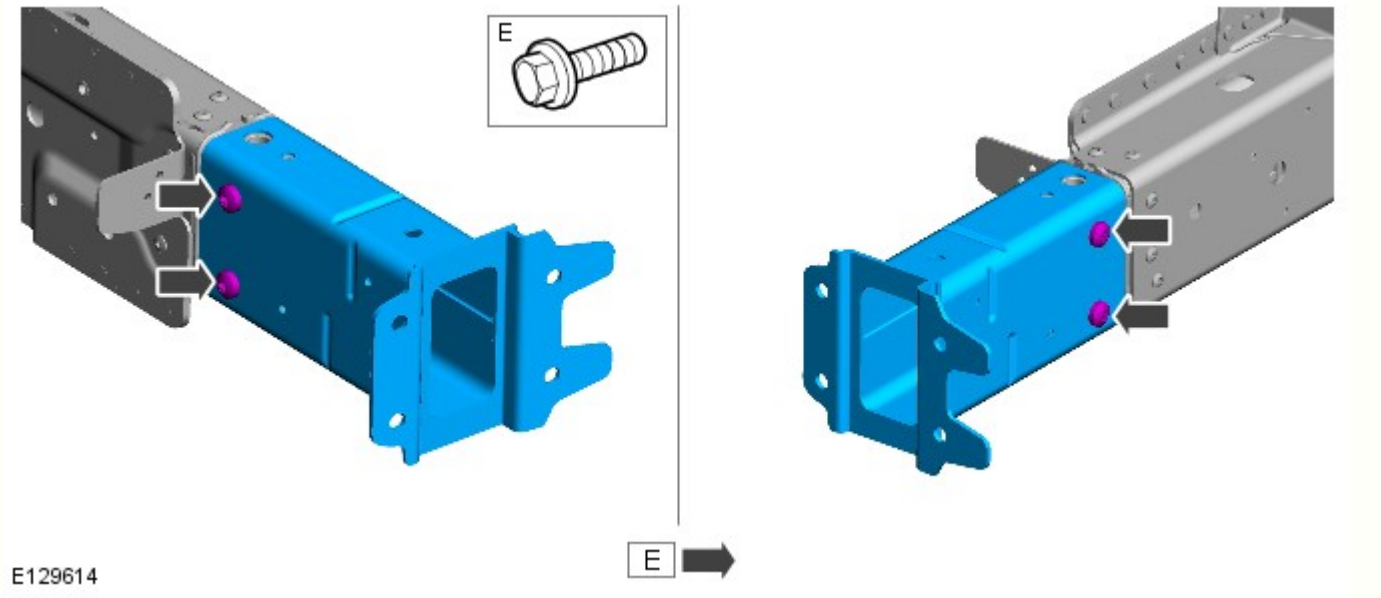


Installation

1. Offer up the side member deformation element. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

2. NOTE: Bolts are pre-coated to inhibit galvanic corrosion and can be re-installed only if the coating is not damaged.

Install the bolts to the side member deformation element bracket.
- Tighten to 62 Nm.



3. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

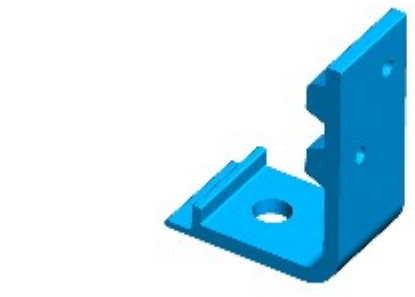
Front End Sheet Metal Repairs - Hood Latch Panel Mounting Bracket

Removal and Installation

Removal

1. The hood latch panel mounting bracket is a category B repair.



E128319

2. NOTE: The hood latch panel mounting bracket is manufactured from aluminium alloy 6014-T6/7.

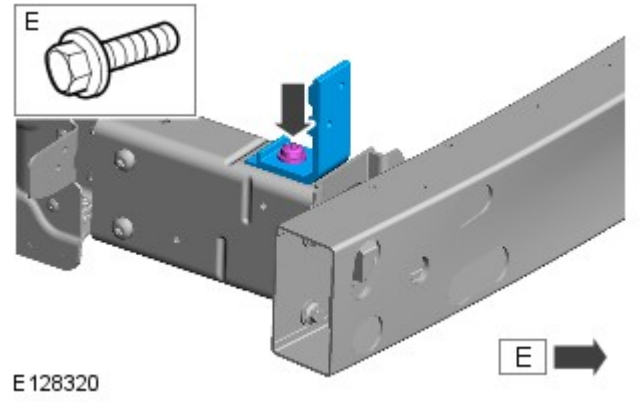
The hood latch panel mounting bracket is serviced as a separate bolt-on panel.

3. The hood latch panel mounting bracket is replaced in conjunction with:
- Front bumper cover
- Hood latch panel
- Front fender(s)

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery ground cable.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove the hood latch panel.
For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).



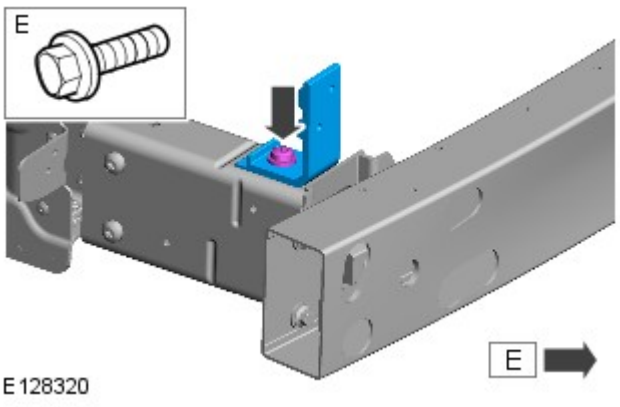
E128320

7. Remove the hood latch panel mounting bracket.

Installation

1. Loosely install the hood latch panel mounting bracket.

2. Offer up the hood latch panel. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.



3. With the hood latch panel correctly aligned, align and fully tighten the hood latch panel mounting bracket retaining bolt.

NOTE: Bolts are pre-coated to inhibit galvanic corrosion and can be reused only if the coating is not damaged.

- Tighten to 25 Nm.

4. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform

- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability

Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

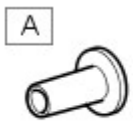
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

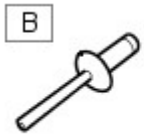
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

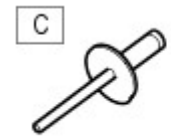
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

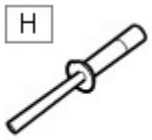
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

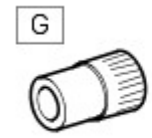
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

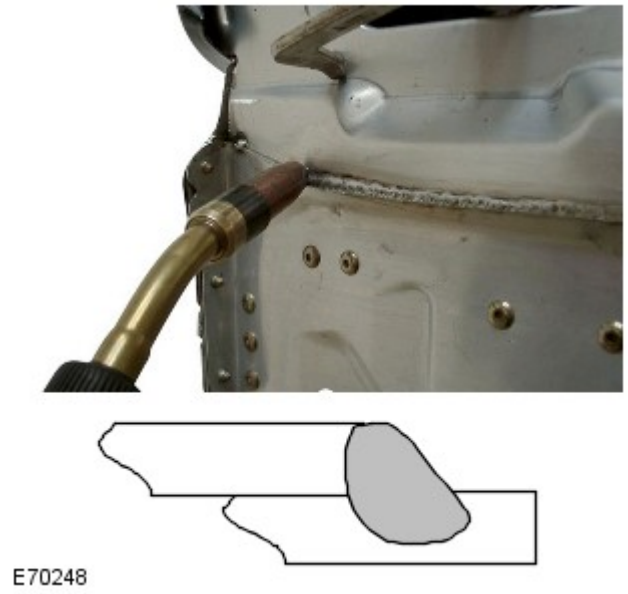
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

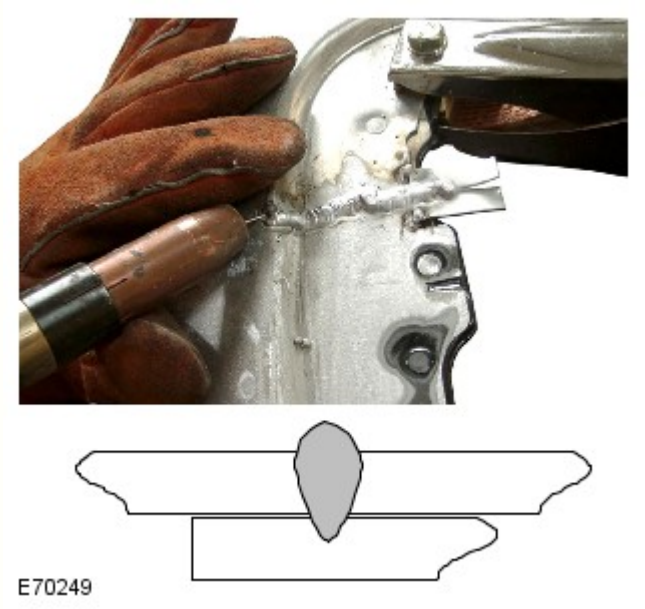
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

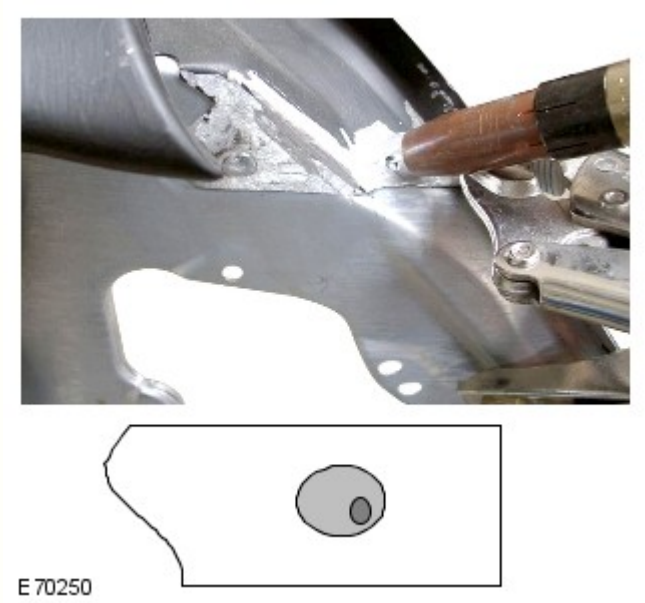
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Bumpers - Front Bumper

Removal and Installation

Removal

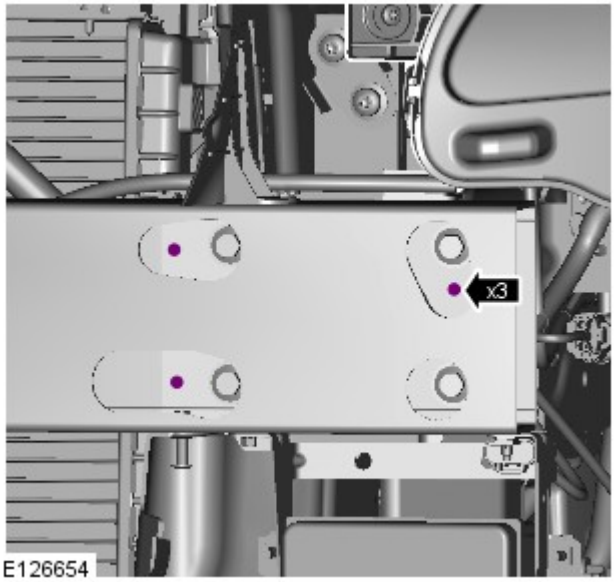
NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

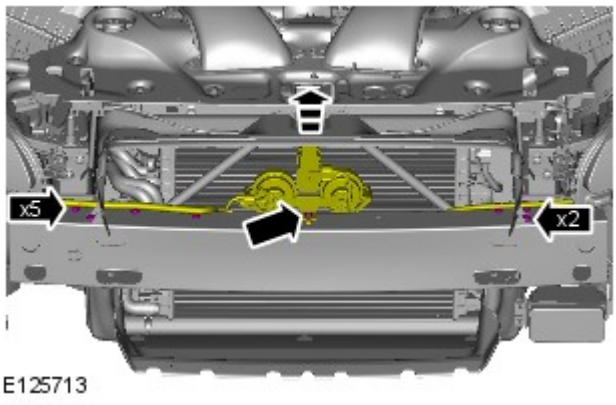


4. CAUTIONS:

Use a drill stop. Do not drill deeper than 5 mm.

LH illustration shown, RH is similar.

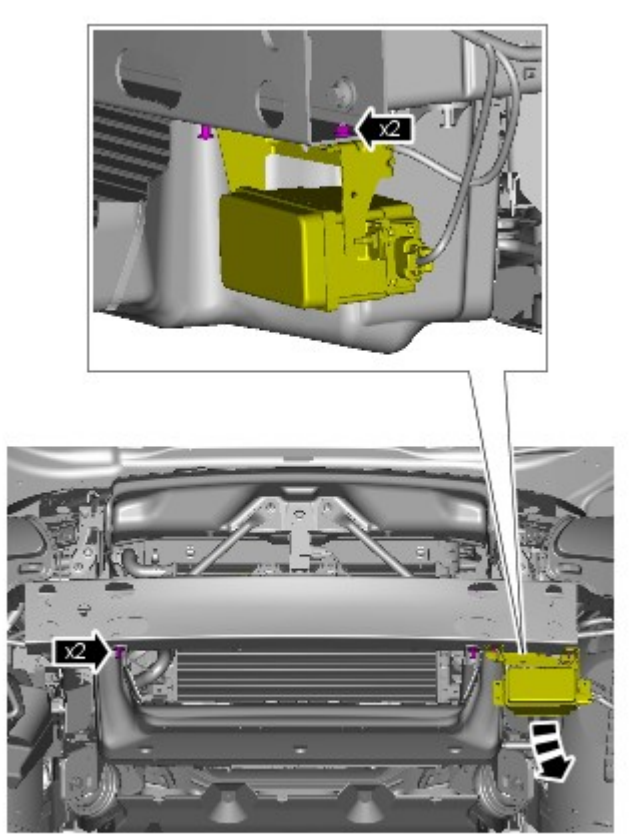
NOTE: The procedure must be carried out on both sides.



5. NOTE: Support as necessary.

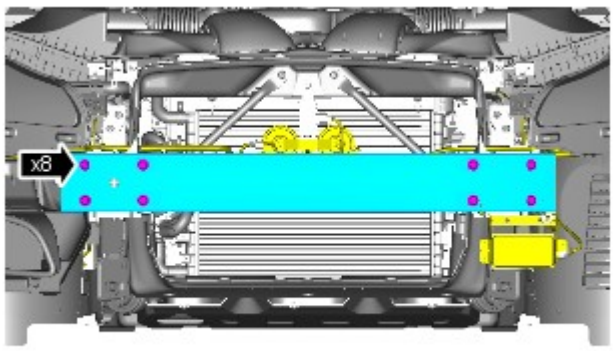
Torque: 10 Nm

6. NOTE: Support as necessary.



E125714

Torque: 10 Nm



E125715

7. CAUTION: Protect the surrounding components.

Torque: 55 Nm

Installation

1. To install, reverse the removal procedure.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

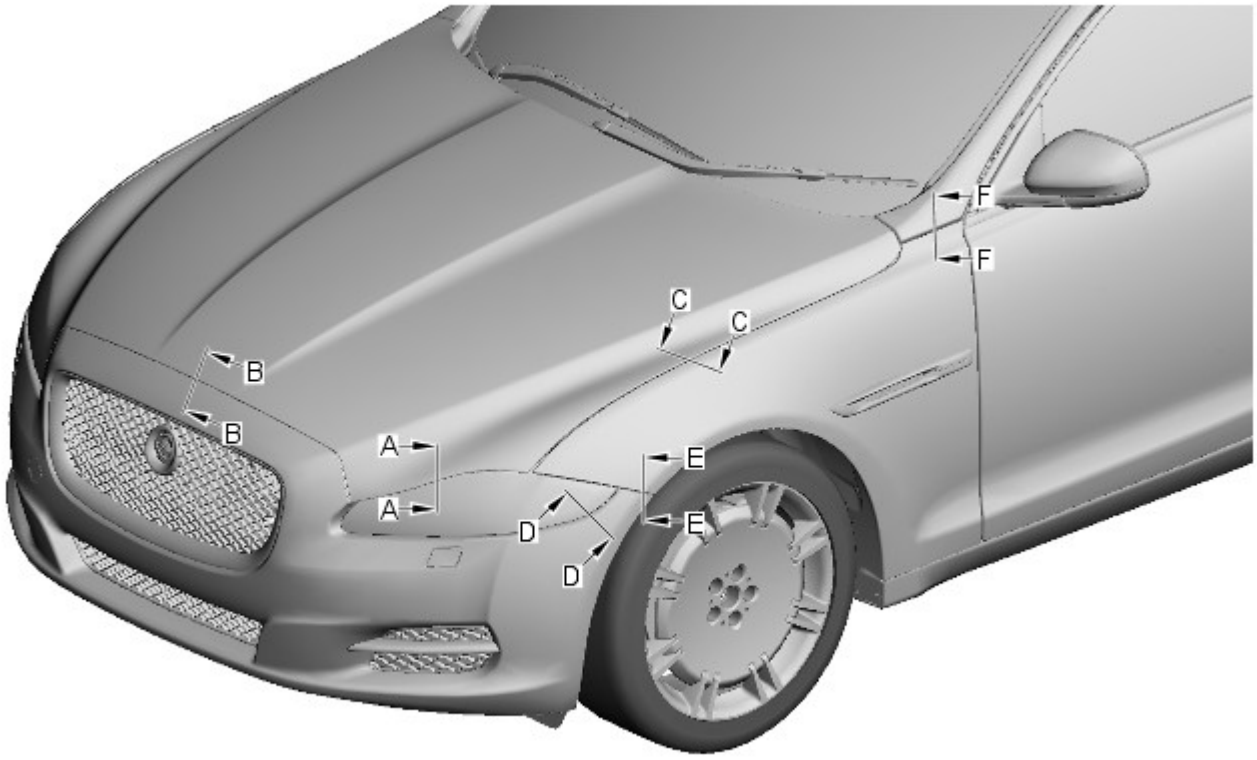
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

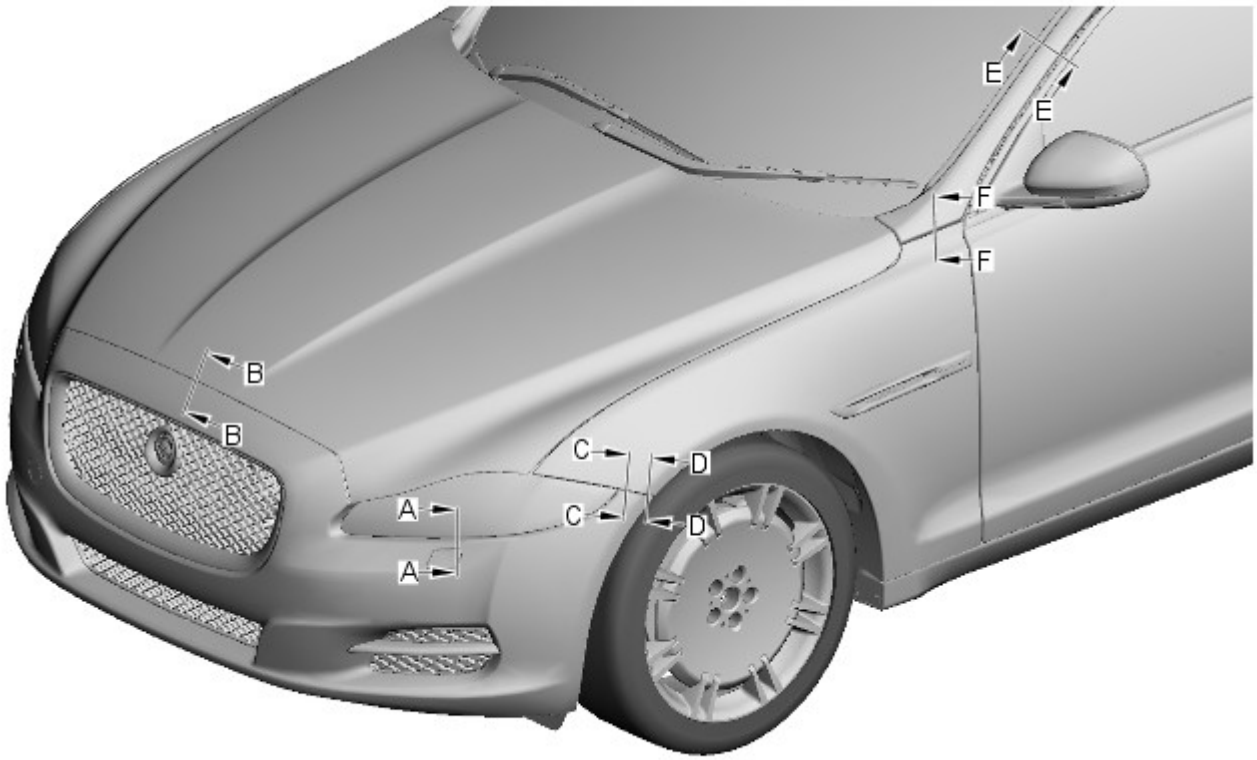
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



E133472

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

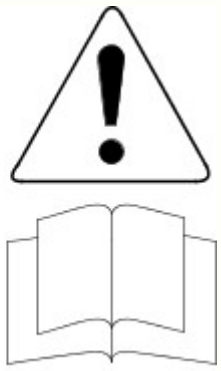
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

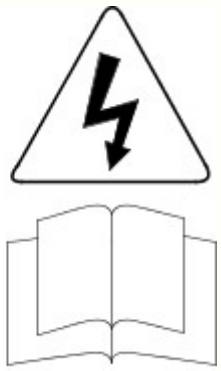
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



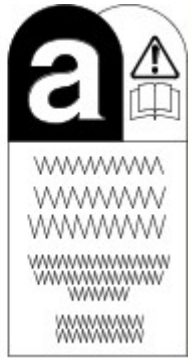
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



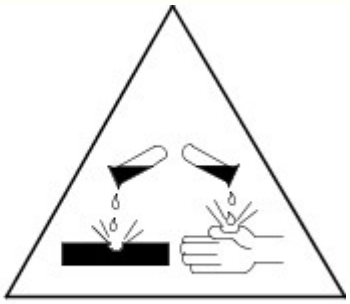
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

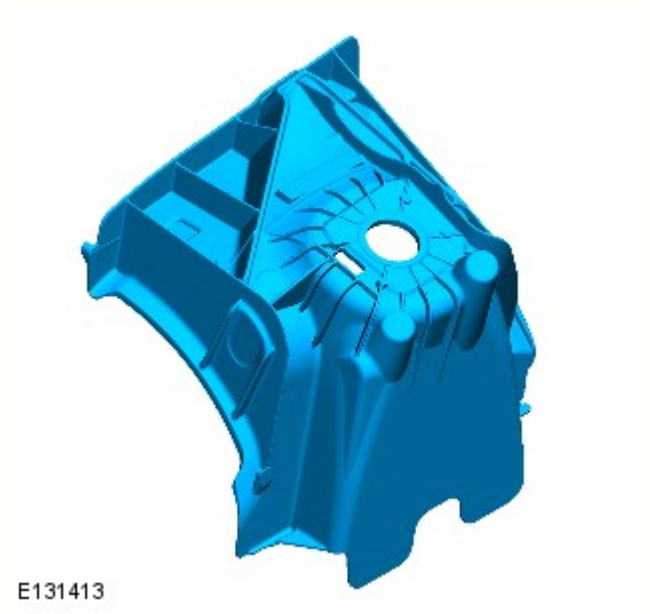
Front End Sheet Metal Repairs - Suspension Top Mount

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The suspension top mount is a category A repair.



2. NOTES:

The suspension top mount is manufactured from high pressure die cast aluminium HPDC.

The right-hand suspension top mount contains the stamped Vehicle Identification Number, (VIN). When a new right hand suspension top mount is requested it will be supplied stamped with the Vehicle Identification Number, (VIN). This operation is carried out within the Jaguar parts supply process.

The suspension top mount is serviced as a separate riveted and bonded panel, including the hood latch panel mounting and the hood hinge mounting. It does not include the hood strut mounting panel. The suspension top mount is also part of the front side member and suspension top mount service panel.

3. In this procedure, to make sure that the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The suspension top mount is replaced in conjunction with:
- Front bumper cover
- Front fender
- Front door
- Hood
- Hood hinge
- Hood latch panel
- Fender apron panel
- Fender apron panel closing panel.
- Engine, transmission, front subframe and front suspension, as an assembly

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7.

Remove the fender apron panel.
For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

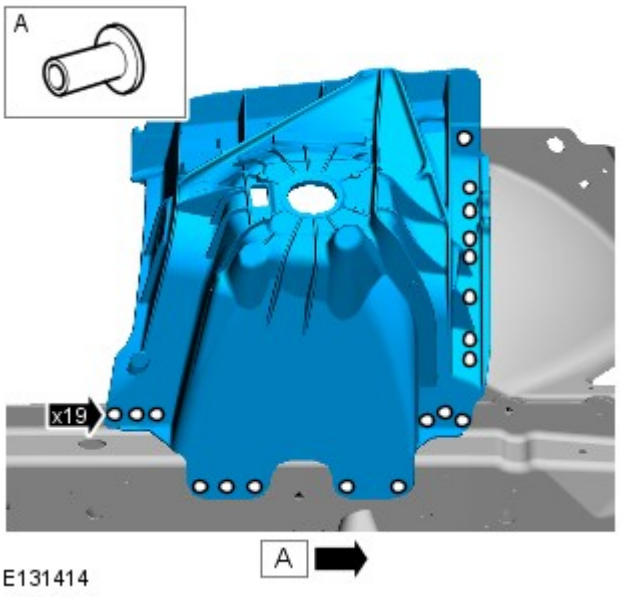
8. Remove the engine, transmission, front subframe and front suspension as an assembly.

9. If the right-hand suspension top mount is to be replaced, remove the side member heatshield.

10. Remove the insulating material from the outer bulkhead and transmission tunnel.

11. Remove the front suspension upper arm.
For additional information, refer to: Upper Arm LH - 3.0L Diesel (204-01, Removal and Installation) / Upper Arm LH - V8 5.0L Petrol/V8 S/C 5.0L Petrol (204-01 Front Suspension, Removal and Installation) / Upper Arm RH - 3.0L Diesel (204-01, Removal and Installation) / Upper Arm RH - V8 5.0L Petrol/V8 S/C 5.0L Petrol (204-01 Front Suspension, Removal and Installation).

12. Remove any remaining miscellaneous components from the repair area as necessary.

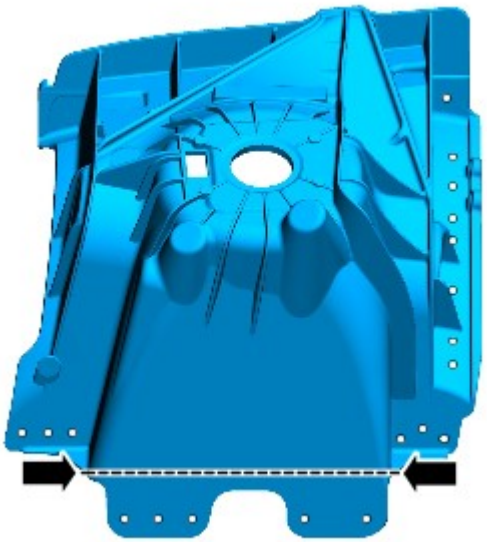


13. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.

14. NOTE: Retain the old panel as it will be used as a template.

Separate the joints and remove the old panel.

15. Cut a section from the old panel to be used as a template, as indicated.



E131415

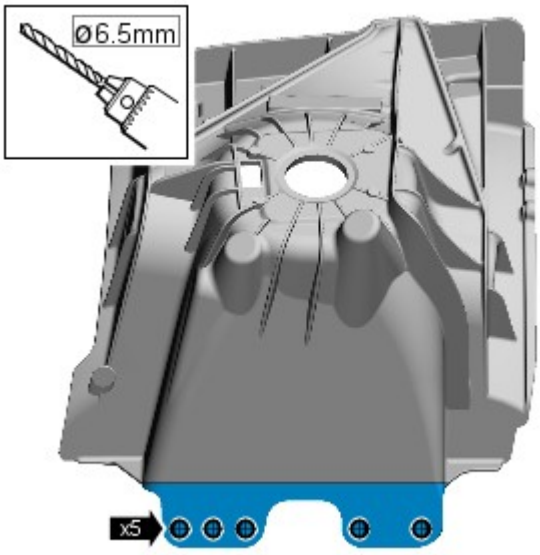
Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

4. Remove the new panel.



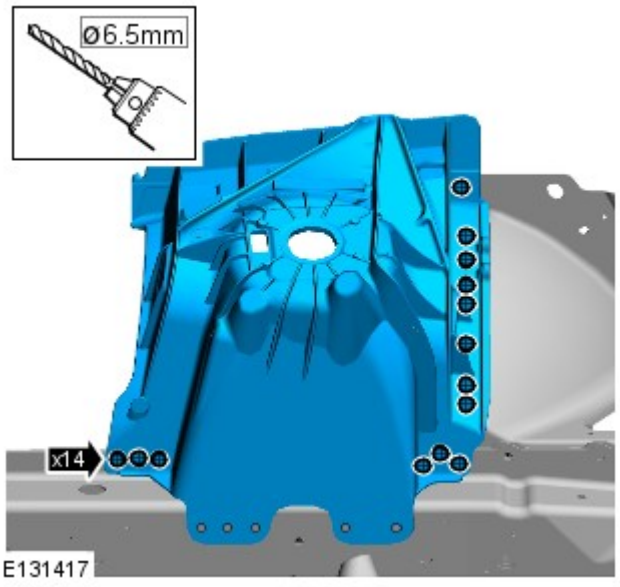
E131416

5. Clamp the template to the new panel and using a 6.5mm Cryobit drill bit, drill holes through the template into the new panel, ready for Hemloks to be installed.

6. Debur the drilled holes.

7. Offer up the new panel and clamp into position.

8. Using a 6.5mm Cryobit drill bit, drill holes at the points where Hemloks are to be installed.



9. Remove the new panel.

10. Debur the drilled holes.

11. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

12. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

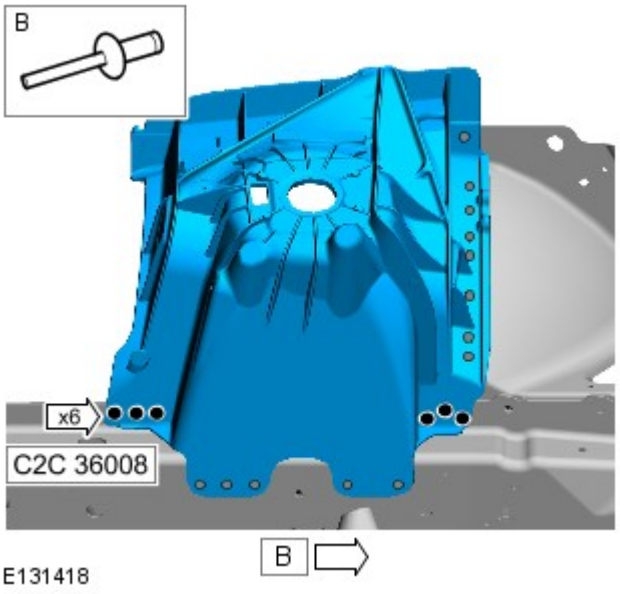
13. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

14. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

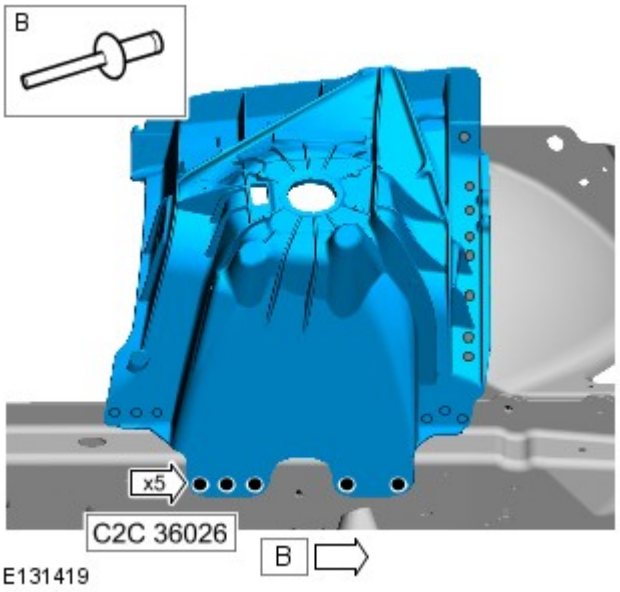
15. Offer up the new panel and clamp into position.

16. Using the Genesis G4, install the Hemloks.



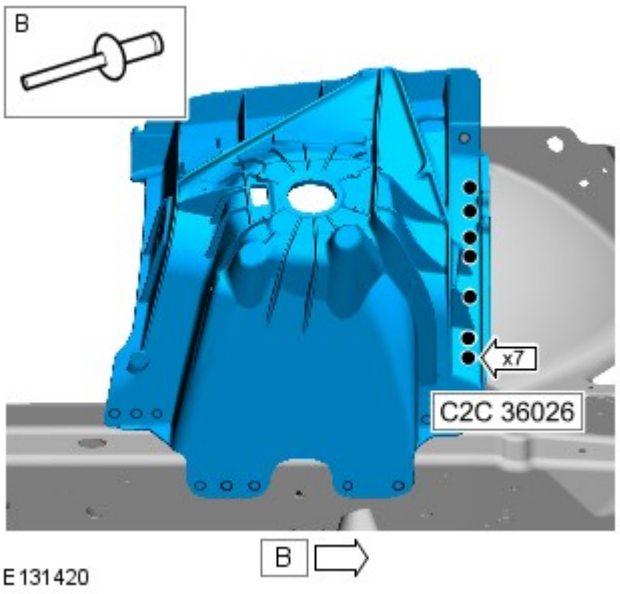
E131418

17. Using the Genesis G4, install the Hemloks.

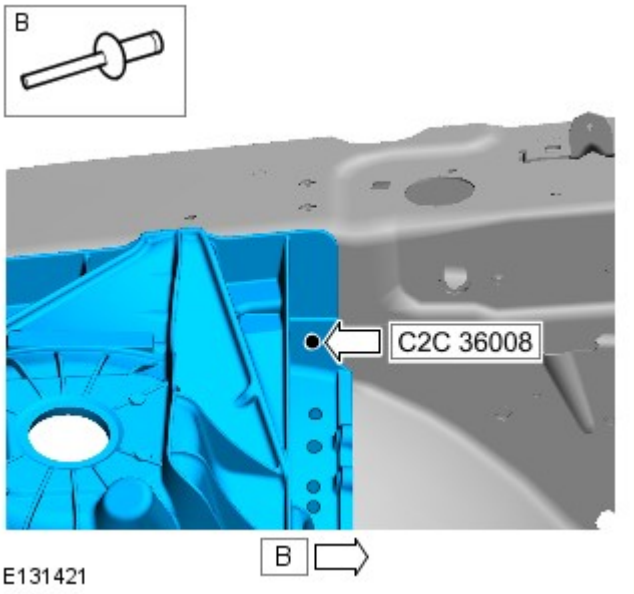


E131419

18. Using the Genesis G4, install the Hemloks.



E131420



19. NOTE: This Hemlok is installed following the installation of the fender apron panel and fender apron panel closing panel.

Following the installation of the fender apron panel and the fender apron panel closing panel, install the Hemlok.

20. Remove any excess adhesive.

21. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

22. The installation of associated panels and components is the reversal of removal procedure.

Published: 28-Dec-2012

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Front Suspension - Upper Arm LH V8 5.0L Petrol/V8 S/C 5.0L Petrol

Removal and Installation

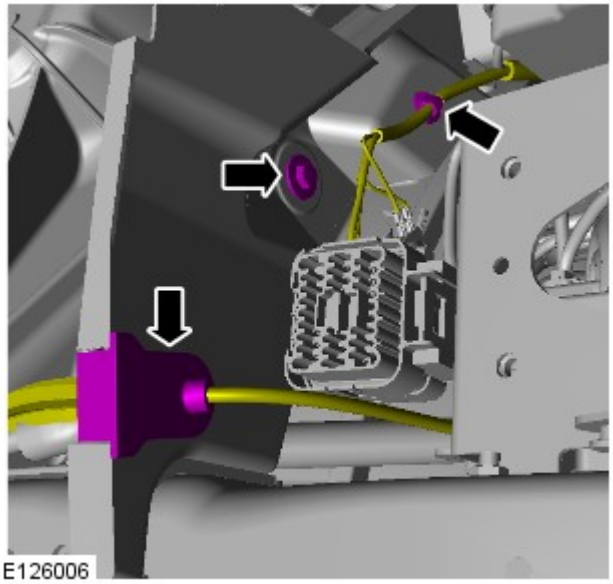
Removal

1. WARNING: Make sure to support the vehicle with axle stands.

   Raise and support the vehicle.

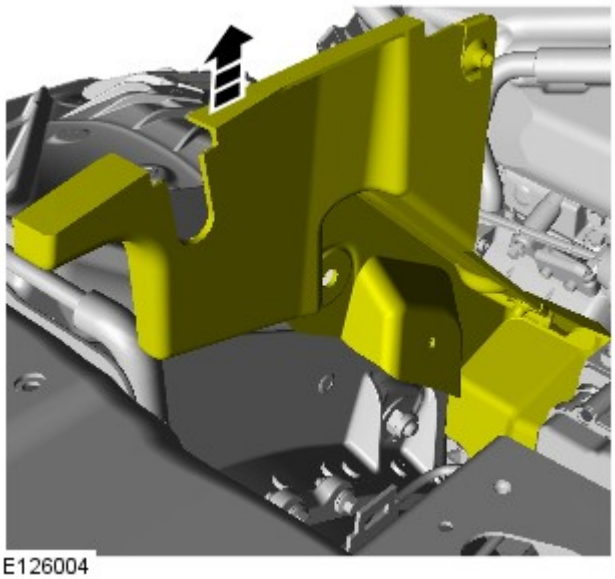
2. Remove the shock absorber and spring assembly.
   For additional information, refer to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation).

3. Remove the secondary bulkhead LH panel.
   For additional information, refer to: Secondary Bulkhead Panel LH (501-02 Front End Body Panels, Removal and Installation).



E126006

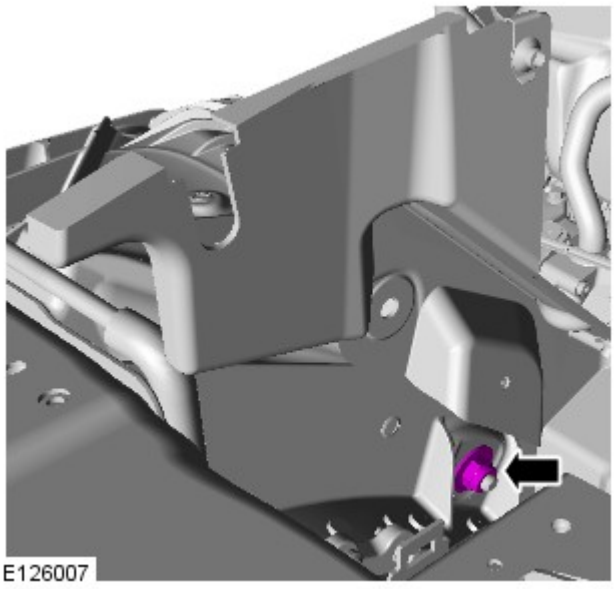
4. Release the secondary bulkhead outer LH panel.
   - Remove the bolt.
   - Release the cable clip.
   - Release the wiring harness clip.



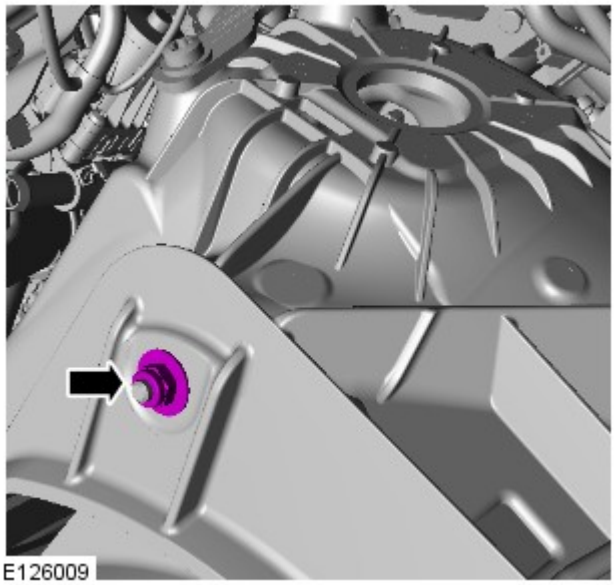
E126004

5. Aside the secondary bulkhead outer LH panel.
   - Tie aside.

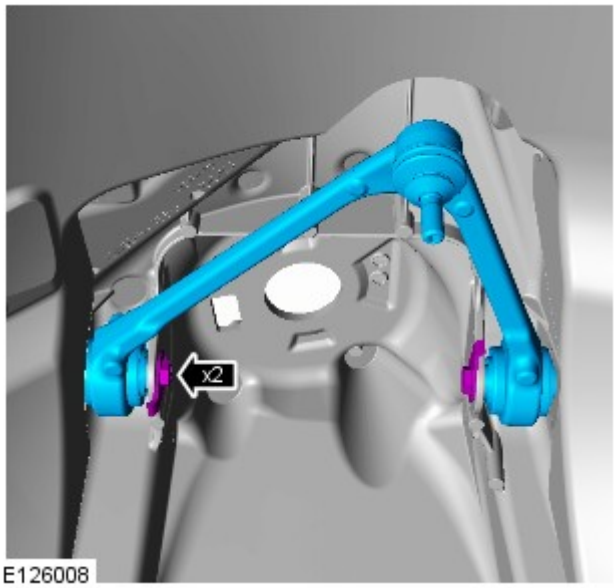
6. Remove the air cleaner.
   For additional information, refer to: Air Cleaner LH (303-12 Intake Air Distribution and Filtering - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).



7. Remove the upper arm retaining nut.

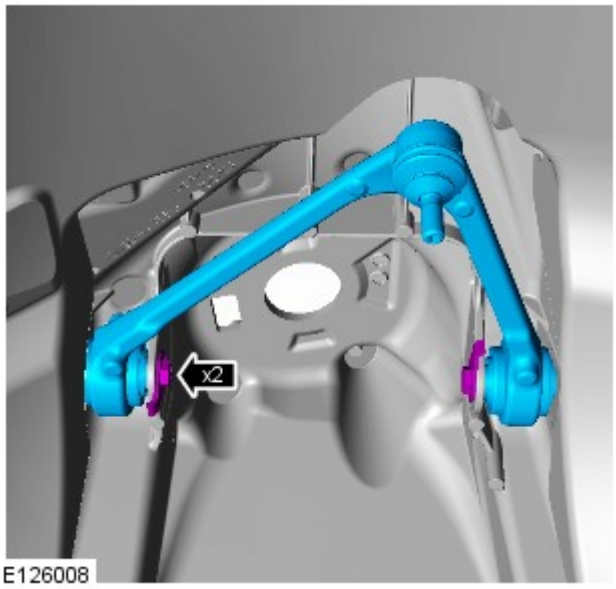


8. Remove the upper arm retaining nut.

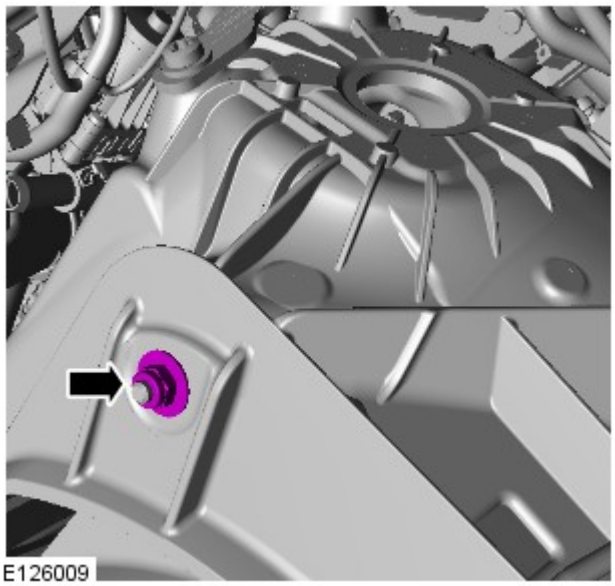


9. Remove the upper arm.

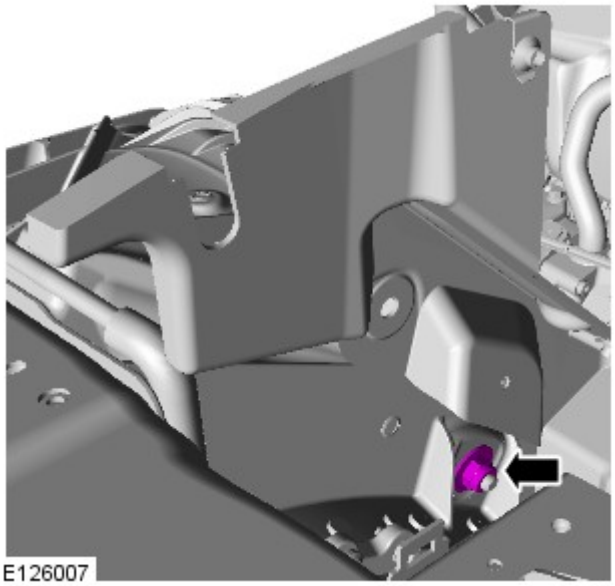
Installation



1. Install the upper arm.

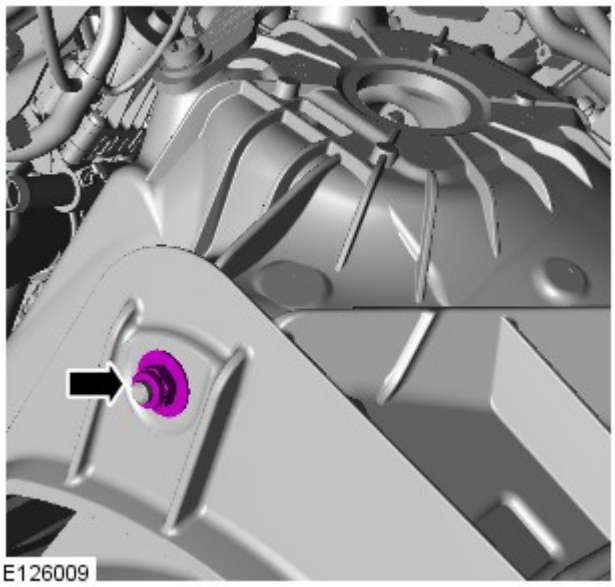


2. Install the upper arm retaining nut, but do not tighten fully at this stage.



3. Install the upper arm retaining nut, but do not tighten fully at this stage.

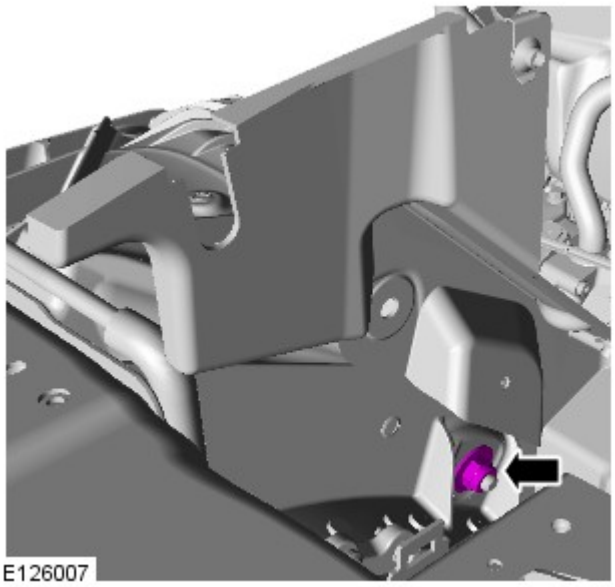
4. Install the shock absorber and spring assembly.
For additional information, refer to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation).



E126009

5. CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

Tighten to 70 Nm (52 lb.ft).



E126007

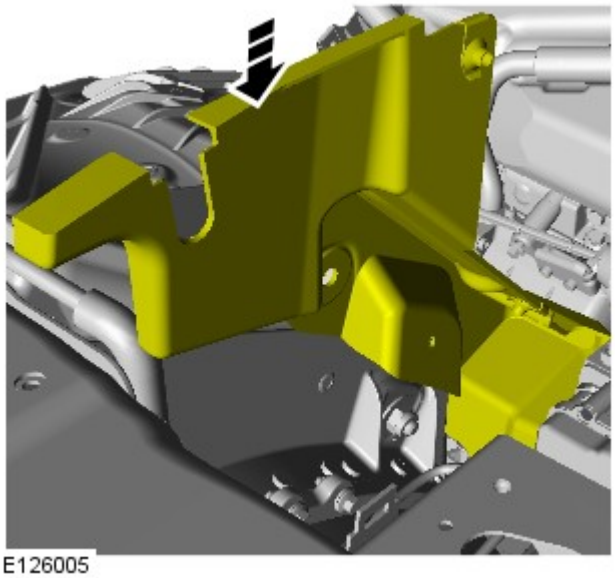
6. CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

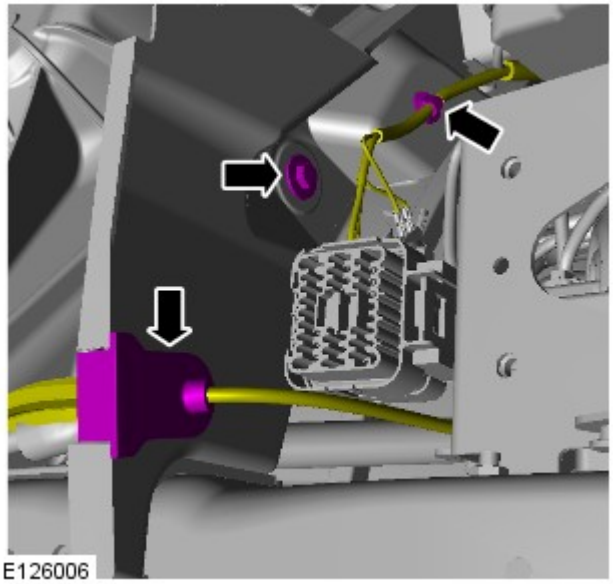
Tighten to 70 Nm (52 lb.ft).

7. Install the air cleaner.
For additional information, refer to: Air Cleaner LH (303-12 Intake Air Distribution and Filtering - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

8. Release the secondary bulkhead outer LH panel.
   - Cut the cable tie.



E126005



E126006

9. Secure the secondary bulkhead outer LH panel.
   - Tighten the bolt to 7 Nm (5 lb.ft).
   - Secure the cable in the clip.
   - Secure the wiring harness clip.

10. Install the secondary bulkhead LH panel.
For additional information, refer to: Secondary Bulkhead Panel LH (501-02 Front End Body Panels, Removal and Installation).

Battery, Mounting and Cables - Battery Disconnect and Connect

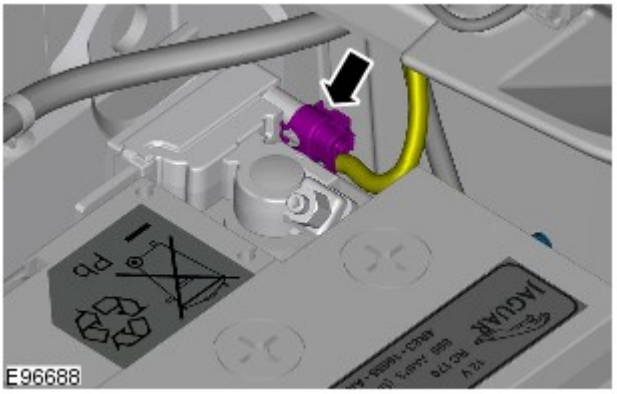
General Procedures

Disconnect

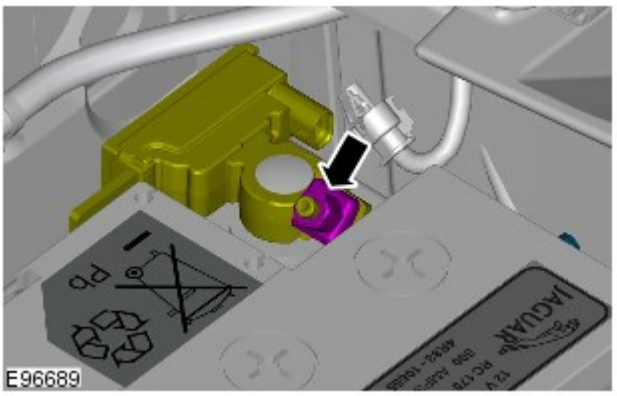
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

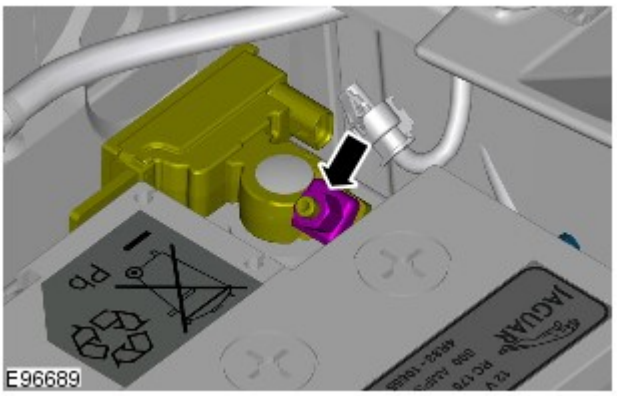


CAUTION: Take extra care not to damage the wiring harness.

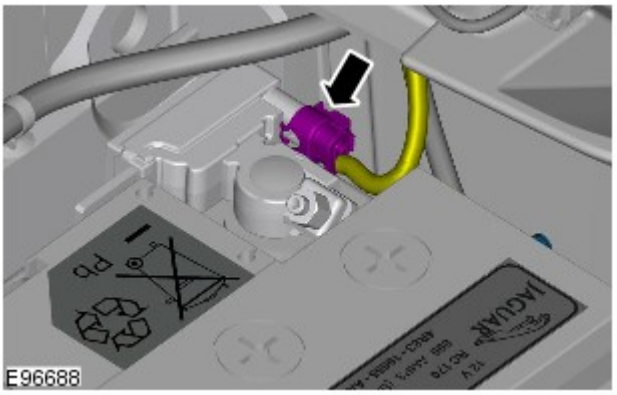


5.

Connect

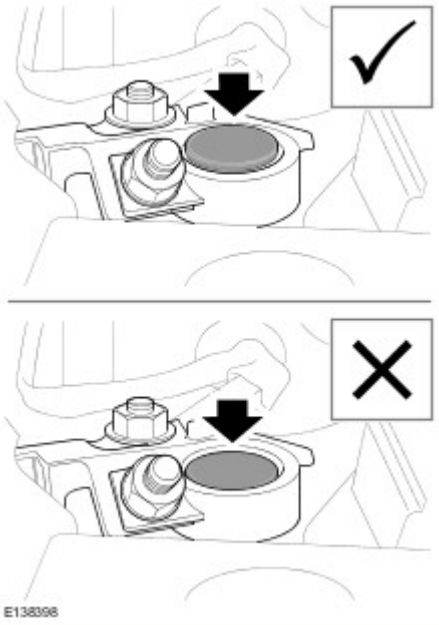


1. *Torque:* 6 Nm



2.

3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Published: 11-May-2011

Front Suspension - Upper Arm RH V8 5.0L Petrol/V8 S/C 5.0L Petrol

Removal and Installation

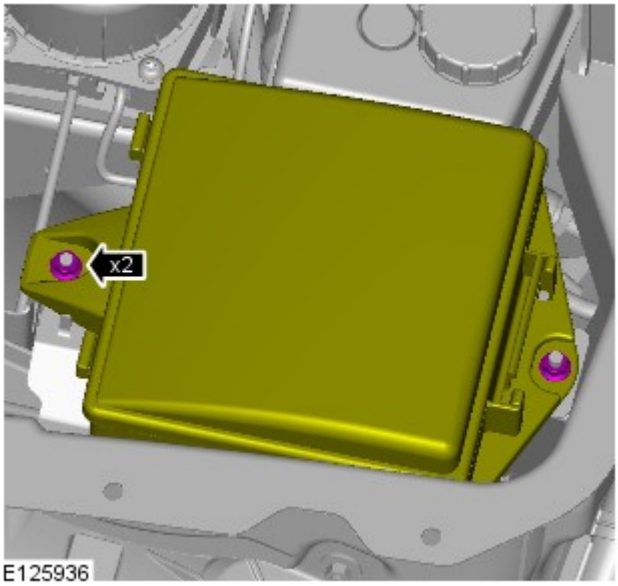
Removal

1. WARNING: Make sure to support the vehicle with axle stands.

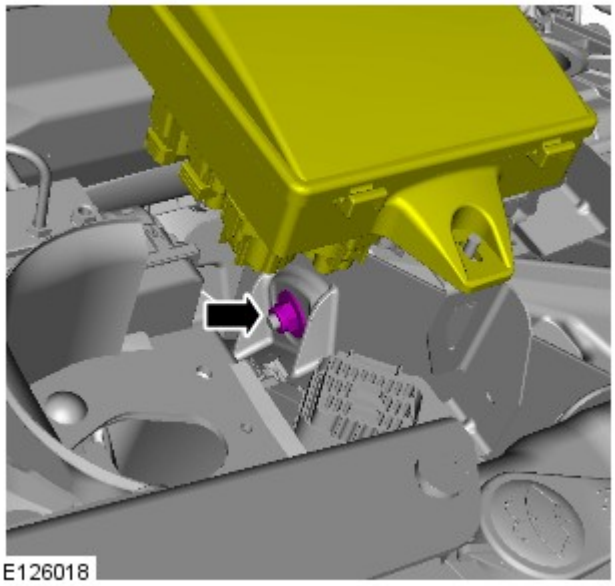
Raise and support the vehicle.

2. Remove the shock absorber and spring assembly.
For additional information, refer to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation).

3. Remove the RH secondary bulkhead panel.
For additional information, refer to: Secondary Bulkhead Panel RH (501-02 Front End Body Panels, Removal and Installation).



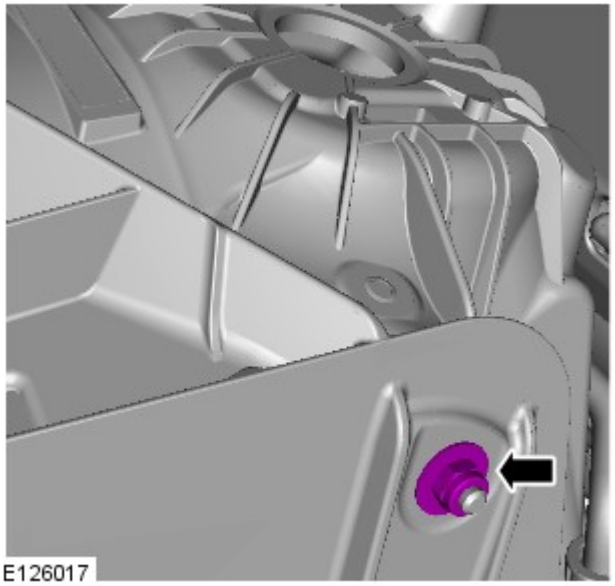
4. Release the fuse box.
   - Remove the 2 nuts.
   - Position the fuse box aside for access to the inboard retaining nut.

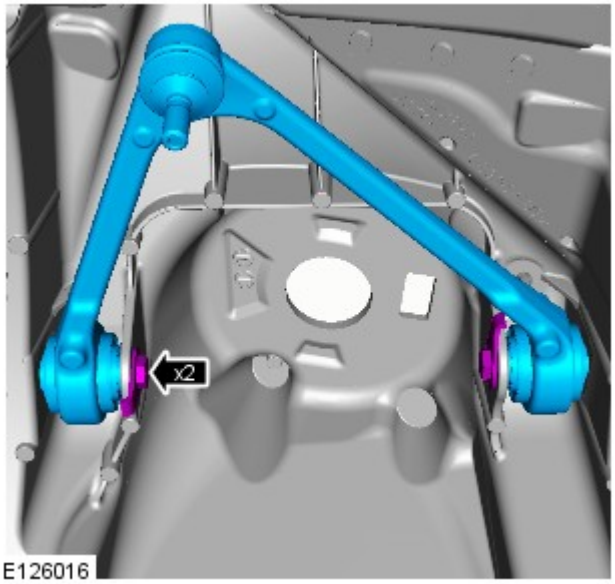


5. Remove the upper arm retaining nut.

6. Remove the air cleaner.
For additional information, refer to: Air Cleaner RH (303-12 Intake Air Distribution and Filtering - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

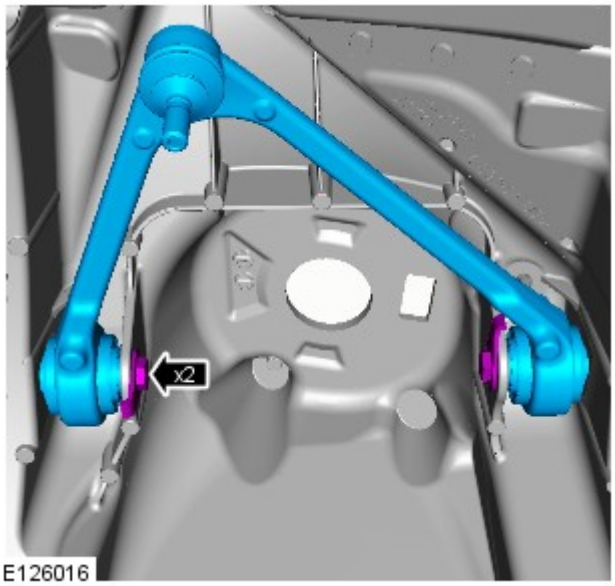
7. Remove the upper arm retaining nut.



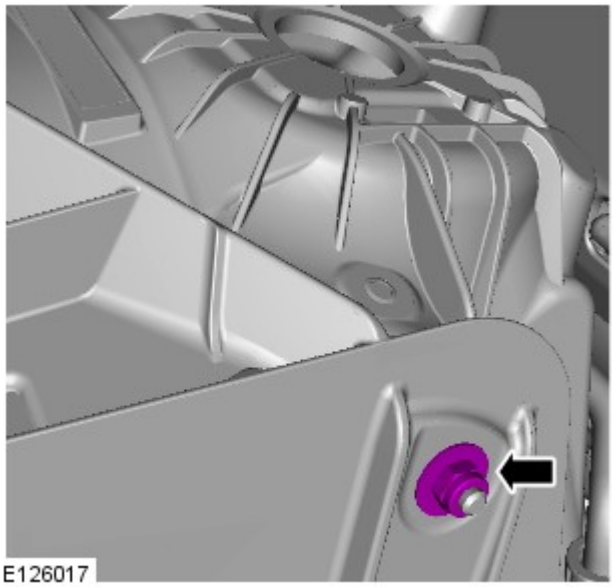


8. Remove the upper arm.

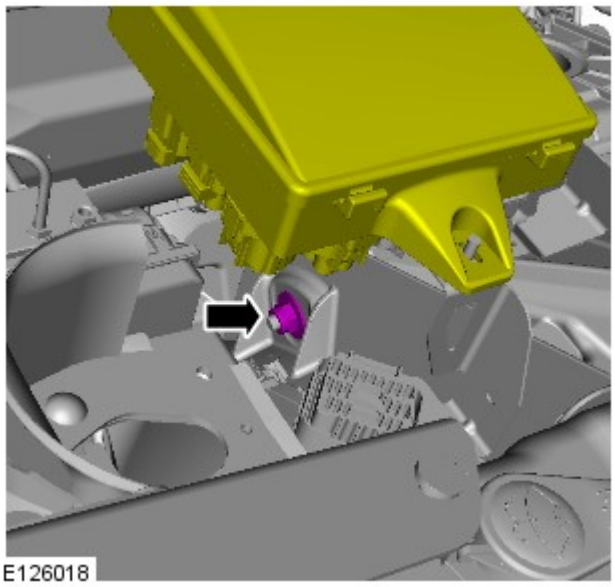
Installation



1. Install the upper arm.



2. Install the upper arm retaining nut, but do not tighten fully at this stage.

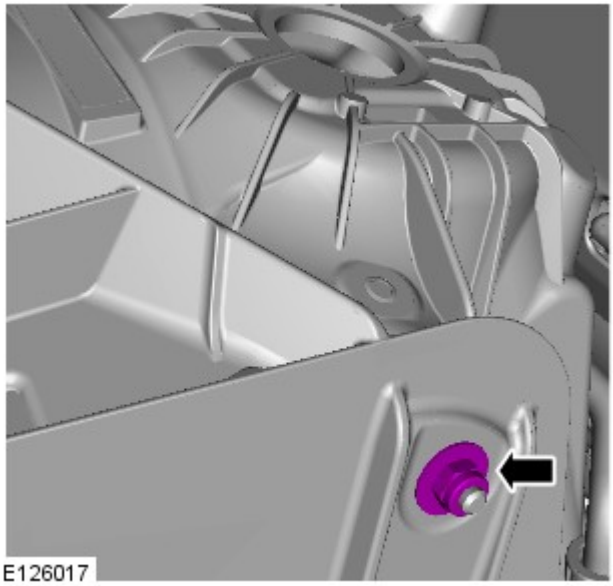


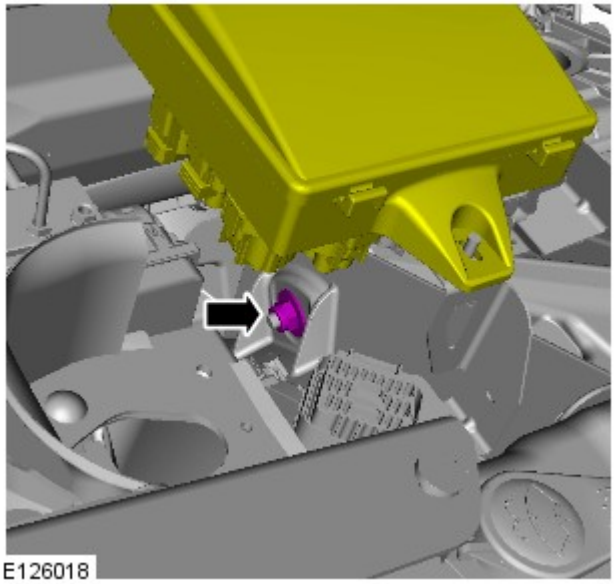
3. Install the upper arm retaining nut, but do not tighten fully at this stage.

4. Install the shock absorber and spring assembly.
For additional information, refer to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation).

5. CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

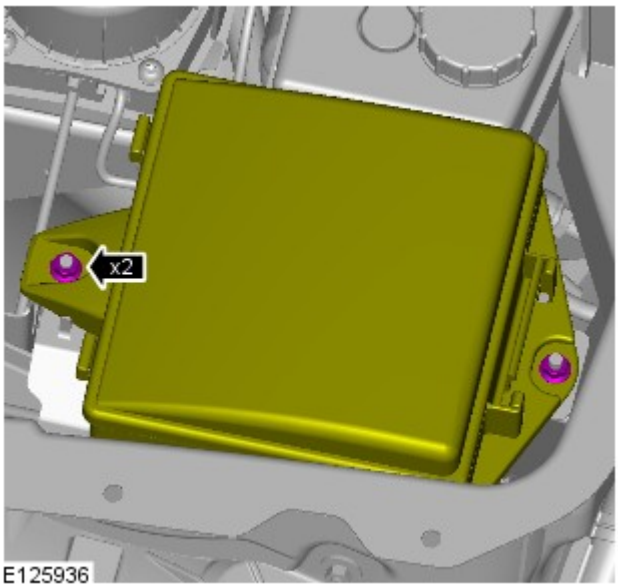
Tighten to 70 Nm (52 lb.ft).





6. CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

Tighten to 70 Nm (52 lb.ft).



7. Secure the fuse box.
   - Install the 2 nuts and tighten to 7 Nm (5 lb.ft).

8.

Install the air cleaner.
For additional information, refer to: Air Cleaner RH (303-12 Intake Air Distribution and Filtering - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

9. Install the RH secondary bulkhead panel.
For additional information, refer to: Secondary Bulkhead Panel RH (501-02 Front End Body Panels, Removal and Installation).

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

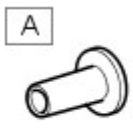
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

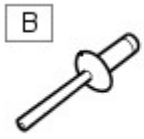
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

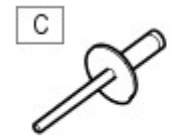
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

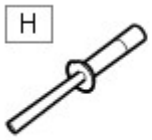
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

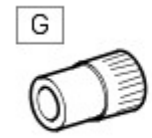
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

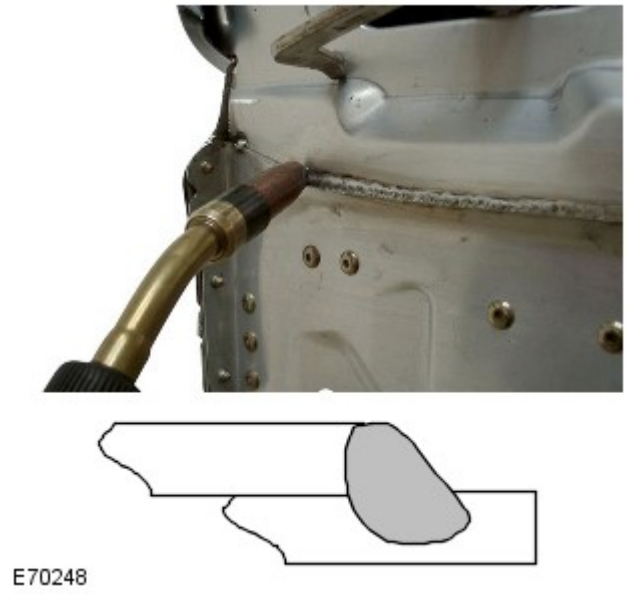
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

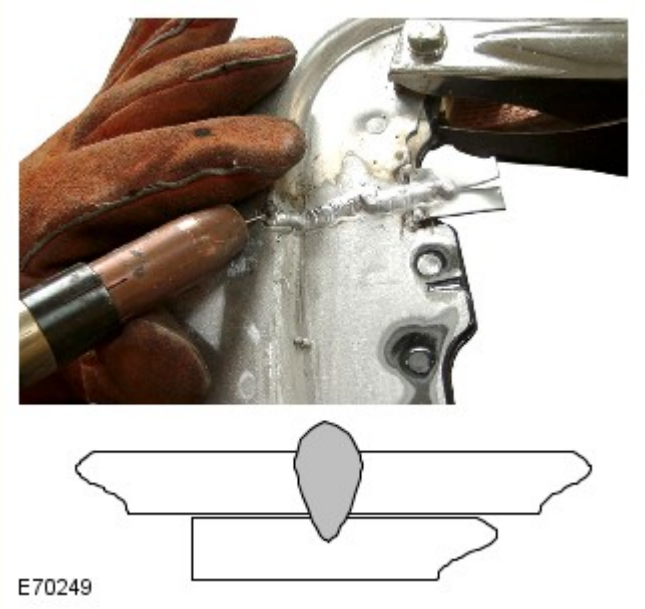
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

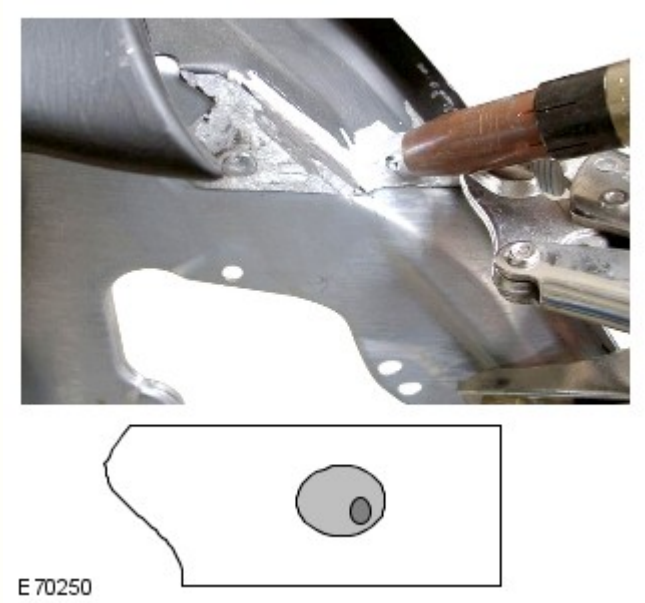
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

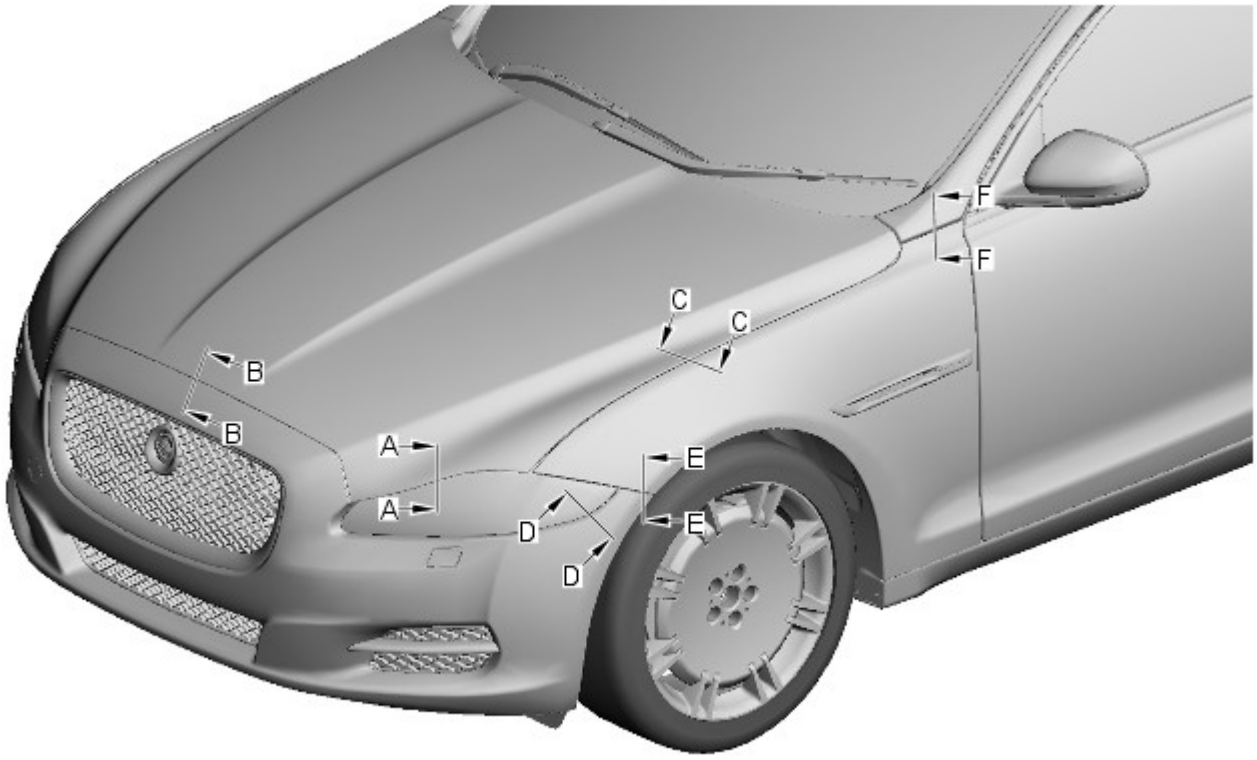
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

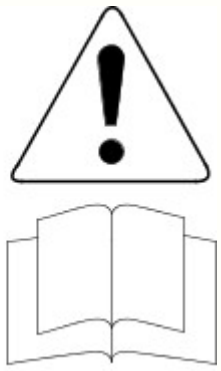
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

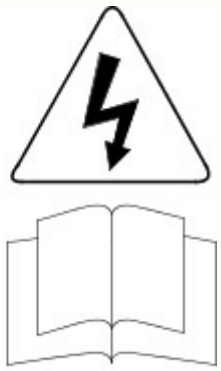
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



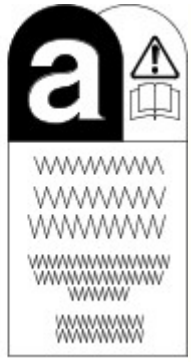
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



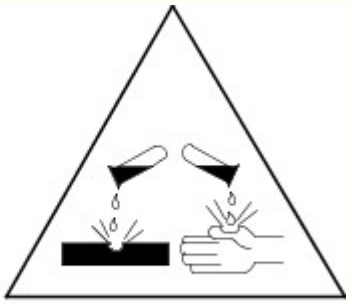
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Front End Sheet Metal Repairs - Fender Apron Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The fender apron panel is a category A repair.

2. NOTE: The fender apron panel is manufactured from aluminium alloy 5754-NG.

   The fender apron panel is serviced as a separate riveted and bonded panel, including the hood latch panel mounting and the hood hinge mounting. It does not include the hood strut mounting panel.

3. The fender apron panel closing panel is replaced in conjunction with:
- Front bumper cover
- Front fender
- Front door
- Hood
- Hood hinge
- Hood latch panel
- Fender apron panel closing panel

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the vehicle battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

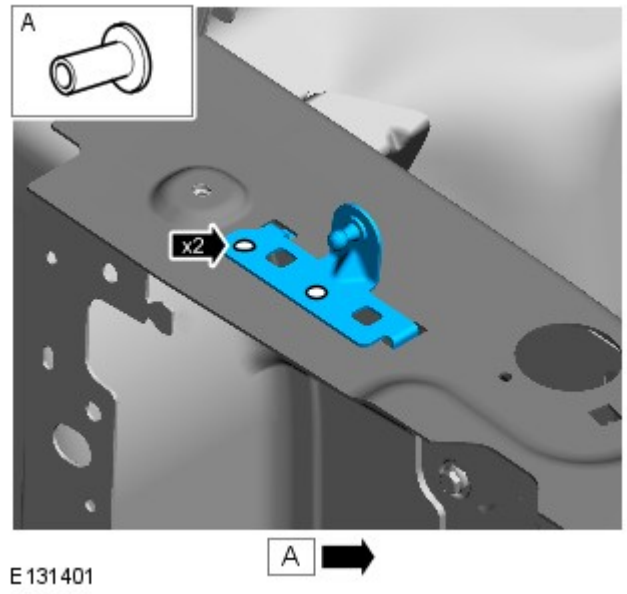
6. Remove the fender apron panel closing panel.
For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

7. Remove the hood hinge.
For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

8. Prior to removal, mark the position of the fender apron panel in relation to adjacent panels, for ease of alignment on installation.

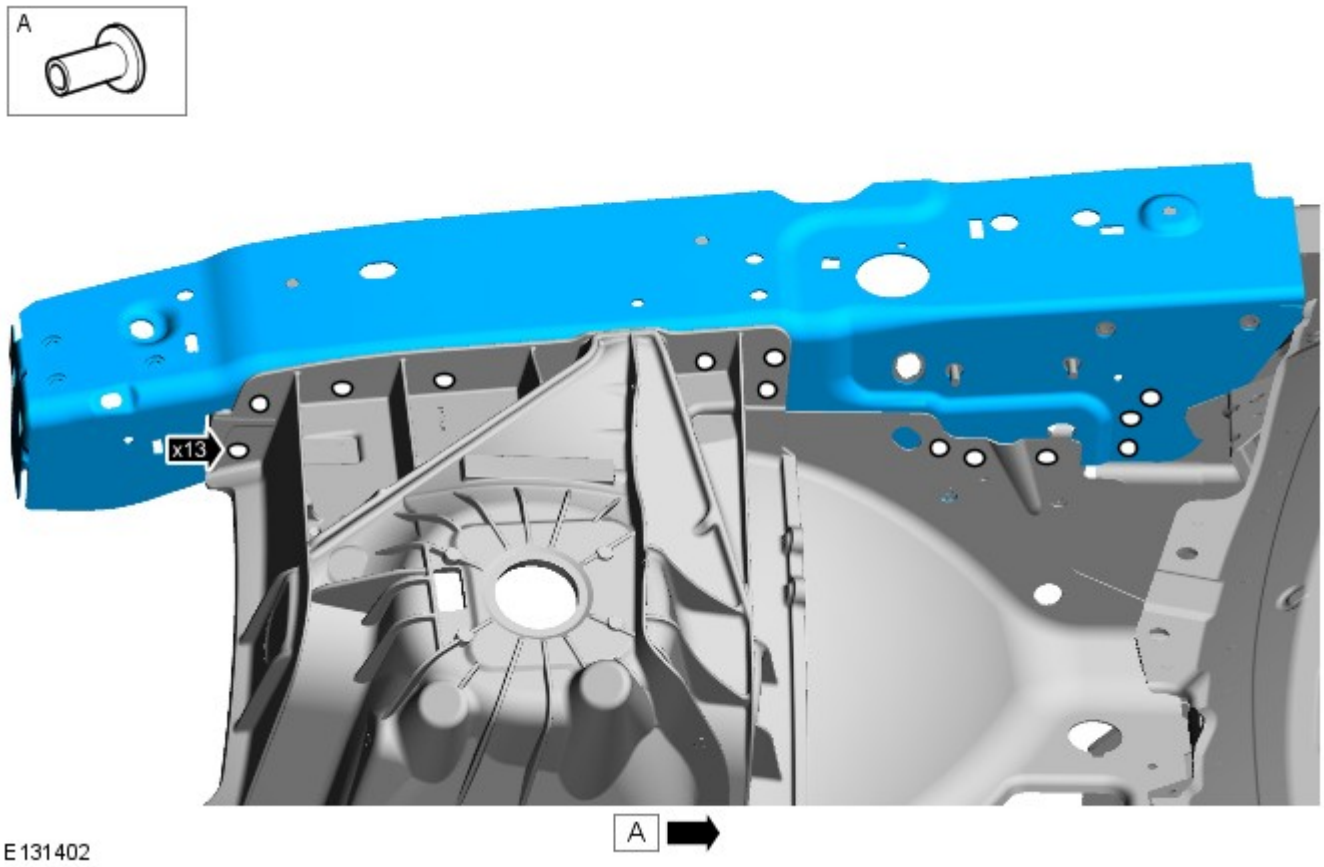
9. NOTE: If the hood strut mounting bracket is to be replaced, it is not necessary to remove it. Retain if being re-used.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets to the hood strut mounting panel.



E131401

10. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets.



E131402

11. Separate the joints and remove the old panel.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

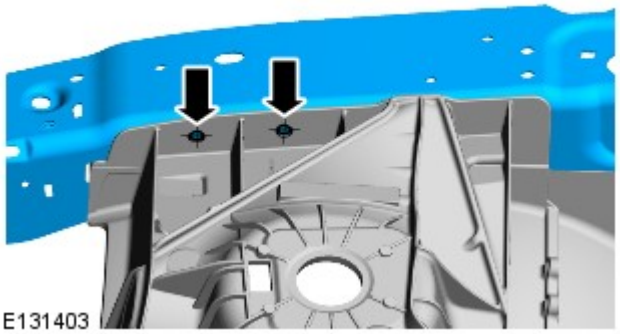
3.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

4. Using a Roloc fine bristle disc, clean and prepare the panel surfaces of the hood strut mounting panel.

5. NOTE: If a new hood strut mounting panel is required, it can be installed with 2 self piercing rivets using the ESN50.

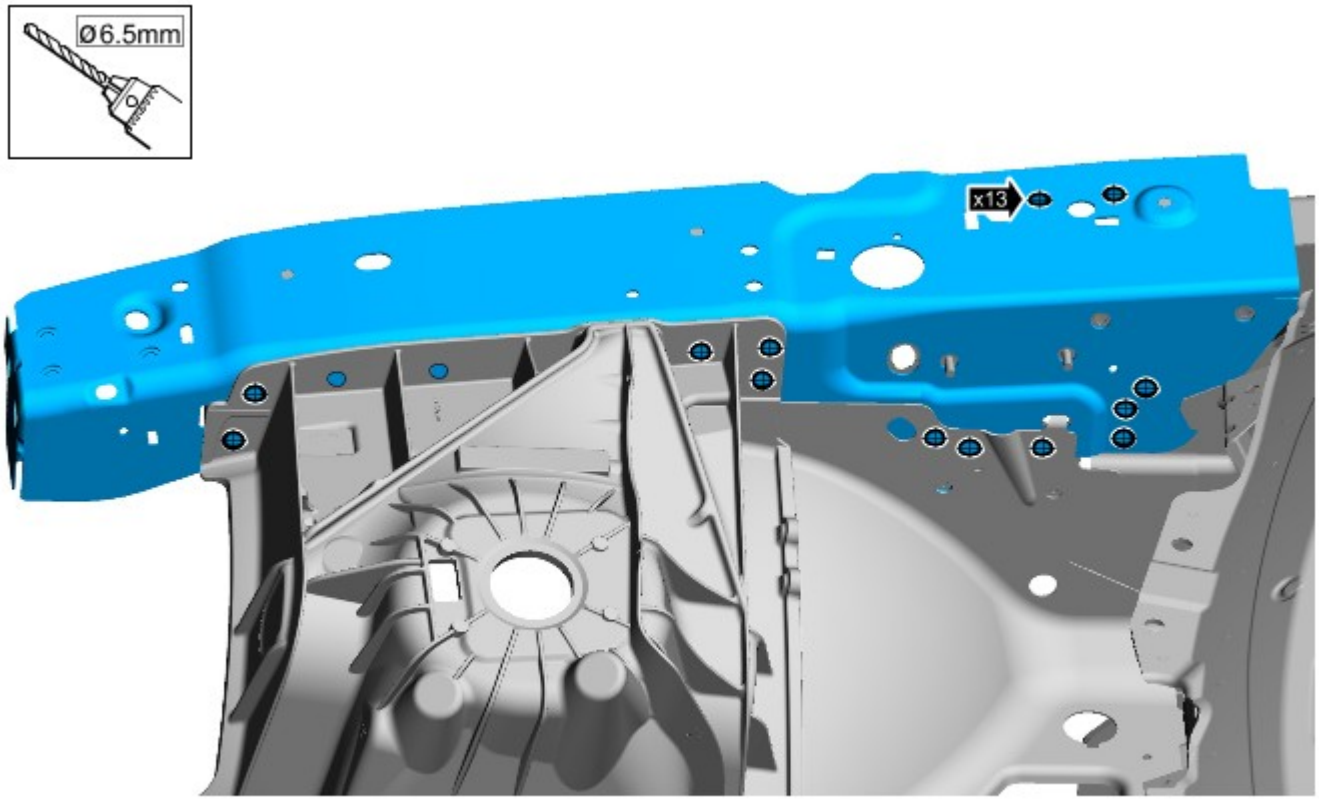
Offer up the original hood strut mounting panel to the new fender apron panel, align and clamp into position.



E131403

6. NOTE: Where it is not possible to install Hemloks, due to tooling access, torx screws and rivet nuts must be installed.

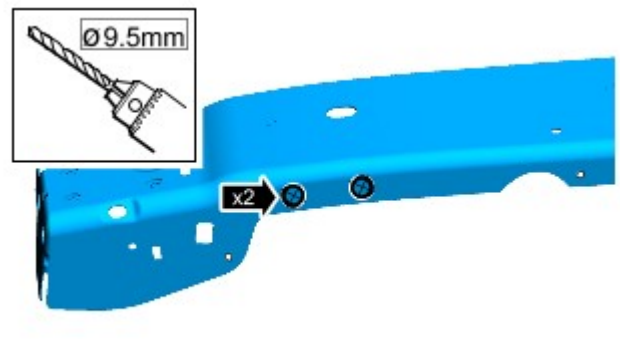
Mark the position where the rivet nuts are to be installed.



E131404

8. Remove the new panel and separate the hood hinge mounting panel.

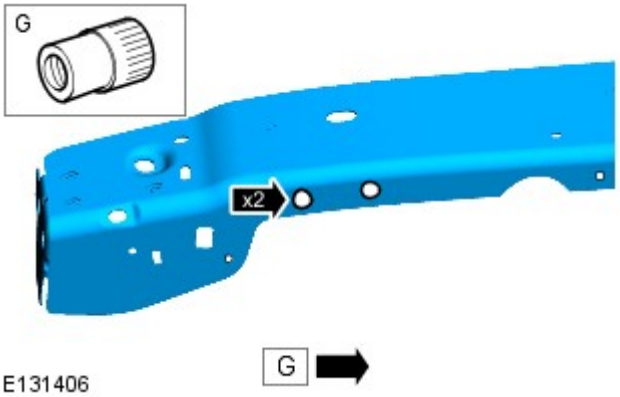
9.



E131405

Using a 9.5mm drill bit, drill the marked holes for the rivet nuts.

10. Debur the drilled holes.



E131406

11. Using the HES 412 rivet nut tool, insert the rivet nuts.

12. Offer up the new panel into position to ensure holes for rivets and torx screws are aligned. If correct proceed to next step, if not, rectify and recheck before proceeding.

13. Remove the new panel.

14. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

15. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

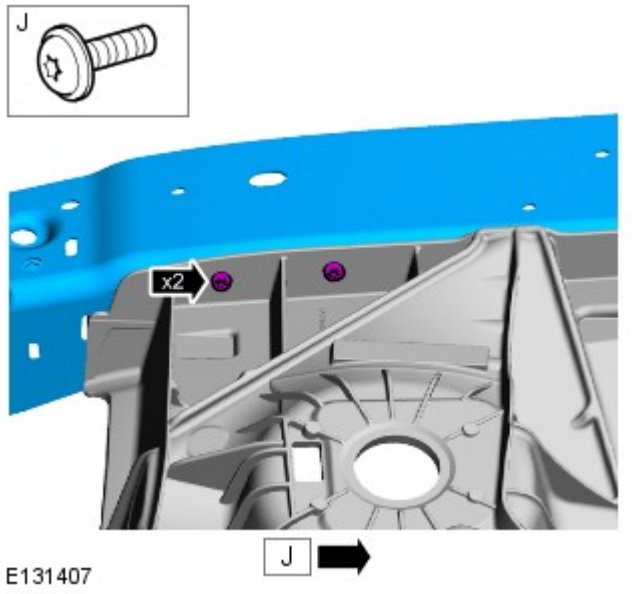
16. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

17. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

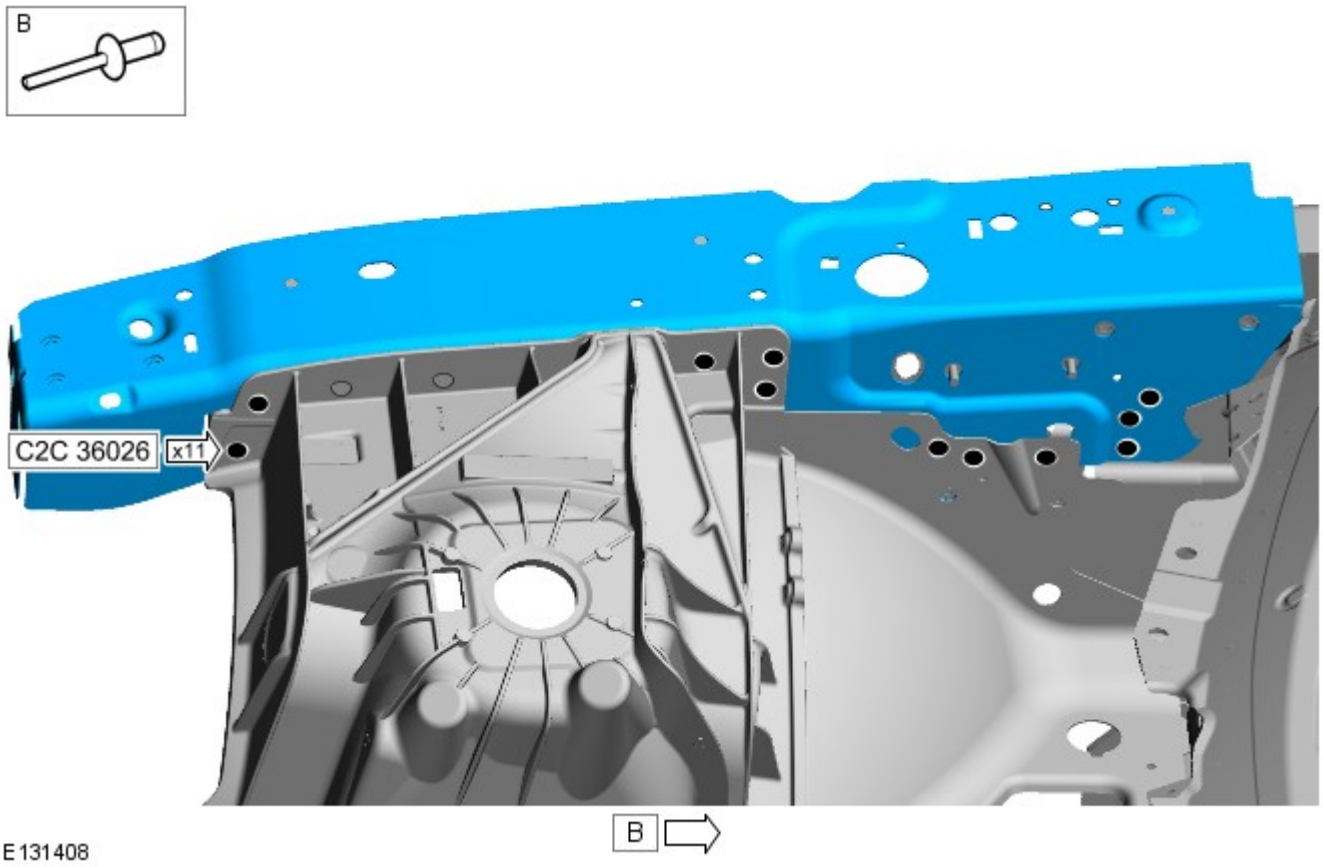
Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

18. Offer up the new panel and clamp into position.

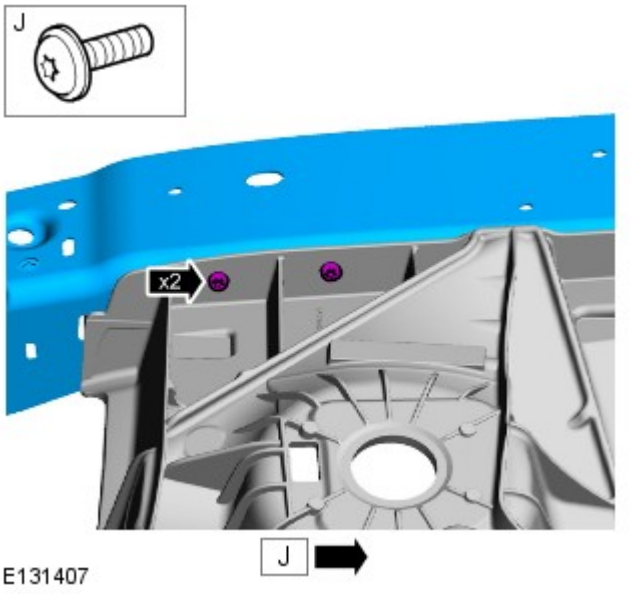
19. Loosely install the torx screws, do not tighten.



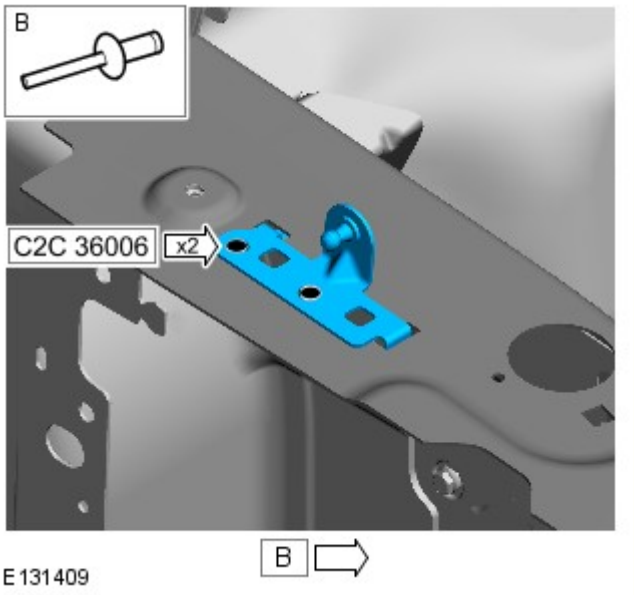
20. Using the Genesis G4, install the Hemloks.



21. Fully tighten the torx screws.
    - Tighten to 6 Nm.



22. Remove any excess adhesive.



23. NOTES:

The hood strut mounting panel is manufactured from mild steel, any mating surfaces should be suitably sealed prior to installation.

If a new hood strut mounting panel is required, it can be installed with 2 self piercing rivets using the ESN50.

Using the Genesis G4, install the Hemloks.

24. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

25. The installation of associated panels and components is the reversal of removal procedure.

Glass, Frames and Mechanisms - Door Window Motor Initialization

General Procedures

NOTES:

Make sure that the vehicle battery is fully charged before carrying out this procedure.

After the battery has been disconnected or a new window regulator and motor or door module has been installed, it is necessary to initialize each door window motor separately to operate the **one-touch** and anti-trap function.

In addition to this manual procedure, the approved diagnostic tool can also be used to initialize the door window motor.

1. Start the engine.

2. Operate the window control switch until the door window glass is in the fully closed position, continue to operate the window control switch for a further two seconds.

3. Release the window control switch.

4. Operate the window control switch in the closed position and continue to operate the window control switch for a further two seconds.

5. Operate the window control switch until the door window glass is in the fully open position (**one-touch** down).

6. NOTES:

If the door window motor initialization has been completed correctly, when the window control switch is operated, the door window glass should move to the fully closed position (**one-touch** up) automatically.

If the door window glass does not fully close automatically (**one-touch** up), repeat the complete procedure.

Operate the window control switch once to the close position.

- If multiple attempts have failed to initialize the door window motor, refer the diagnosis and testing procedure.
  For additional information, refer to: Glass, Frames and Mechanisms (501-11 Glass, Frames and Mechanisms, Diagnosis and Testing).

7. Repeat the door window motor initialization for each door window motor.

Published: 12-Oct-2016

Glass, Frames and Mechanisms - Glass, Frames and Mechanisms

Diagnosis and Testing

Principles of Operation

For a detailed description of the glass, frames and mechanisms systems and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (501-11 Glass, Frames and Mechanisms)

Specifications (Specifications),
Specifications (Specifications),

Specifications (Specifications).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

1. Verify the customer concern.

2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
• Window control switches condition and installation • Window motors/regulators • Window channels/runners • Window cables • Window seals	• Fuses • Harnesses and connectors • Window lift relay • Window control switches • Window motors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Manual Sunblind Initialization Routine

Where a sunblind module has been replaced, there is an initialization routine available on the diagnostic tool. This requires a new module to be initially installed in the fully down position and running of the "Initialize Specified Function/Feature" diagnostic routine on the manufacturer approved diagnostic tool. Alternatively, the sunblind may be initialized manually by following the procedures described below:

1. Raise the sunblind to top (fully retracted) position

2. Press and hold the window 'down' switch for 15 seconds (the sunblind will go down and will then be in initialization mode)

3. Release window switch and press window 'down' switch again to drive blind fully into lower block

4. Activate window switch 'up' until the sunblind reaches the top (fully retracted) position and release switch

5. The sunblind is now initialized and should have 'one-touch' functionality

Symptom Chart

Symptom	Possible Cause	Action
Window(s) inoperative	• Fuse(s) • Switch fault • Front switch isolator fault • Motor/Regulator fault • Channel/Runner fault • Cable fault • Harness fault	• Check the fuses. Check the suspect window operation from the individual door switch and from the driver door master switch (it is unlikely that both switches would fail at the same time, so if the window is inoperative from either switch, suspect a fault other than a switch). If the inoperative window is a rear unit, check the function of the isolator at the master switch. • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door window regulator
Window(s) 'one-shot' function inoperative	• Window motor initialization required • Switch fault	• If the battery has been disconnected, carry out the initialization procedure. Refer to the relevant section of the workshop manual. Check the switch function after initialization. • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door window regulator
Window(s) noisy	• Channel/Runner fault • Cable fault • Motor/Regulator fault	• Check the channels and runners for foreign objects, etc. Check the cable condition and routing. Check the motor and regulator condition. • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door window regulator
	• Fuse	

Rear window does not defrost	• Switch fault • Relay fault • Element fault • Circuit fault	Check fuse. Check the operation of the heated rear window switch and relay. Check the element for continuity. Check the heated rear window circuit. Refer to the electrical guides.

Window Regulator Diagnostic

This diagnostic procedure is to be carried out if the window glass, - Closes to the top, then reopens **Bounce back** - Does not **fully close** to the top of the door frame - The **One touch** function is disabled

PINPOINT TEST A : DIAGNOSTIC PROCEDURE	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: DOOR WINDOW GLASS - SEAL CONDITION / FOREIGN MATERIAL	
NOTE: To check that the door window glass seal is free from foreign material and has no sign of damage and is not worn in the door channels	
	1 Carry out visual inspection for: • Foreign material • Obstruction • Signs of damage or wear to door window glass seal
	Is the door window glass seal free from foreign material, damage and wear? **Yes** GO to A2 . **No** Remove any foreign material or were necessary install new door window glass seal. Test the system for correct operation
A2: DOOR WINDOW GLASS - SEAL INSTALLATION	
NOTE: To check that the door window glass seal is installed correctly	
	1 Check that the door window glass seal is installed correctly, ensure that it is fully installed into the corner areas
	Is the door window glass seal installed correctly? **Yes** GO to A3 . **No** Correctly install the door window glass seal. Test the system for correct operation
A3: DOOR WINDOW GLASS - SECURITY	
NOTE: To check the door window glass is secure	
	1 Check if the door glass installed correctly and secured to the door window regulator
	Is the door window glass correctly installed and secure? **Yes** GO to A4 . **No** Adjust the door window glass referring to the door glass installation process REFER to: (501-11 Glass, Frames and Mechanisms) Front Door Window Glass (Removal and Installation), Rear Door Window Glass (Removal and Installation). Test the system for correct operation
A4: DOOR WINDOW GLASS - RESET PROCEDURE	
	1 Disconnect vehicle battery, wait for a minimum of 2 minutes, then reconnect the battery
	2 **For vehicles between VIN V03480 and V18030** , the latest version of the diagnostic software must be loaded. SDD must be loaded with SDD DVD126_V6.03 and Calibration File 77 (or later)
	3 With the vehicle engine running, initialize the window motors, REFER to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).
	4 Cycle the glass 20 times, using the 'one–touch' function to open and close the window
	5 **NOTE:** The window regulator motor may thermally cut out after too many operations, if this occurs wait 30 seconds before continuing
	Is window closing correctly and the **One-touch** function operational? **Yes** No further action requires **No** Replace the front door window regulator REFER to: Front Door Window Regulator and Motor (501-11 Glass, Frames and Mechanisms, Removal and Installation).

	, or rear door window regulator REFER to: Rear Door Window Regulator and Motor (501-11 Glass, Frames and Mechanisms, Removal and Installation). Test the system for correct operation

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Driver Door Module/Passenger Door Module (DDM/PDM) (100-00 General Information, Description and Operation).

Glass, Frames and Mechanisms - Front Glass Roof Panel

Removal and Installation

Removal

CAUTIONS:

Always protect the interior components when removing body glass.

Protect the surrounding paintwork to avoid damage.

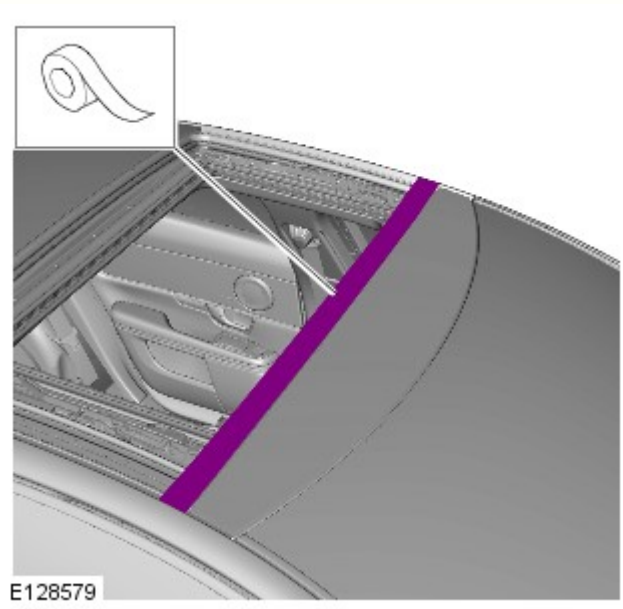
Measure all gaps between the glass roof panels before prior to removal to help aid installation.

NOTE: The cutting blades used in this procedure are from the standard BTB glass removal kit.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

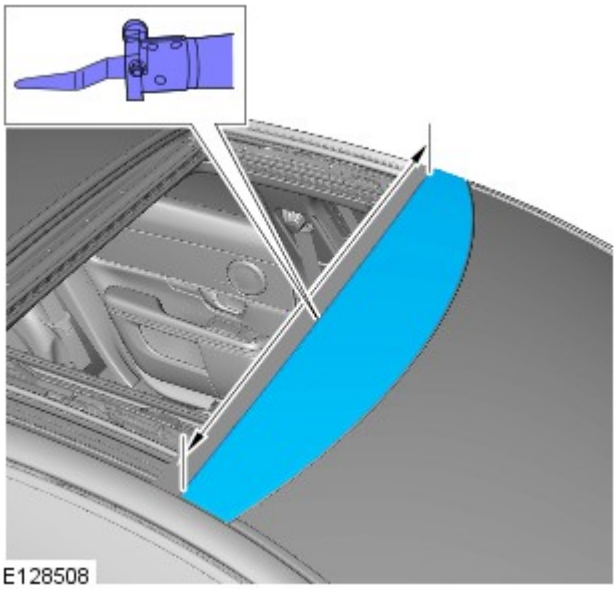
2. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

3.
- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.



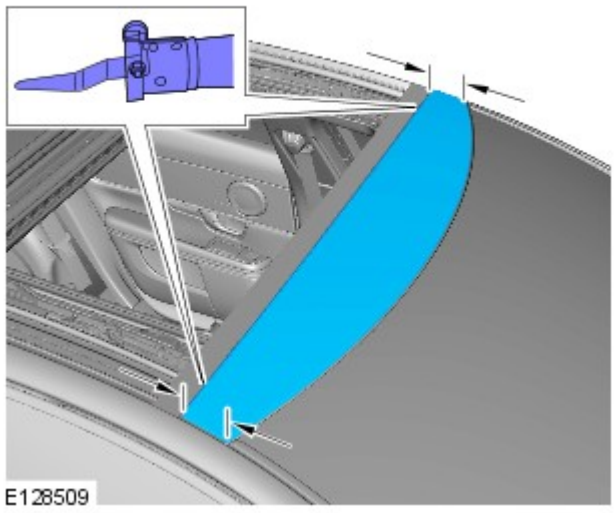
4. CAUTION: Use suitable tape to protect the roof opening panel weather strip.

5. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.
- Use a WK24ZS blade, cutting with the flat side against the body.



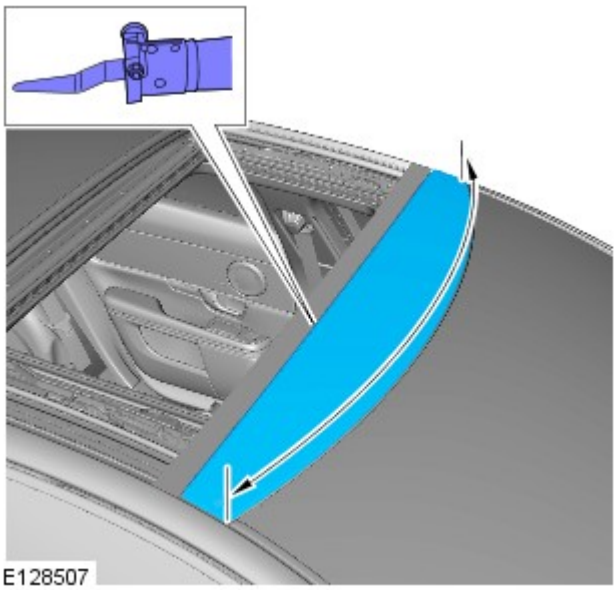
6. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

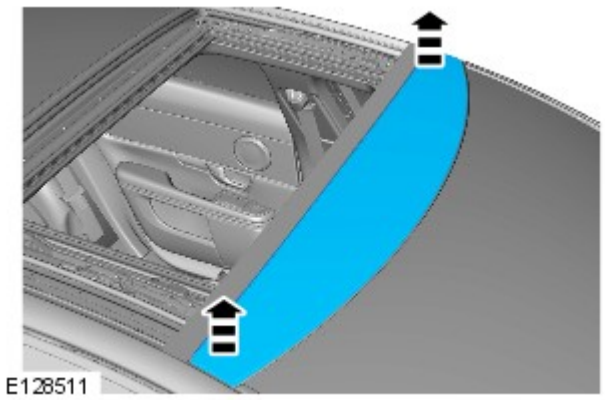
- Use a WK2S blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, set to 75mm to control the cutting depth.



7. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

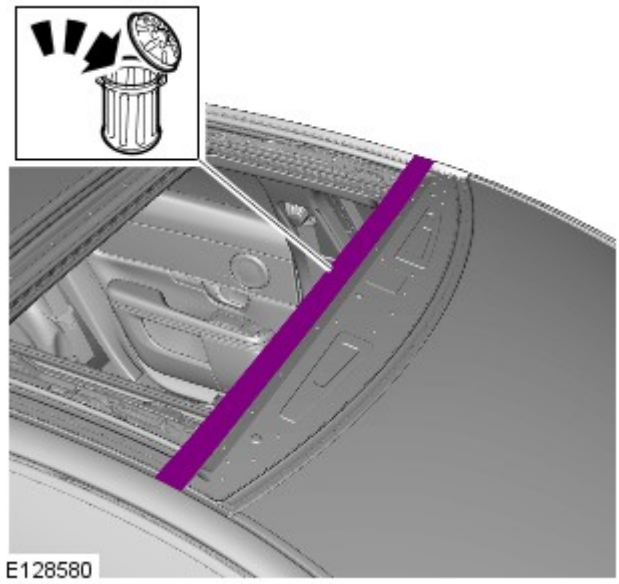
- Use a WK2S blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, the depth of the cut will vary from 75mm to 160mm as the glass widens towards the centre.



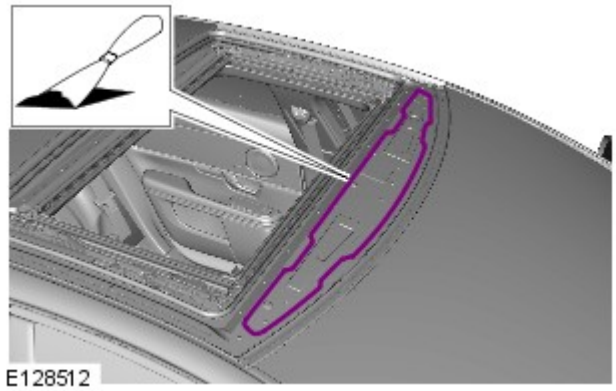


8.

Installation



1. NOTE: Remove the tape.



2. CAUTIONS:

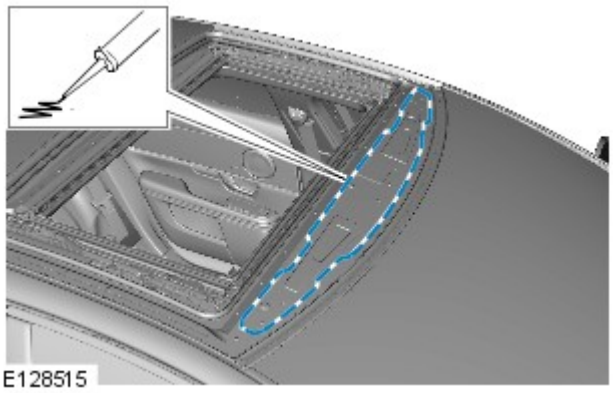
Make sure that the mating faces are clean and free of foreign material.

Correct preparation of body apertures "post painting" to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

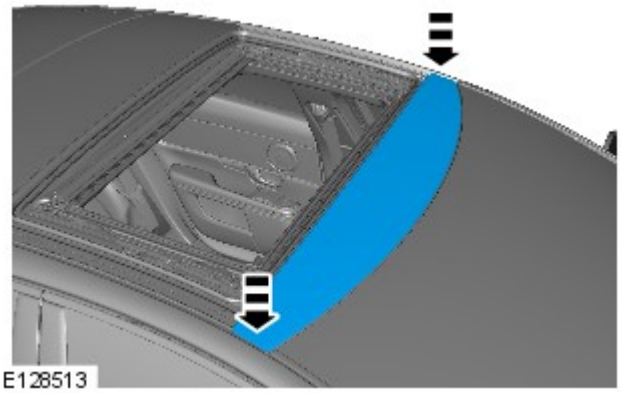
- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.

3. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.



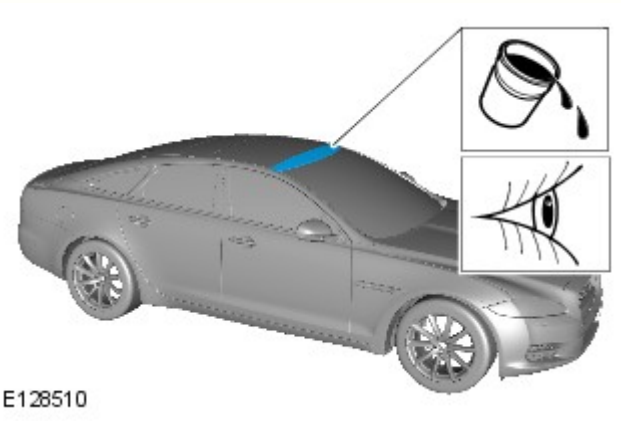
E128515



E128513

4.
- Make sure the component is aligned with the measurements taken prior to removal. Failure to follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature.
- Allow up to 1 hour, depending on temperature and humidity, to allow the adhesive to set before continuing with the procedure.

5. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).



E128510

6. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.

7. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

Battery, Mounting and Cables - Battery Disconnect and Connect

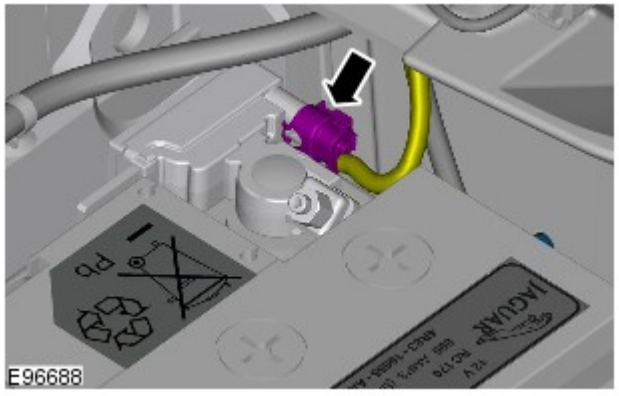
General Procedures

Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

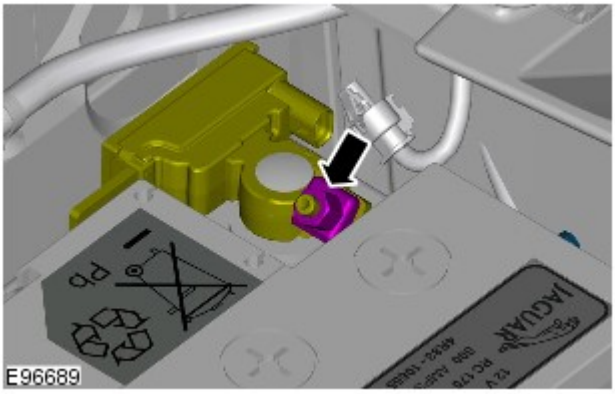
2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.



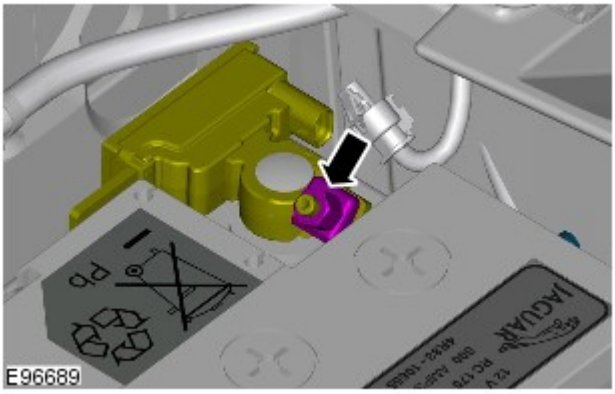
4. CAUTION: Take extra care not to damage the wiring harness.

5.

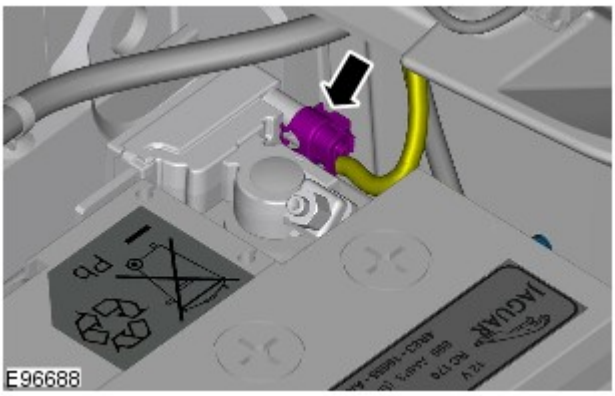


Connect

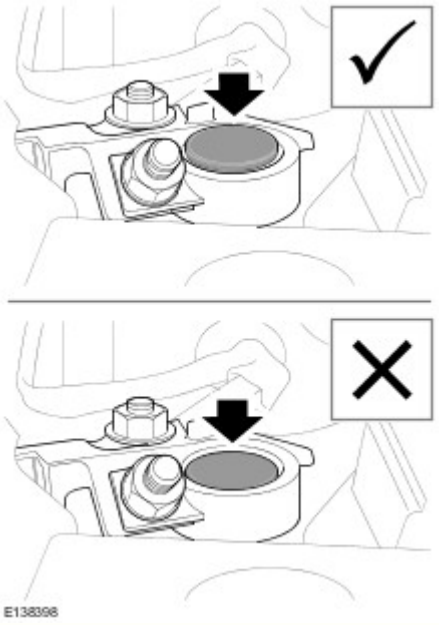
1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.



4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Make sure that the clip is correctly located.

If the correct clip is not available, make sure that a suitable hardened pin is used such as a drill bit, do not use a paperclip.

Make sure that the roof opening panel blind is not released from the drive mechanism until the clip has been correctly located.

Install the retaining clip.

Installation

1. Make sure that the roof opening panel blind tension is correct prior to installation. If the tension has been released refer to the roof opening panel blind rewind procedure.

Refer to: Roof Opening Panel Blind Rewind Procedure (501-17 Roof Opening Panel, General Procedures).

2. To install, reverse the removal procedure.

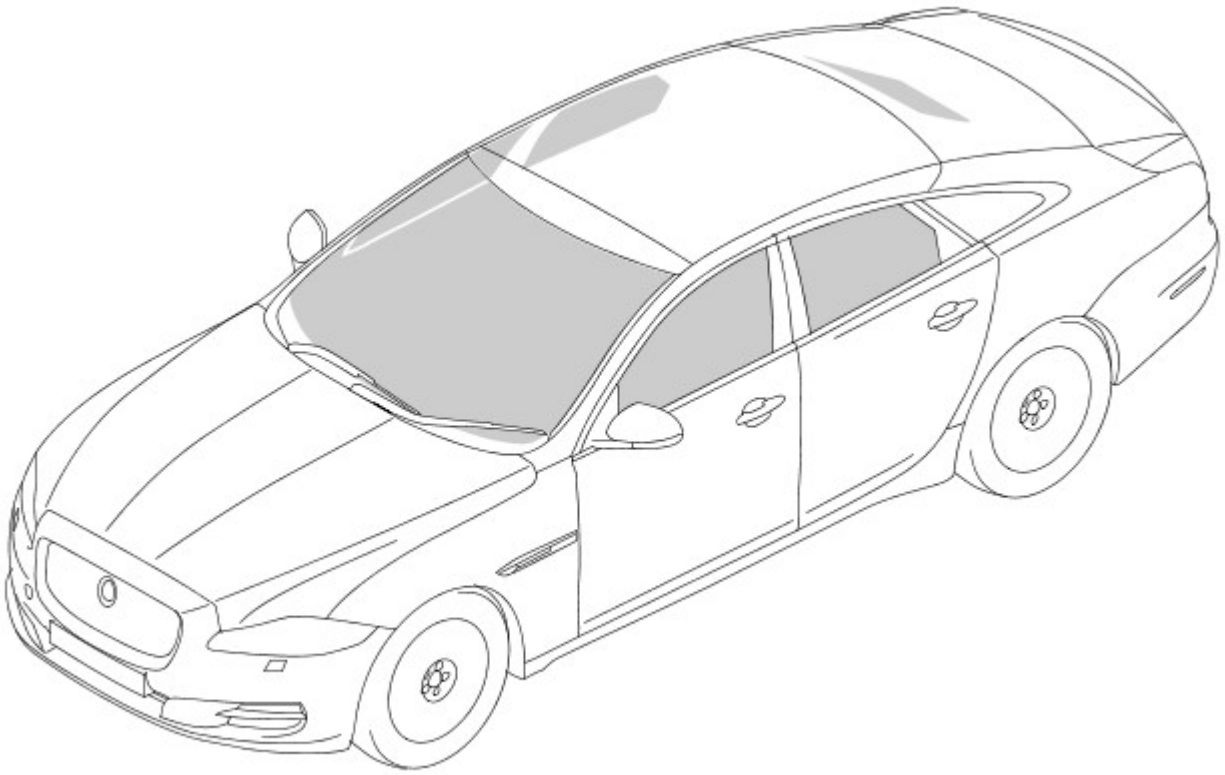
Glass, Frames and Mechanisms - Glass, Frames and Mechanisms Armoured

Description and Operation

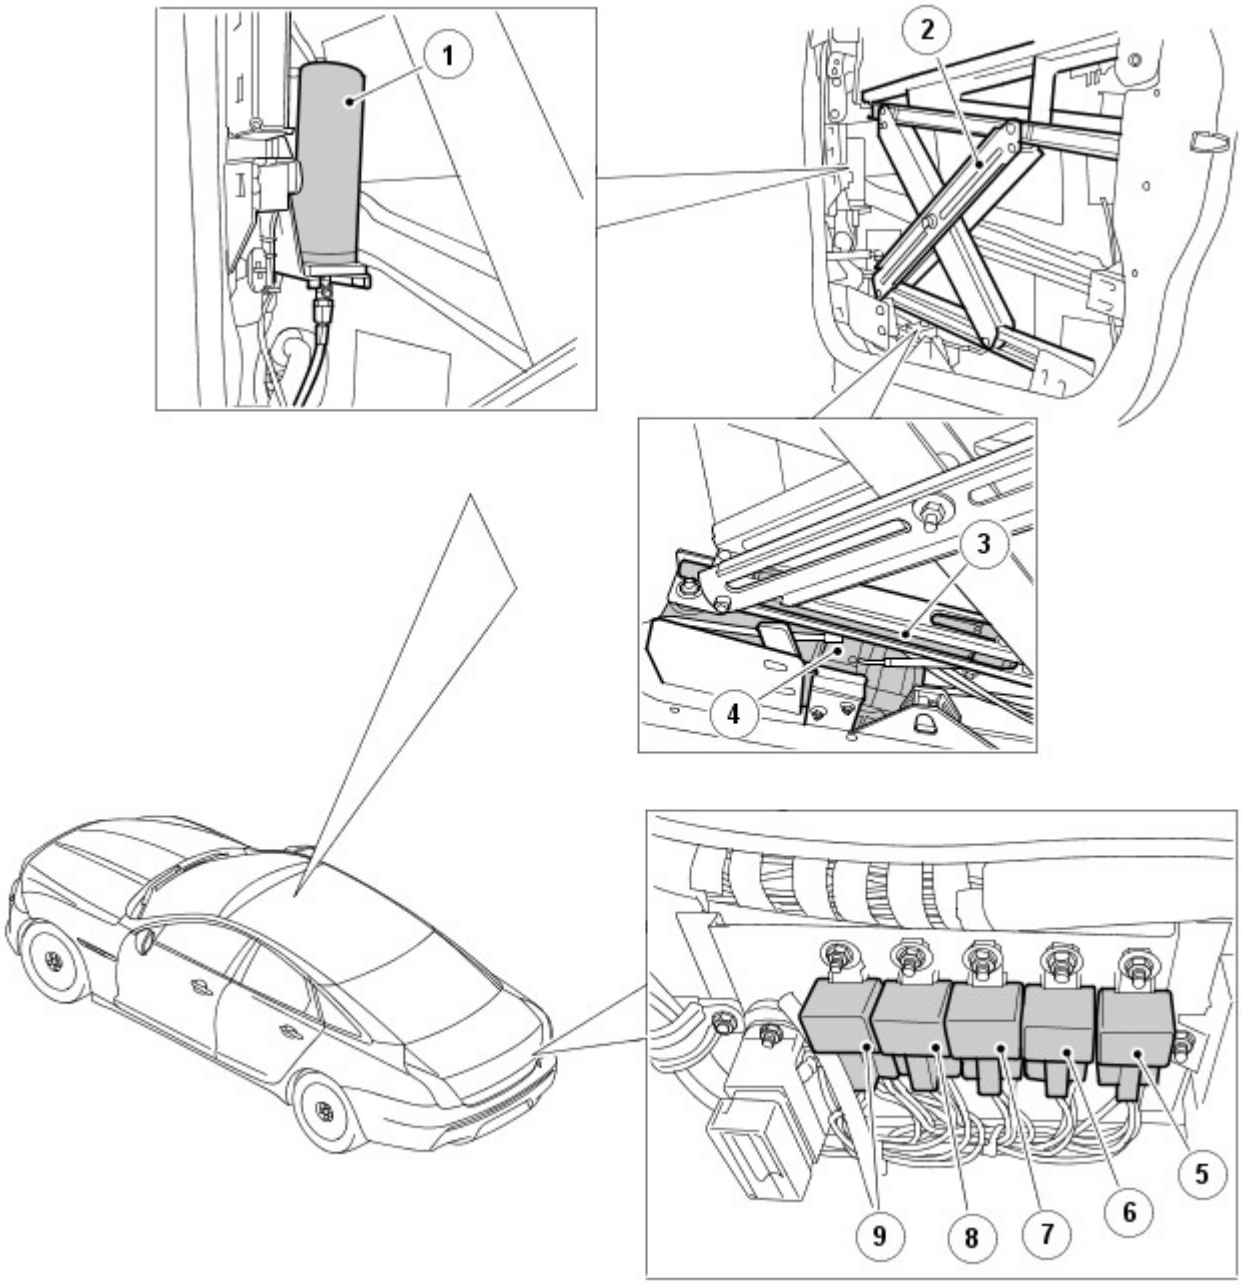
COMPONENT LOCATION - SHEET 1 OF 2

NOTE: Shaded areas denote armored glass.



E131313

COMPONENT LOCATION - SHEET 2 OF 2



E131314

Item	Description
1	Hydraulic reservoir
2	Window regulator
3	Hydraulic ram
4	Hydraulic pump and motor
5	Armored rear window heater relay
6	Left front window close relay
7	Left front window open relay
8	Right front window close relay
9	Right front window open relay

OVERVIEW

Armored glass replaces the glass used in non-armored vehicles for the windshield and the door windows. Armored glass is also installed in an aperture in the steel armor behind the rear seats. The armored glass offers ballistic protection whilst retaining the optical quality of the glass in non–armored vehicles. The glass used in non-armored vehicles is retained for the roof, above the armor, for the sixth lights, and for the rear window. The rear window and the sixth lights are internally treated using an anti-smash film. There is no sunroof option on armored vehicles.

The windshield and the armored rear window incorporate heater elements as standard. Windshield heating is the same as on non-armored vehicles. Armored rear window heating is controlled by a relay under the luggage compartment floor cover, in the rear right corner of the spare wheel well, that switches power from the satellite junction box to the heater element.

The rear doors have fixed windows. The driver and front passenger doors either have a fixed window or an hydraulically operated window with a maximum opening of approximately 100 mm (4 in.). All of the window switches from non-armored vehicles are retained in armored vehicles, but only those related to an hydraulically operated front window are operative.

Hydraulically operated windows use the same door modules that are installed on non-armored vehicles, but the electric motor and cable regulator in the door are replaced by an hydraulic reservoir, reversible electric motor and hydraulic pump, and a scissor action regulator driven by an hydraulic ram. The opposing sides of the piston in the hydraulic ram are connected to the hydraulic pump so that the extension and retraction of the ram is related to the direction of rotation of the pump. The direction of rotation of the pump is controlled by window open and window close relays installed in the rear right corner of the spare wheel well, which switch power from the satellite junction box to the hydraulic pump motor.

SYSTEM OPERATION

Window Heating

Operation of windshield heating and rear window heating is the same as on non-armored vehicles, but when rear window heating is selected, the power output from the CJB (central junction box) to the rear window heater is also used to energize the armored rear window heater relay. The energized relay then connects power from the satellite junction box to the armored rear window heater.

Hydraulically Operated Window

While the window open and window close relays are de-energized, they connect opposing poles of the hydraulic pump motor to ground. When energized, the relays replace the ground connection with a power feed from the satellite junction box. By energizing one or other of the relays, the door module controls the direction of rotation of the hydraulic pump. When a window open or close selection is made with a window switch, the door module energizes the appropriate relay to move the window in the required direction. Window movement stops immediately the switch is released.

WARNING: There is no one-shot or anti-trap operation on hydraulically operated windows.

Glass, Frames and Mechanisms - Glass, Frames and Mechanisms

Diagnosis and Testing

Principles of Operation

For a detailed description of the glass, frames and mechanisms systems and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (501-11 Glass, Frames and Mechanisms)

Specifications (Specifications),
Specifications (Specifications),
Specifications (Specifications).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

1. Verify the customer concern.

2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
• Window control switches condition and installation • Window motors/regulators • Window channels/runners • Window cables • Window seals	• Fuses • Harnesses and connectors • Window lift relay • Window control switches • Window motors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Manual Sunblind Initialization Routine

Where a sunblind module has been replaced, there is an initialization routine available on the diagnostic tool. This requires a new module to be initially installed in the fully down position and running of the "Initialize Specified Function/Feature" diagnostic routine on the manufacturer approved diagnostic tool. Alternatively, the sunblind may be initialized manually by following the procedures described below:

1. Raise the sunblind to top (fully retracted) position

2. Press and hold the window 'down' switch for 15 seconds (the sunblind will go down and will then be in initialization mode)

3. Release window switch and press window 'down' switch again to drive blind fully into lower block

4. Activate window switch 'up' until the sunblind reaches the top (fully retracted) position and release switch

5. The sunblind is now initialized and should have 'one-touch' functionality

Symptom Chart

Symptom	Possible Cause	Action
Window(s) inoperative	• Fuse(s) • Switch fault • Front switch isolator fault • Motor/Regulator fault • Channel/Runner fault • Cable fault • Harness fault	• Check the fuses. Check the suspect window operation from the individual door switch and from the driver door master switch (it is unlikely that both switches would fail at the same time, so if the window is inoperative from either switch, suspect a fault other than a switch). If the inoperative window is a rear unit, check the function of the isolator at the master switch. • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door window regulator
Window(s)		

'one-shot' function inoperative	• Window motor initialization required • Switch fault	• If the battery has been disconnected, carry out the initialization procedure. Refer to the relevant section of the workshop manual. Check the switch function after initialization. • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door window regulator
Window(s) noisy	• Channel/Runner fault • Cable fault • Motor/Regulator fault	• Check the channels and runners for foreign objects, etc. Check the cable condition and routing. Check the motor and regulator condition. • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door window regulator
Rear window does not defrost	• Fuse • Switch fault • Relay fault • Element fault • Circuit fault	Check fuse. Check the operation of the heated rear window switch and relay. Check the element for continuity. Check the heated rear window circuit. Refer to the electrical guides.

Window Regulator Diagnostic

This diagnostic procedure is to be carried out if the window glass, - Closes to the top, then reopens **Bounce back** - Does not **fully close** to the top of the door frame - The **One touch** function is disabled

PINPOINT TEST A : DIAGNOSTIC PROCEDURE	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: DOOR WINDOW GLASS - SEAL CONDITION / FOREIGN MATERIAL	
NOTE: To check that the door window glass seal is free from foreign material and has no sign of damage and is not worn in the door channels	
	1 Carry out visual inspection for: • Foreign material • Obstruction • Signs of damage or wear to door window glass seal
	Is the door window glass seal free from foreign material, damage and wear? **Yes** GO to A2 . **No** Remove any foreign material or were necessary install new door window glass seal. Test the system for correct operation
A2: DOOR WINDOW GLASS - SEAL INSTALLATION	
NOTE: To check that the door window glass seal is installed correctly	
	1 Check that the door window glass seal is installed correctly, ensure that it is fully installed into the corner areas
	Is the door window glass seal installed correctly? **Yes** GO to A3 . **No** Correctly install the door window glass seal. Test the system for correct operation
A3: DOOR WINDOW GLASS - SECURITY	
NOTE: To check the door window glass is secure	
	1 Check if the door glass installed correctly and secured to the door window regulator
	Is the door window glass correctly installed and secure? **Yes** GO to A4 . **No** Adjust the door window glass referring to the door glass installation process REFER to: (501-11 Glass, Frames and Mechanisms) Front Door Window Glass (Removal and Installation), Rear Door Window Glass (Removal and Installation). Test the system for correct operation
A4: DOOR WINDOW GLASS - RESET PROCEDURE	
	1 Disconnect vehicle battery, wait for a minimum of 2 minutes, then reconnect the battery

	2	**For vehicles between VIN V03480 and V18030** , the latest version of the diagnostic software must be loaded. SDD must be loaded with SDD DVD126_V6.03 and Calibration File 77 (or later)
	3	With the vehicle engine running, initialize the window motors, REFER to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).
	4	Cycle the glass 20 times, using the 'one–touch' function to open and close the window
	5	**NOTE:** The window regulator motor may thermally cut out after too many operations, if this occurs wait 30 seconds before continuing
	Is window closing correctly and the **One-touch** function operational? **Yes** No further action requires **No** Replace the front door window regulator REFER to: Front Door Window Regulator and Motor (501-11 Glass, Frames and Mechanisms, Removal and Installation). , or rear door window regulator REFER to: Rear Door Window Regulator and Motor (501-11 Glass, Frames and Mechanisms, Removal and Installation). Test the system for correct operation	

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Driver Door Module/Passenger Door Module (DDM/PDM) (100-00 General Information, Description and Operation).

Published: 20-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Driver Door Module/Passenger Door Module (DDM/PDM)

Description and Operation

Driver/Passenger Door Module (DDM/PDM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Driver/Passenger Door Module (DDM/PDM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.

For additional information, refer to: Driver Door Module (DDM) (419-10 Multifunction Electronic Modules, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B108F-23	Cabin Lock/Unlock Switch - Signal stuck low	• Switch pressed longer than 20 seconds • Circuit fault	• Check for mechanical faults/sticking on the left and right door trim switches. Check circuits for short to ground or other circuits. Replace switch or repair wiring as required
B109C-15	Front Courtesy Light - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test front courtesy light circuit for short to power or open circuit
B109D-11	Front Courtesy Light - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test front courtesy light circuit for short ground
B10EB-11	Driver Door Double Locking Motor - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver door double locking motor circuit for short ground
B10EB-15	Driver Door Double Locking Motor - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver door double locking motor circuit for short to power or open circuit
B10EC-11	Passenger Door Double Locking Motor - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test passenger door double locking motor circuit for short ground
B10EC-15	Passenger Door Double Locking Motor - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test passenger door double locking motor circuit for short to power or open circuit
B10ED-11	Rear Door Driver Side Double Locking Motor - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver door double locking motor circuit for short ground
B10ED-15	Rear Door Driver Side Double Locking Motor - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver door double locking motor circuit for short to power or open circuit
B10EE-11	Rear Door Passenger Side Double Locking Motor - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver door double locking motor circuit for short ground
B10EE-15	Rear Door Passenger Side Double Locking Motor - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver door double locking motor circuit for short to power or open circuit
B1108-11	Driver Door Central Locking Motor - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver door central locking motor circuit for short ground
B1108-15	Driver Door Central Locking Motor - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver door central locking motor circuit for short to power or open circuit
B1109-11	Passenger Door Central Locking Motor - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test passenger door central locking motor circuit for short ground
B1109-15	Passenger Door Central Locking Motor - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test passenger door central locking motor circuit for short to power or open circuit

B1163-11	Left Mirror Heater Output Short To Ground - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test left mirror heater output circuit for short to ground
B1163-15	Left Mirror Heater Output Short To Power - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test left mirror heater output circuit for short to power or open circuit
B1164-11	Right Mirror Heater Output Short To Ground - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test right mirror heater output circuit for short to ground
B1164-15	Right Mirror Heater Output Short To Power - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test right mirror heater output circuit for short to power or open circuit
B1165-11	Left Front Puddle Lamp Output Short To Ground - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test left front puddle lamp output circuit for short to ground
B1165-15	Left Front Puddle Lamp Output Open Load Or Short To Battery - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test left front puddle lamp output circuit for short to power or open circuit
B1166-11	Right Front Puddle Lamp Output Short To Ground - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test right front puddle lamp output circuit for short to ground
B1166-15	Right Front Puddle Lamp Output Open Load Or Short To Battery - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test right front puddle lamp output circuit for short to power or open circuit
B117E-07	Front Power Window Up - Mechanical failure	• Mechanical fault	• Inspect the relevant door mechanism for obstructions or mechanical faults. Repair as required. Clear DTC and retest. If DTC remains suspect relevant door module. Refer to the warranty policy and procedures manual if a module is suspect
B117E-72	Front Power Window Up - Actuator stuck open	• Door module internal relay sticking open	• Renew the relevant door module. Refer to the warranty policy and procedures manual if a module is suspect
B117E-73	Front Power Window Up - Actuator stuck closed	• Door module internal relay sticking closed	• Renew the relevant door module. Refer to the warranty policy and procedures manual if a module is suspect
B117F-72	Front Power Window Down - Actuator stuck open	• Door module internal relay sticking open	• Renew the relevant rear door module. Refer to the warranty policy and procedures manual if a module is suspect
B117F-73	Front Power Window Down - Actuator stuck closed	• Door module internal relay sticking closed	• Renew the relevant rear door module. Refer to the warranty policy and procedures manual if a module is suspect
B1189-29	Front Window Position Sensor - Signal invalid	• Missing signal from hall sensor 1 or 2 • Sensor circuit fault • Hall sensor fault	• Refer to the electrical circuit diagrams and check the hall sensor circuit between the door module and window motor. Repair as necessary. If the problem persists, renew the window motor
B118A-29	Rear Window Position Sensor - Signal invalid	• Missing signal from hall sensor 1 or 2 • Sensor circuit fault • Hall sensor fault	• Refer to the electrical circuit diagrams and check the hall sensor circuit between the door module and window motor. Repair as necessary. If the problem persists, renew the window motor

B118C-04	Left Blindspot Warning Indicator - System internal fault	• Camera module internal fault	• Check Blindspot Monitoring System Module for DTCs and refer to the relevant DTC index
B118E-00	Left Front Window - No sub type information	• Window travel limits not learned	• Refer to the workshop manual and operate the window to allow the door module to learn the fully open and closed positions. Clear the DTC and retest.
B118F-00	Right Front Window - No sub type information	• Window travel limits not learn	• Refer to the workshop manual and operate the window to allow the door module to learn the fully open and closed positions. Clear the DTC and retest.
B1190-00	Left Rear Window - No sub type information	• Window travel limits not learned	• Refer to the workshop manual and operate the window to allow the door module to learn the fully open and closed positions. Clear the DTC and retest.
B1191-00	Right Rear Window - No sub type information	• Window travel limits not learn	• Refer to the workshop manual and operate the window to allow the door module to learn the fully open and closed positions. Clear the DTC and retest.
B11D1-83	LIN Bus Circuit "C" - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Refer to the electrical circuit diagrams and test LIN circuits between driver door switchpack and Driver Door Module for short/open circuits, clear DTC and re-test
B11D1-86	LIN Bus Circuit "C" - Signal invalid	• Signal Invalid	• Refer to the electrical circuit diagrams and test LIN circuits between driver door switchpack and Driver Door Module for short/open circuits, clear DTC and re-test
B11D1-87	LIN Bus Circuit "C" - Missing message	• Missing Message	• Refer to the electrical circuit diagrams and test LIN circuits between driver door switchpack and Driver Door Module for short/open circuits, clear DTC and re-test
B11F6-11	Driver Folding Mirror Motor - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and mirror movement control circuits between driver door mirror and Driver Door Module for short to ground, repair wiring as required, clear DTC and re-test. If DTC remains suspect mirror, refer to the warranty policy and procedures manual if a module is suspect
B11F6-15	Driver Folding Mirror Motor - Circuit short to battery or open	• Circuit short to power or open circuit	• Refer to the electrical circuit diagrams and mirror movement control circuits between driver door mirror and Driver Door Module for short to power or open circuit, repair wiring as required, clear DTC and re-test. If DTC remains suspect mirror, refer to the warranty policy and procedures manual if a module is suspect
B11F7-11	Passenger Folding Mirror Motor - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and mirror movement control circuits between passenger door mirror and Passenger Door Module for short to ground, repair wiring as required, clear DTC and re-test. If DTC remains suspect mirror, refer to the warranty policy and procedures manual if a module is suspect
B11F7-15	Passenger Folding Mirror Motor - Circuit short to battery or open	• Circuit short to power or open circuit	• Refer to the electrical circuit diagrams and mirror movement control circuits between passenger door mirror and Passenger Door Module for short to power or open circuit, repair wiring as required, clear DTC and re-test. If DTC remains suspect mirror, refer to the warranty policy and procedures manual if a module is suspect
B1A94-11	Driver Mirror - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver mirror fold motor circuit for short to ground
	Driver Mirror -		

B1A94-15	Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver mirror fold motor circuit for short to power or open circuit
B1A95-11	Passenger Mirror - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test passenger mirror fold motor circuit for short to ground
B1A95-15	Passenger Mirror - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test passenger mirror fold motor circuit for short to power or open circuit
B1A98-83	LIN Bus Circuit #1 - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Refer to the electrical circuit diagrams and test LIN circuit between driver switch pack and DDM for short/open circuits, clear DTC and re-test. If DTC remains install a new switch pack
B1A98-86	LIN Bus Circuit #1 - Signal invalid	• Signal Invalid	• Refer to the electrical circuit diagrams and test LIN circuit between driver switch pack and DDM for short/open circuits, clear DTC and re-test. If DTC remains install a new switch pack
B1A98-87	LIN Bus Circuit #1 - Missing message	• Missing Message	• Refer to the electrical circuit diagrams and test LIN circuit between driver switch pack and DDM for short/open circuits, clear DTC and re-test. If DTC remains install a new switch pack
B1C09-11	Driver Left/Right Mirror Motor Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver left/right mirror motor circuit for short to ground
B1C09-15	Driver Left/Right Mirror Motor Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver left/right mirror motor circuit for short to power or open circuit
B1C10-11	Driver Up/Down Mirror Motor Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver up/down mirror motor circuit for short to ground
B1C10-15	Driver Up/Down Mirror Motor Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver up/down mirror motor circuit for short to power or open circuit
B1C11-11	Passenger Left/Right Mirror Motor Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test passenger left/right mirror motor circuit for short to ground
B1C11-15	Passenger Left/Right Mirror Motor Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test passenger left/right mirror motor circuit for short to power or open circuit
B1C12-11	Passenger Up/Down Mirror Motor Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test passenger up/down mirror motor circuit for short to ground
B1C12-15	Passenger Up/Down Mirror Motor Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test passenger up/down mirror motor circuit for short to power or open circuit
B1C13-11	Driver Up/Down Mirror Motor Feedback Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver up/down mirror motor feedback circuit for short to ground
B1C13-15	Driver Up/Down Mirror Motor		

	Feedback Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver up/down mirror motor feedback circuit for short to power or open circuit
B1C14-11	Driver Left/Right Mirror Motor Feedback Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test driver left/right mirror motor feedback circuit for short to ground
B1C14-15	Driver Left/Right Mirror Motor Feedback Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test driver left/right mirror motor feedback circuit for short to power or open circuit
B1C15-11	Passenger Up/Down Mirror Motor Feedback Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test passenger up/down mirror motor feedback circuit for short to ground
B1C15-15	Passenger Up/Down Mirror Motor Feedback Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test passenger up/down mirror motor feedback circuit for short to power or open circuit
B1C16-11	Passenger Left/Right Mirror Motor Feedback Circuit - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test passenger left/right mirror motor feedback circuit for short to ground
B1C16-15	Passenger Left/Right Mirror Motor Feedback Circuit - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test passenger left/right mirror motor feedback circuit for short to power or open circuit
B1C39-29	Key Lock Switch - Signal invalid	• Lock and unlock signals both active or inactive for more than 20 seconds	• Check key lock switch for damage/mechanical faults. Check lock circuits for short circuit to each other
B1D06-11	Left Turn Indicator - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test left door indicator circuit for short to ground
B1D06-15	Left Turn Indicator - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test left door indicator circuit for short to power or open circuit
B1D07-11	Right Turn Indicator - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test right door indicator circuit for short to ground
B1D07-15	Right Turn Indicator - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test right door indicator circuit for short to power or open circuit
C1B14-11	Sensor Supply #1 - Circuit short to ground	• Short to ground	• Refer to the electrical circuit diagrams and test window sensor supply circuit for short to ground
C1B14-15	Sensor Supply #1 - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test window sensor supply circuit for short to power or open circuit
U0010-00	Medium Speed CAN Communication Bus - No sub type information	• Medium speed CAN communication Bus	• Carry out network integrity test using manufacturer approved diagnostic system. Refer to electrical circuit diagrams and test Medium speed CAN network for open, short circuit and high resistance
U0140-00	Lost Communication	• Logged when subscribed CAN message missing	• Refer to the electrical circuit diagrams and test power and ground supplies to Central Junction Box. Check CAN network between Driver Door Module and Central Junction

	With CJB - No sub type information	from Central Junction Box	Box. Carry out network integrity test using manufacturer approved diagnostic system
U0208-00	Lost Communication With Driver Seat Module (DSM) - No sub type information	• Missing message	• Refer to the electrical circuit diagrams and test power and ground supplies to Driver Seat Module. Check CAN network between Driver Door Module and Driver Seat Module. Carry out network integrity test using manufacturer approved diagnostic system
U0300-00	Internal Control Module Software Incompatibility - No sub type information	• Car configuration file mismatch with vehicle specification	NOTE: After updating the car configuration file, set the ignition to on and wait 30 seconds before clearing the DTCs • Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary
U0300-4A	Internal Control Module Software Incompatibility - Incorrect component installed	• DTC is set if an incorrect front or rear door module/software is connected	• Check correct door modules are installed on the vehicle. Reprogram the modules using the manufacturers approved diagnostic system
U2002-24	Switch - Signal stuck high	• Signal stuck high	• Clear DTC and re-test. If DTC remains, install a new passenger side window switch
U2010-11	Switch Illumination - Circuit short to ground	• Circuit short to ground	• Carry out CAN network tests using the manufacturer approved diagnostic system
U2010-12	Switch Illumination - Circuit short to battery	• Circuit short to power	• Carry out CAN network tests using the manufacturer approved diagnostic system
U2012-08	Car Configuration Parameter(s) - Bus signal/message Failures	• Bus signal/message failures	• Cycle the ignition status and re-test. If DTC remains, re-configure the Auxiliary Junction Box using the manufacturer approved diagnostic system
U2013-24	Switch Pack - Signal stuck high	• Signal stuck high	• Clear DTC and re-test. If DTC remains, install a new driver side window switch pack
U2014-44	Control Module Hardware - Data memory failure	• Data Memory Failure	• Install a new Driver Door Module/Passenger Door Module, refer to the new module installation note at the top of the DTC Index
U2100-00	Initial Configuration Not Complete - No sub type information	• No sub type information	• Re-configure the Driver Door Module/Passenger Door Module using the manufacturer approved diagnostic system
U2101-00	Control Module Configuration Incompatible - No sub type information	• Incorrect component installed • Vehicle not configured correctly	• Check/configure the car configuration using the approved diagnostic system
U3000-49	Control Module - Internal electronic failure	• Internal electronic failure	• Install a new Driver Door Module/Passenger Door Module, refer to the new module installation note at the top of the DTC Index
U3002-55	Vehicle Identification Number (VIN) - Not configured	• Driver/passenger door module is not configured correctly	• Re-configure the relevant module as new using the manufacturer approved diagnostic system and re-test. If DTC remains install a new module, refer to the new module installation note at the top of the DTC Index
U3002-81	Vehicle Identification	• Vehicle/component mis-match. Corrupt VIN data being transmitted, module previously	• Install original module, check for DTCs and refer to relevant DTC Index

	Number (VIN) - Invalid serial data received	installed to other vehicle	
U3003-62	Battery Voltage - Signal compare failure	• Mis-match of battery voltage, of 2 volts or lower, between Driver Door Module/Passenger Door Module and Auxiliary Junction Box	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power and ground supply circuits to both modules

Glass, Frames and Mechanisms - Door Window Motor Initialization

General Procedures

NOTES:

Make sure that the vehicle battery is fully charged before carrying out this procedure.

After the battery has been disconnected or a new window regulator and motor or door module has been installed, it is necessary to initialize each door window motor separately to operate the **one-touch** and anti-trap function.

In addition to this manual procedure, the approved diagnostic tool can also be used to initialize the door window motor.

1. Start the engine.

2. Operate the window control switch until the door window glass is in the fully closed position, continue to operate the window control switch for a further two seconds.

3. Release the window control switch.

4. Operate the window control switch in the closed position and continue to operate the window control switch for a further two seconds.

5. Operate the window control switch until the door window glass is in the fully open position (**one-touch** down).

6. NOTES:

If the door window motor initialization has been completed correctly, when the window control switch is operated, the door

window glass should move to the fully closed position (**one-touch** up) automatically.

If the door window glass does not fully close automatically (**one-touch** up), repeat the complete procedure.

Operate the window control switch once to the close position.

- If multiple attempts have failed to initialize the door window motor, refer the diagnosis and testing procedure.
  For additional information, refer to: Glass, Frames and Mechanisms (501-11 Glass, Frames and Mechanisms, Diagnosis and Testing).

7. Repeat the door window motor initialization for each door window motor.

Glass, Frames and Mechanisms - Fixed Window Glass

Diagnosis and Testing

Principles of Operation

For a detailed description of the Glass, Frames and Mechanisms, refer to the relevant Description and Operation section in the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If a control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Refer to Section 100-00 General Information for window glass health and safety precautions.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Electrical
• Physical damage to the windshield

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index
5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required

Warranty Repairs

NOTES:

The warranty period for the windshield is twelve months with the exception of delamination and electrical faults.

Warranty repairs should be completed using genuine parts, in accordance with the Warranty Policy and Procedures Manual.

1. Draw a line around the windshield damage using a marker pen.
2. Photograph the entire windshield. If the damage extends behind any trim, remove the trim and take further photographs.
3. Photograph the trademark logo and code to validate the windshield as factory fitment.

Symptom Chart

Symptom	Possible Causes	Action

Scratches	• Debris trapped under a wiper blade • Foreign object damage • Fouling by trim	• GO to Pinpoint Test A.
Chips	• Foreign object damage	• GO to Pinpoint Test B.
Cracks	• Foreign object damage • Impact damage during assembly	• GO to Pinpoint Test C.
Delamination	• Manufacturing defect	• GO to Pinpoint Test D.

Pinpoint Tests

PINPOINT TEST A : SCRATCH TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: SCRATCH TEST 1	
NOTE: A scratch will usually be regular in shape, following the line of the object that caused it.	
	1 Probe using the tip of a pencil to identify a groove in the windshield surface.
	Is there a groove? **Yes** Windshield scratched. GO to A2 . **No** Defect not valid.
A2: SCRATCH TEST 2	
	1 Check for trim, body panels, or foreign objects that may have caused the scratch.
	Was the scratch caused by a foreign object? **Yes** The damage is not due to a defect or an assembly error. **No** Rectify as appropriate.

PINPOINT TEST B : CHIP TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
B1: CHIP TEST 1	
NOTE: Impact damage may cause a crack to form.	
	1 Assess the damage by probing with the tip of a pencil.
	Is the damaged area rough (indicating a breach of the windshield surface)? **Yes** Damage caused by the impact of a foreign object. Not a manufacturing defect. **No** Install a new windshield.

PINPOINT TEST C : CRACK TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
C1: CRACK TEST 1	
	NOTE: A crack will be detectable as a step in the glass. 1 Confirm the presence of a crack by probing with the tip of a pencil.
	Is the windshield cracked? **Yes** Windshield cracked. GO to C2 . **No** Windshield not cracked. GO to Pinpoint Test A.
C2: CRACK TEST 2	
NOTE: Multiple cracks will radiate out from the source.	
	1 Assess the source of the crack by probing with the tip of a pencil.
	Is there evidence of impact damage being the source of the crack? **Yes** GO to Pinpoint Test B. **No**

	Install a new windshield.

PINPOINT TEST D : DELAMINATION TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
D1: DELAMINATION TEST 1	
	1 Visually assess the windshield for delamination.
	Have the glass laminates separated? **Yes** Install a new windshield. **No** No further action.

DTC Index

For a complete list of all Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Glass, Frames and Mechanisms - Rear Glass Roof Panel Lubrication

General Procedures

Check

CAUTIONS:

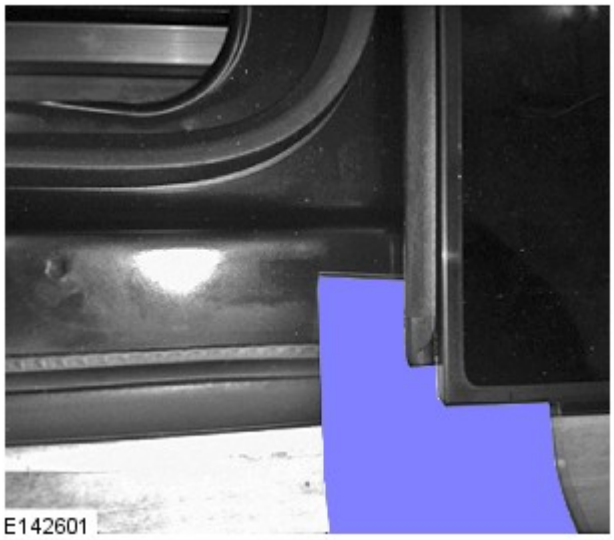
Make sure that the vehicle is clean and dry prior to commencing this procedure.

Make sure that the vehicle is kept in a dry environment and is not washed within 24 hours of completing this procedure, failure to follow this instruction will prevent the slip coat from curing correctly.

NOTE: **The lubricant used in this procedure (LIP AC612/21) is part of the Squeaks & Rattles Kit. For more information on the Squeaks & Rattles Kit, safety data sheets and details of how to order the kit or parts thereof, please visit (www.squeaksandrattles.info).**

1. Open the roof opening panel glass to the full tilt position.

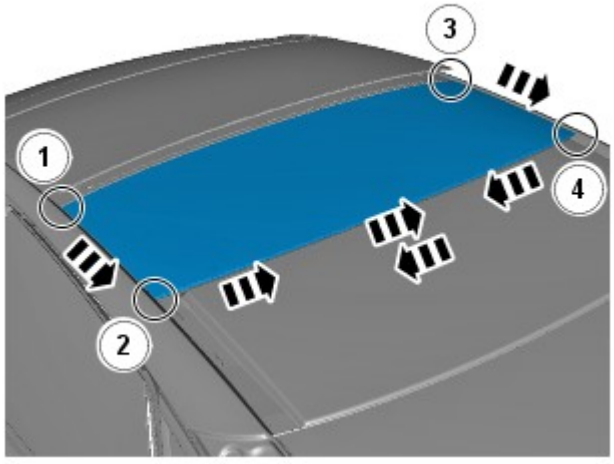
2. Insert a suitable applicator card in to the position shown at the left hand front corner of the rear glass roof panel.



E142601

3. CAUTION: Make sure that the two areas that are cleaned with the applicator card overlap at the centre of the vehicle.

- Starting at position 1 in the left hand front corner of the rear glass roof panel, carefully slide the applicator card around the rear glass roof panel through position 2 and past the centre point of the vehicle.
- Remove and clean the applicator card.
- Starting at position 3 in the right hand front corner of the rear glass roof panel, carefully slide the applicator card around the rear glass roof panel through position 4 and past the centre point of the vehicle.
- Remove and clean the applicator card.



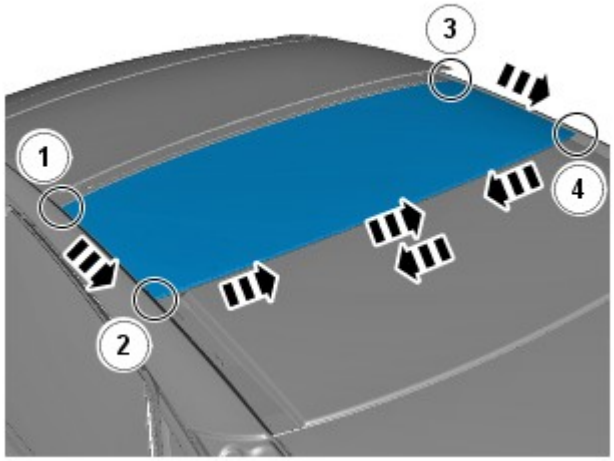
E142600

4.

E142602

CAUTION: Make sure that the bottle is well shaken before applying the fluid to the applicator card.

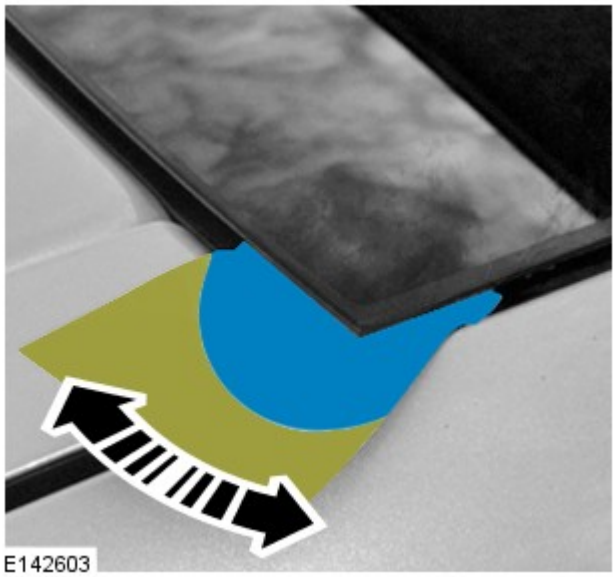
- Insert a suitable applicator card in to the position shown at the left hand front corner of the rear glass roof panel.
- Spray a sufficient amount of LIP AC612/21 fluid on to the applicator card until the fluid runs between the rear glass fixed panel and the seal.



E142600

5. CAUTION: Make sure that the applicator card does not slip from under the rear glass roof panel as the card is rotated around the corners.

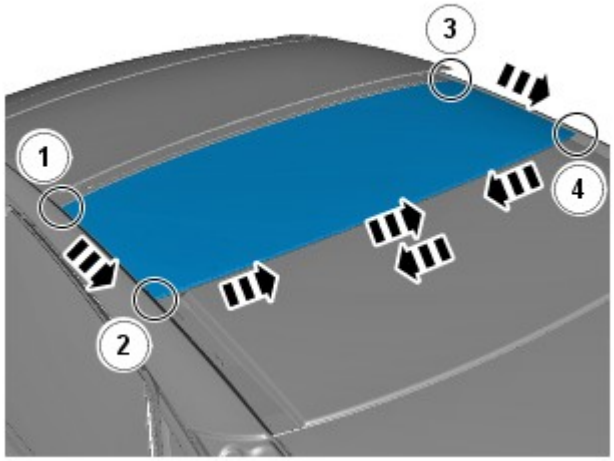
- Carefully slide the applicator card along the edge of the rear fixed glass panel to position 2.
- Slide the applicator card backwards and forwards from position 1 to 2 to make sure that a sufficient amount of fluid is applied to the rear fixed glass panel.
- If required, apply more fluid to the applicator card and repeat the above step.



E142603

6. CAUTION: Make sure that the applicator card does not slip from under the rear glass roof panel as the card is rotated around the corners.

- At the position 2, spray a sufficient amount of LIP AC612/21 fluid on to the applicator card until the fluid runs between the rear glass fixed panel and the seal.
- Rotate the applicator card backwards and forwards 5 times at the corner of the rear fixed glass panel.



E142600

7. CAUTION: Make sure that the applicator card does not slip from under the rear glass roof panel as the card is rotated around the corners.

- Carefully slide the applicator card along the edge of the rear fixed glass panel from position 2 past the centre of the vehicle.
- If required, apply more fluid to the applicator card and repeat the above step.
- Remove and clean the applicator card.

8. Repeat steps 4 to 7 for the other side of the vehicle.

9. Wipe away any excess fluid.

Removal and Installation

Removal

CAUTIONS:

Always protect the interior components when removing body glass.

Protect the surrounding paintwork to avoid damage.

Measure all gaps between the glass roof panels before prior to removal to help aid installation.

NOTE: The cutting blades used in this procedure are from the standard BTB glass removal kit.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Refer to: Interior Rear View Mirror (501-09 Rear View Mirrors, Removal and Installation).

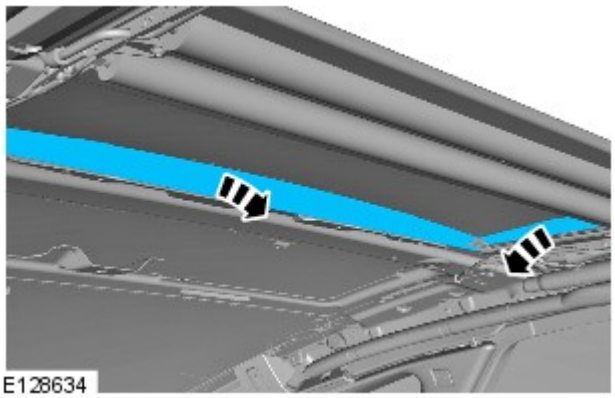
21. CAUTION: Protect the surrounding trim to avoid damage.

NOTE: Lower and reposition the headliner to aid access.

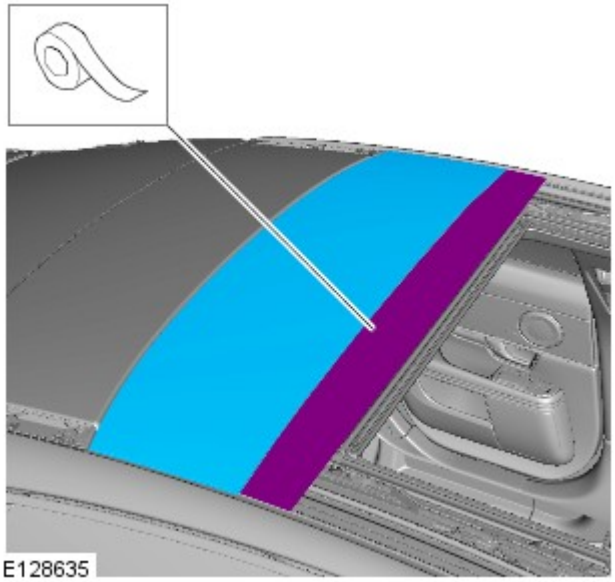
22. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

23.

- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

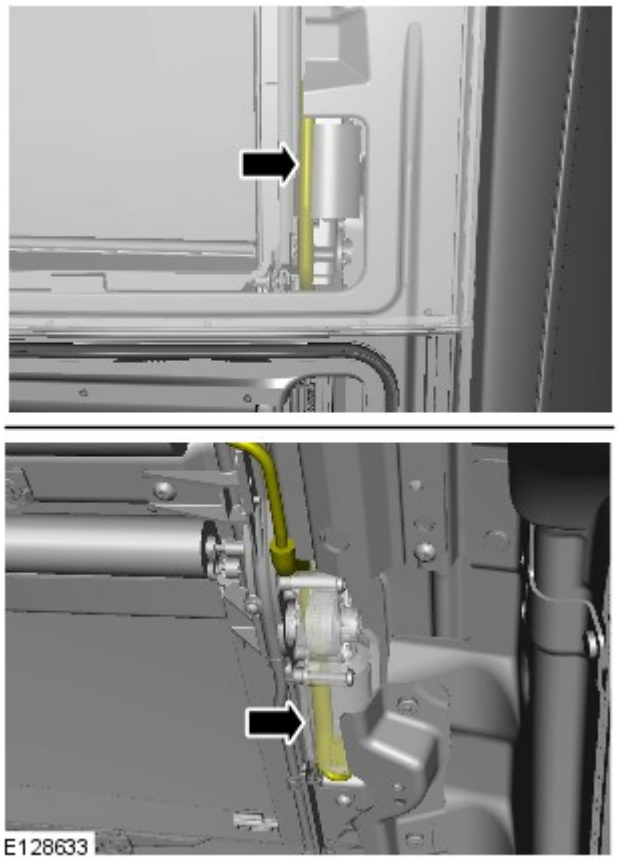


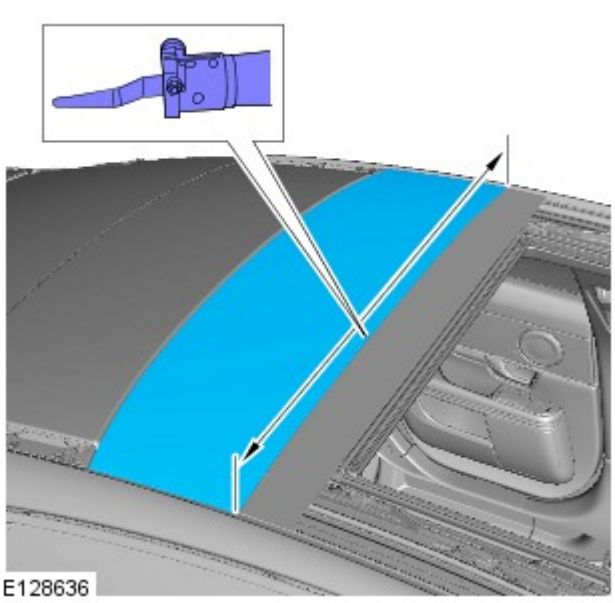
24.



25. CAUTION: Use suitable tape to protect the roof opening panel weather strip.

26. CAUTION: Using suitable tape, protect the roof opening panel bilnd motor wiring harness.



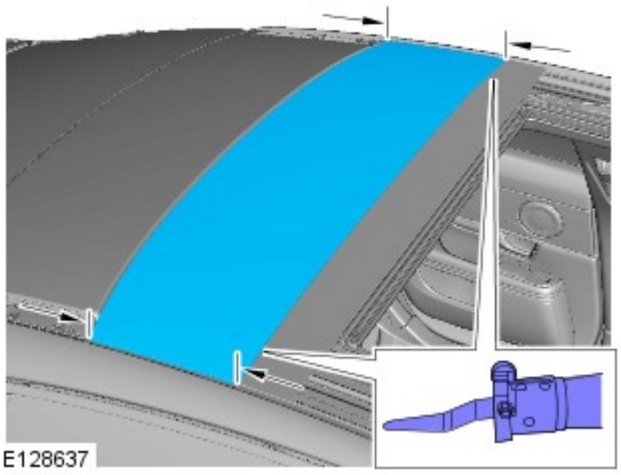


27. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

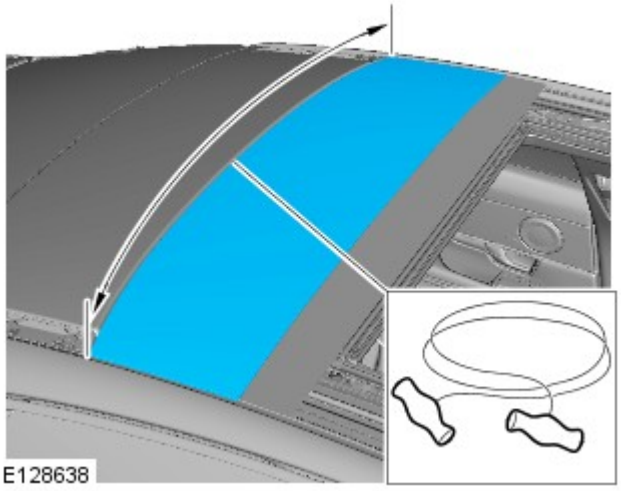
- Use a WK2S blade, cutting with the flat side against the body.

28. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

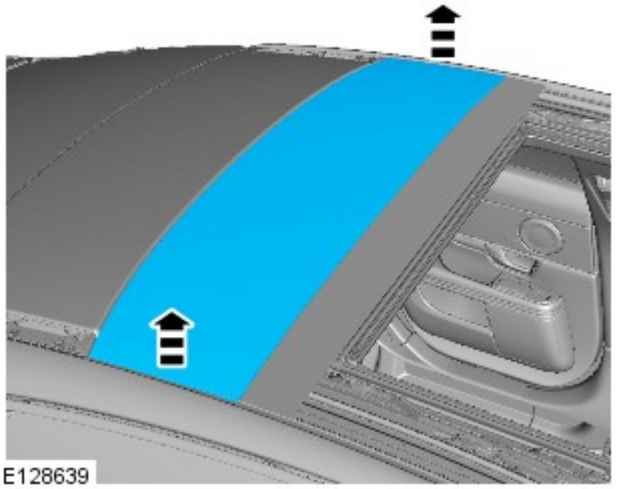
- Use a WK2S blade, cutting with the flat side against the body, a WK1X blade may be needed for long wheelbase vehicles.



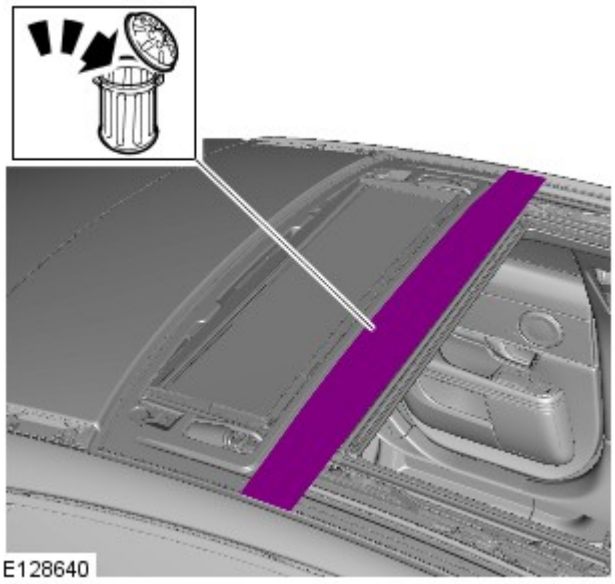
29. CAUTION: Using cheese wire to carry out this operation will potentially cause damage to the glass plastic lamination. A new component must be installed if the glass plastic lamination is damaged.



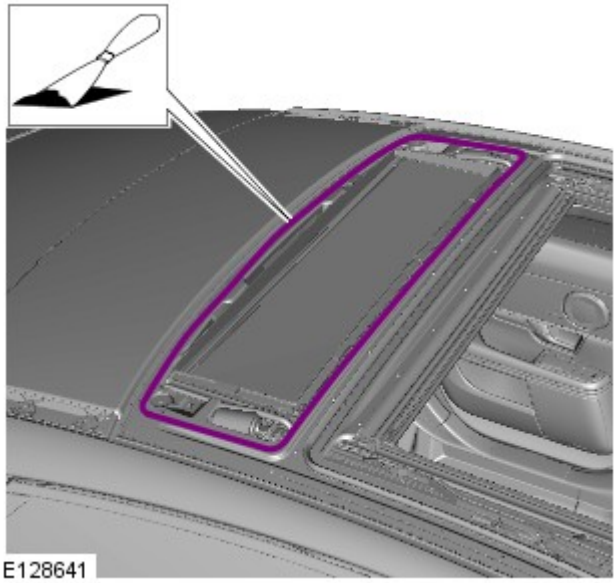
30.



Installation



1. NOTE: Remove the tape.

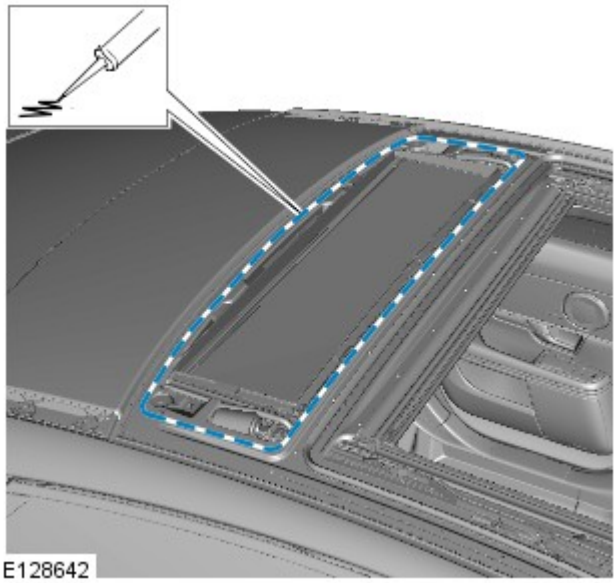


2. CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

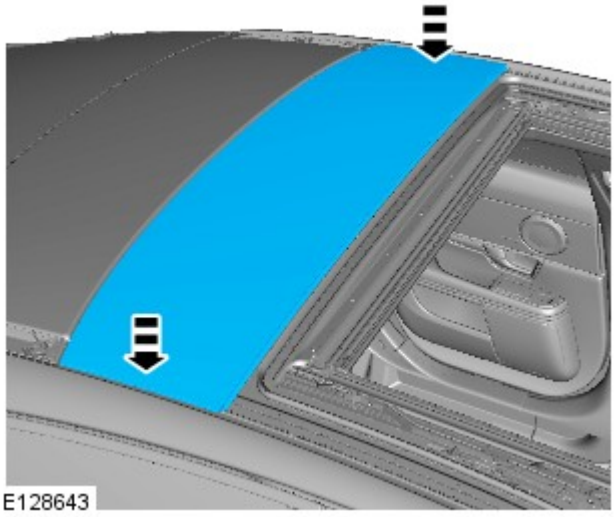
Correct preparation of body apertures “post painting” to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.



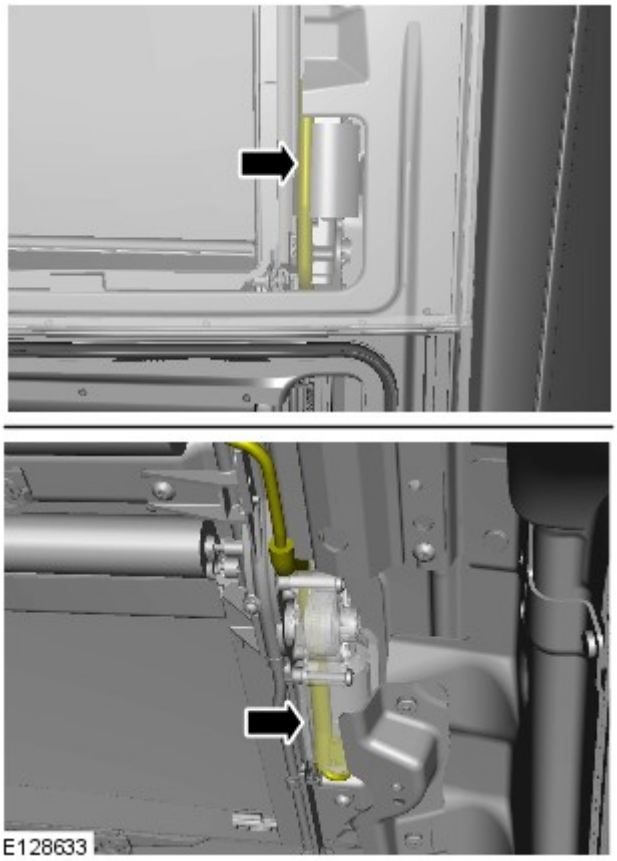
3. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.



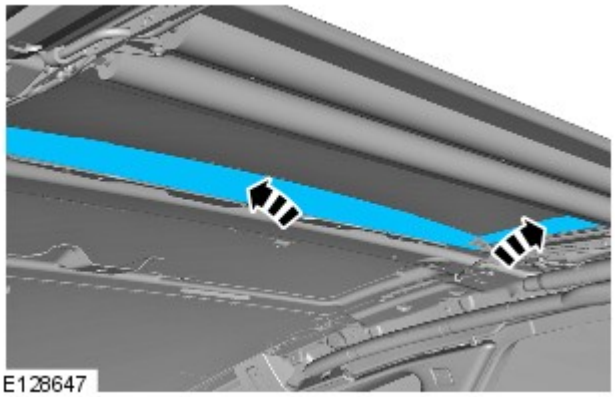
4.

- Make sure the component is aligned with the measurements taken prior to removal. Failure to follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature of the glass.
- Allow up to 1 hour, depending on temperature and humidity, to allow the adhesive to set before continuing with the procedure.



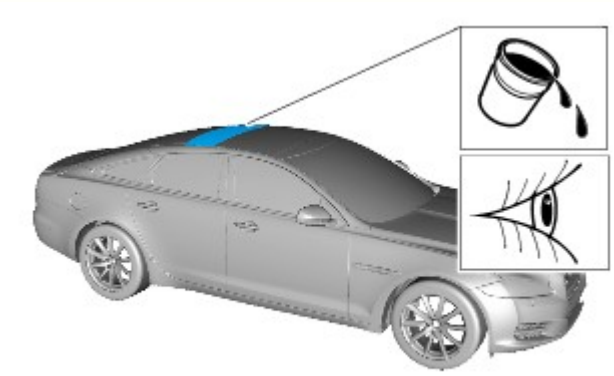
5. NOTE: Remove the tape.

6.



E128647

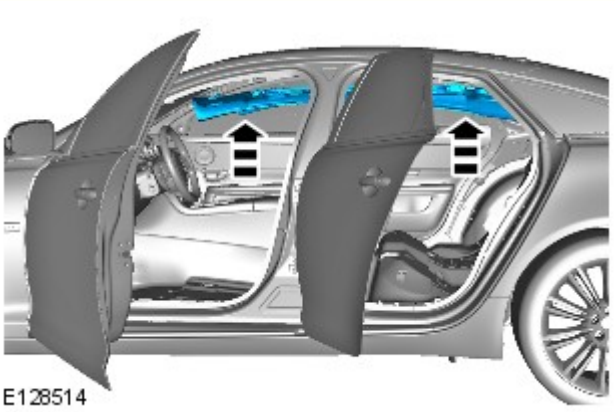
7. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).



E128644

8. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.



E128514

9. CAUTION: Protect the surrounding trim to avoid damage.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

1. Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

Removal and Installation

Removal

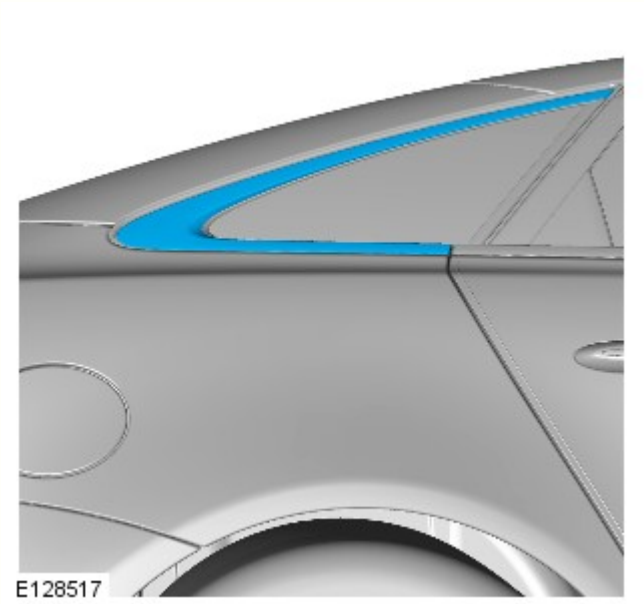
NOTE: RH illustration shown, LH is similar.

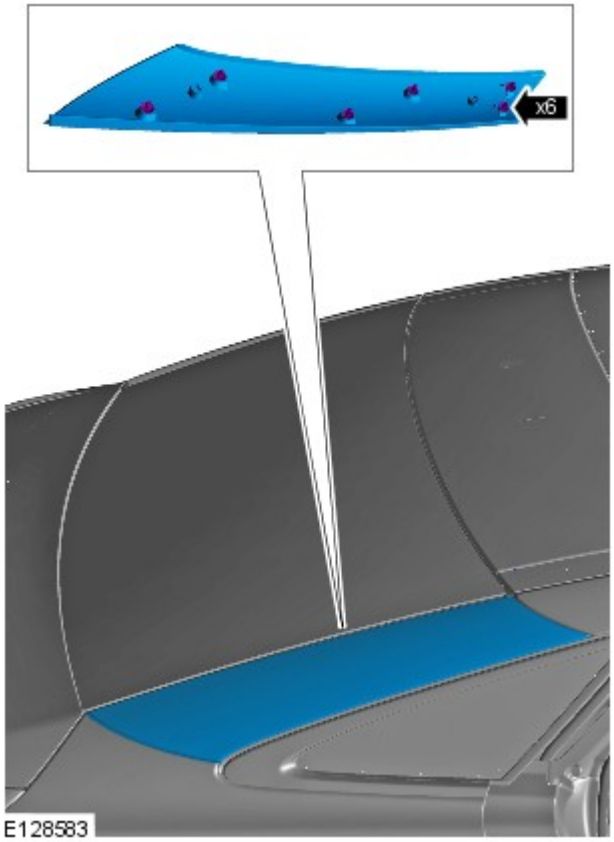
1. Refer to: C-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

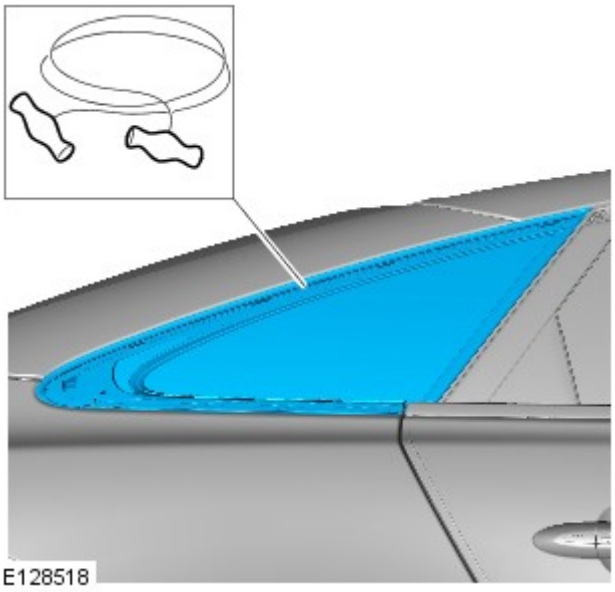
2.
   - Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.



3. CAUTION: Discard the component.

4.



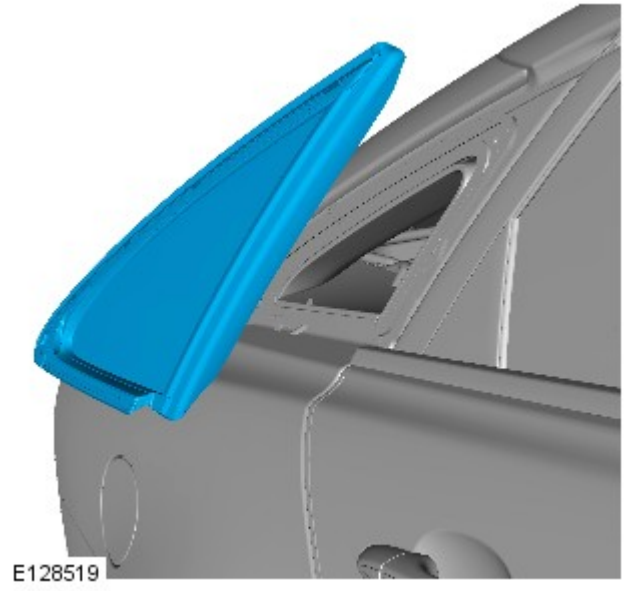


5. CAUTIONS:

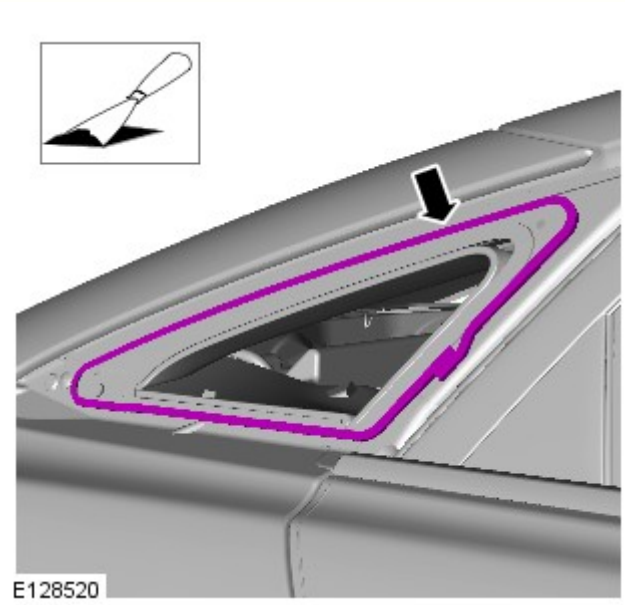
Protect the surrounding components.

Protect the surrounding paintwork to avoid damage.

6.



Installation

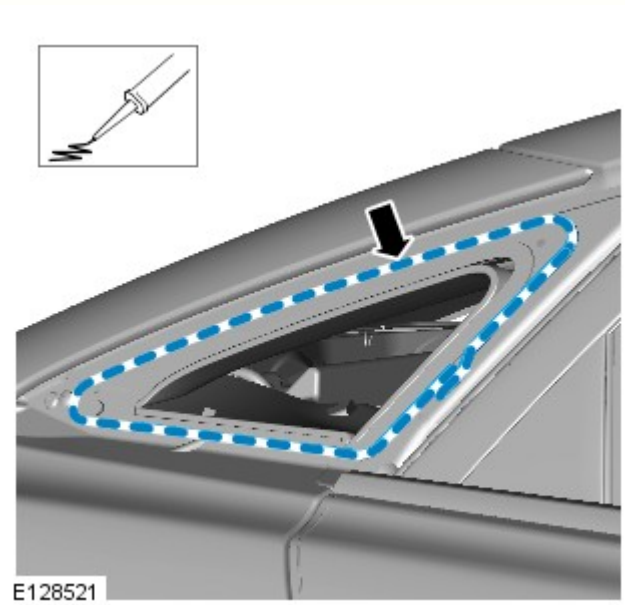


1. CAUTIONS:

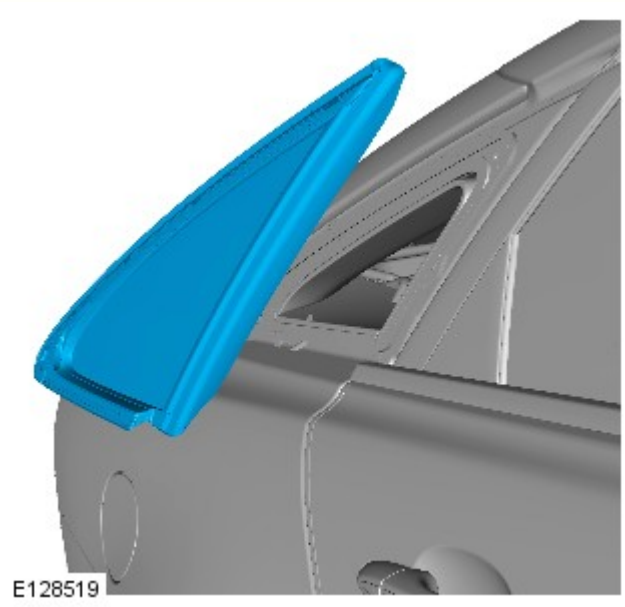
⚠ Make sure that the mating faces are clean and free of foreign material.

⚠ Correct preparation of body apertures “post painting” to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.



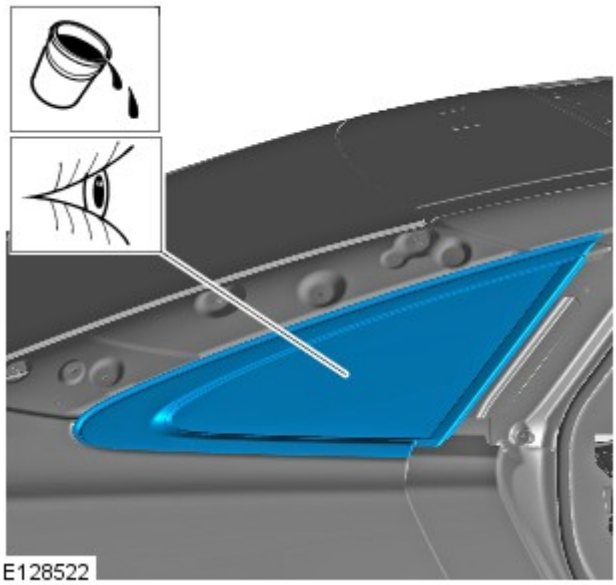
2. ⚠ CAUTION: Touching the adhesive surface will impair rebonding.



3. CAUTION: Make sure that equal pressure is applied to the full length of the component.

NOTE: Align to the orientation noted on removal.

- Install the rear quarter window glass.
- If the ambient temperature falls below 10 degrees C, apply warm air (25 degrees C) continuously for 15 minutes.



4. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.

Glass, Frames and Mechanisms - Rear Window Glass

Removal and Installation

Removal

CAUTIONS:

Always protect paintwork and glass when removing exterior components.

Always protect the interior components when removing body glass.

Lay the glass on felt covered supports. Do not stand on edge as this can cause chips which subsequently develop into cracks.

NOTES:

The following equipment is required: l Cutting wire and handles l Kent knife l Glazing knife l Windshield replacement kit l Sealant applicator gun l Suction cups l A felt covered table or stand to support glass

Removal steps in this procedure may contain installation details.

1. NOTE: The procedure must be carried out on both sides.

   Refer to: C-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.
   - Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Cowl Vent Screen (501-02 Front End Body Panels, Removal and Installation).

2. NOTE: The procedure must be carried out on both sides.

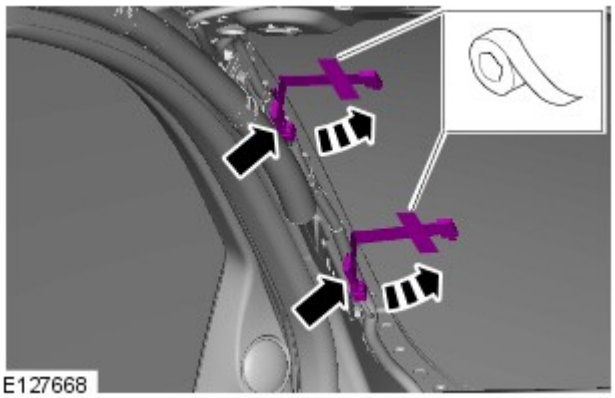
Refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Refer to: Rain Sensor (501-16 Wipers and Washers, Removal and Installation).

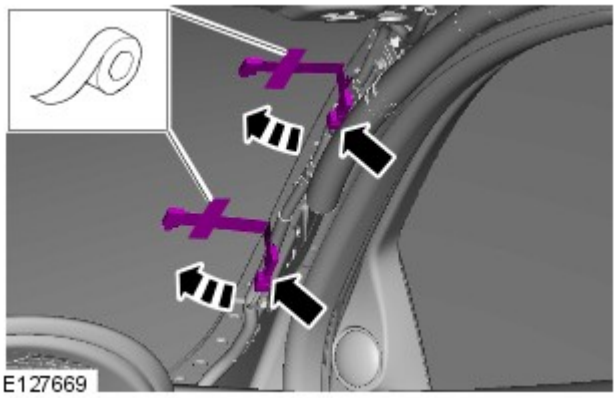
4.

- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

5.



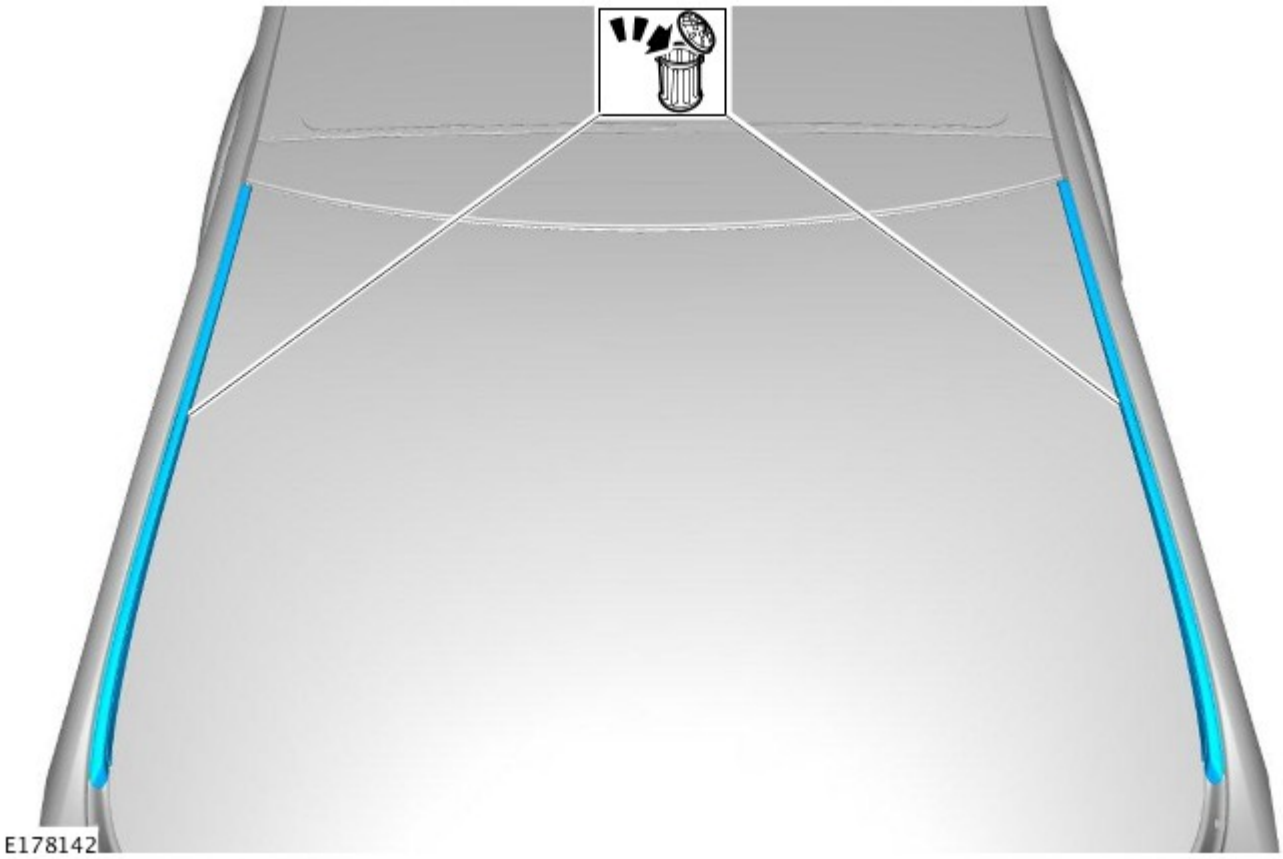
6.



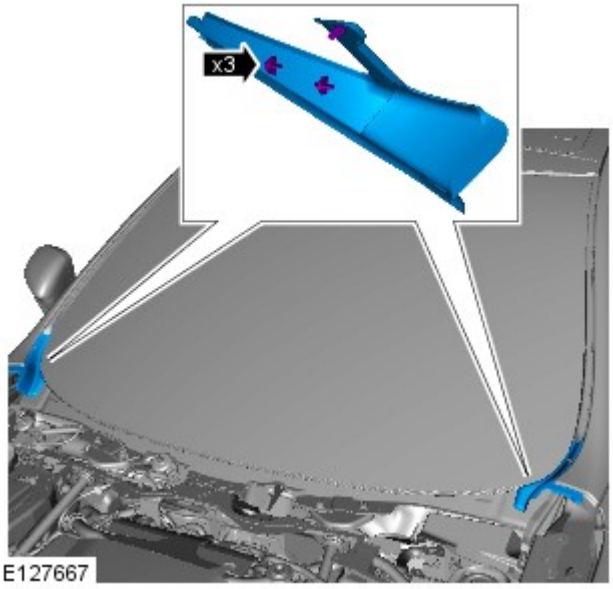
7. NOTES:

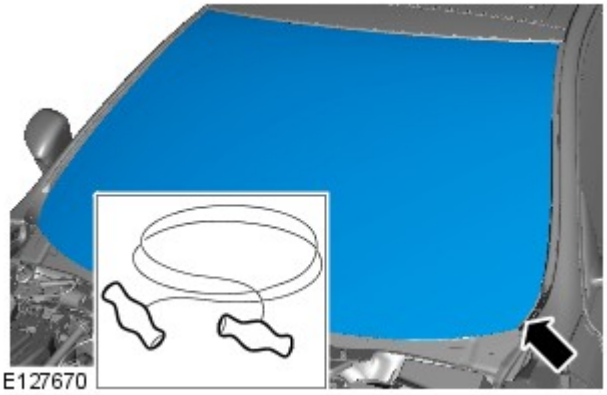
If the windshield glass is removed for access, the finishers will require removing and discarding. If the windshield glass is removed to install a new glass, then the finishers are supplied with the new windshield glass.

Note orientation of the components.



8.

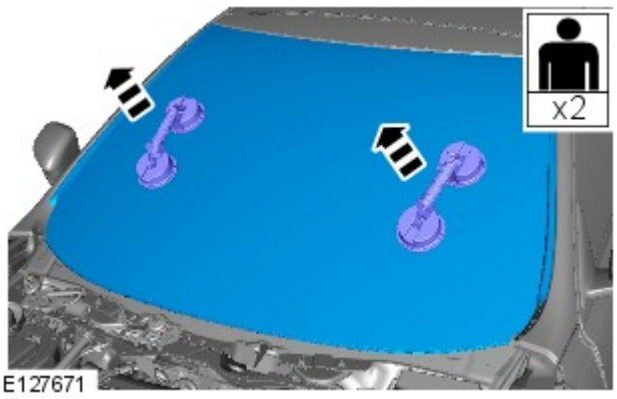




9. CAUTIONS:

Protect the surrounding components.

Protect the surrounding paintwork to avoid damage.



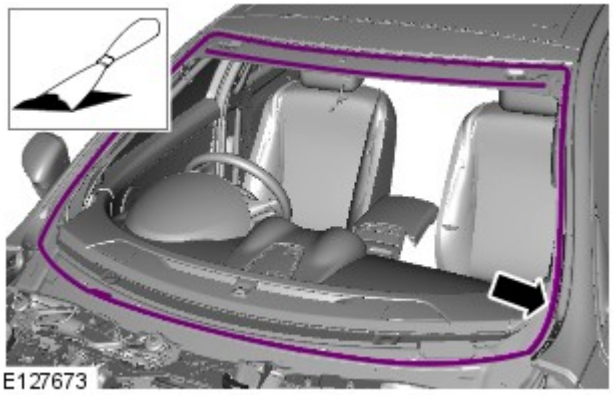
10. WARNING: This step requires the aid of another technician.

Installation

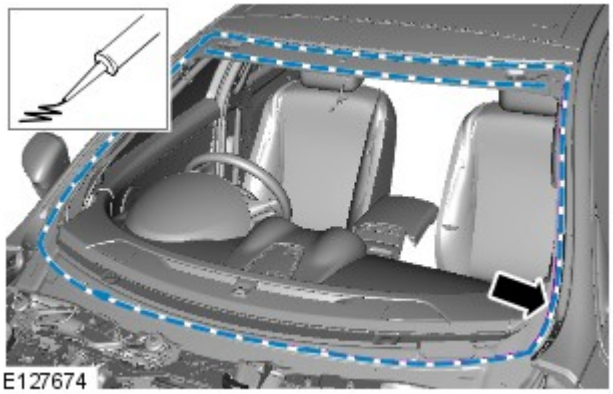
1. CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

Correct preparation of body apertures “post painting” to ensure satisfactory glass adhesion, must be carried out in line with industry practise.



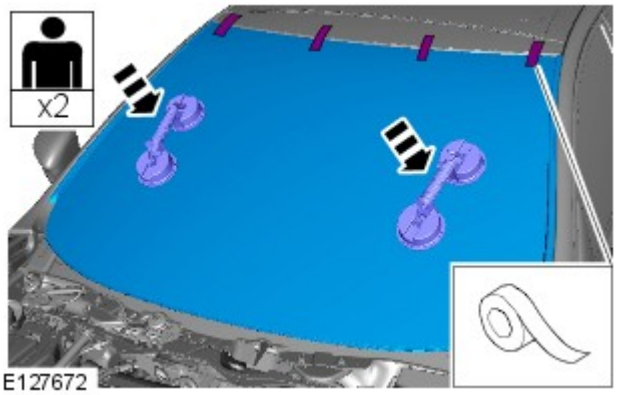
- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.



2. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

Modify the nozzle to achieve a bead section in the shape of a right angle triangle with a base of 8 mm and a vertical height of 12 mm.



3. WARNING: This step requires the aid of another technician.

CAUTIONS:

Make sure that the component is correctly located on the locating dowels.

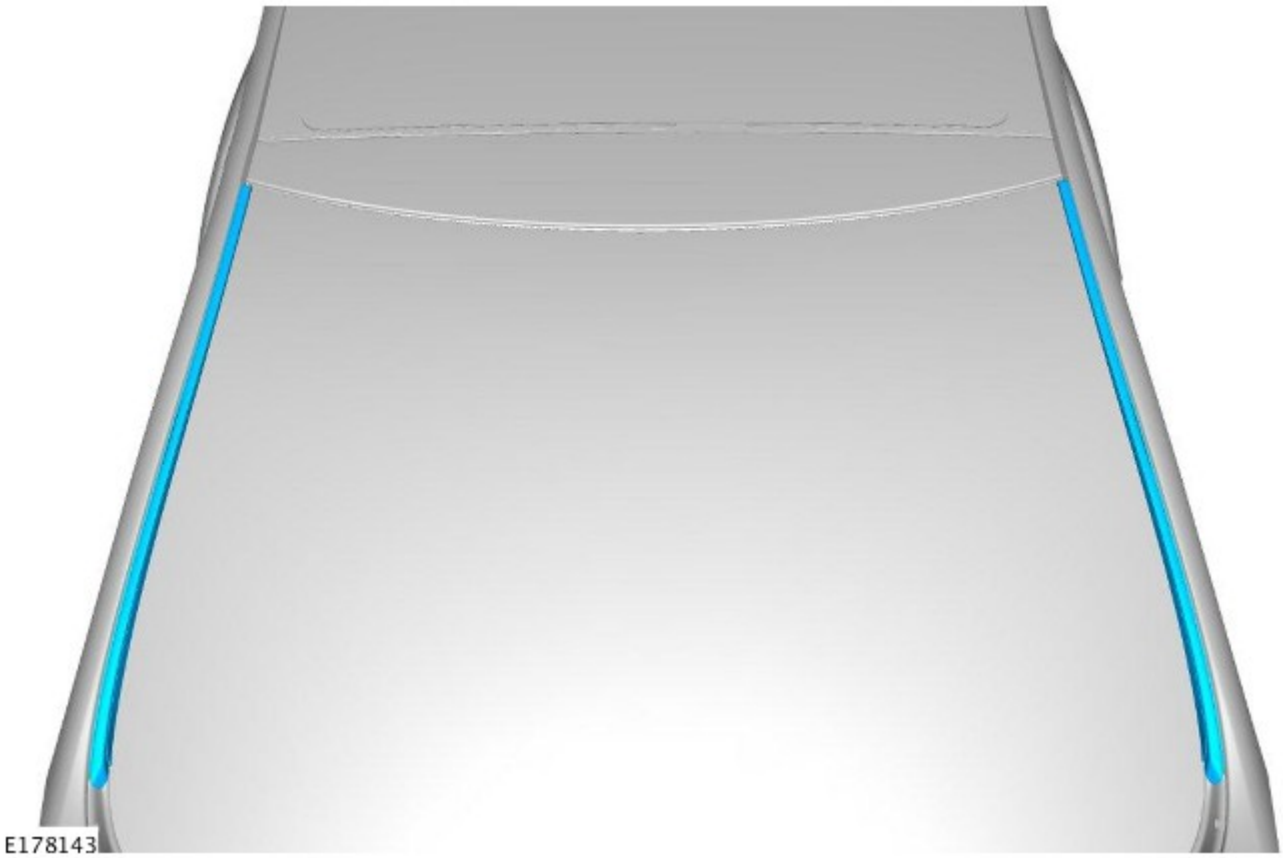
Make sure that equal pressure is applied to the full length of the component.

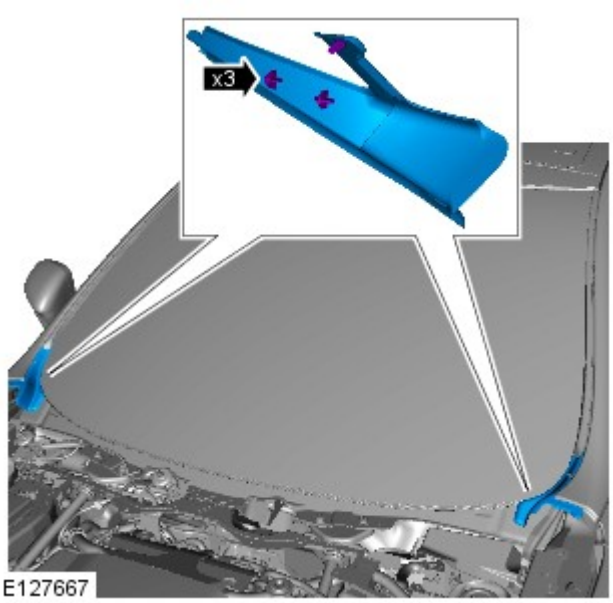
- With assistance, install and align the windshield glass.
- If the ambient temperature falls below 10 degrees C, apply warm air (25 degrees C) continuously for 15 minutes.

4. NOTES:

This step is only required if the windshield glass is removed for access.

Make sure that the components are installed in correct orientation.





5.

6. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.

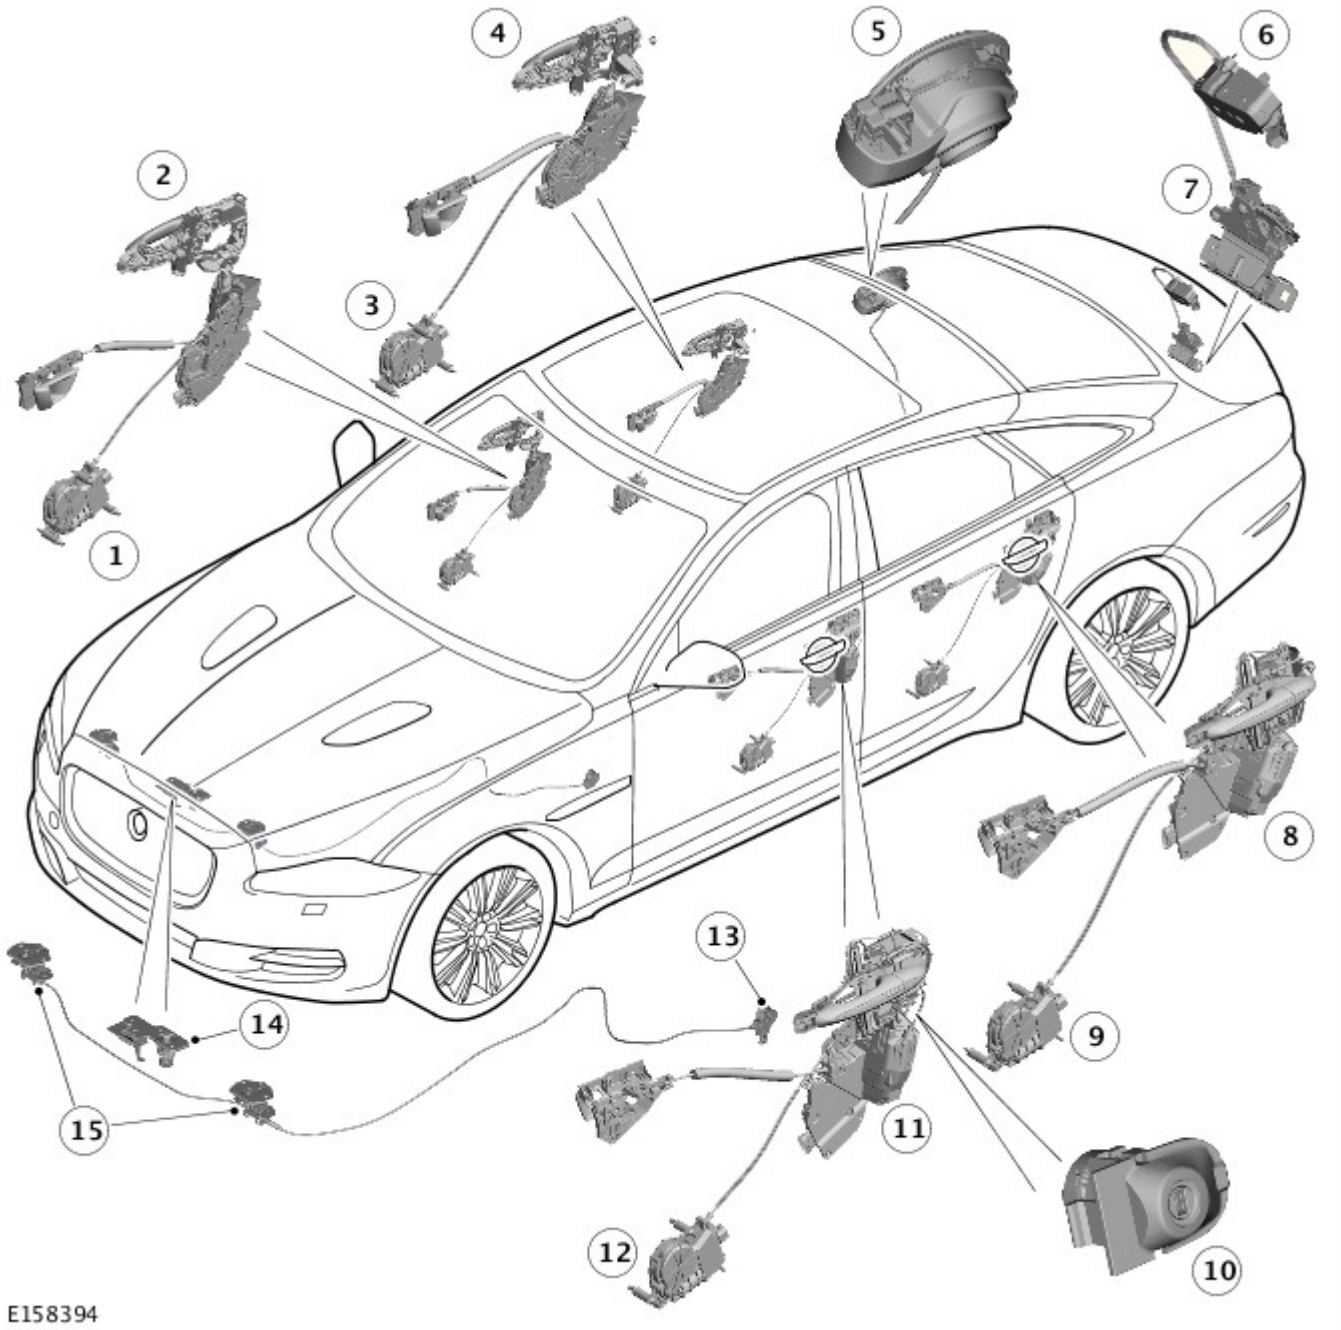
Handles, Locks, Latches and Entry Systems - Handles, Locks, Latches and Entry Systems - Component Location

Description and Operation

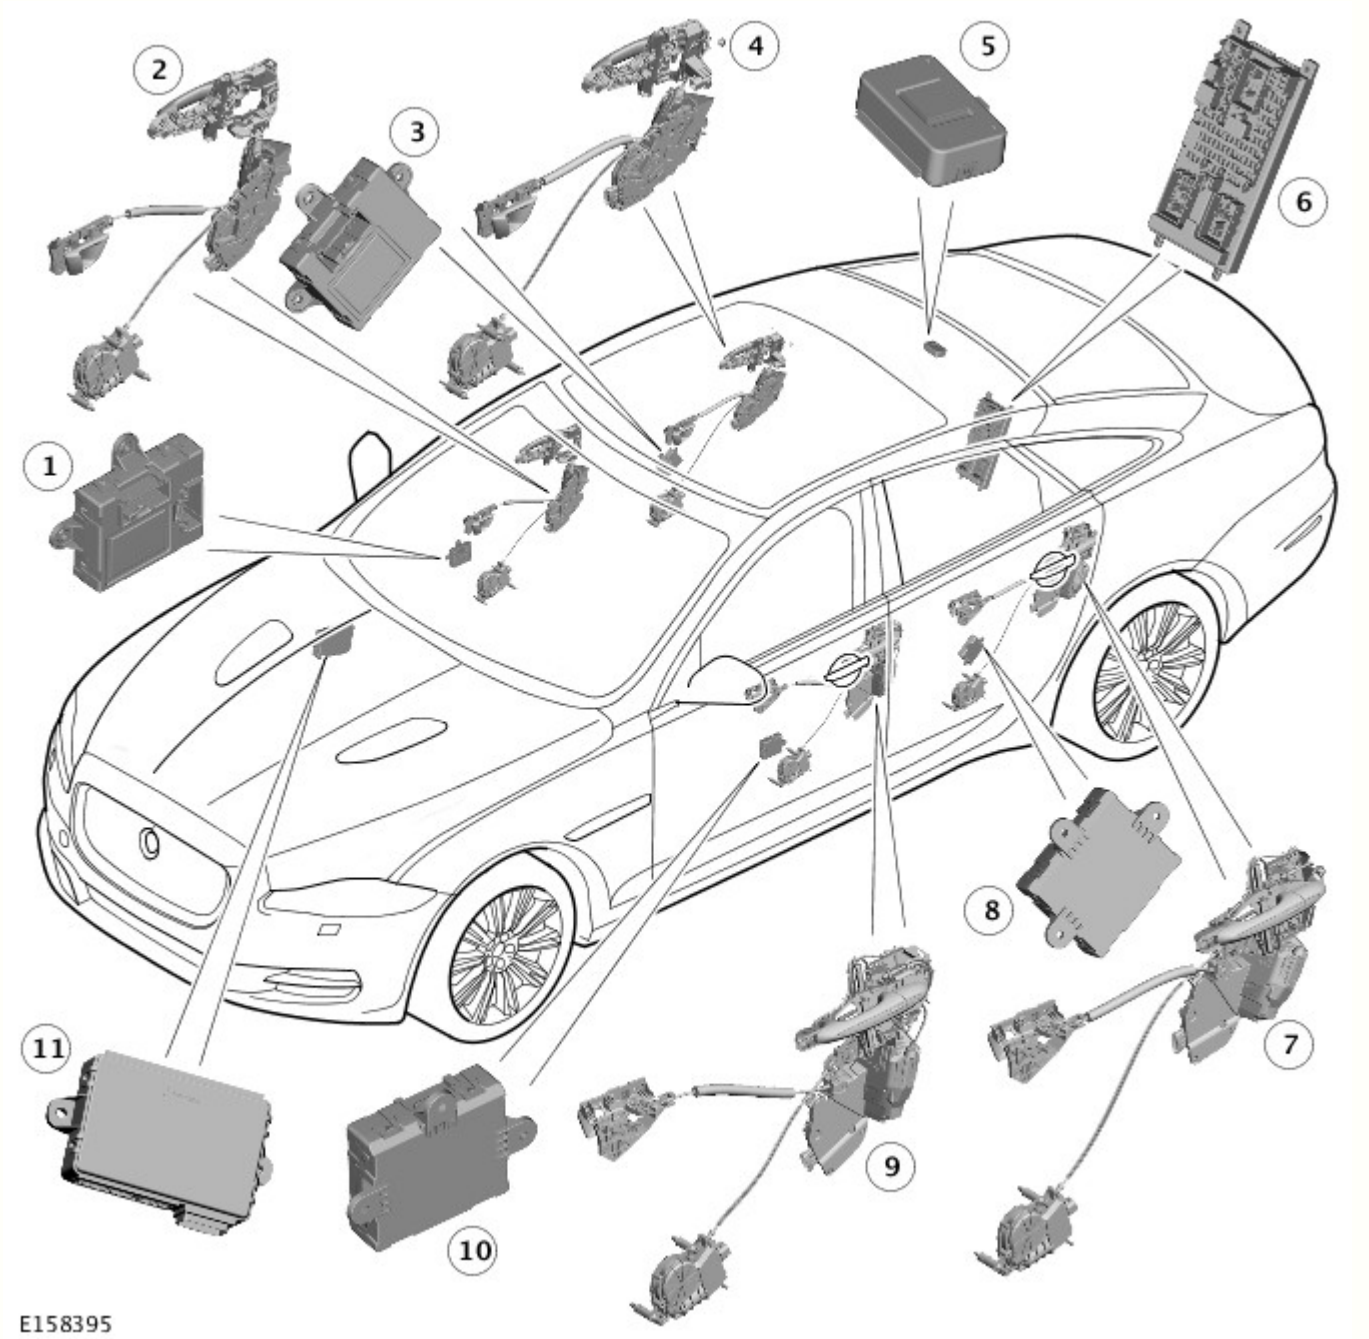
Locks and Latches – Component Location



Item	Description
1	RH front door - closing motor
2	RH front door handles, latch and motor
3	RH rear door - closing motor
4	RH rear door handles, latch and motor
5	Fuel filler door and motor
6	Luggage compartment lid – closing motor
7	Luggage compartment lid – striker and latch assembly
8	LH rear door handles, latch and motor
9	LH rear door - closing motor
10	Emergency key barrel – LH front door only

11	LH front door handles, latch and motor
12	LH front door – closing motor
13	Engine compartment lid – release lever and cable
14	Engine compartment lid - striker
15	Engine compartment lid – safety hook and guide

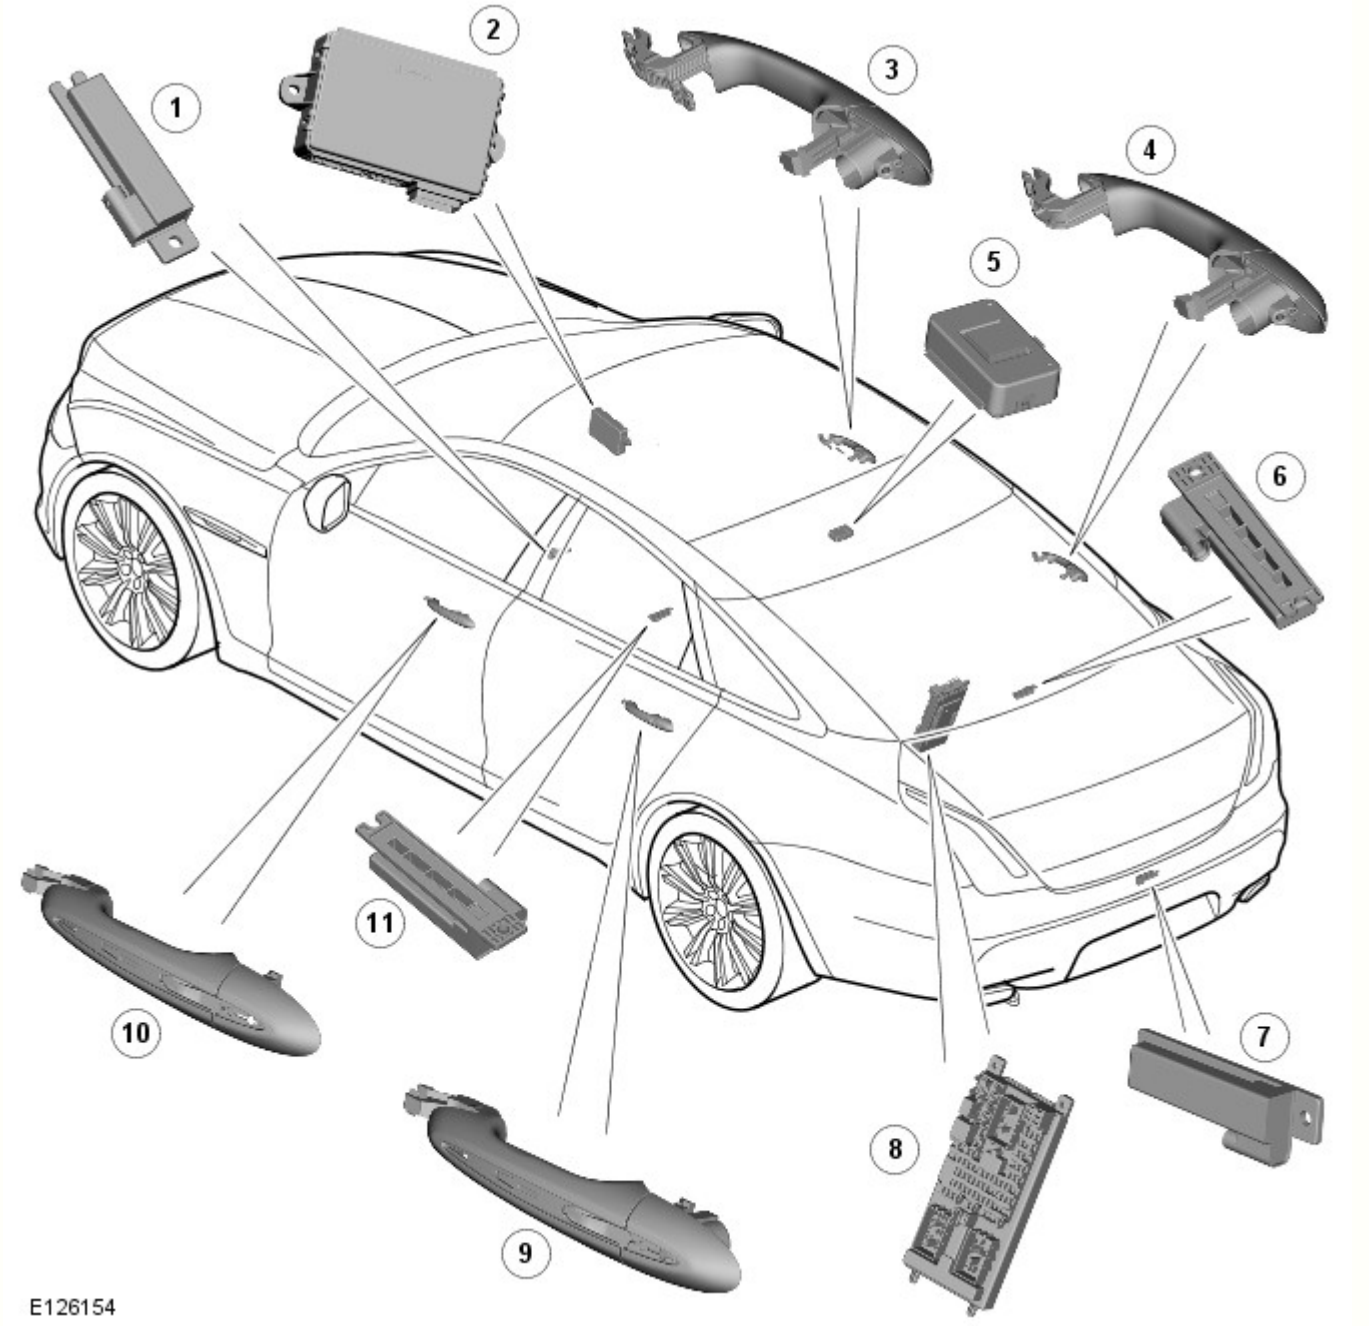
Central Locking – Component Location



Item	Description
1	RH (right-hand) front door module
2	RH front door handles, latch, motor and closing motor
3	RH rear door module
4	RH rear door handles, latch, motor and closing motor
5	Radio frequency receiver
6	CJB (central junction box)
7	LH (left-hand) rear door handles, latch, motor and closing motor
8	LH rear door module
9	LH front door module

10	LH front door handles, latch, motor and closing motor
11	KVM (Keyless Vehicle Module)

Passive Entry – Component Location



Item	Description
1	Antenna – located in center console (front)
2	KVM (Keyless Vehicle Module)
3	RH front antenna – integral to handle
4	RH rear antenna – integral to handle
5	Radio frequency receiver
6	Antenna – located below rear parcel shelf
7	Antenna – located behind rear bumper cover
8	CJB
9	LH rear antenna – integral to handle
10	LH front antenna – integral to handle
11	Antenna – located in center console (rear)

Handles, Locks, Latches and Entry Systems - Handles, Locks, Latches and Entry Systems - Overview

Description and Operation

Overview

The hinged panels are secured with latches and strikers. A remotely operated central locking system controls the locking and unlocking of the door and luggage compartment latches. A radio frequency Smart Key allows the vehicle to be locked and unlocked by pressing the appropriate handset buttons. Two levels of central locking system are available:

- remote central locking, and an
- optional passive entry system.

The remote central locking system provides locking and unlocking of the vehicle from inside and outside of the vehicle. The system is operated using buttons on the Smart Key, which transmits radio frequency signals to the central locking, radio frequency receiver.

The closing mechanism of the doors is by an electronic latch with the addition of a soft-closing motor. The closing motor pulls the latch closed for the last 6 mm of travel.

On vehicles fitted with the optional passive entry system, the vehicle can be unlocked without the use of a key or pressing buttons on the Smart Key. The passive entry system functions when the Smart Key is within a particular distance of the vehicle.

Published: 12-Oct-2016

Handles, Locks, Latches and Entry Systems - Locks, Latches and Entry Systems

Diagnosis and Testing

Principle of Operation

For a detailed description of the locks, latches and entry systems and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Handles, Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

1. Verify the customer concern, to be sure the correct issue is investigated
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
• Incorrectly aligned door(s), hood or tailgate • Fuel filler door lock actuator • Hood release handle • Hood release cables • Hood latch(es) • Exterior door handle(s) • Interior door handle(s) • Cable(s) • Tailgate release switch • Rear window release switch	• Fuses • Wiring harness • Wiring connector(s) • Door lock actuator(s) • Remote transmitter (key-fob or smart key) • Central locking switches • Controller Area Network (CAN) circuits • Radio frequency (RF) receiver • Central junction box (CJB) • Loose or corroded connections

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index

Symptom Chart

NOTE: **Complete the diagnostic steps below to confirm any concern prior to replacing any component**

Symptom	Possible Causes	Action
The message center indicates that the hood, the luggage compartment is open when it appears to be closed Vehicle indicates a miss-lock when the hood, luggage compartment appear to be closed	• Incorrect striker alignment/adjustment • Ajar switch circuit short circuit to ground • Ajar switch failure	• Check/adjust the strikers as necessary • Check for DTCs indicating an ajar switch fault. Refer to the DTC index
Fuel flap does not lock/unlock	• Fuel flap cable detached from body • Fuel flap actuator detached from mounting bracket • Fuel flap actuator disconnected • Fuel flap actuator failure	• Check the condition and installation of the fuel flap cable • Check the security of the fuel flap actuator and bracket • Check the security of the actuator electrical connector • Check for DTCs indicating a fuel flap actuator fault. Refer to the DTC index
Door(s) will not unlatch/open when	• Exterior door handle condition/installation	• Check the exterior door handle condition and installation • Check the condition and security of the exterior release cable

using outside door handle	• Exterior release cable disconnected from exterior door handle or door latch	• **Single door will not open from the outside (but opens from the inside)** GO to Pinpoint Test A.
Door(s) will not unlatch/open when using inside door handle	• Child lock(s) engaged • Interior door handle condition/installation • Interior release cable disconnected from interior door handle or door latch	• Check that the child locks are disengaged • Check the interior door handle condition and installation • Check the condition and security of the interior release cable • **Single Door Will Not Open From The Inside (but opens from the outside)** GO to Pinpoint Test B.
Door(s) will not lock/unlock from key fob, key or internal lock switch	• Wiring harness/connectors • Central junction box (CJB) • Door lock switch • Cable fault	• Check for relevant stored DTCs • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door latch (C1Latch) • Once any DTC related faults have been rectified continue with the diagnostic steps below • **No lock / unlock function from key-fob** GO to Pinpoint Test C.
Door ajar or miss lock signal at message centre when door(s) are closed or alarm triggering	• Wiring harness • Instrument cluster • Incorrect striker alignment/adjustment • Ajar switch circuit short circuit to ground • Ajar switch failure	• **Latch Mounted Door Ajar Switch Test** GO to Pinpoint Test D.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Communications Network (418-00 Module Communications Network, Diagnosis and Testing) / Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Diagnosis and Testing).

Pinpoint Test

PINPOINT TEST A : SINGLE DOOR WILL NOT OPEN FROM THE OUTSIDE (BUT OPENS FROM THE INSIDE)	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CHECK THE EXTERIOR DOOR RELEASE CABLE TO EXTERIOR DOOR HANDLE IS INSTALLED CORRECTLY	
	1 Remove the door trim panel as necessary
	2 Confirm the exterior door release cable is correctly installed to the exterior door handle
	Is the cable correctly installed?

	Yes GO to A2 . **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation
A2: CHECK THE EXTERIOR DOOR HANDLE RELEASE CONNECTION TO THE DOOR LATCH	
 E150683	1 Confirm the exterior door handle release connection to the door latch is installed correctly
	Is the exterior door handle release cable installed correctly? **Yes** GO to Pinpoint Test C. **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation

PINPOINT TEST B : SINGLE DOOR WILL NOT OPEN FROM THE INSIDE (BUT OPENS FROM THE OUTSIDE)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CHECK THE INTERIOR DOOR RELEASE CABLE TO INTERIOR DOOR HANDLE IS INSTALLED CORRECTLY	
 E150684	NOTE: Figure A - Child lock off position shown 1 Make sure the child lock is disengaged (rear door only)
	2 Remove the door trim panel as necessary

 E150685	
	3 Confirm the interior door release cable is correctly installed to the interior door handle
	Is the cable correctly installed? **Yes** GO to B2 . **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation
B2: CHECK THE INTERIOR DOOR HANDLE RELEASE CONNECTION TO THE DOOR LATCH	
 E150686	1 Confirm the interior door handle release connection to the door latch is installed correctly
	Is the interior door handle release cable installed correctly? **Yes** GO to Pinpoint Test C. **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation

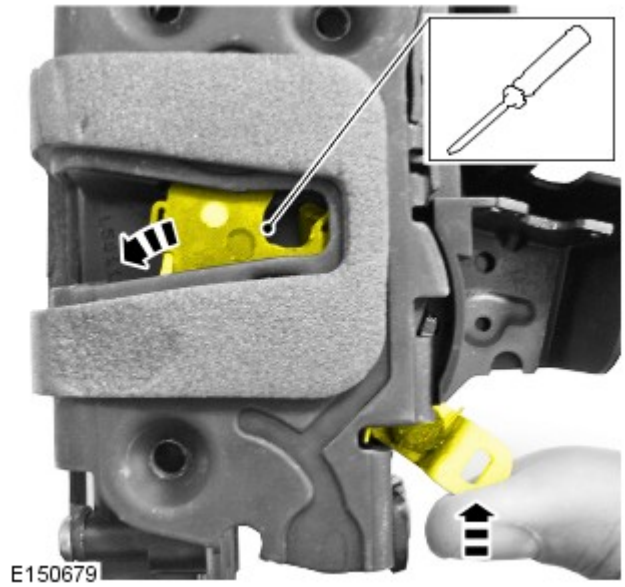
PINPOINT TEST C : DOOR LATCHING AND LOCKING FUNCTION TEST

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: HARNESS CONNECTION	
NOTE: Test as a single component to ensure that the door latch is not replaced unnecessarily, when another component may be at fault	
	1 Remove the door trim panel as necessary

 E150687	2 Disconnect harness from latch, check for corrosion or damage to both connectors at socket points and pins. Re-connect harness ensuring robust assembly when all parts confirmed to be in good order. If harness or latch connectors are damaged, install new harness/latch as necessary. Test the system for normal operation
	Check for normal operation, does latch function correctly? **Yes** Re-assemble door trim and test for normal operation **No** GO to C2 .
C2: LOCK COMMAND SIGNAL FROM VEHICLE HARNESS	
 E139357	1 Close all vehicle doors apart from door being investigated, please note which door, left side or right side is under investigation
	2 Disconnect harness from latch to enable access to socket points to carry-out conductivity testing as detailed
	3 Monitor the circuit for momentary power when locking the vehicle via the key-fob or smart key between terminals **5 and 7 left side** or **5 and 7 right side**
	Is there momentary power (for approx 8 seconds) between terminals **5 and 7 left side** or **5 and 7 right side** when locking the vehicle via the key-fob or smart key **Yes** The vehicle electrical system is locking correctly, providing the signal to the latch GO to C3 . **No** Refer to the electrical circuit diagrams and investigate why vehicle electrical system is not providing signals to the latch. Using the manufacturer approved diagnostic system check for logged DTCs to localize the fault
C3: UNLOCK COMMAND SIGNAL FROM VEHICLE HARNESS	
	1 Monitor the circuit for momentary power when unlocking the vehicle via the key-fob or smart key between terminals **5 and 7 left side** or **5 and 7 right side**
	Is there momentary power (for approx 8 seconds) between terminals **5 and 7 left side** and **5 and 7 right side** when unlocking the vehicle via the key-fob or smart key? **Yes** The vehicle electrical system is unlocking correctly, providing the signal to the latch GO to C4 . **No**

	Refer to the electrical circuit diagrams and investigate why vehicle electrical system is not providing signals to the latch. Using the manufacturer approved diagnostic system check for logged DTCs to localize the fault
C4: PHYSICAL TEST 1	
	1 Remove latch module from door
	2 Inspect latch module for any visual damage
	3 With the latch in hand, connect the electrical connector(s) to connect door latch to door harness
	NOTE: THE LATCH IS NOW READY TO TEST 4 Close all vehicle doors except the door being investigated
	NOTES: Figure 1 - Unlatched position shown Figure 2 - First safety latched position shown Figure 3 - Fully latched position shown Test will not work if latch is only in first safety latch position 5 Rotate latch claw (using a small screw driver or similar), to the fully latched position (figure 3)
	NOTE: Unlocked position shown 6 Confirm that the latch interior release lever is in the unlocked position as shown
	NOTE: Locked position shown

 E150677	7 Press the **lock** button on the key-fob or smart key
	Does the latch interior release lever move from the unlocked position to the locked position? **Yes** GO to C5 . **No** If this is a repeat test and the vehicle electrical test section has been completed and confirmed that vehicle is working correctly, then replace the door latch. If replacing latch as part of a warranty claim, please quote reference code **LKINOP** in the technician comments section of the warranty claim
C5: PHYSICAL TEST 2	
 E150678	NOTE: Unlocked position shown 1 With the latch in the locked state (i.e. the latch interior release lever is in the locked position), press the key-fob or smart key **unlock** button
	Does the latch interior release lever move from the locked position to the unlocked position? **Yes** GO to C6 . **No** If this is a repeat test and the vehicle electrical test section has been completed and confirmed that vehicle is working correctly, then replace the door latch. If replacing latch as part of a warranty claim, please quote reference code **LKINOP** in the technician comments section of the warranty claim
C6: PHYSICAL TEST 3	
	NOTE: Fully latched position shown 1



1 With the latch in its unlocked state, push the latch exterior release lever against its return spring, whilst simultaneously applying a light pressure to release the latch claw using a small screw driver or similar

Does the latch claw release?

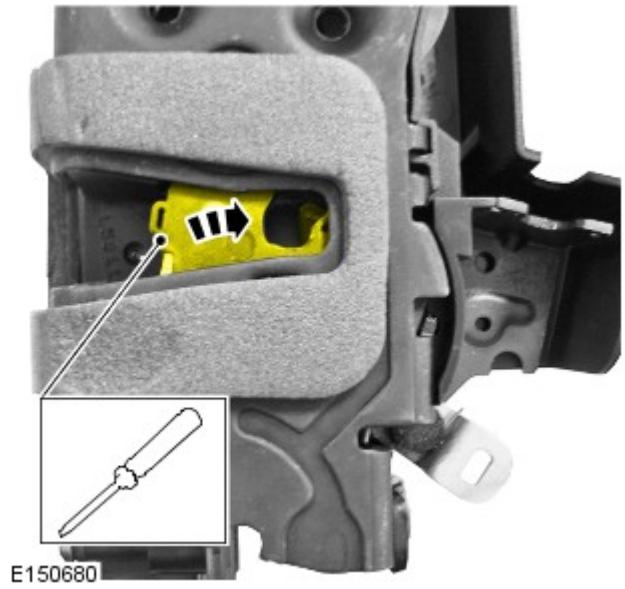
Yes

GO to C7 .

No

Repeat tests **C5** and **C6** to confirm the fault GO to C5 . If the repeat test has confirmed that the exterior release lever will not release the claw on an unlocked latch replace the door latch. If replacing latch as part of a warranty claim, please quote reference code **EXTINOP** in the technician comments section of the warranty claim

C7: PHYSICAL TEST 4

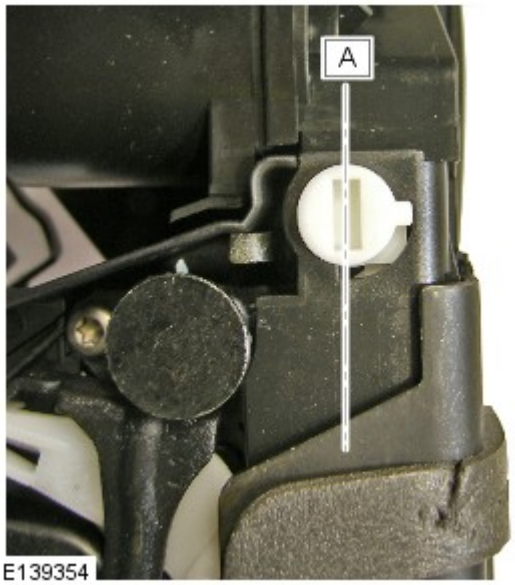


NOTE: Fully latched position shown

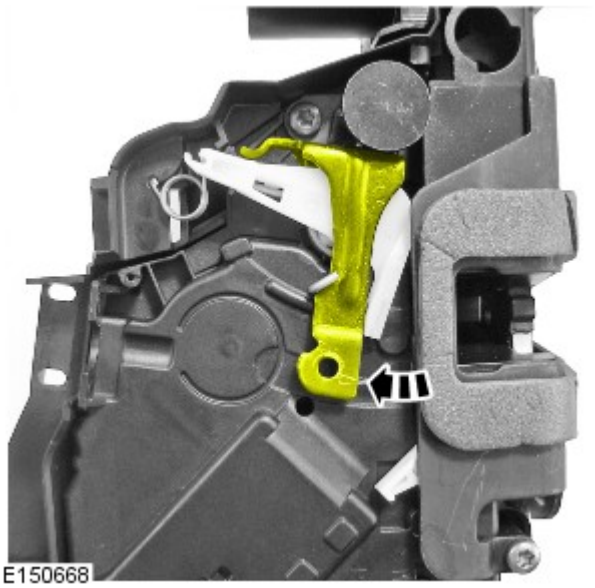
1 Using a small screw driver or similar, rotate latch claw to the second fully latched position

NOTE: Figure A - Child lock off position shown

2 If testing a rear door latch, ensure that the child lock is turned to the off position



E139354



E150668

NOTE: Unlocked position shown

3 Confirm that the latch interior release lever is in the unlocked position as shown

E139355

4 Whilst the latch is still in its unlocked state, push the latch interior release lever against its return spring, whilst simultaneously applying a light pressure to release the latch claw using a small screw driver or similar

Does the latch claw release?

Yes

	Latch has passed all tests to confirm its correct function. **DO NOT REPLACE LATCH** as part of any attempts to resolve any locking functionality issues
	No Repeat test GO to C7 . If repeat test has confirmed that the interior release lever will not release the claw when the latch is in the unlocked state, then replace the latch. If replacing latch as part of a warranty claim, please quote reference code **INTINOP** in the technician comments section of the warranty claim

PINPOINT TEST D : LATCH MOUNTED DOOR AJAR SWITCH TEST

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: TEST 4 DOOR LATCH	
NOTES: If a customer is complaining of issues relating to a door ajar signal e.g. door latch won't lock, or alarm system triggering (indicated via DTC's), there may be several components that generate the fault, including • Body wiring harness / connectors • Door wiring harness / connectors • Alarm control module • Central junction box (CJB) • Door Latch ajar switch	
To investigate the functioning of the door ajar switch contained within the door latch, to prove or eliminate the door latch mounted door ajar switch as the root cause, follow the process below. This will prevent the unnecessary replacement of a correctly functioning door latch	
	1 Remove door trim from door
	2 Disconnect door harness from latch for access to connector pins for latch electrical testing
	3 Inspect latch module for any visual damage
	NOTES: Figure 1 - Unlatched position shown Figure 2 - First safety latched position shown Figure 3 - Fully latched position shown **Test will not work if latch is only in first safety latch position** 4 Using a small screw driver or similar, rotate latch claw to the second fully latched position (figure 3)
	5 Carry out continuity test between terminals **1 and 4 (left side)** or **8 and 4 (right side)** with claw closed

	
	Does the continuity test pass? **Yes** The latch ajar switch is working correctly. **Do not replace latch** . Investigate for fault elsewhere in vehicle system **No** Release latch claw and repeat test from step 4 to confirm result. If this is a repeat test and you are sure that the ajar switch does not provide continuity when fully latched. Replace the latch. If replacing latch as part of a warranty claim, please quote reference code **AJARINOP** in the technician comments section of the warranty claim

Published: 09-Dec-2013

Module Communications Network - Communications Network

Diagnosis and Testing

Principles of Operation

For a detailed description of the Communications Network, refer to the relevant Description and Operation sections in the workshop manual.

Inspection and Verification

CAUTIONS:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

1. Verify the customer concern
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Electrical
• Fuses (refer to electrical guide) • Wiring harness • Correct engagement of electrical connectors • Loose or corroded connections • Routing of fibre optic harnesses • Correct engagement of optical connectors • Correct placement of optical connectors (ring order) • Correct assembly of optical connectors (backout, etc) • Damage to fibre (chafing, abrasion, kinking, cuts, etc)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index

Symptom Chart

Symptom	Possible Causes	Action
MOST network fault - Touch Screen (TS) soft keys greyed out and inoperative	• MOST ring broken • Control module on MOST network power or ground circuit open circuit, high resistance • Control module on MOST network internal failure	• GO to Pinpoint Test B.
MOST network fault - Touch Screen (TS) blank	• Touch Screen (TS) power or ground circuit open circuit, high resistance • Wake up signal not received by the Touch Screen (TS) • Touch Screen (TS) internal failure	• GO to Pinpoint Test G.

Controller Area Network (CAN)

Control Module Connections to the CAN Harness

Control modules are connected to the CAN harness either in a 'loop' or 'spur' configuration. In the 'loop' type configuration the CAN harness loops into the module (via two connector pins) and then loops out of the module (via another two connector pins). In the 'spur' type configuration, a harness spur is spliced into the main 'backbone' of the CAN harness and the module is connected to the harness spur via two connector pins.

CAN Harness Architecture

For a detailed description of the CAN Networks and architecture, refer to the relevant Description and Operation section in the Workshop Manual.

CAN Network Integrity Tests

If a control module is suspected of non-communication, the Network Integrity test application available on the manufacturer approved diagnostic system can be used to confirm if communication is possible between the control modules on the vehicle and the manufacturer approved diagnostic system (via the J1962 diagnostic connector). The results from the test can be used to determine if either a single module or multiple modules are failing to communicate.

CAN Terminating Modules

If the Network Integrity test indicates that one or more module on one of the CAN networks (HS or MS) are failing to communicate, there are several checks that can be made. The first step is to identify if both of the CAN terminating modules on each individual CAN Bus are communicating. If both CAN terminating modules for each individual CAN Bus are communicating (identified via the Network Integrity test), then it can be confirmed that the main 'backbone' of the CAN harness is complete. The main 'backbone' of the CAN harness consists of all the modules connected to the CAN harness via a 'loop' configuration and also includes the two terminating modules.

Communication with both CAN terminating modules via the Network Integrity test confirms the physical integrity of the main 'backbone' of the CAN harness (and the harness spur to the J1962 diagnostic connector). This means that there is no requirement to check the resistance of the CAN Network. This is because the standard check for 60 ohms across the CAN High and CAN Low lines will not provide any additional information regarding the physical condition of the CAN harness, beyond what has already been determined from the Network Integrity test.

Non-Communication of a Terminating Module

If a Network Integrity test reveals a terminating module is failing to communicate it can indicate a break in the main 'backbone' of the CAN harness. The first checks should always be to confirm the power and ground supplies to the non-communicating module are correct. Providing these are correct, the resistance between the CAN High and CAN Low lines at the J1962 connector can be checked to determine the integrity of the main 'backbone' of the CAN harness. After disconnecting the battery a reading of 120 ohms would indicate an open circuit in the main 'backbone' of the CAN harness. Alternatively, a reading of 60 ohms would indicate that there is no open circuit fault with the main 'backbone' of the CAN harness.

It is worth noting that even if one of the terminating modules is disconnected from the CAN harness, communications between the modules still connected may still be possible. Therefore communication between the manufacturer approved diagnostic system and the connected modules may also be possible.

Locating CAN Harness Open Circuits

In the case where multiple modules, including a terminating module, are failing to communicate, having first confirmed the power and ground supplies are correct, the approximate location of the open circuit can be identified from analysis of the Network Integrity test results and reference to the relevant CAN network circuit diagrams. For example, if an open circuit existed in a certain position on the CAN harness, any module positioned on the Network between the J1962 connector and the open circuit should return a response during the Network Integrity test. No responses would be returned from any modules past the open circuit fault in the Network.

CAN Harness 'Spur' Type Configuration Circuits

If, after the initial checks (Network Integrity test using the manufacturer approved diagnostic system, and power and ground supplies to the module have been checked and confirmed as correct), a module that is connected to the CAN harness via a

'spur' type configuration is suspected of not communicating, then the physical integrity of the CAN harness 'spur' can be checked.

This is most easily undertaken by individually checking the continuity of the CAN High and CAN Low lines between the non-communicating module connector (with the module disconnected) and the J1962 diagnostic connector.

'Lost Communications' DTCs

As well as the methods described so far in this document, which can be used to determine the location of an open circuit in the CAN harness, 'Lost Communications' DTCs can also be used for this purpose. Lost communication DTCs mean that a module is not receiving CAN information from another module.

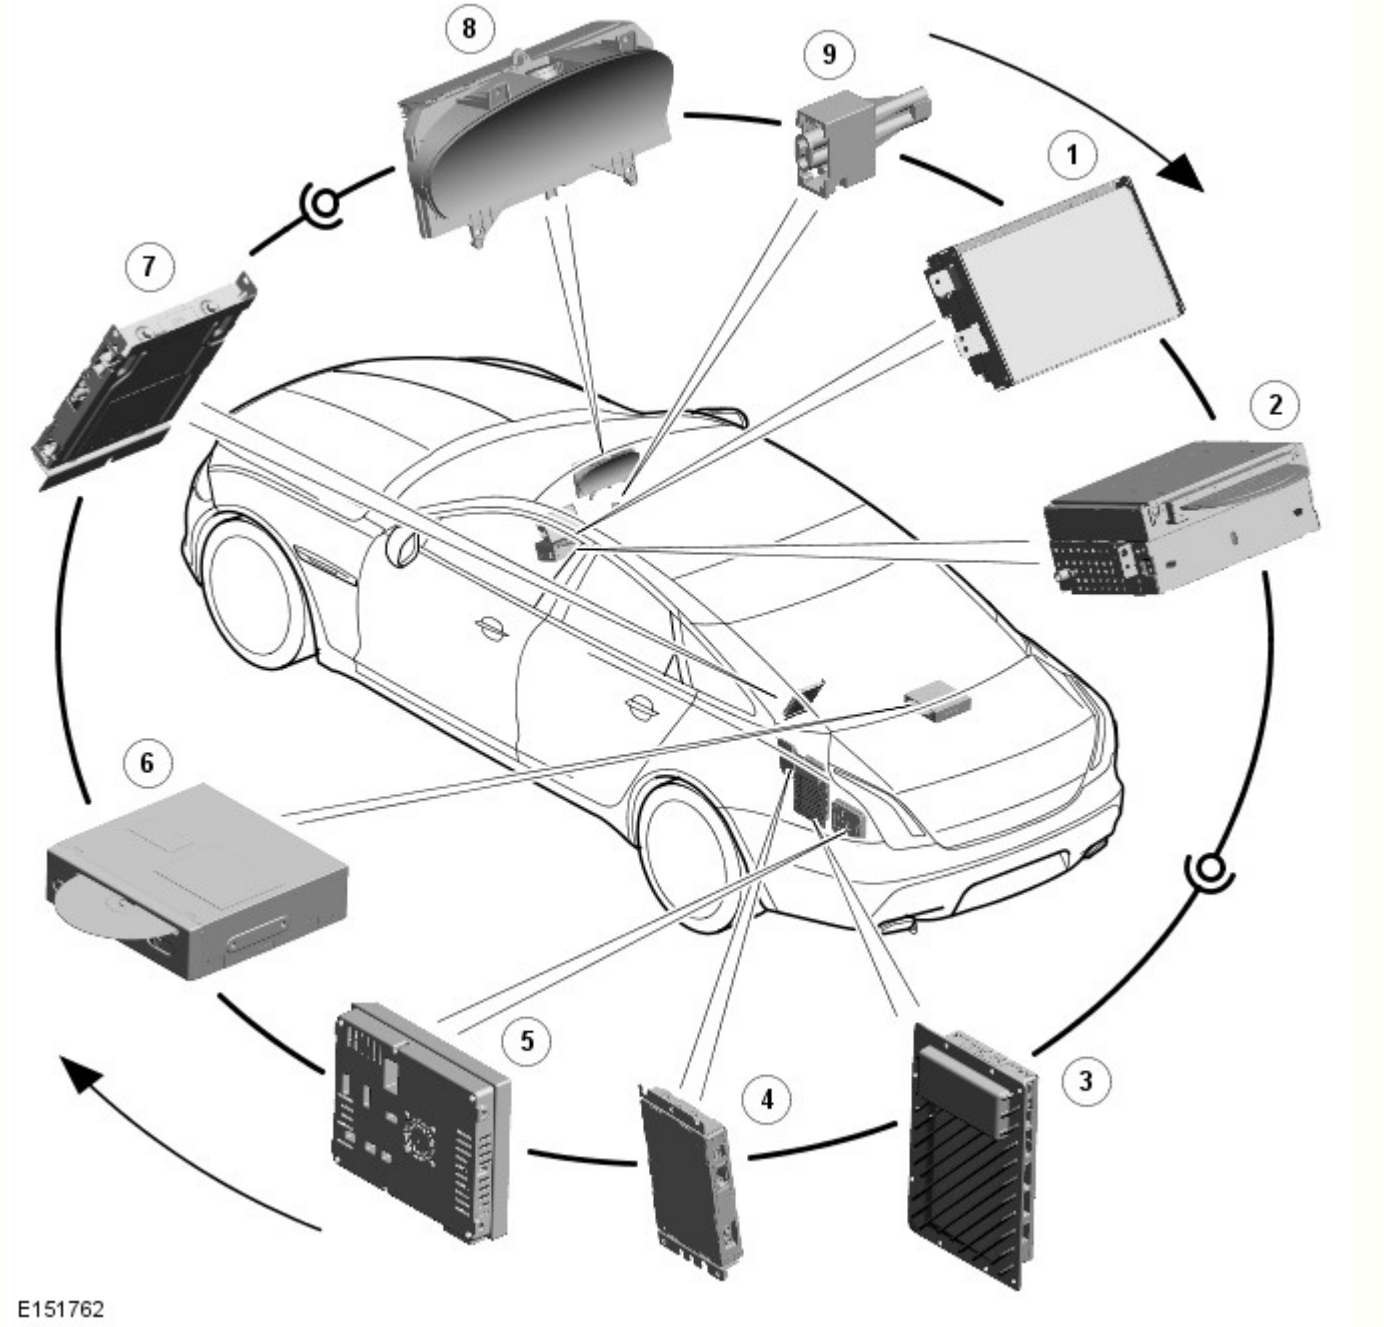
For example, if a global DTC read were to be carried out, only DTCs stored in the modules that the manufacturer approved diagnostic system could communicate with would be displayed. If there was an open circuit fault in a certain position on the CAN harness, the modules that could display DTCs would all be prior to the open circuit on the Network, and these modules should display 'Lost Communications' DTCs with all the modules located on the Network past the open circuit fault.

'Bus off' DTCs

The references to bus and its condition refer to the network concerned and the modules on that network.

If a module logs a 'Bus Off' DTC, it means that the module has detected CAN transmission errors and has disabled it's own CAN transmissions and disconnected itself from the network in an attempt to allow the rest of the network to function. At this point the 'Bus Off' DTC is set. A common cause of 'Bus Off' DTCs can be a short circuit in the CAN network.

Media Oriented Systems Transport (MOST)



NOTE: Items 1, 2, 3, 8 and 9 will always be present. The remaining items are optional and/or market specific.

Item	Description
1	Touch Screen (TS)
2	Integrated Audio Module (IAM)
3	Audio Amplifier Module (AAM)
4	Digital Radio Control Module (DRCM)
5	TV Control Module (TVCM)
6	Navigation Control Module (NCM) - Japan
7	Rear Seat Entertainment Control Module (RSECM)
8	Instrument Cluster (IC)
9	MOST diagnostic connector

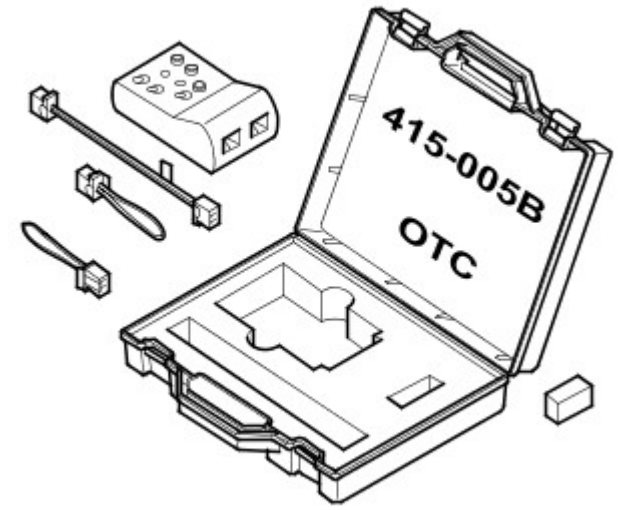
Overview

The basic guidelines are covered in the description and operation section, such as not attempting to repair fibre optic cables, but additional precautions include:

- Do not touch the exposed ends of the optical fibres (grease from skin can contaminate the fibre)
- Whenever the fibre optic cable is disconnected, cover the connectors to prevent dust contamination
- Do not expose the fibre optic cable to heat
- Do not bend the fibre optic cable through less than a 25 mm (one inch) radius
- Do not use laser pens to test the fibre optic cable's ability to pass light

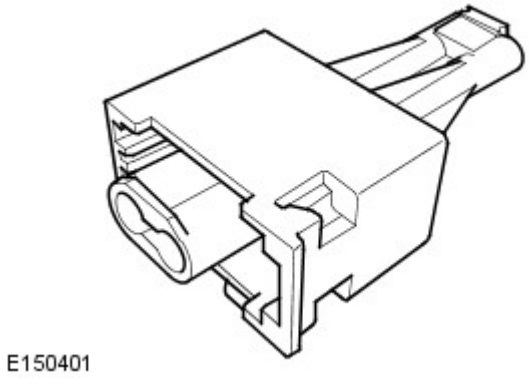
MOST Diagnostic Tools

There are two dedicated tools for testing the MOST system:



E150402

MOST tester. The MOST tester is connected to the MOST network in place of a control module. It will confirm receipt of any existing MOST signal and transmit it to the next control module on the network. Perform the following tests to validate the operation of the MOST tester. GO to Pinpoint Test A.



E150401

MOST prism. The MOST prism is connected in the same way as the MOST tester but will simply reflect any existing signal onward to the next control module. Using the MOST prism before or after a long run of harness may cause a ring break as a good signal may be too weak after travelling the extended distance. Also, the MOST prism will pass light in either direction so will not detect reversed MOST terminals elsewhere in the network. For these reasons, the MOST tester is the preferred tool and should be used unless limited access does not permit it

MOST Ring Break Indication

A ring break in the MOST network is indicated by the Touch Screen (TS) soft keys being greyed out and inoperative. Possible causes of ring breaks are listed in the symptom chart

Pinpoint Tests

PINPOINT TEST A : MOST TESTER TESTS	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: MOST TESTER BATTERY TEST	
	1 Set the MOST tester power switch to 'on'
	Is the power LED illuminated? **Yes** Test passed. GO to A2 . **No** Test failed. Install a new battery into the MOST tester. GO to A1 .
A2: 2+0 INPUT/OUTPUT TEST	
NOTES:	

'2+0' indicates that the loop harness connector consists of 2 fibre optic terminals and 0 electrical terminals.

The MOST tester may continue to emit a tone or illuminate the LED after the test switch is released. This does not indicate a fault.

	1	Set the MOST tester power switch to 'on'
	2	Set the connector selector switch to '2+0'
	3	Set the indication switch to 'beep' or 'LED'
	4	Remove the covers from the MOST tester 2+0 connector and the 2+0 loop harness connector
	5	Connect the 2+0 loop harness to the MOST tester 2+0 connector
	6	Operate the test switch and check the MOST tester beep/LED
	Did the MOST tester emit a tone or illuminate the LED? **Yes** Test passed. GO to A3 . **No** Test failed. MOST tester or 2+0 harness fault	

A3: 2+4 INPUT/OUTPUT TEST

NOTES:

'2+4' indicates that the loop harness connector consists of 2 fibre optic terminals and 4 electrical terminals.

The MOST tester may continue to emit a tone or illuminate the LED after the test switch is released. This does not indicate a fault.

	1	Set the MOST tester power switch to 'on'
	2	Set the connector selector switch to '2+4'
	3	Set the indication switch to 'beep' or 'LED'
	4	Remove the covers from the MOST tester 2+4 connector and the 2+4 loop harness connector
	5	Connect the 2+4 loop harness to the MOST tester 2+4 connector
	6	Operate the test switch and check the MOST tester beep/LED
	Did the MOST tester emit a tone or illuminate the LED? **Yes** Test passed. GO to A4 . **No** Test failed. MOST tester or 2+4 harness fault	

A4: ADAPTER HARNESS AND PRISM TEST

NOTE: The MOST tester may continue to emit a tone or illuminate the LED after the test switch is released. This does not indicate a fault.

	1	Set the MOST tester power switch to 'on'
	2	Set the connector selector switch to '2+0'
	3	Set the indication switch to 'beep' or 'LED'
	4	Remove the covers from the MOST tester 2+0 connector, the prism, and the adapter harness connectors
	5	Connect the adapter harness to the MOST tester 2+0 connector
	6	Connect the prism to the adapter harness
	7	Operate the test switch and check the MOST tester beep/LED
	Did the MOST tester emit a tone or illuminate the LED? **Yes** Test passed **No** Test failed. MOST tester, adapter harness or prism fault	

PINPOINT TEST B : MOST NETWORK INITIAL TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

B1: MOST NETWORK INITIAL TEST 1

NOTE: When connecting the MOST tester, use the 2+0 or 2+4 socket as appropriate and set the connector selector switch to match the socket in use

	1	Switch on the audio/video system
	2	Remove the cover from the MOST diagnostic connector

	3	Set the MOST tester power switch to 'on'
	4	Connect the MOST tester to the MOST diagnostic connector
	5	Check the Touch Screen (TS) for indication of a MOST network fault
	Has the MOST network been restored? **Yes** The MOST diagnostic connector cover is causing the MOST network fault. GO to B2 . **No** The MOST diagnostic connector cover is not causing the MOST network fault. GO to B3 .	
B2: MOST NETWORK INITIAL TEST 2		
	1	Disconnect the MOST tester
	2	Install the cover to the MOST diagnostic connector
	Has the MOST network been restored? **Yes** No further action required **No** Install a new MOST diagnostic connector cover	
B3: MOST NETWORK INITIAL TEST 3		
	1	Check the MOST tester beep/LED
	Did the MOST tester emit a tone or illuminate the LED? **Yes** MOST signal received. The MOST network fault is located downstream of the MOST tester. GO to Pinpoint Test E. **No** MOST signal not received. The MOST network fault is located upstream of the MOST tester. Disconnect the MOST harness connector from the MOST tester and reconnect it to the control module. GO to Pinpoint Test C.	

PINPOINT TEST C : MOST NETWORK UPSTREAM TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS	
C1: MOST NETWORK UPSTREAM TEST 1		
	1	Refer to the electrical circuit diagrams and identify the preceding control module on the MOST network
	Is this control module the Touch Screen (TS)? **Yes** GO to Pinpoint Test F. **No** GO to C2 .	
C2: MOST NETWORK UPSTREAM TEST 2		
	1	Disconnect the MOST harness connector from the control module
	2	Direct the MOST harness connector at a suitable surface and check for the presence of red light
	Is red light present? **Yes** The MOST network fault is in the control module or the MOST harness to the succeeding control module. GO to C3 . **No** The MOST network fault is located upstream of the disconnected control module. Reconnect the MOST harness connector to the control module. GO to C1 .	
C3: MOST NETWORK UPSTREAM TEST 3		
NOTE: When connecting the MOST tester, use the 2+0 or 2+4 socket as appropriate and set the connector selector switch to match the socket in use		
	1	Connect the MOST harness connector to the MOST tester
	2	Check the Touch Screen (TS) for indication of a MOST network fault
	Has the MOST network been restored? **Yes** The disconnected control module is causing the MOST network fault. GO to Pinpoint Test D. **No** The fault is in the MOST harness between the MOST tester and the succeeding control module. Install a new MOST harness as necessary	

PINPOINT TEST D : CONTROL MODULE TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: CONTROL MODULE TEST 1	
NOTES: When connecting the MOST tester, use the 2+0 or 2+4 socket as appropriate and set the connector selector switch to match the socket in use	

The MOST tester may continue to emit a tone or illuminate the LED after the test switch is released. This does not indicate a fault.

	1	Connect the MOST tester to the relevant control module using the adapter harness
	2	Operate the test switch and check the MOST tester beep/LED
	Did the MOST tester emit a tone or illuminate the LED? **Yes** MOST signal received. Tests inconclusive. Reconnect the MOST harness connector to the control module and confirm that the MOST network fault is still present. Repeat the tests from the beginning. GO to Pinpoint Test B. **No** GO to D2 .	

D2: CONTROL MODULE TEST 2		
	1	Refer to the electrical circuit diagrams and check the relevant control module power and ground circuits for open circuit, high resistance
	Are the power and ground circuits within specification? **Yes** GO to D3 . **No** Repair the power and/or ground circuit	

D3: CONTROL MODULE TEST 3		
	1	Reconnect the MOST harness to the control module
	2	Check the Touch Screen (TS) for indication of a MOST network fault
	Has the MOST network been restored? **Yes** Tests inconclusive. Repeat the tests from the beginning. GO to Pinpoint Test B. **No** Install a new control module	

PINPOINT TEST E : MOST NETWORK FINAL DOWNSTREAM TEST

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

E1: MOST NETWORK FINAL DOWNSTREAM TEST 1

NOTES:

When connecting the MOST tester, use the 2+0 or 2+4 socket as appropriate and set the connector selector switch to match the socket in use

The MOST tester may continue to emit a tone or illuminate the LED after the test switch is released. This does not indicate a fault.

	1	Disconnect the MOST tester from the MOST diagnostic connector
	2	Install the cover to the MOST diagnostic connector
	3	Disconnect the MOST harness connector from the Touch Screen (TS)
	4	Connect the MOST harness connector to the MOST tester
	5	Operate the test switch and check the MOST tester beep/LED
	Did the MOST tester emit a tone or illuminate the LED? **Yes** GO to E2 . **No** The fault is in the harness between the MOST diagnostic connector and the Touch Screen (TS). Install a new MOST harness as necessary	

E2: MOST NETWORK FINAL DOWNSTREAM TEST 2

	1	Disconnect the MOST harness connector from the MOST tester
	2	Reconnect the MOST harness connector to the Touch Screen (TS)
	3	Check the Touch Screen (TS) for indication of a MOST network fault
	Has the MOST network been restored? **Yes** Tests inconclusive. Repeat the tests from the beginning. GO to Pinpoint Test B. **No** GO to Pinpoint Test G.	

PINPOINT TEST F : MOST NETWORK FINAL UPSTREAM TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

F1: MOST NETWORK FINAL UPSTREAM TEST 1

	1	Disconnect the MOST harness connector from the Touch Screen (TS)

	2 Direct the Touch Screen (TS) at a suitable surface and check for the presence of red light
	Is red light present? **Yes** The fault is in the MOST harness between the Touch Screen (TS) and the Integrated Audio Module (IAM). Install a new MOST harness as necessary **No** GO to Pinpoint Test G.

PINPOINT TEST G : TOUCH SCREEN (TS) TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
G1: TOUCH SCREEN (TS) TEST 1	
	1 Using the manufacturer approved diagnostic system, check the Touch Screen (TS) for related DTCs
	Is communication possible between the manufacturer approved diagnostic system and the Touch Screen (TS)? **Yes** Refer to the relevant DTC index **No** GO to G2 .
G2: TOUCH SCREEN (TS) TEST 2	
	1 Refer to the electrical circuit diagrams and check the Touch Screen (TS) power and ground circuits for open circuit, high resistance
	Are the power and ground circuits within specification? **Yes** GO to G3 . **No** Repair the power and/or ground circuit
G3: TOUCH SCREEN (TS) TEST 3	
	1 Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the medium speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance
	Is the medium speed CAN bus within specification? **Yes** Install a new Touch Screen (TS) **No** Repair the medium speed CAN bus circuit

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Touch Screen Display (FCDIM) (100-00 General Information, Description and Operation).

System Operation

System Operation

The hinged panels are secured with latches and strikers. A remotely operated central locking system controls the locking and unlocking of the door and luggage compartment latches. A radio frequency Smart Key allows the vehicle to be locked and unlocked by pressing the appropriate handset buttons. Two levels of central locking system are available: remote central locking and an optional passive entry system.

The passive entry and associated passive start system allows the driver to unlock and start the vehicle without using a vehicle key in a door-lock or ignition switch. The passive entry system is an optional fitment while the passive start system is a standard fitment on all vehicles. The passive start system is combined with the passive anti-theft immobilization system.
Refer to: Anti-Theft - Passive (419-01B Anti-Theft - Passive, Description and Operation).

Emergency access to the vehicle is provided by a concealed key barrel located in the front left-hand door handle. The key barrel is concealed by a plastic cover which can be removed by inserting the blade of the emergency key into a slot in the cover. The removable emergency key blade is located in the Smart Key. There is no emergency unlocking key aperture in the luggage compartment lid.

Operation of the key barrel unlocks the vehicle but does not disarm the alarm system. Locking and unlocking conditions using the emergency key in the door key barrel are:

- If the alarm is not armed the vehicle can be centrally unlocked.
- If the alarm is armed the door only can be opened and the alarm will be triggered.
- The vehicle cannot be double locked or the alarm system armed using the emergency key.

The vehicle can be centrally locked and unlocked from inside using the interior handle release levers on the front doors only. The driver can select locking options, single point entry or drive away locking for example, from a menu available on the touch screen.

Central Locking – Radio Frequency Remote System

The radio frequency central locking system provides locking and unlocking from inside the vehicle and outside within a 20 meter range. The system is operated using buttons on the Smart Key, which transmits radio frequency signals to the radio frequency receiver.

Additional buttons on the Smart Key provide for the convenience operation of the headlamp delay, panic alarm and luggage compartment lid release.
Refer to: Body Closures (501-03 Body Closures, Description and Operation).

Depending on vehicle market functions offered by the Jaguar Smart Key include:

- Double locking the doors from outside the vehicle if the lock button on the Smart Key is pressed twice within 3 seconds.
- Drive-away locking - switched on or off by the customer using the vehicle security settings menu available on the touch screen.
- Single or two stage unlocking - single-stage unlocking unlocks all doors with a single press; two-stage unlocking unlocks the driver's door only with a single press and all other doors with a second press.

Changing the unlocking mode between single stage and two stage also affects the unlocking mode for passive entry (see below). The single or two-stage unlocking function can be switched on or off, as can remote global open or close for the electric windows using the vehicle security settings menu available on the touch screen.

Actuated from the front door levers only, the doors can be locked from inside the vehicle by pressing the interior door release levers inwards and unlocked by pulling the levers. The Touch-screen incorporates a valet mode feature which inhibits access to the boot and the glove box while also limiting the use of the Touch-screen.

On leaving the vehicle with passive entry the user must press an external button on the door handle once to centrally lock the vehicle or twice within 3 seconds to double lock. The user has a further 3 seconds to pull the door handle to check the vehicle is locked without the Jaguar Smart Key proximity function unlocking the door again. Pulling the handle after the 3 seconds has lapsed will unlock the door as normal.

If any aperture is not fully closed when the locking process is initiated, either passively or by Jaguar Smart Key transmitter, the locking function will be inhibited and an audible error indication will be given. If the ignition is left on an audible warning will be given if the user exits the vehicle, if the user attempts to lock the vehicle (ignition on), another audible indication will be given, and the locking function will be inhibited.

If the door is closed without locking and no key left in the car the ignition will be switched off immediately. If the ignition is left on at any time without starting the vehicle it will switch off automatically after 60 minutes.

If the door is opened by the mechanical key, the full alarm system will sound until the user enters the vehicle and presses either the start/stop button, remote unlock button, or places the Jaguar Smart Key next to the IAU (immobilizer antenna unit) whilst pressing the start/stop button.

The fuel filler flap is locked by the global locking function. It is not locked by drive-away locking, or if doors are locked from inside the vehicle using the handles.

Passive Entry

On vehicles fitted with the optional passive entry system, the vehicle can be unlocked without the use of a key blade or pressing buttons on the Smart Key. The Smart Key operates the passive entry system in addition to the passive start system.
Refer to: Anti-Theft - Passive (419-01B Anti-Theft - Passive, Description and Operation).

The passive entry system is controlled by the keyless vehicle module and low frequency antennas strategically situated within the vehicle; including one in each door handle. When in the vehicle the antennas ensure the Jaguar Smart Key is always within the active transmission zone of the antennas, wherever the key is placed inside the vehicle. For this reason the orientation and positioning of the antennas is critical to the correct functioning of the system.

When a vehicle door handle is pulled to the first five-percent of its travel and the Smart Key is within one meter of the handle; the Smart Key receives the low-frequency signal transmitted from the keyless vehicle module.

The Smart Key responds with a radio frequency transmission of its authorization code. The radio frequency signal is received by the radio-frequency receiver and passed to the keyless vehicle module which checks and approves the code as valid.

Once the handle is pulled to eighty percent of its travel the keyless vehicle module then drives the fast latch directly to allow the door to be opened. The keyless vehicle module also transmits an unlock request to the CJB (central junction box). The CJB then passes an unlock request to the door modules.

Locking of the vehicle is performed by pressing one of the buttons located on each exterior door handle, with the Smart Key within a one meter range of the vehicle. When the door handle button is pressed, the keyless vehicle module transmits a low-frequency signal via the low-frequency handle antenna to the Smart Key. The Smart Key transmits a radio frequency signal which is verified by the keyless vehicle module and allows the doors to be locked or double locked and the alarm system to be armed.

To double lock the vehicle, the button on the exterior door handle must be pressed twice within three seconds, with the Smart Key within one meter range of the vehicle. If a door, engine-compartment lid or the luggage compartment lid is ajar when an attempt to lock the vehicle is made, an error tone is emitted and no locking action will occur.
Refer to: Anti-Theft - Active (419-01A Anti-Theft - Active, Description and Operation).

When unlocking the vehicle using passive entry with single stage unlocking selected and a valid Jaguar Smart key present, pulling the door handle will centrally unlock the vehicle. When the vehicle is configured for two stage unlocking and the drivers door handle is pulled with a valid smart key present only the drivers door will unlock, however if a passenger door handle is pulled with a valid smart key present the vehicle will centrally unlock. If the boot is unlocked and opened with a valid smart key present all the doors remain locked.

Provided the key is within range of the desired point of entry, approximately one meter from vehicle door or luggage compartment lid, it need only be on the driver's person, for example in a pocket, handbag, or briefcase to provide access to the vehicle. The driver has to pull the door handle, or press the luggage compartment lid release button and the vehicle then unlocks according to the current security setting; either single-stage or two-stage entry.

NOTE: Passive unlocking of the luggage compartment lid does not unlock the rest of the vehicle.

Component Description

Engine Compartment Lid Latches

Two engine-compartment lid latches are located on the front crossmember. An engine-compartment lid release lever is located below the instrument panel on the left-hand 'A' pillar and is connected with a cable to the latches. An engine-compartment lid ajar switch is integrated in the engine-compartment lid latch.

Door Latches

The door latches are located at the rear of each door and engage with a striker on the adjacent pillar. Each door latch motor assembly contains micro-switches for lock, unlock and door ajar. Motors provide for the central door locking and the double locking feature. The electrical control for the door latch components is provided by the CJB via the driver's and passenger door modules.

When the latch engages with the striker plate a signal transmitted from the latch actuator mechanism to the door module confirms the latch is engaged. The module activates the closing motor to pull the latch closed through the last 6 mm of travel. A mechanical cable connection between the motor and latch assembly is used to complete the closing process.

The interior door handles are connected by a cable to the latch release mechanisms. The interior door handles also incorporate a locking facility to allow the doors to be locked from inside the vehicle when all the doors are closed. If a door is ajar the locking feature is inhibited.

Luggage Compartment Lid Latch

Luggage compartment lid; refer to:
Refer to: Body Closures (501-03 Body Closures, Description and Operation).
(501-03 Body Closures, Luggage Compartment Lid, Description and Operation).

Fuel Filler Door

The fuel filler door is electrically locked by a motor located on the fuel door housing. The filler flap will only be locked closed when the vehicle is centrally locked.

Handles, Locks, Latches and Entry Systems - Locks, Latches and Entry Systems

Diagnosis and Testing

Principle of Operation

For a detailed description of the locks, latches and entry systems and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Handles, Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

1. Verify the customer concern, to be sure the correct issue is investigated
2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
• Incorrectly aligned door(s), hood or tailgate • Fuel filler door lock actuator • Hood release handle • Hood release cables • Hood latch(es) • Exterior door handle(s) • Interior door handle(s) • Cable(s) • Tailgate release switch • Rear window release switch	• Fuses • Wiring harness • Wiring connector(s) • Door lock actuator(s) • Remote transmitter (key-fob or smart key) • Central locking switches • Controller Area Network (CAN) circuits • Radio frequency (RF) receiver • Central junction box (CJB) • Loose or corroded connections

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the cause is not visually evident verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index

Symptom Chart

NOTE: **Complete the diagnostic steps below to confirm any concern prior to replacing any component**

Symptom	Possible Causes	Action
The message center indicates that the hood, the luggage compartment is open		

when it appears to be closed Vehicle indicates a miss-lock when the hood, luggage compartment appear to be closed	• Incorrect striker alignment/adjustment • Ajar switch circuit short circuit to ground • Ajar switch failure	• Check/adjust the strikers as necessary • Check for DTCs indicating an ajar switch fault. Refer to the DTC index
Fuel flap does not lock/unlock	• Fuel flap cable detached from body • Fuel flap actuator detached from mounting bracket • Fuel flap actuator disconnected • Fuel flap actuator failure	• Check the condition and installation of the fuel flap cable • Check the security of the fuel flap actuator and bracket • Check the security of the actuator electrical connector • Check for DTCs indicating a fuel flap actuator fault. Refer to the DTC index
Door(s) will not unlatch/open when using outside door handle	• Exterior door handle condition/installation • Exterior release cable disconnected from exterior door handle or door latch	• Check the exterior door handle condition and installation • Check the condition and security of the exterior release cable • **Single door will not open from the outside (but opens from the inside)** GO to Pinpoint Test A.
Door(s) will not unlatch/open when using inside door handle	• Child lock(s) engaged • Interior door handle condition/installation • Interior release cable disconnected from interior door handle or door latch	• Check that the child locks are disengaged • Check the interior door handle condition and installation • Check the condition and security of the interior release cable • **Single Door Will Not Open From The Inside (but opens from the outside)** GO to Pinpoint Test B.
Door(s) will not lock/unlock from key fob, key or internal lock switch	• Wiring harness/connectors • Central junction box (CJB) • Door lock switch • Cable fault	• Check for relevant stored DTCs • Using the manufacturer approved diagnostic system run application - Inline diagnostic unit 2 diagnostic test - Door latch (C1Latch) • Once any DTC related faults have been rectified continue with the diagnostic steps below • **No lock / unlock function from key-fob** GO to Pinpoint Test C.
Door ajar or miss lock signal at message centre when door(s) are closed or alarm triggering	• Wiring harness • Instrument cluster • Incorrect striker alignment/adjustment • Ajar switch circuit short circuit to ground • Ajar switch failure	• **Latch Mounted Door Ajar Switch Test** GO to Pinpoint Test D.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Communications Network (418-00 Module Communications Network, Diagnosis and Testing) / Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Diagnosis and Testing).

Pinpoint Test

PINPOINT TEST A : SINGLE DOOR WILL NOT OPEN FROM THE OUTSIDE (BUT OPENS FROM THE INSIDE)	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: CHECK THE EXTERIOR DOOR RELEASE CABLE TO EXTERIOR DOOR HANDLE IS INSTALLED CORRECTLY	
	1 Remove the door trim panel as necessary

	2 Confirm the exterior door release cable is correctly installed to the exterior door handle
	Is the cable correctly installed? **Yes** GO to A2 . **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation

A2: CHECK THE EXTERIOR DOOR HANDLE RELEASE CONNECTION TO THE DOOR LATCH

	1 Confirm the exterior door handle release connection to the door latch is installed correctly
	Is the exterior door handle release cable installed correctly? **Yes** GO to Pinpoint Test C. **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation

PINPOINT TEST B : SINGLE DOOR WILL NOT OPEN FROM THE INSIDE (BUT OPENS FROM THE OUTSIDE)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CHECK THE INTERIOR DOOR RELEASE CABLE TO INTERIOR DOOR HANDLE IS INSTALLED CORRECTLY	
	NOTE: Figure A - Child lock off position shown 1 Make sure the child lock is disengaged (rear door only)

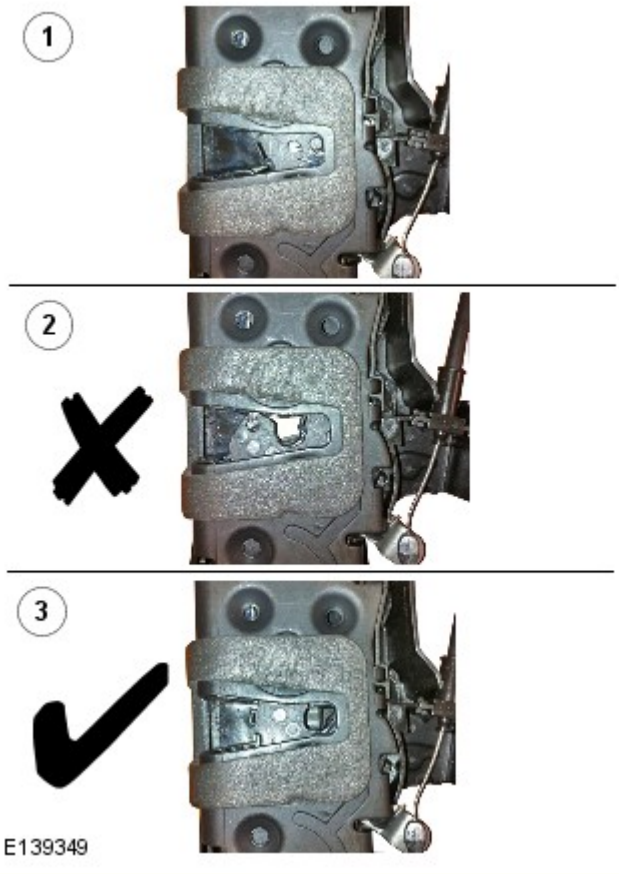
 E150684	
 E150685	2 Remove the door trim panel as necessary
	3 Confirm the interior door release cable is correctly installed to the interior door handle
	Is the cable correctly installed? **Yes** GO to B2 . **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation
B2: CHECK THE INTERIOR DOOR HANDLE RELEASE CONNECTION TO THE DOOR LATCH	
	1 Confirm the interior door handle release connection to the door latch is installed correctly

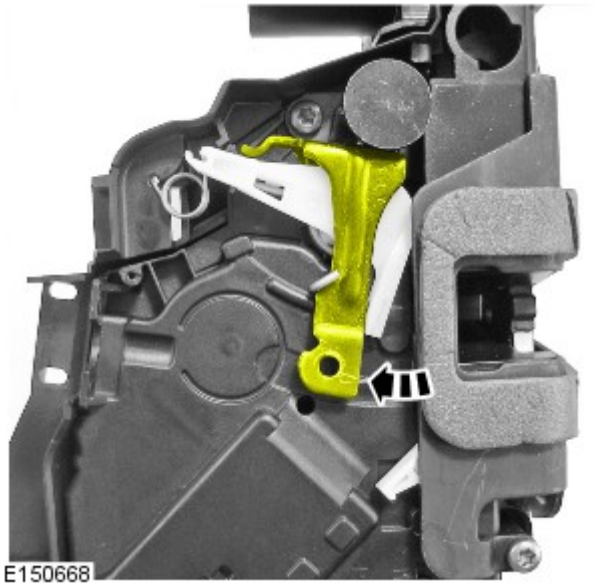
	Is the interior door handle release cable installed correctly? **Yes** GO to Pinpoint Test C. **No** Connect the door release cable correctly. **If the cable is damaged, install a new door release cable** . Test the system for normal operation

PINPOINT TEST C : DOOR LATCHING AND LOCKING FUNCTION TEST

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: HARNESS CONNECTION	
NOTE: Test as a single component to ensure that the door latch is not replaced unnecessarily, when another component may be at fault	
	1 Remove the door trim panel as necessary
	2 Disconnect harness from latch, check for corrosion or damage to both connectors at socket points and pins. Re-connect harness ensuring robust assembly when all parts confirmed to be in good order. If harness or latch connectors are damaged, install new harness/latch as necessary. Test the system for normal operation
	Check for normal operation, does latch function correctly? **Yes** Re-assemble door trim and test for normal operation **No** GO to C2 .
C2: LOCK COMMAND SIGNAL FROM VEHICLE HARNESS	
	1 Close all vehicle doors apart from door being investigated, please note which door, left side or right side is under investigation

 E139357	
	2 Disconnect harness from latch to enable access to socket points to carry-out conductivity testing as detailed
	3 Monitor the circuit for momentary power when locking the vehicle via the key-fob or smart key between terminals **5 and 7 left side** or **5 and 7 right side**
	Is there momentary power (for approx 8 seconds) between terminals **5 and 7 left side** or **5 and 7 right side** when locking the vehicle via the key-fob or smart key **Yes** The vehicle electrical system is locking correctly, providing the signal to the latch GO to C3 . **No** Refer to the electrical circuit diagrams and investigate why vehicle electrical system is not providing signals to the latch. Using the manufacturer approved diagnostic system check for logged DTCs to localize the fault
C3: UNLOCK COMMAND SIGNAL FROM VEHICLE HARNESS	
	1 Monitor the circuit for momentary power when unlocking the vehicle via the key-fob or smart key between terminals **5 and 7 left side** or **5 and 7 right side**
	Is there momentary power (for approx 8 seconds) between terminals **5 and 7 left side** and **5 and 7 right side** when unlocking the vehicle via the key-fob or smart key? **Yes** The vehicle electrical system is unlocking correctly, providing the signal to the latch GO to C4 . **No** Refer to the electrical circuit diagrams and investigate why vehicle electrical system is not providing signals to the latch. Using the manufacturer approved diagnostic system check for logged DTCs to localize the fault
C4: PHYSICAL TEST 1	
	1 Remove latch module from door
	2 Inspect latch module for any visual damage
	3 With the latch in hand, connect the electrical connector(s) to connect door latch to door harness
	NOTE: THE LATCH IS NOW READY TO TEST 4 Close all vehicle doors except the door being investigated
	NOTES: Figure 1 - Unlatched position shown Figure 2 - First safety latched position shown Figure 3 - Fully latched position shown Test will not work if latch is only in first safety latch position 5 Rotate latch claw (using a small screw driver or similar), to the fully latched position (figure 3)



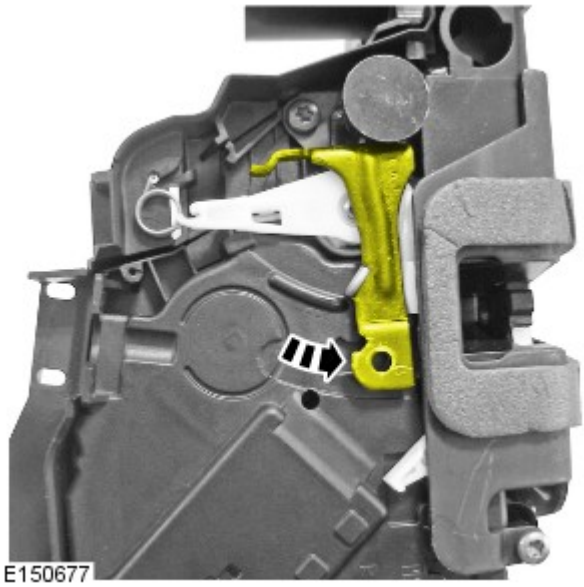


NOTE: Unlocked position shown

6 Confirm that the latch interior release lever is in the unlocked position as shown

NOTE: Locked position shown

7 Press the **lock** button on the key-fob or smart key



Does the latch interior release lever move from the unlocked position to the locked position?

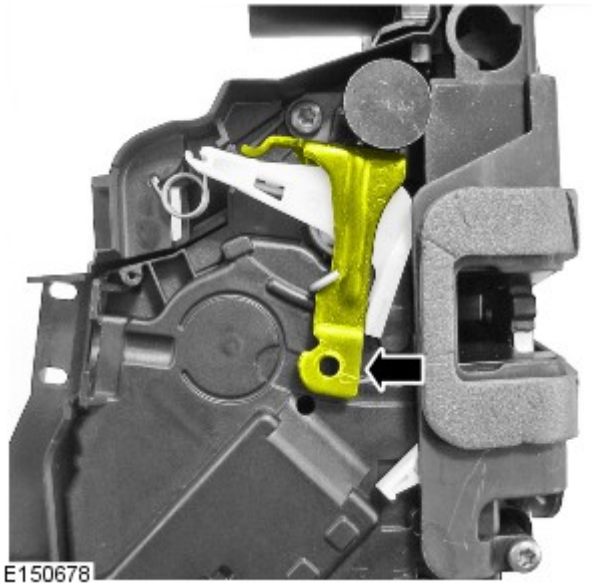
Yes

GO to C5 .

No

If this is a repeat test and the vehicle electrical test section has been completed and confirmed that vehicle is working correctly, then replace the door latch. If replacing latch as part of a warranty claim, please quote reference code **LKINOP** in the technician comments section of the warranty claim

C5: PHYSICAL TEST 2



NOTE: Unlocked position shown

1 With the latch in the locked state (i.e. the latch interior release lever is in the locked position), press the key-fob or smart key **unlock** button

Does the latch interior release lever move from the locked position to the unlocked position?

Yes

GO to C6 .

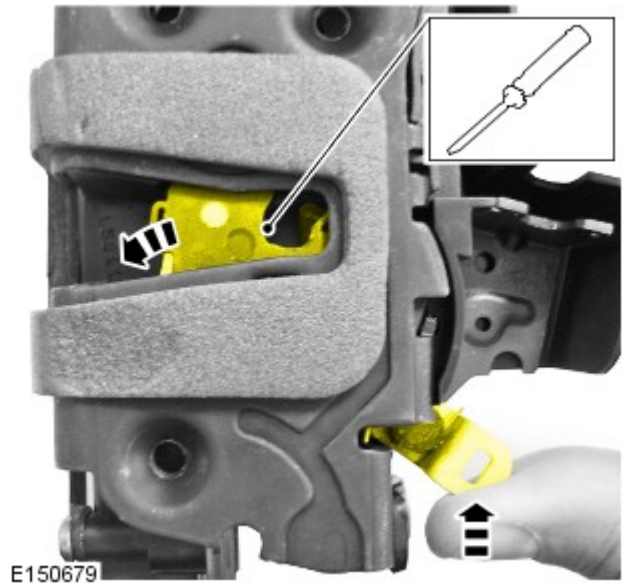
No

If this is a repeat test and the vehicle electrical test section has been completed and confirmed that vehicle is working correctly, then replace the door latch. If replacing latch as part of a warranty claim, please quote reference code **LKINOP** in the technician comments section of the warranty claim

C6: PHYSICAL TEST 3

NOTE: Fully latched position shown

1



1 With the latch in its unlocked state, push the latch exterior release lever against its return spring, whilst simultaneously applying a light pressure to release the latch claw using a small screw driver or similar

Does the latch claw release?

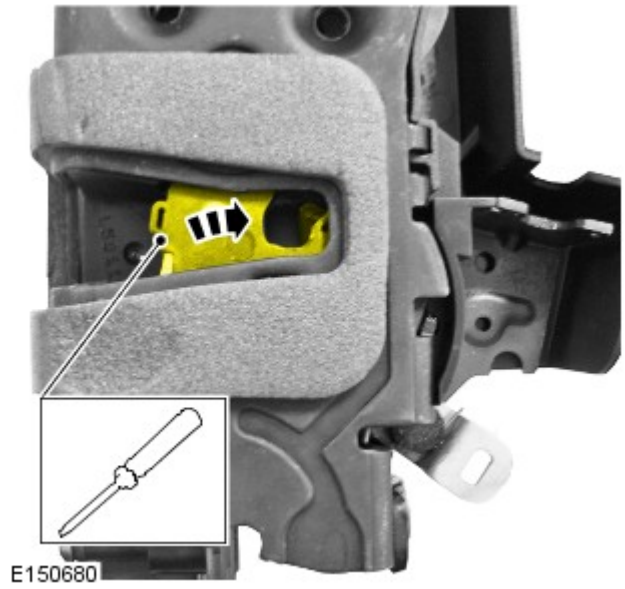
Yes

GO to C7 .

No

Repeat tests **C5** and **C6** to confirm the fault GO to C5 . If the repeat test has confirmed that the exterior release lever will not release the claw on an unlocked latch replace the door latch. If replacing latch as part of a warranty claim, please quote reference code **EXTINOP** in the technician comments section of the warranty claim

C7: PHYSICAL TEST 4

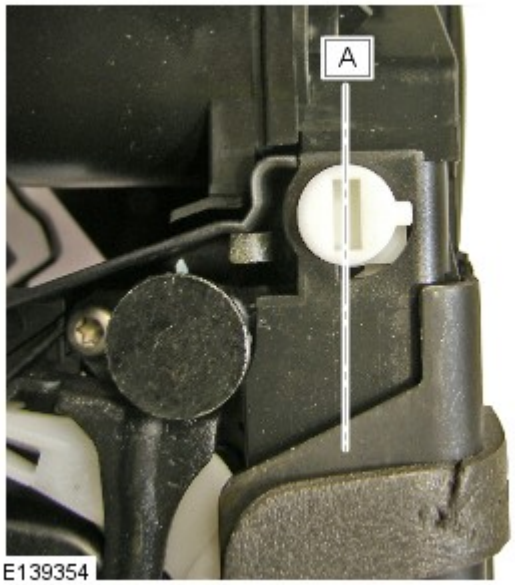


NOTE: Fully latched position shown

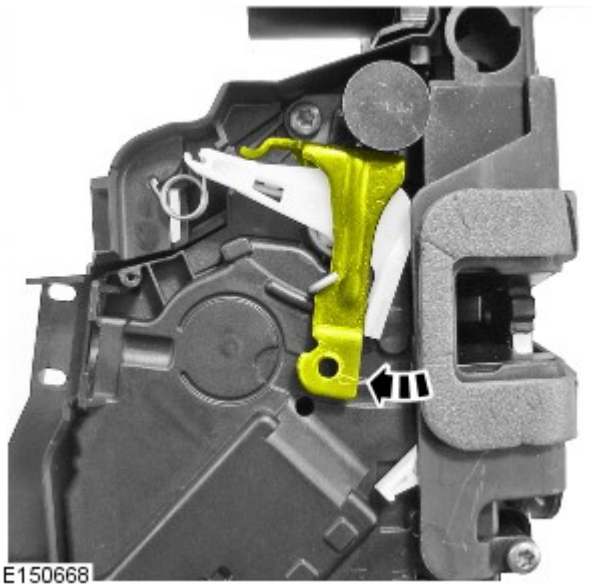
1 Using a small screw driver or similar, rotate latch claw to the second fully latched position

NOTE: Figure A - Child lock off position shown

2 If testing a rear door latch, ensure that the child lock is turned to the off position



E139354



E150668

NOTE: Unlocked position shown

3 Confirm that the latch interior release lever is in the unlocked position as shown

E139355

4 Whilst the latch is still in its unlocked state, push the latch interior release lever against its return spring, whilst simultaneously applying a light pressure to release the latch claw using a small screw driver or similar

Does the latch claw release?

Yes

	Latch has passed all tests to confirm its correct function. **DO NOT REPLACE LATCH** as part of any attempts to resolve any locking functionality issues
	No Repeat test GO to C7 . If repeat test has confirmed that the interior release lever will not release the claw when the latch is in the unlocked state, then replace the latch. If replacing latch as part of a warranty claim, please quote reference code **INTINOP** in the technician comments section of the warranty claim

PINPOINT TEST D : LATCH MOUNTED DOOR AJAR SWITCH TEST

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: TEST 4 DOOR LATCH	
NOTES: If a customer is complaining of issues relating to a door ajar signal e.g. door latch won't lock, or alarm system triggering (indicated via DTC's), there may be several components that generate the fault, including • Body wiring harness / connectors • Door wiring harness / connectors • Alarm control module • Central junction box (CJB) • Door Latch ajar switch	
To investigate the functioning of the door ajar switch contained within the door latch, to prove or eliminate the door latch mounted door ajar switch as the root cause, follow the process below. This will prevent the unnecessary replacement of a correctly functioning door latch	
	1 Remove door trim from door
	2 Disconnect door harness from latch for access to connector pins for latch electrical testing
	3 Inspect latch module for any visual damage
	NOTES: Figure 1 - Unlatched position shown Figure 2 - First safety latched position shown Figure 3 - Fully latched position shown **Test will not work if latch is only in first safety latch position** 4 Using a small screw driver or similar, rotate latch claw to the second fully latched position (figure 3)
	5 Carry out continuity test between terminals **1 and 4 (left side)** or **8 and 4 (right side)** with claw closed

 E139356	
	Does the continuity test pass? **Yes** The latch ajar switch is working correctly. **Do not replace latch** . Investigate for fault elsewhere in vehicle system **No** Release latch claw and repeat test from step 4 to confirm result. If this is a repeat test and you are sure that the ajar switch does not provide continuity when fully latched. Replace the latch. If replacing latch as part of a warranty claim, please quote reference code **AJARINOP** in the technician comments section of the warranty claim

17	Door handle, lock/unlock switch and antenna - LH front

System Operation

System Operation

The hinged panels are secured with latches and strikers. A remotely operated central locking system controls the locking and unlocking of the door and luggage compartment latches. A radio frequency Smart Key allows the vehicle to be locked and unlocked by pressing the appropriate handset buttons. Two levels of central locking system are available: remote central locking and an optional passive entry system.

The passive entry and associated passive start system allows the driver to unlock and start the vehicle without using a vehicle key in a door-lock or ignition switch. The passive entry system is an optional fitment while the passive start system is a standard fitment on all vehicles. The passive start system is combined with the passive anti-theft immobilization system.
Refer to: Anti-Theft - Passive (419-01B Anti-Theft - Passive, Description and Operation).

Emergency access to the vehicle is provided by a concealed key barrel located in the front left-hand door handle. The key barrel is concealed by a plastic cover which can be removed by inserting the blade of the emergency key into a slot in the cover. The removable emergency key blade is located in the Smart Key. There is no emergency unlocking key aperture in the luggage compartment lid.

Operation of the key barrel unlocks the vehicle but does not disarm the alarm system. Locking and unlocking conditions using the emergency key in the door key barrel are:

- If the alarm is not armed the vehicle can be centrally unlocked.
- If the alarm is armed the door only can be opened and the alarm will be triggered.
- The vehicle cannot be double locked or the alarm system armed using the emergency key.

The vehicle can be centrally locked and unlocked from inside using the interior handle release levers on the front doors only. The driver can select locking options, single point entry or drive away locking for example, from a menu available on the touch screen.

Central Locking – Radio Frequency Remote System

The radio frequency central locking system provides locking and unlocking from inside the vehicle and outside within a 20 meter range. The system is operated using buttons on the Smart Key, which transmits radio frequency signals to the radio frequency receiver.

Additional buttons on the Smart Key provide for the convenience operation of the headlamp delay, panic alarm and luggage compartment lid release.
Refer to: Body Closures (501-03 Body Closures, Description and Operation).

Depending on vehicle market functions offered by the Jaguar Smart Key include:

- Double locking the doors from outside the vehicle if the lock button on the Smart Key is pressed twice within 3 seconds.
- Drive-away locking - switched on or off by the customer using the vehicle security settings menu available on the touch screen.
- Single or two stage unlocking - single-stage unlocking unlocks all doors with a single press; two-stage unlocking unlocks the driver's door only with a single press and all other doors with a second press.

Changing the unlocking mode between single stage and two stage also affects the unlocking mode for passive entry (see below). The single or two-stage unlocking function can be switched on or off, as can remote global open or close for the electric windows using the vehicle security settings menu available on the touch screen.

Actuated from the front door levers only, the doors can be locked from inside the vehicle by pressing the interior door release levers inwards and unlocked by pulling the levers. The Touch-screen incorporates a valet mode feature which inhibits access to the boot and the glove box while also limiting the use of the Touch-screen.

On leaving the vehicle with passive entry the user must press an external button on the door handle once to centrally lock the vehicle or twice within 3 seconds to double lock. The user has a further 3 seconds to pull the door handle to check the vehicle is locked without the Jaguar Smart Key proximity function unlocking the door again. Pulling the handle after the 3 seconds has lapsed will unlock the door as normal.

If any aperture is not fully closed when the locking process is initiated, either passively or by Jaguar Smart Key transmitter, the locking function will be inhibited and an audible error indication will be given. If the ignition is left on an audible warning will be given if the user exits the vehicle, if the user attempts to lock the vehicle (ignition on), another audible indication will be given, and the locking function will be inhibited.

If the door is closed without locking and no key left in the car the ignition will be switched off immediately. If the ignition is left on at any time without starting the vehicle it will switch off automatically after 60 minutes.

If the door is opened by the mechanical key, the full alarm system will sound until the user enters the vehicle and presses either the start/stop button, remote unlock button, or places the Jaguar Smart Key next to the IAU (immobilizer antenna unit) whilst pressing the start/stop button.

The fuel filler flap is locked by the global locking function. It is not locked by drive-away locking, or if doors are locked from inside the vehicle using the handles.

Passive Entry

On vehicles fitted with the optional passive entry system, the vehicle can be unlocked without the use of a key blade or pressing buttons on the Smart Key. The Smart Key operates the passive entry system in addition to the passive start system.
Refer to: Anti-Theft - Passive (419-01B Anti-Theft - Passive, Description and Operation).

The passive entry system is controlled by the keyless vehicle module and low frequency antennas strategically situated within the vehicle; including one in each door handle. When in the vehicle the antennas ensure the Jaguar Smart Key is always within the active transmission zone of the antennas, wherever the key is placed inside the vehicle. For this reason the orientation and positioning of the antennas is critical to the correct functioning of the system.

When a vehicle door handle is pulled to the first five-percent of its travel and the Smart Key is within one meter of the handle; the Smart Key receives the low-frequency signal transmitted from the keyless vehicle module.

The Smart Key responds with a radio frequency transmission of its authorization code. The radio frequency signal is received by the radio-frequency receiver and passed to the keyless vehicle module which checks and approves the code as valid.

Once the handle is pulled to eighty percent of its travel the keyless vehicle module then drives the fast latch directly to allow the door to be opened. The keyless vehicle module also transmits an unlock request to the CJB (central junction box). The CJB then passes an unlock request to the door modules.

Locking of the vehicle is performed by pressing one of the buttons located on each exterior door handle, with the Smart Key within a one meter range of the vehicle. When the door handle button is pressed, the keyless vehicle module transmits a low-frequency signal via the low-frequency handle antenna to the Smart Key. The Smart Key transmits a radio frequency signal which is verified by the keyless vehicle module and allows the doors to be locked or double locked and the alarm system to be armed.

To double lock the vehicle, the button on the exterior door handle must be pressed twice within three seconds, with the Smart Key within one meter range of the vehicle. If a door, engine-compartment lid or the luggage compartment lid is ajar when an attempt to lock the vehicle is made, an error tone is emitted and no locking action will occur.
Refer to: Anti-Theft - Active (419-01A Anti-Theft - Active, Description and Operation).

When unlocking the vehicle using passive entry with single stage unlocking selected and a valid Jaguar Smart key present, pulling the door handle will centrally unlock the vehicle. When the vehicle is configured for two stage unlocking and the drivers door handle is pulled with a valid smart key present only the drivers door will unlock, however if a passenger door handle is pulled with a valid smart key present the vehicle will centrally unlock. If the boot is unlocked and opened with a valid smart key present all the doors remain locked.

Provided the key is within range of the desired point of entry, approximately one meter from vehicle door or luggage compartment lid, it need only be on the driver's person, for example in a pocket, handbag, or briefcase to provide access to the vehicle. The driver has to pull the door handle, or press the luggage compartment lid release button and the vehicle then unlocks according to the current security setting; either single-stage or two-stage entry.

NOTE: Passive unlocking of the luggage compartment lid does not unlock the rest of the vehicle.

Component Description

Engine Compartment Lid Latches

Two engine-compartment lid latches are located on the front crossmember. An engine-compartment lid release lever is located below the instrument panel on the left-hand 'A' pillar and is connected with a cable to the latches. An engine-compartment lid ajar switch is integrated in the engine-compartment lid latch.

Door Latches

The door latches are located at the rear of each door and engage with a striker on the adjacent pillar. Each door latch motor assembly contains micro-switches for lock, unlock and door ajar. Motors provide for the central door locking and the double locking feature. The electrical control for the door latch components is provided by the CJB via the driver's and passenger door modules.

When the latch engages with the striker plate a signal transmitted from the latch actuator mechanism to the door module confirms the latch is engaged. The module activates the closing motor to pull the latch closed through the last 6 mm of travel. A mechanical cable connection between the motor and latch assembly is used to complete the closing process.

The interior door handles are connected by a cable to the latch release mechanisms. The interior door handles also incorporate a locking facility to allow the doors to be locked from inside the vehicle when all the doors are closed. If a door is ajar the locking feature is inhibited.

Luggage Compartment Lid Latch

Luggage compartment lid; refer to:
Refer to: Body Closures (501-03 Body Closures, Description and Operation).
(501-03 Body Closures, Luggage Compartment Lid, Description and Operation).

Fuel Filler Door

The fuel filler door is electrically locked by a motor located on the fuel door housing. The filler flap will only be locked closed when the vehicle is centrally locked.

System Operation

Passive Start System

Upon receiving the 'start button pressed' hardwired signal, the CJB sends a message via the medium speed CAN (controller area network) bus to the KVM initiating the vehicle starting process.

The KVM then energizes the low frequency antennas within the vehicle cabin which transmit a 125KHz signal to the Jaguar Smart Key, upon receipt of the LF signal the Jaguar Smart Key transmits either a 433 MHz or a 315 MHz RF signal containing the authorisation code to the RF receiver.

The RF receiver relays the code, via a serial communication line, to the KVM which then checks and approves the code as valid. The KVM will only respond to a valid Jaguar Smart Key.

The KVM continues the passive start process by communicating a 'Jaguar Smart Key valid' signal to the CJB via the medium speed CAN bus, Once the CJB receives the Jaguar Smart Key authorisation it confirms the response matches with an internal calculation.

Before the CJB sends a mobilisation signal to the ECM , via the high speed CAN bus, it will exchange encrypted data with following components:

- The instrument cluster via the high speed CAN bus,
- The steering column lock via the high speed CAN bus, to authorise unlocking the steering column. The steering column unlocking function is powered by the CJB and grounded via the instrument cluster

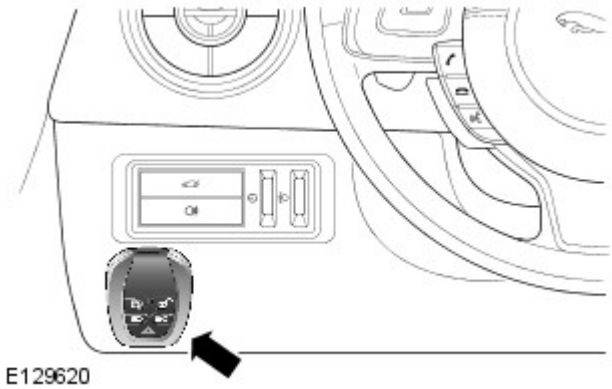
When the CJB receives a hardwired Park/Neutral signal from the JaguarDrive Selector, a high speed CAN bus message from the ABS module and a simultaneous start/stop switch signal it interprets this as an engine crank request. Before the engine crank request is processed, the CJB verifies the brake pressure signal received from the ABS module. If the signal is greater than the stored threshold value, a crank request signal is sent to the ECM on the high speed CAN bus.

NOTE: If the KVM fails to locate the Smart Key, a message 'SMART KEY NOT FOUND REFER TO HANDBOOK' will appear in the instrument cluster message center and the keyless start back-up process will have to be used to mobilize and start the vehicle.

To ensure optimum long term reliability of the smart key the battery must be replaced with a brand new, unused battery. If a used battery is installed the "SMART KEY BATTERY LOW" message may not be cleared. To avoid contamination of the contacts the battery should be removed from its packaging and installed into the smart key while wearing gloves. To confirm that the replacement battery is working correctly press the unlock button twice while holding the smart key outside the vehicle, then enter the vehicle with the smart key, press the start button and confirm that the "SMART KEY BATTERY LOW" message is not displayed.

Keyless Start Back-up

If the vehicle has been unlocked using the emergency key blade or the Smart Key is not detected by the vehicle, it will be necessary to use the keyless start back-up system to disarm the alarm and start the engine. The following process must be followed in this event:

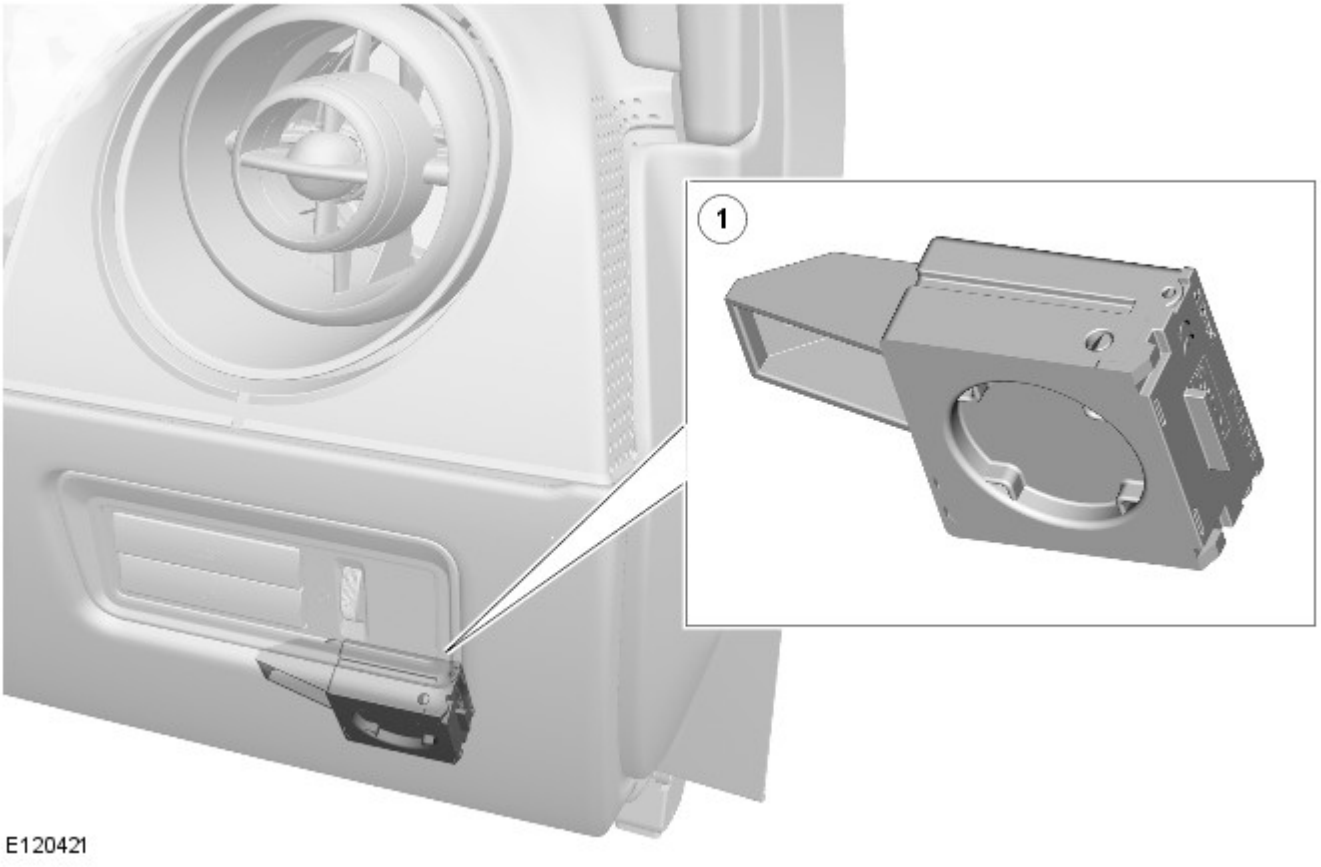


- Position the Smart Key against the underside of the instrument panel, on the outboard side of the steering column, with the buttons facing downwards. This is the location of the IAU.
- Holding the Smart Key in position and with the brake pedal depressed, press the start/stop button to start the engine.

This process bypasses the data exchange between the KVM and the CJB . A transponder within the Smart Key is detected by the IAU. The IAU confirms the code output from the transponder and communicates this code confirmation with the CJB via a LIN (local interconnect network) bus connection. The CJB then initiates the vehicle start process in the normal manner.

Component Description

Immobilizer Antenna Unit (IAU)

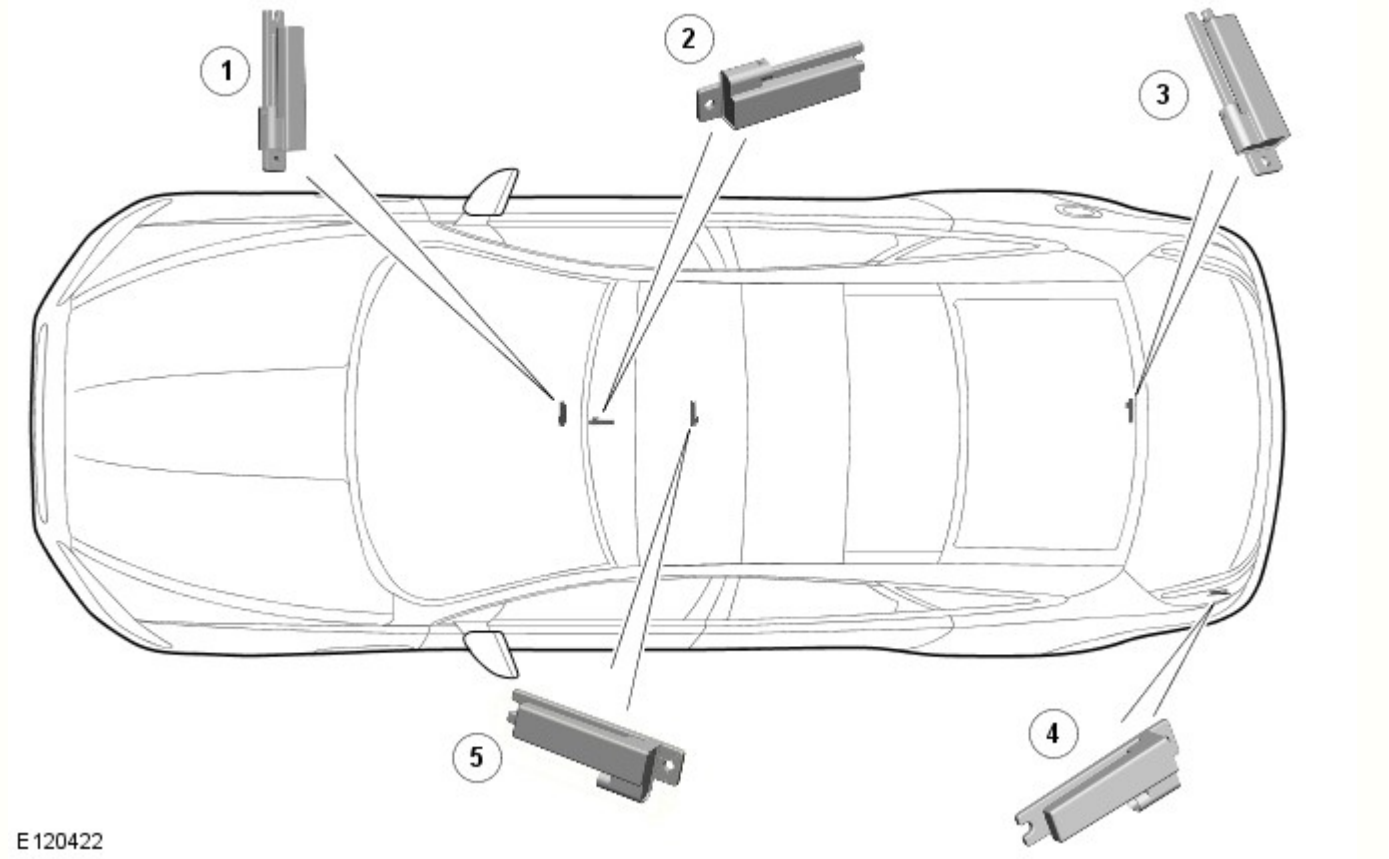


Item	Description
1	IAU

The IAU is located on the driver's side behind the instrument panel just below the auxiliary lighting switch. The IAU cannot be seen as it is located behind the trim panel. The IAU is used if the KVM is unable to authorize the Smart Key. The driver will be alerted to this by a chime and a message in the instrument cluster message center 'SMART KEY NOT FOUND REFER TO HANDBOOK'.

If the KVM is unable to identify the Smart Key, for example if the Smart Key battery voltage is low or there is local RF interference, the transponder within the Smart Key can be read by holding the smart key against then instrument panel.

Low Frequency Antenna



Item	Description
1	Interior antenna - front compartment
2	Interior antenna - front compartment
3	Interior antenna - rear compartment
4	Interior antenna LH (left-hand) - luggage compartment
5	Interior antenna - center compartment

Five Low Frequency (LF) antennae for the passive start system are positioned in specific locations within the vehicle.

The KVM transmits an LF signal via the antennas which is received by the Smart Key. The Smart Key then responds by transmitting a RF signal which is received by the RF receiver and passed to the KVM for authorization.

Keyless Vehicle Module

The keyless vehicle module controls signal transmissions to and from the Smart Key and provides authorization to allow the vehicle to be started. The module has a medium speed CAN connection to the CJB for authorizing vehicle starting.

Radio Frequency Receiver

The Radio Frequency (RF) receiver transmission is received from the Smart Key to enable key identification.

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

Roof Opening Panel - Motor Synchronization

General Procedures

1. CAUTIONS:

Make sure that the ambient temperature is above 5°C and below 40°C before carrying out this procedure.

Make sure that the gear selector is in the P position.

- Set the ignition to the ON position.
- Start the engine.
- Press and hold the front of the switch, hold down until the roof opening panel is fully closed.

2.
- Press and hold the front of the roof opening panel switch.
- After approximately 45 seconds the roof opening panel will begin to move. Keep the front of the switch pressed until the roof opening panel and the roof blinds have fully opened, then closed.

3.
- Once the open/close cycle has completed and the roof opening panel has stopped moving, release the switch.
- The roof opening panel is now synchronized.
- The roof opening panel can now be operated as normal.

4.
- Turn off the engine.
- Set the ignition to the OFF position.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

Glass, Frames and Mechanisms - Windshield Glass

Removal and Installation

Removal

CAUTIONS:

Always protect paintwork and glass when removing exterior components.

Always protect the interior components when removing body glass.

Lay the glass on felt covered supports. Do not stand on edge as this can cause chips which subsequently develop into cracks.

NOTES:

The following equipment is required: l Cutting wire and handles l Kent knife l Glazing knife l Windshield replacement kit l Sealant applicator gun l Suction cups l A felt covered table or stand to support glass

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Cowl Vent Screen (501-02 Front End Body Panels, Removal and Installation).

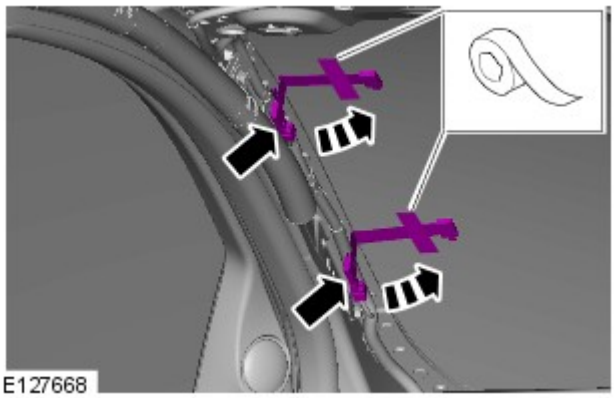
2. NOTE: The procedure must be carried out on both sides.

Refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

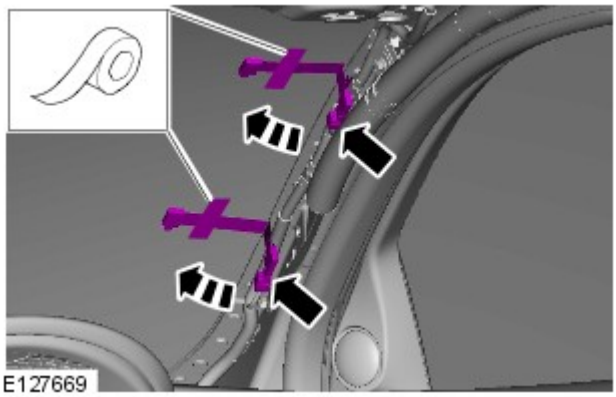
3. Refer to: Rain Sensor (501-16 Wipers and Washers, Removal and Installation).

4.

- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.



5.

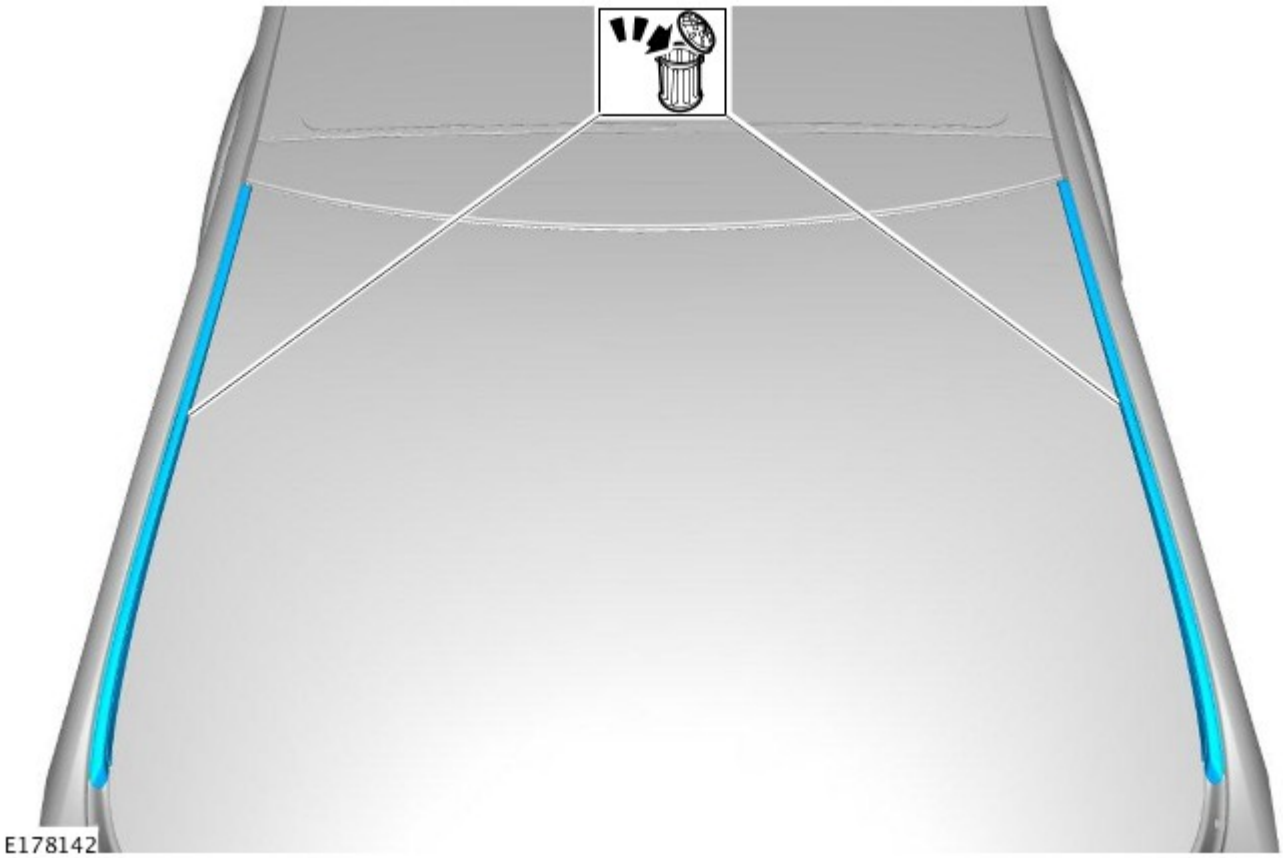


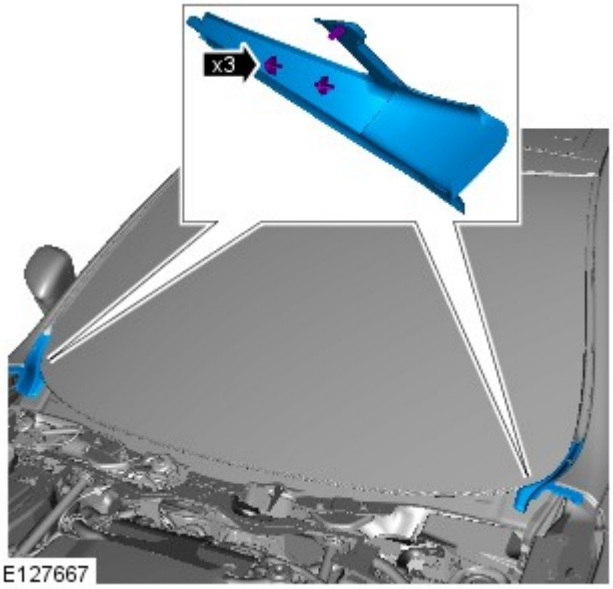
6.

7. NOTES:

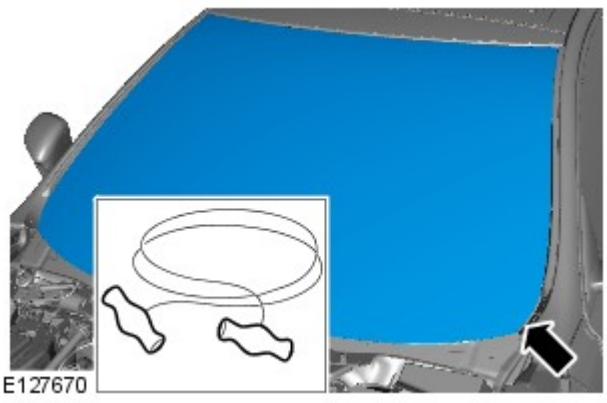
If the windshield glass is removed for access, the finishers will require removing and discarding. If the windshield glass is removed to install a new glass, then the finishers are supplied with the new windshield glass.

Note orientation of the components.





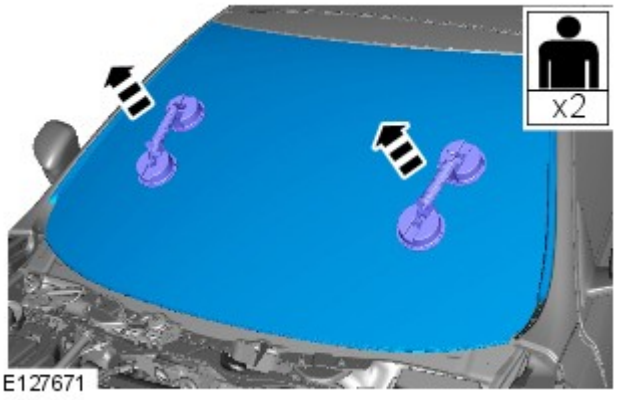
8.



9. CAUTIONS:

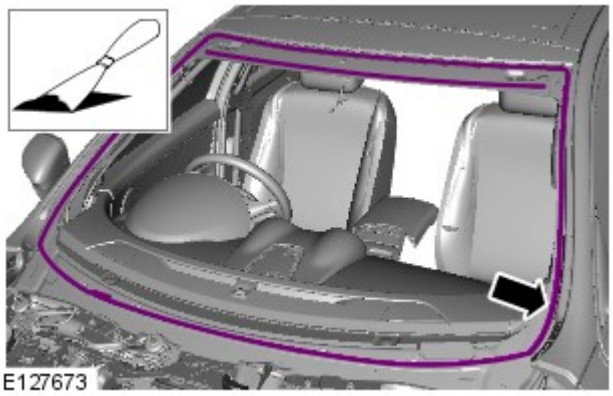
Protect the surrounding components.

Protect the surrounding paintwork to avoid damage.



10. WARNING: This step requires the aid of another technician.

Installation

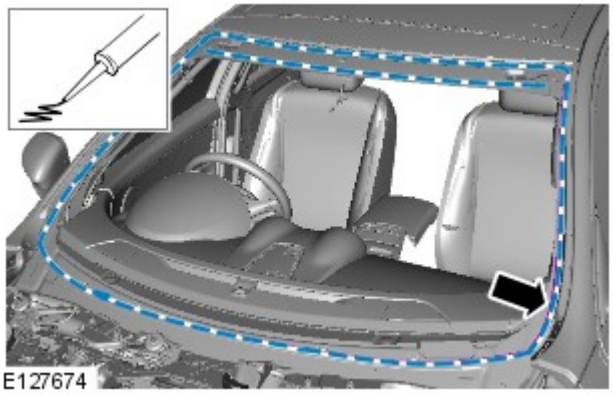


1. CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

Correct preparation of body apertures "post painting" to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

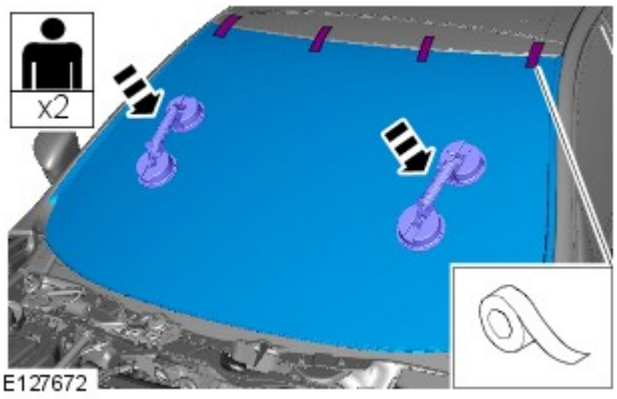
- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.



2. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

Modify the nozzle to achieve a bead section in the shape of a right angle triangle with a base of 8 mm and a vertical height of 12 mm.



3. WARNING: This step requires the aid of another technician.

CAUTIONS:

Make sure that the component is correctly located on the locating dowels.

Make sure that equal pressure is applied to the full length of the component.

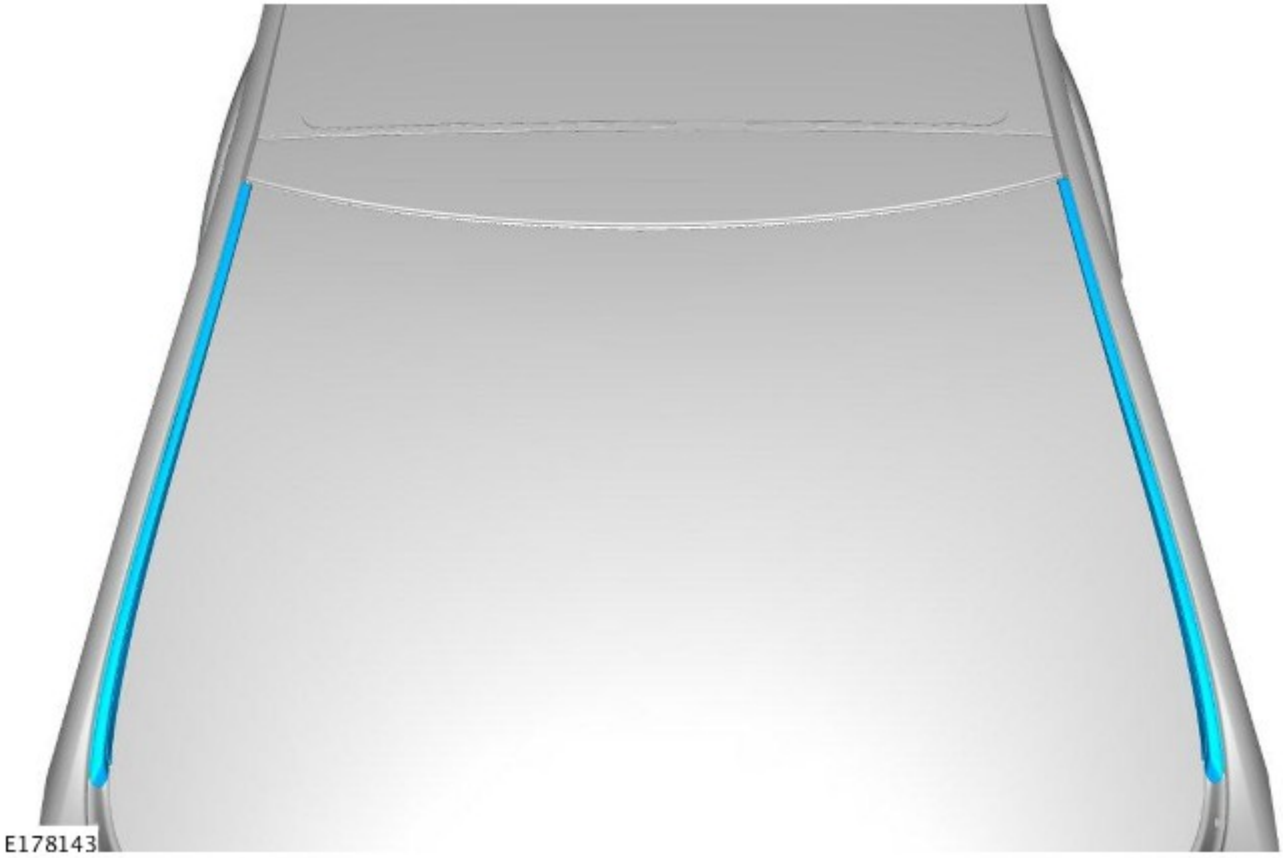
- With assistance, install and align the windshield glass.

- If the ambient temperature falls below 10 degrees C, apply warm air (25 degrees C) continuously for 15 minutes.

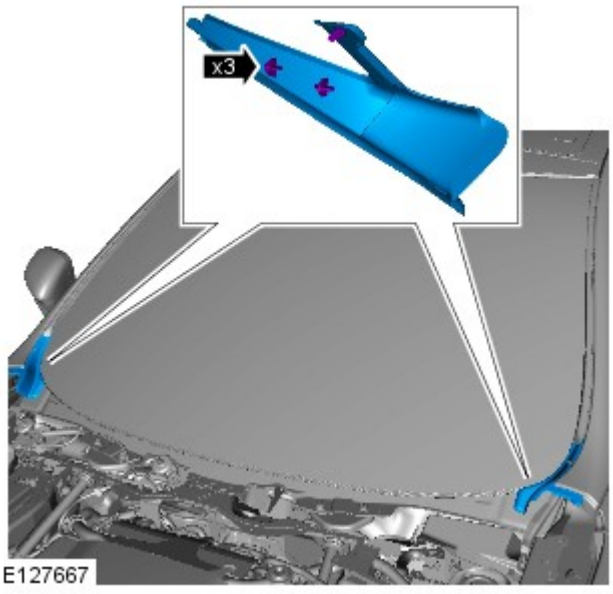
4. NOTES:

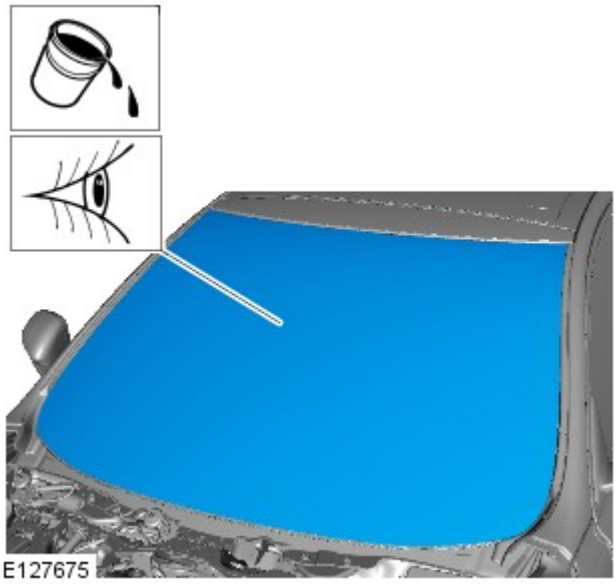
This step is only required if the windshield glass is removed for access.

Make sure that the components are installed in correct orientation.



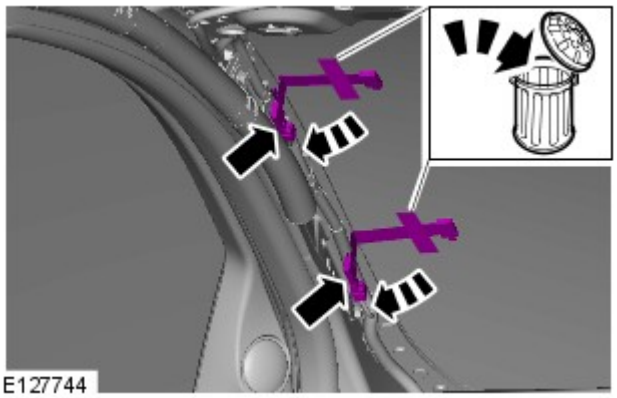
5.



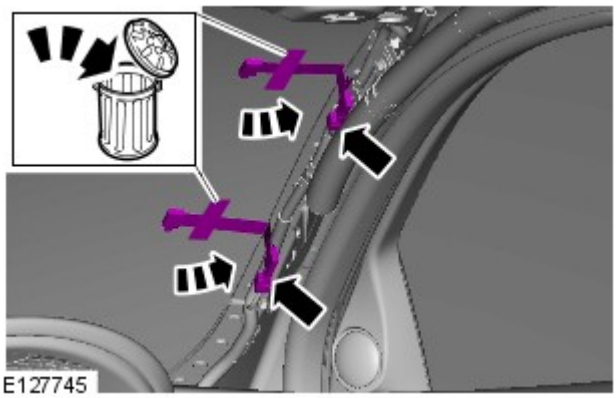


6. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.



7.



8.

9. Refer to: Rain Sensor (501-16 Wipers and Washers, Removal and Installation).

10. NOTE: The procedure must be carried out on both sides.

2.
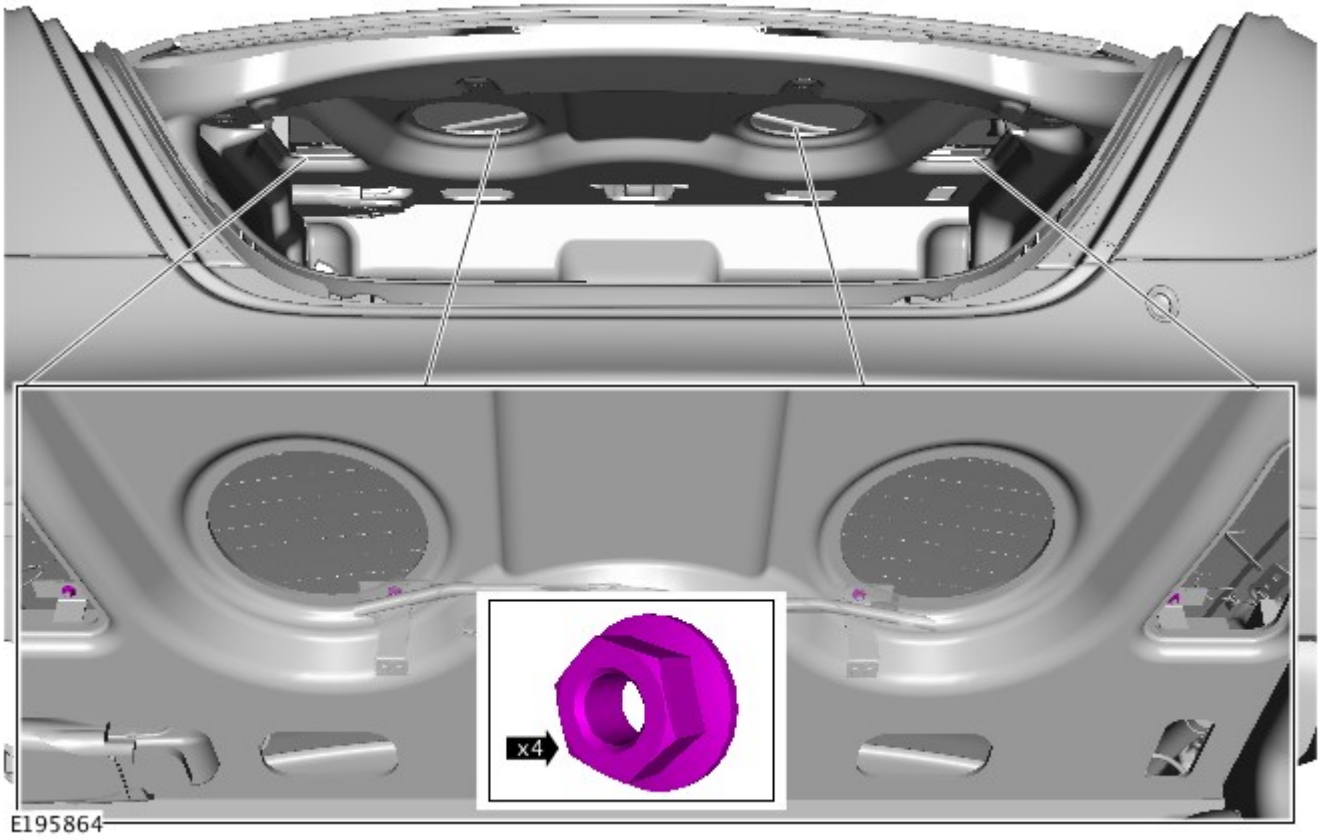
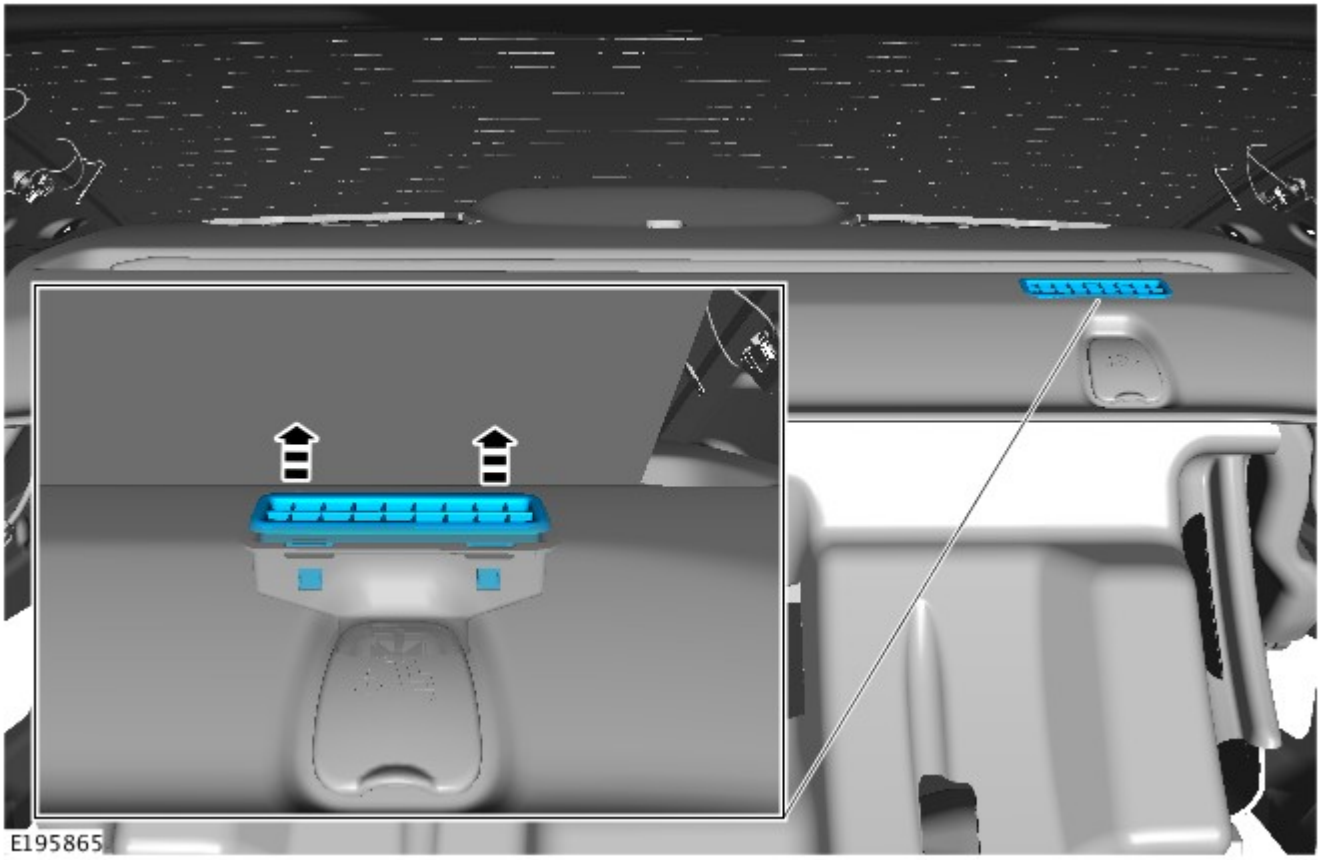
   - Remove the 4 nuts.



3. NOTE: If equipped.
   - Remove the cooling vent.

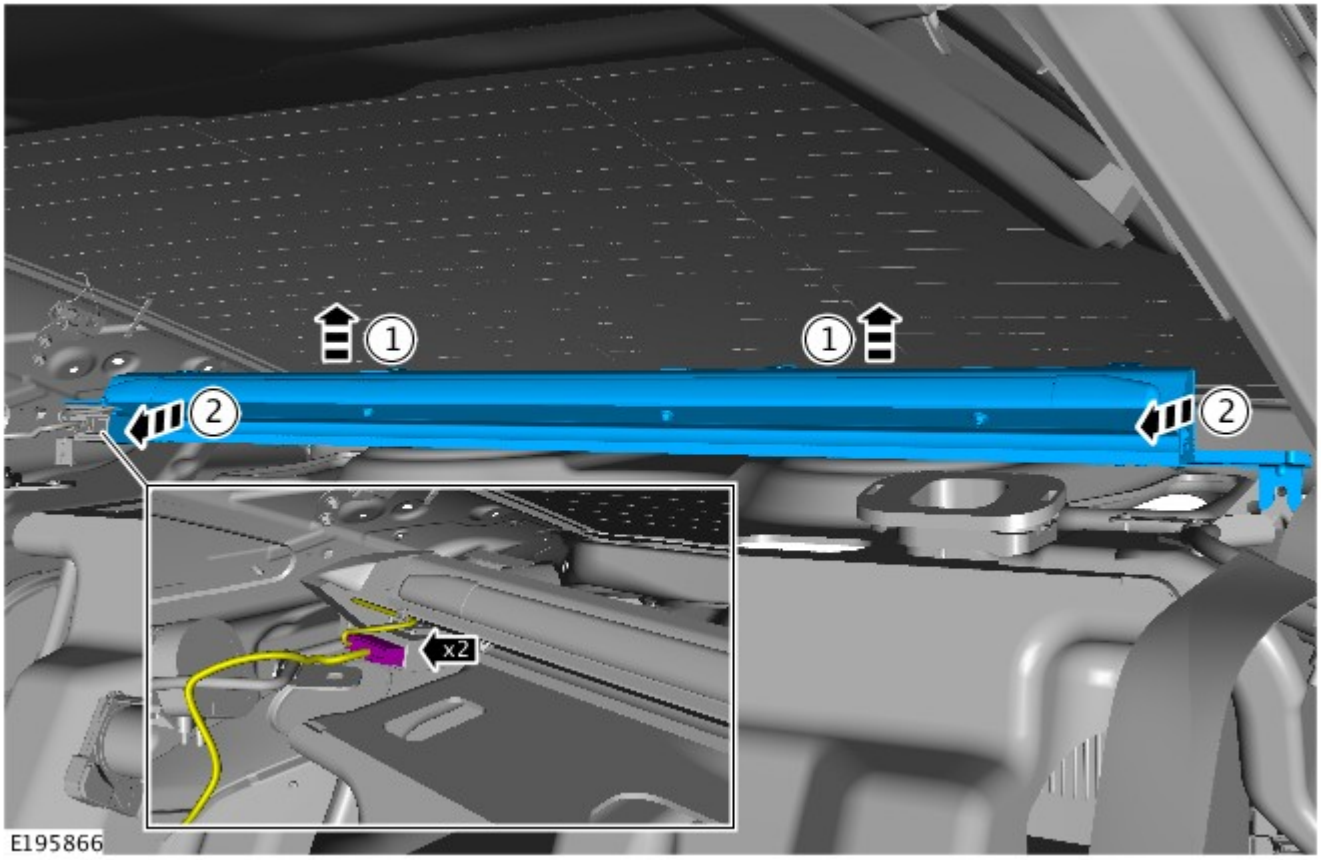


4. Remove the parcel shelf.

Refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

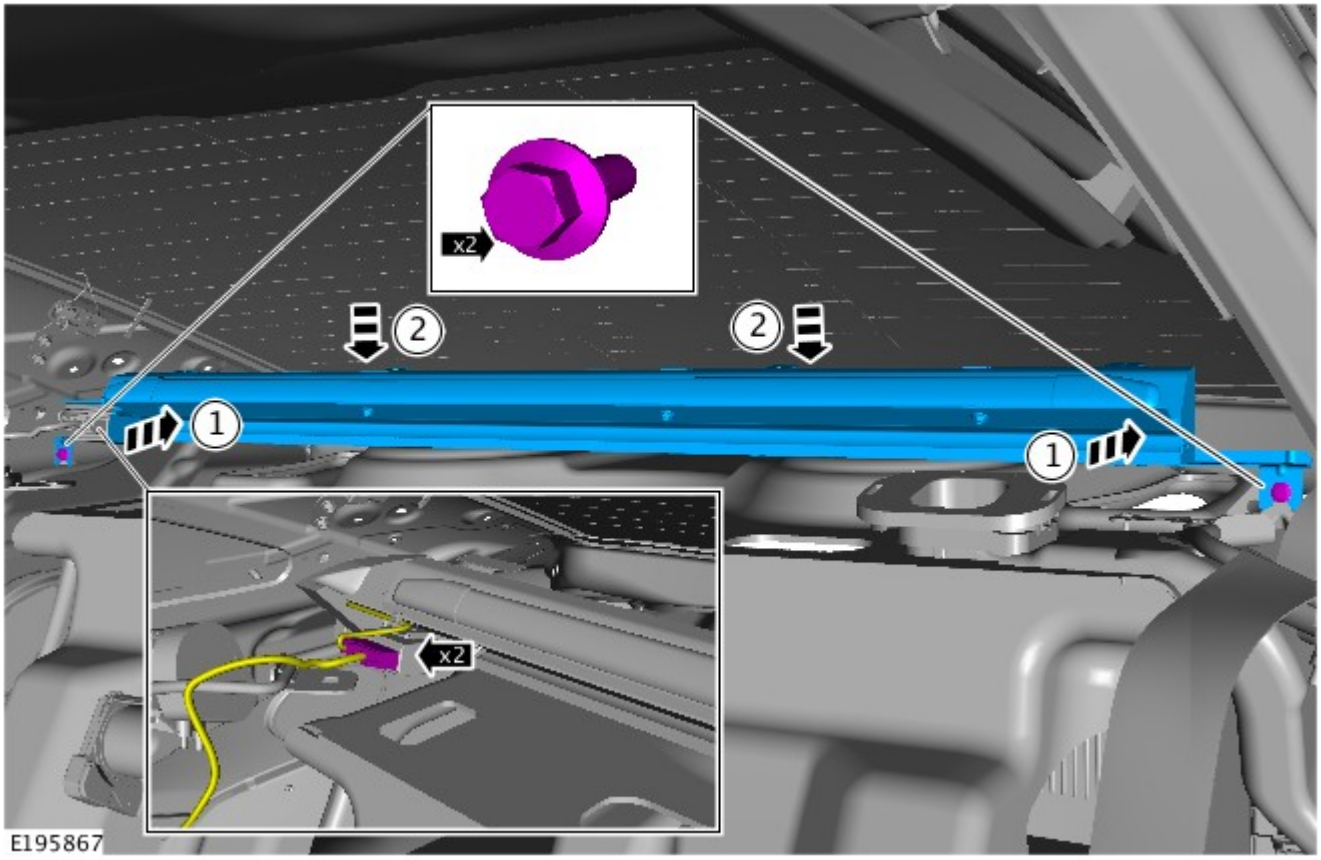
5.

- Disconnect the 2 electrical connectors.
- Lift the Rear Window Blind upwards before removing it.



Installation

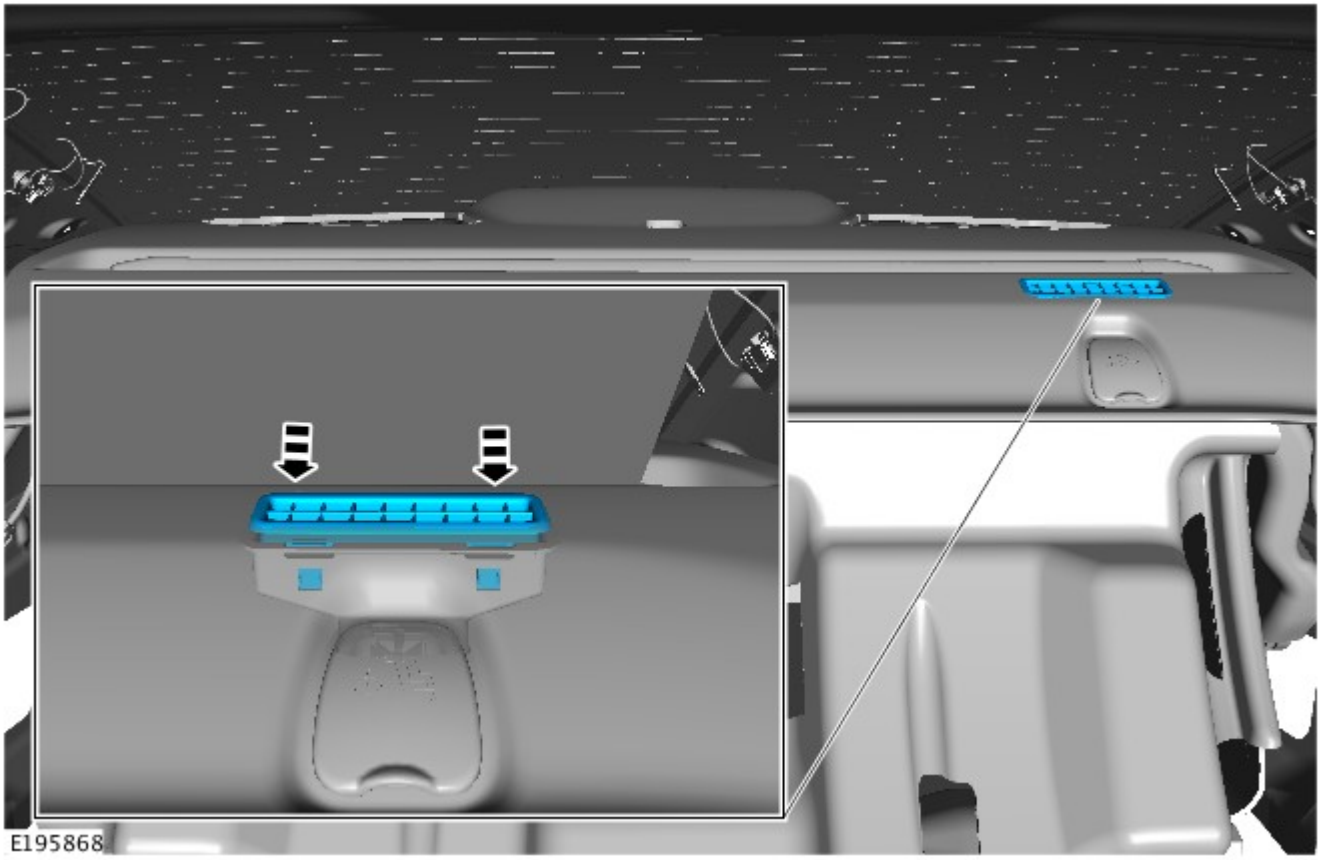
1.
   - Install the Rear Window Blind over the bolts as illustrated.
   - Do not fully tighten at this stage.
   - Reconnect the 2 electrical connectors.



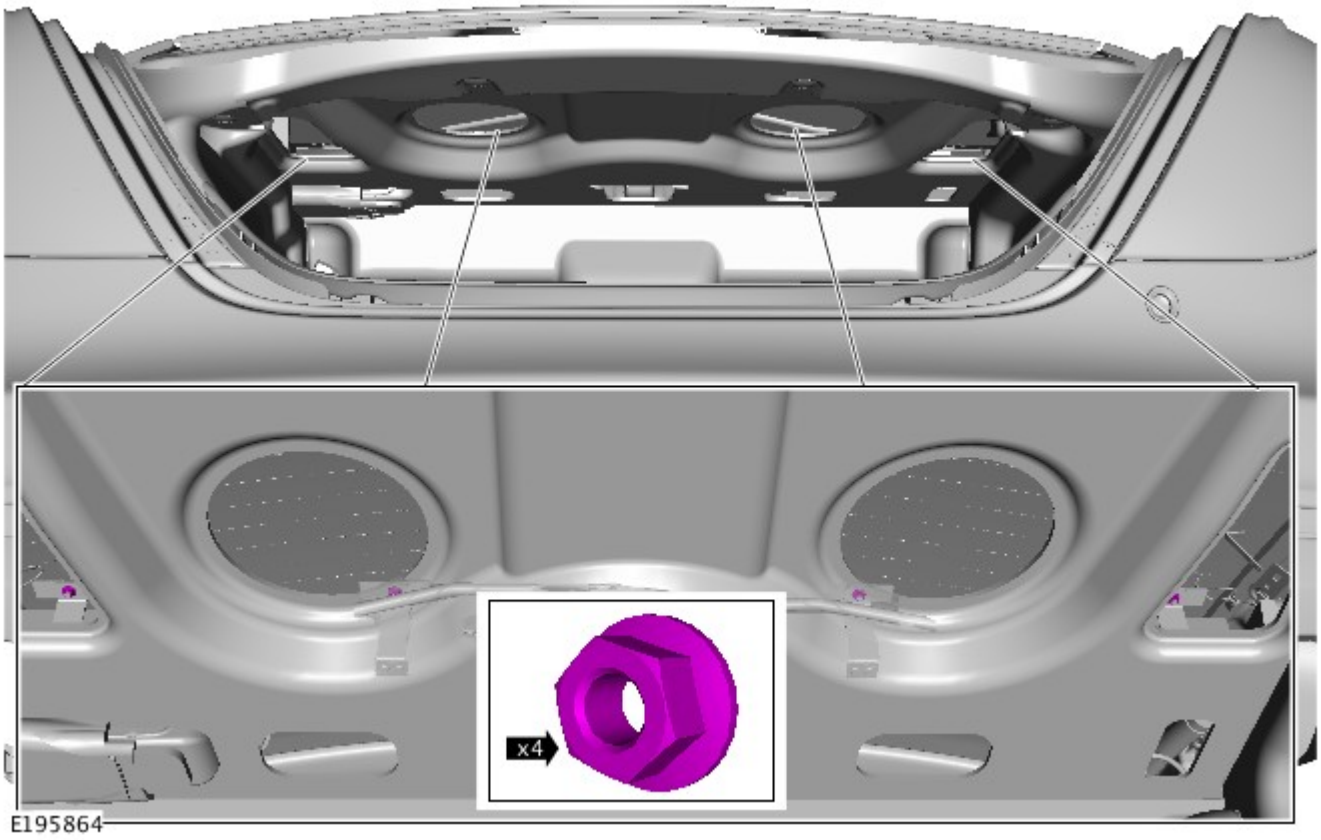
2. Install the parcel shelf.

Refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Install the cooling vent.



4.
- Install the 4 nuts.
- *Torque:* 4 Nm



5. Connect the primary battery ground cable.

Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

Battery, Mounting and Cables - Battery Disconnect and Connect

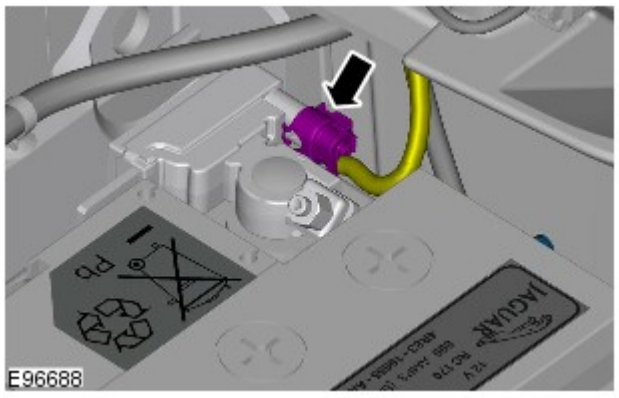
General Procedures

Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

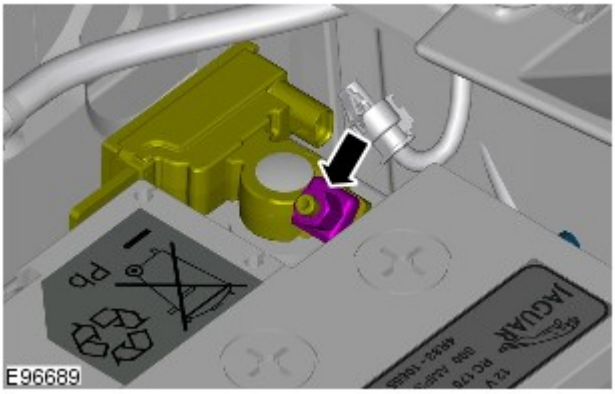
2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.



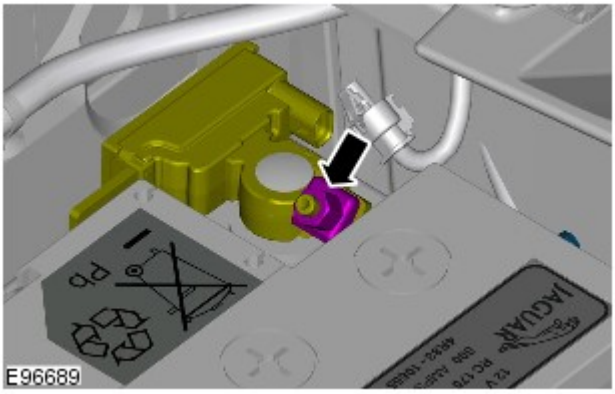
4. CAUTION: Take extra care not to damage the wiring harness.

5.

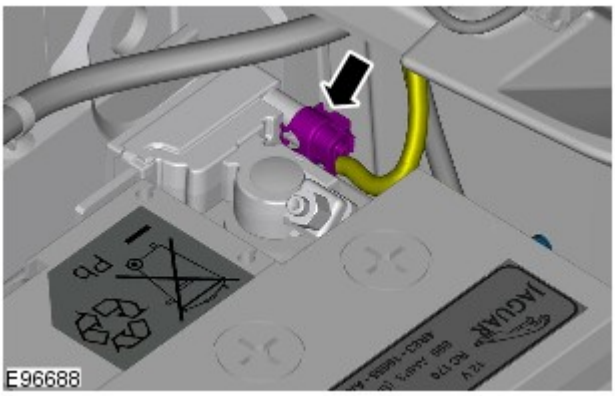


Connect

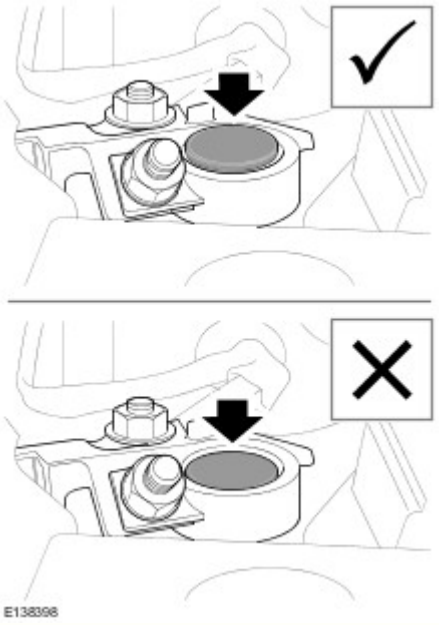
1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.



4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Interior Trim and Ornamentation - Sun Visor Vanity Mirror

Removal and Installation

General Equipment

Interior trim remover

Removal

1. Using a suitable tool, release the retaining clips and remove the sun visor vanity mirror from the sun visor.

General Equipment: Interior trim remover

Installation

1. CAUTION: Do not use excessive force to install the component.

Press firmly against the areas indicated until an audible click is heard.

Published: 11-May-2011

Pedestrian Protection System - Pedestrian Protection System

Diagnosis and Testing

Principles of Operation

For a detailed description of the Pedestrian Protection System, refer to the relevant Description and Operation section in the workshop manual.
REFER to: Pedestrian Protection System (501-20C Pedestrian Protection System, Description and Operation) / Pedestrian Protection System (501-20C Pedestrian Protection System, Description and Operation) / Pedestrian Protection System (501-20C Pedestrian Protection System, Description and Operation).

Inspection and Verification

WARNINGS:

TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY PEDESTRIAN PROTECTION SYSTEM COMPONENTS. TO DEPLETE THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT TWO MINUTES. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

Do not use a multimeter to probe the pedestrian protection system actuators. It is possible for the power from the multimeter battery to trigger the activation of the actuator. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

It is advisable not to use a cellular phone or to have a cellular phone in close proximity when working on the pedestrian protection system or components

Given the legal implications of a restraints system failure, harness repairs to pedestrian protection system circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.

After 5 hood deployment events, a new Restraints Control Module (RCM) and wiring harness must be installed.

1. Verify the customer concern

2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
• Hood • Hood hinges • Hood deployment controls	• Fuses • Wiring harnesses and connectors • Restraints Control Module (RCM) • Impact sensors • Hood deployment controls

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index

5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required

Symptom Chart

Symptom	Message	Possible Causes	Action
Hood deployed	CHECK PEDESTRIAN SYSTEM	• Low speed collision with pedestrian or other object	WARNING: The vehicle must not be driven if the hood has been deployed. NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary
Hood not deployed	CHECK PEDESTRIAN SYSTEM	• Restraints system fault	NOTE: The vehicle may be driven if a pedestrian protection system fault is present but the hood has not been deployed. • Check the vehicle for collision damage. Repair as necessary. Using the manufacturer approved diagnostic system, check the restraints control module for related DTCs and refer to the relevant DTC index

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Restraints Control Module (RCM) (100-00 General Information, Description and Operation).

General Information - Diagnostic Trouble Code (DTC) Index DTC: Restraints Control Module (RCM)

Description and Operation

Restraints Control Module (RCM)

WARNINGS:

TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO

DEPLETE THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

Do not use a multimeter to probe the restraints control module. It is possible for the power from the meter battery to trigger the activation of the airbags. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

It is advisable not to use a cellular phone or to have a cellular phone in close proximity when working on the restraints control module or associated systems.

Given the legal implications of a restraints system failure, harness repairs to Air Bag module circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Restraints Control Module (RCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual. For additional information, refer to: Air Bag Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Diagnosis and Testing) / Pedestrian Protection System (501-20C Pedestrian Protection System, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B0001-11	Driver Frontal Stage 1 Deployment Control - Circuit short to ground	• Driver airbag (stage 1) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag

Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-95	Driver Frontal Stage 2 Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0010-11	Passenger Frontal Stage 1 Deployment Control - Circuit short to ground	• Passenger airbag (stage 1) circuit short to ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-12	Passenger Frontal Stage 1 Deployment Control - Circuit short to battery	• Passenger airbag (stage 1) circuit short to power	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-13	Passenger Frontal Stage 1 Deployment Control - Circuit open	• Passenger airbag (stage 1) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-1A	Passenger Frontal Stage 1 Deployment Control - Circuit resistance below threshold	• Passenger airbag (stage 1) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-2B	Passenger Frontal Stage 1 Deployment Control - Signal cross coupled	• Passenger airbag (stage 1) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-95	Passenger Frontal Stage 1 Deployment control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0011-11	Passenger Frontal Stage 2 Deployment Control - Circuit short to ground	• Passenger airbag (stage 2) circuit short to ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag

B0011-12	Passenger Frontal Stage 2 Deployment Control - Circuit short to battery	• Passenger airbag (stage 2) circuit short to power	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-13	Passenger Frontal Stage 2 Deployment Control - Circuit open	• Passenger airbag (stage 2) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-1A	Passenger Frontal Stage 2 Deployment Control - Circuit resistance below threshold	• Passenger airbag (stage 2) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-2B	Passenger Frontal Stage 2 Deployment Control - Signal cross coupled	• Passenger airbag (stage 2) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-95	Passenger Frontal Stage 2 Deployment control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0020-11	Left Side Air Bag Deployment Control - Circuit short to ground	• Left side airbag (seat) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-12	Left Side Air Bag Deployment Control - Circuit short to battery	• Left side airbag (seat) circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-13	Left Side Airbag Deployment Control - Circuit open	• Left side airbag (seat) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-1A	Left Side Air Bag Deployment Control - Circuit resistance below threshold	• Left side airbag (seat) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-2B	Left Side Air Bag Deployment Control - Signal cross coupled	• Left side airbag (seat) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)

B0020-95	Left Side Airbag Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0021-11	Left Curtain Deployment Control 1 - Circuit short to ground	• Left side air curtain circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-12	Left Curtain Deployment Control 1 - Circuit short to battery	• Left side air curtain circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-13	Left Curtain Deployment Control 1 - Circuit open	• Left side air curtain circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-1A	Left Curtain Deployment Control 1 - Circuit resistance below threshold	• Left side air curtain circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-2B	Left Curtain Deployment Control 1 - Signal cross coupled	• Left side air curtain circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-95	Left Curtain Deployment Control 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0028-11	Right Side Air Bag Deployment Control - Circuit short to ground	• Right side airbag (seat) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-12	Right Side Air Bag Deployment Control - Circuit short to battery	• Right side airbag (seat) circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-13	Right Side Airbag Deployment Control - Circuit open	• Right side airbag (seat) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
	Right Side Air Bag Deployment	• Right side airbag (seat) circuit short	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness

B0028-1A	Control - Circuit resistance below threshold	circuit between power and ground	fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-2B	Right Side Air Bag Deployment Control - Signal cross coupled	• Right side airbag (seat) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-95	Right Side Airbag Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0029-11	Right Curtain Deployment Control 1 - Circuit short to ground	• Right side air curtain circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-12	Right Curtain Deployment Control 1 - Circuit short to battery	• Right side air curtain circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-13	Right Curtain Deployment Control 1 - Circuit open	• Right side air curtain circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-1A	Right Curtain Deployment Control 1 - Circuit resistance below threshold	• Right side air curtain circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-2B	Right Curtain Deployment Control 1 - Signal cross coupled	• Right side air curtain circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-95	Right Curtain Deployment Control 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0050-11	Driver Seatbelt Sensor - Circuit short to ground	• Driver buckle switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to ground

	Driver Seatbelt	• Driver buckle switch circuit	

B0050-13	Sensor - Circuit open	open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for open circuit, high resistance
B0050-1E	Driver Seatbelt Sensor - Circuit resistance out of range	• Driver buckle switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0050-2B	Driver Seatbelt Sensor - Signal cross coupled	• Driver buckle switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to another restraints circuit
B0050-95	Driver Seatbelt Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0052-11	Passenger Seatbelt Sensor - Circuit short to ground	• Passenger buckle switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to ground
B0052-12	Passenger Seatbelt Sensor - Circuit short to battery	• Passenger buckle switch circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to power
B0052-13	Passenger Seatbelt Sensor - Circuit open	• Passenger buckle switch circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for open circuit, high resistance
B0052-1E	Passenger Seatbelt Sensor - Circuit resistance out of range	• Passenger buckle switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0052-2B	Passenger Seatbelt Sensor - Signal cross coupled	• Passenger buckle switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to another restraints circuit
B0052-95	Passenger Seatbelt Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0070-11	Driver Seatbelt Pretensioner Deployment Control - Circuit short to ground	• Driver seatbelt pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner

B0070-12	Driver Seatbelt Pretensioner Deployment Control - Circuit short to battery	• Driver seatbelt pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-13	Driver Seatbelt Pretensioner Deployment Control - Circuit open	• Driver seatbelt pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-1A	Driver Seatbelt Pretensioner Deployment Control - Circuit resistance below threshold	• Driver seatbelt pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-2B	Driver Seatbelt Pretensioner Deployment Control - Signal cross coupled	• Driver seatbelt pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-95	Driver Seatbelt Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0072-11	Passenger Seatbelt Pretensioner Deployment Control - Circuit short to ground	• Passenger seatbelt pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-12	Passenger Seatbelt Pretensioner Deployment Control - Circuit short to battery	• Passenger seatbelt pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-13	Passenger Seatbelt Pretensioner Deployment Control - Circuit open	• Passenger seatbelt pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-1A	Passenger Seatbelt Pretensioner Deployment Control - Circuit resistance below threshold	• Passenger seatbelt pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-2B	Passenger Seatbelt Pretensioner "A" Deployment	• Passenger seatbelt pretensioner circuit short	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic

	Control - Signal cross coupled	circuit to another restraints circuit	system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-95	Passenger Seatbelt Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0090-11	Left Frontal Restraints Sensor - Circuit short to ground	• Front left impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to ground
B0090-12	Left Frontal Restraints Sensor - Circuit short to battery	• Front left impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to power
B0090-2B	Left Frontal Restraints Sensor - Signal cross coupled	• Front left impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to another impact sensor circuit
B0090-4A	Left Frontal Restraints Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0090-87	Left Frontal Restraints Sensor - Missing message	• Front left impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0090-92	Left Frontal Restraints Sensor - Performance or incorrect operation	• Front left impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0090-95	Left Frontal Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0090-96	Left Frontal Restraints Sensor - Component internal failure	• Front left impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0091-11	Left Side Restraints Sensor 1 - Circuit short to ground	• Left C pillar impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to ground
B0091-12	Left Side Restraints Sensor 1 - Circuit short to battery	• Left C pillar impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to power
B0091-2B	Left Side Restraints Sensor 1 - Signal cross	• Left C pillar impact sensor circuit short circuit to	

	coupled	another impact sensor circuit	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to another impact sensor circuit
B0091-4A	Left Side Restraints Sensor 1 - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0091-87	Left Side Restraints Sensor 1 - Missing message	• Left C pillar impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0091-92	Left Side Restraints Sensor 1 - Performance or incorrect operation	• Left C pillar impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0091-95	Left Side Restraints Sensor 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0091-96	Left Side Restraints Sensor 1 - Component internal failure	• Left C pillar impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0095-11	Right Frontal Restraints Sensor - Circuit short to ground	• Front right impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to ground
B0095-12	Right Frontal Restraints Sensor - Circuit short to battery	• Front right impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to power
B0095-2B	Right Frontal Restraints Sensor - Signal cross coupled	• Front right impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to another impact sensor circuit
B0095-4A	Right Frontal Restraints Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0095-87	Right Frontal Restraints Sensor - Missing message	• Front right impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
	Right Frontal Restraints Sensor - Performance or		

B0095-92	incorrect operation	• Front right impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0095-95	Right Frontal Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0095-96	Right Frontal Restraints Sensor - Component internal failure	• Front right impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0096-11	Right Side Restraints Sensor 1 - Circuit short to ground	• Right C pillar impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to ground
B0096-12	Right Side Restraints Sensor 1 - Circuit short to battery	• Right C pillar impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to power
B0096-2B	Right Side Restraints Sensor 1 - Signal cross coupled	• Right C pillar impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to another impact sensor circuit
B0096-4A	Right Side Restraints Sensor 1 - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B0096-87	Right Side Restraints Sensor 1 - Missing message	• Right C pillar impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0096-92	Right Side Restraints Sensor 1 - Performance or incorrect operation	• Right C pillar impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B0096-95	Right Side Restraints Sensor 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0096-96	Right Side Restraints Sensor 1 - Component internal failure	• Right C pillar impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B00B5-11	Driver Seat Track Position Restraints Sensor - Circuit short to ground	• Driver seat track position sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to ground
	Driver Seat Track Position		

B00B5-12	Restraints Sensor - Circuit short to battery	• Driver seat track position sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to power
B00B5-13	Driver Seat Track Position Restraints Sensor - Circuit open	• Driver seat track position sensor circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for open circuit, high resistance
B00B5-1E	Driver Seat Track Position Restraints Sensor - Circuit resistance out of range	• Driver seat track position sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B00B5-2B	Driver Seat Track Position Restraints Sensor - Signal cross coupled	• Driver seat track position sensor circuit short circuit to another position sensor circuit	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to another position sensor circuit
B00B5-95	Driver Seat Track Position Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B00C5-11	Passenger Seat Track Position Restraints Sensor - Circuit short to ground	• Passenger seat track position sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to ground
B00C5-12	Passenger Seat Track Position Restraints Sensor - Circuit short to battery	• Passenger seat track position sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to power
B00C5-13	Passenger Seat Track Position Restraints Sensor - Circuit open	• Passenger seat track position sensor circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for open circuit, high resistance
B00C5-1E	Passenger Seat Track Position Restraints Sensor - Circuit resistance out of range	• Passenger seat track position sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B00C5-2B	Passenger Seat Track Position Restraints Sensor - Signal cross coupled	• Passenger seat track position sensor circuit short circuit to another position sensor circuit	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to another position sensor circuit
	Passenger Seat		

B00C5-95	Track Position Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B00D2-68	Restraint System Malfunction Indicator 1 - Event information	• Restraints warning indicator fault reported by the instrument cluster	• Using the manufacturer approved diagnostic system, check the instrument cluster for related DTCs and refer to the relevant DTC index
B00D5-12	Restraint System Passenger Disable Indicator - Circuit short to battery	• Passenger airbag deactivation warning indicator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation warning indicator circuit for short circuit to power
B00D5-14	Restraint System Passenger Disable Indicator - Circuit short to ground or open	• Passenger airbag deactivation warning indicator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation warning indicator circuit for short circuit to ground, open circuit, high resistance
B00D5-95	Restraint System Passenger Disable Indicator - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1001-11	Right Hood Deployment Control - Circuit short to ground	• Right hood deployment control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-12	Right Hood Deployment Control - Circuit short to battery	• Right hood deployment control circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-13	Right Hood Deployment Control - Circuit open	• Right hood deployment control circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-1A	Right Hood Deployment Control - Circuit resistance below threshold	• Right hood deployment control circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-2B	Right Hood Deployment Control - Signal	• Right hood deployment control circuit	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring

	cross coupled	short circuit to another restraints circuit	harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-95	Right Hood Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1003-11	Left Hood Deployment Control - Circuit short to ground	• Left hood deployment control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-12	Left Hood Deployment Control - Circuit short to battery	• Left hood deployment control circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-13	Left Hood Deployment Control - Circuit open	• Left hood deployment control circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-1A	Left Hood Deployment Control - Circuit resistance below threshold	• Left hood deployment control circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-2B	Left Hood Deployment Control - Signal cross coupled	• Left hood deployment control circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-95	Left Hood Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1004-11	Right Frontal Impact Classification Sensor - Circuit short to ground	• Pedestrian right impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to ground
B1004-12	Right Frontal Impact Classification Sensor - Circuit short to battery	• Pedestrian right impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to power
B1004-2B	Right Frontal Impact Classification Sensor - Signal cross coupled	• Pedestrian right impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to another impact sensor circuit
	Right Frontal		

B1004-4A	Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1004-87	Right Frontal Impact Classification Sensor - Missing message	• Pedestrian right impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1004-92	Right Frontal Impact Classification Sensor - Performance or incorrect operation	• Pedestrian right impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1004-95	Right Frontal Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1004-96	Right Frontal Impact Classification Sensor - Component internal failure	• Pedestrian right impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1005-11	Left Frontal Impact Classification Sensor - Circuit short to ground	• Pedestrian left impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to ground
B1005-12	Left Frontal Impact Classification Sensor - Circuit short to battery	• Pedestrian left impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to power
B1005-2B	Left Frontal Impact Classification Sensor - Signal cross coupled	• Pedestrian left impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to another impact sensor circuit
B1005-4A	Left Frontal Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian left impact sensor
B1005-87	Left Frontal Impact Classification Sensor - Missing message	• Pedestrian left impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1005-92	Left Frontal Impact Classification Sensor -		• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and

	Performance or incorrect operation	• Pedestrian left impact sensor signal invalid	retest. If the fault persists, install a new pedestrian left impact sensor
B1005-95	Left Frontal Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1005-96	Left Frontal Impact Classification Sensor - Component internal failure	• Pedestrian left impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian left impact sensor
B1006-11	Center Front Impact Classification Sensor - Circuit short to ground	• Pedestrian center impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to ground
B1006-12	Center Front Impact Classification Sensor - Circuit short to battery	• Pedestrian center impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to power
B1006-2B	Center Front Impact Classification Sensor - Signal cross coupled	• Pedestrian center impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to another impact sensor circuit
B1006-4A	Center Front Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor
B1006-87	Center Front Impact Classification Sensor - Missing message	• Pedestrian center impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1006-92	Center Front Impact Classification Sensor - Performance or incorrect operation	• Pedestrian center impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor
B1006-95	Center Front Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1006-96	Center Front Impact Classification Sensor - Component internal failure	• Pedestrian center impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor

B1193-68	Crash Event Storage Full And Locked - Event information	• Pedestrian protection system deployment events maximum number reached	NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary. Install a new restraints control module
B11A0-11	Left Side Restraints Pressure Sensor - Circuit short to ground	• Left impact pressure sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to ground
B11A0-12	Left Side Restraints Pressure Sensor - Circuit short to battery	• Left impact pressure sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to power
B11A0-2B	Left Side Restraints Pressure Sensor - Signal cross coupled	• Left impact pressure sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to another impact sensor circuit
B11A0-4A	Left Side Restraints Pressure Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A0-87	Left Side Restraints Pressure Sensor - Missing message	• Left impact pressure sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B11A0-92	Left Side Restraints Pressure Sensor - Performance or incorrect operation	• Left impact pressure sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A0-95	Left Side Restraints Pressure Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B11A0-96	Left Side Restraints Pressure Sensor - Component internal failure	• Left impact pressure sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A1-11	Right Side Restraints Pressure Sensor - Circuit short to ground	• Right impact pressure sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to ground
B11A1-12	Right Side Restraints Pressure Sensor - Circuit short to battery	• Right impact pressure sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to power
	Right Side Restraints Pressure Sensor -	• Right impact pressure sensor circuit short	

B11A1-2B	Signal cross coupled	circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to another impact sensor circuit
B11A1-4A	Right Side Restraints Pressure Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor
B11A1-87	Right Side Restraints Pressure Sensor - Missing message	• Right impact pressure sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B11A1-92	Right Side Restraints Pressure Sensor - Performance or incorrect operation	• Right impact pressure sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor

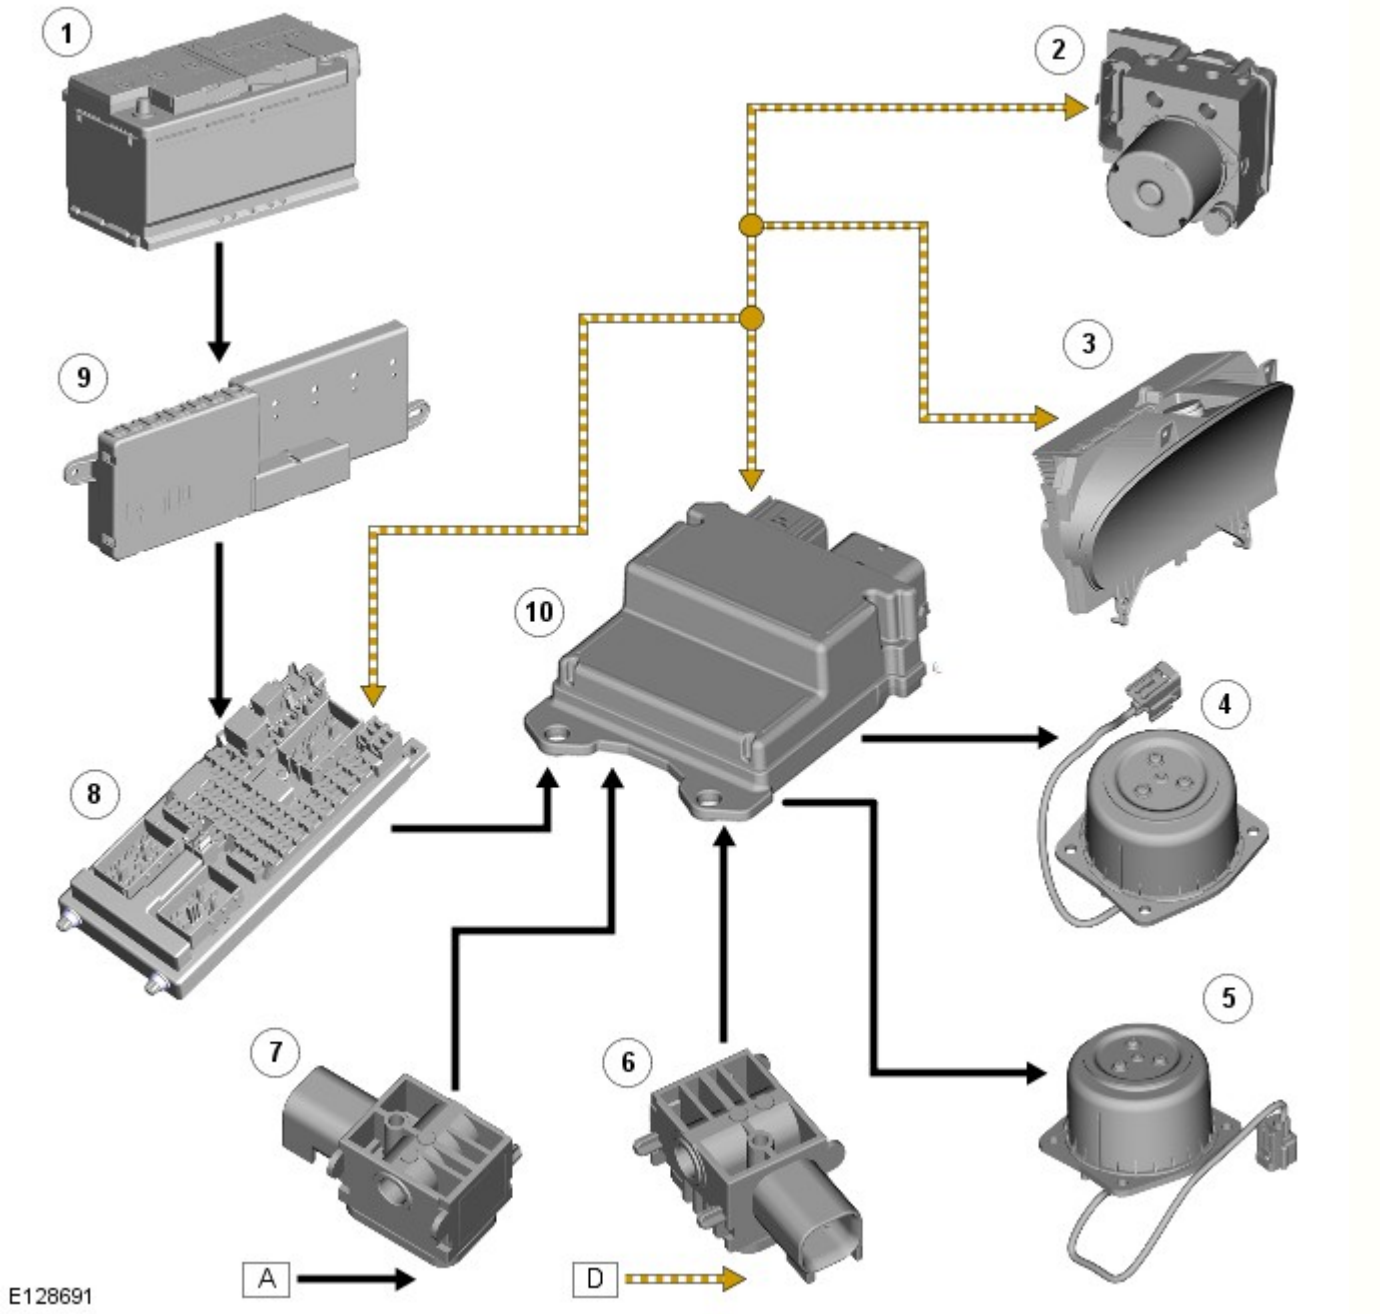
Pedestrian Protection System - Pedestrian Protection System - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: A = Hardwired; D = High speed CAN (controller area network) bus.



Item	Description
1	Battery
2	ABS (anti-lock brake system) module
3	Instrument cluster
4	LH (left-hand) hood actuator
5	RH (right-hand) hood actuator
6	RH pedestrian impact sensor
7	LH pedestrian impact sensor
8	CJB (central junction box)
9	BJB (battery junction box)
10	RCM (restraints control module)

System Operation

PRINCIPLES OF OPERATION

The pedestrian protection system is operational when the vehicle is traveling at speeds between approximately 20 and 45 km/h (12.4 and 28 mph). A vehicle speed signal is received by the RCM over the high speed CAN bus.

The system is able to determine if contact is made with a pedestrian or another object, such as a traffic cone, using signals from the pedestrian impact sensors. When the system determines contact is made with a pedestrian, it fires the hood actuators to lift the rear of the hood approximately 130 mm (5.2 in.) within 35 ms of the 'fire' signal.

When an impact condition is registered, the RCM outputs an impact signal on the high speed CAN bus. This signal is used by the CJB to initiate the hazard warning lamps. If this occurs, the hazard warning lamp switch is disabled for the remainder of the current ignition cycle.

If the RCM detects a fault with the system, it outputs a message on the high speed CAN bus to the instrument cluster message center. On receipt of this, the message center will display the message Check Pedestrian System.

When the vehicle is delivered from the factory the pedestrian protection system is in a safe 'plant' mode. Normal operating mode must be activated using Jaguar approved diagnostic equipment during the PDI (pre-delivery inspection) prior to delivery to the customer.

Failure Mode Detection

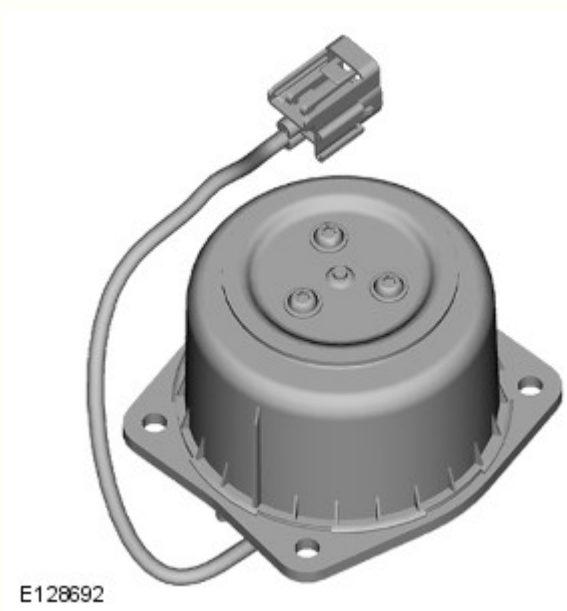
In service, if any fault is detected, the message center displays the warning Check Pedestrian System.

The hood deployment actuators are non-serviceable components. If they are replaced their bar code labels must be read and recorded in the service database against the VIN (vehicle identification number) for security purposes.

After deployment of the pedestrian protection system, the vehicle must be stopped as soon as it is safe to do so. The hazard warning lamps will be activated and can only be switched off by pressing the engine START/STOP button to turn the engine off and on again. A warning message Check Pedestrian System will appear in the message center and the vehicle should be transported to the nearest dealer/authorised repairer. The vehicle must not be driven when the hood has been deployed.

Component Description

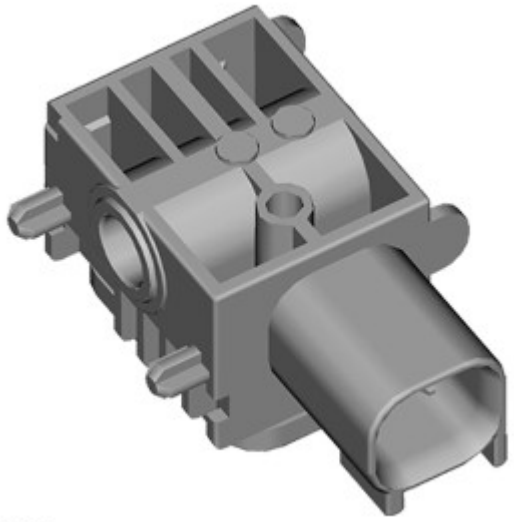
HOOD ACTUATORS



E128692

The hood actuators are pyrotechnic air bags installed on mounting brackets next to the hood hinges. When the hood actuators are deployed, interface plates on the actuators contact reinforced areas on the hood, and raise the rear of the hood.

PEDESTRIAN IMPACT SENSORS



E128693

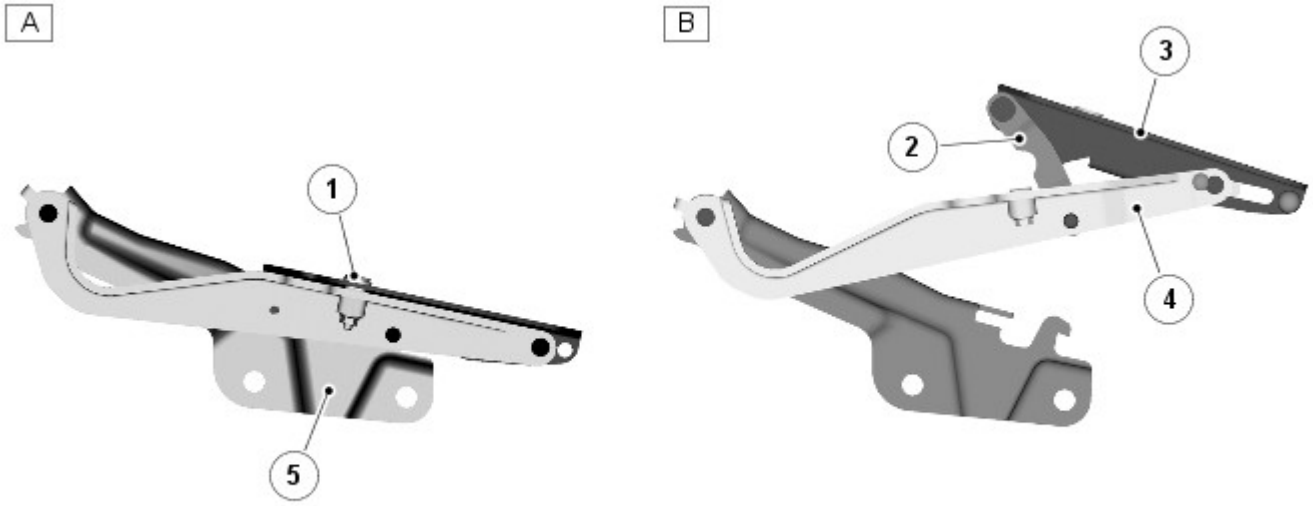
The pedestrian impact sensors are accelerometers mounted on the rear of the front bumper. The RCM uses the sensor inputs to monitor for low level impacts typical of pedestrian accidents.

HOOD

The two-piece hood is fabricated from aluminum. The inner panel has a hexagonal structure, which allows the energy from an impact to be absorbed effectively across the full area of the hood. The hood also has sufficient strength in the rear cross-beam to accept the forces from the actuators and maintain a stable condition.

When deployed, the front hood latches act as the pivot points and the rear hinges allow a controlled degree of upward movement before retaining the hood at the end of its deployment, thus limiting its total upward travel and stabilizing its position.

Hood Hinges



E95115

Item	Description
A	Non-deployed hinge
B	Deployed hinge
1	Firing pin
2	Stabilizing link
3	hood leaf
4	Intermediate leaf
5	Body leaf

The hood hinges incorporate a number of leaves. This includes a leaf attached to the body, an intermediate leaf and a leaf attached to the hood. During normal operation the hinge opens and closes using the hood and intermediate leaves. These are attached together by a firing pin. When the actuators are fired the firing pins fail. This allows the hood and intermediate leaves to separate and deploy the hood upwards.

The hinges deform during the deployment process and will need to be replaced.

Pedestrian Protection System - Pedestrian Protection System - Overview

Description and Operation

OVERVIEW

WARNING: All pyrotechnic devices are dangerous. Before performing any procedures on any pyrotechnic device, read all information contained within the Service Information section of this manual. Refer to: General Service Information (100-00, Description and Operation).

The pedestrian protection system is designed to mitigate injuries in a pedestrian collision with the vehicle. It does this by utilizing a pair of pyrotechnic actuators to lift the hood away from the engine, creating a cushioned impact between the pedestrian and the vehicle.

The pedestrian protection system is controlled by the RCM (restraints control module) , but operates independently of the SRS (supplemental restraint system) .
Refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).

Pedestrian protection is also provided by passive protection integrated into the bumper system and the structure of the hood.

Rear End Sheet Metal Repairs - Back Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The back panel is a category A repair.

E129307

2. NOTE: The back panel is manufactured from aluminium alloy 5754-NG.

The back panel is serviced as a separate riveted and bonded panel, it includes the back panel inner.

3. The back panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation) /
Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. Remove the luggage compartment lid weatherstrip.

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove both the rear mufflers.
For additional information, refer to: Rear Muffler (309-00A, Removal

and Installation) /
Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the right-hand and left-hand rear muffler heatshields.

12. Remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

13. Remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

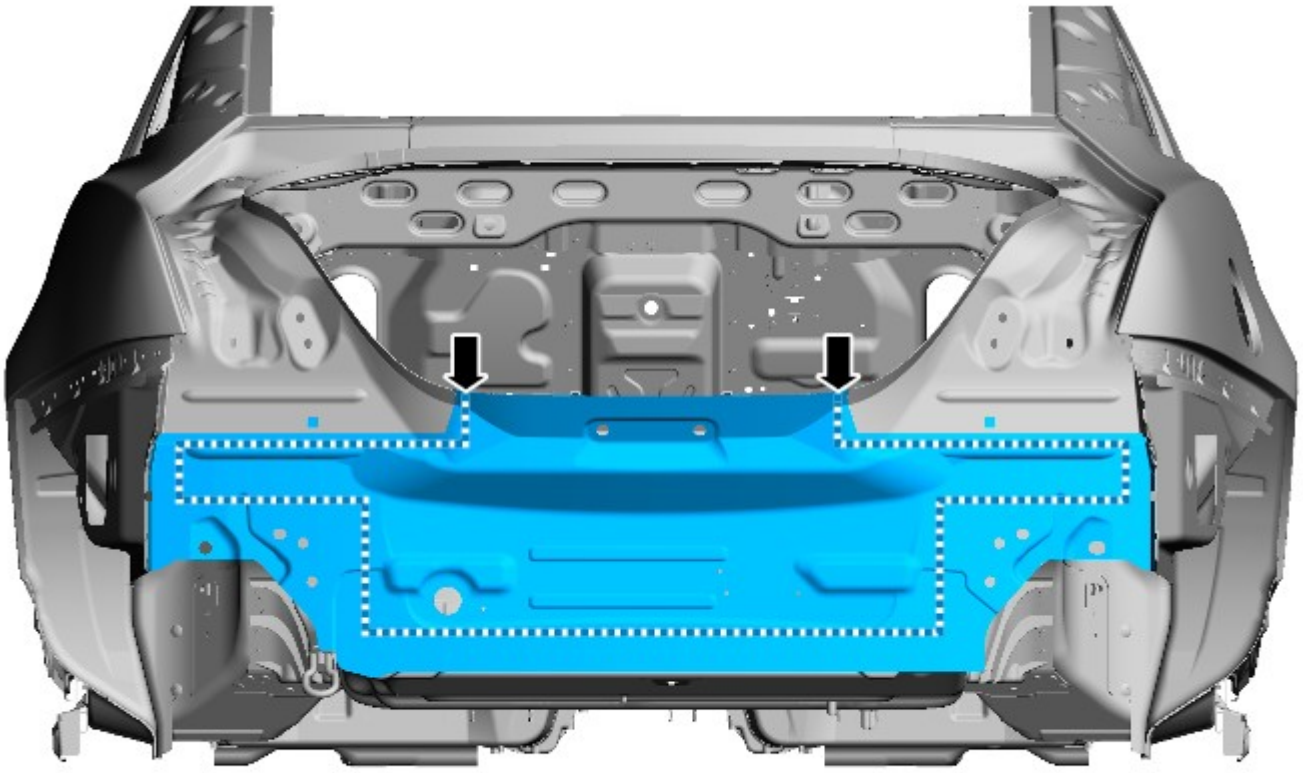
14. Release the back panel and loadspace wiring harness and position it to one side.

15. Remove the luggage compartment latch striker.

16. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

17. Remove any electrical components in the local area of repair to prevent damage.

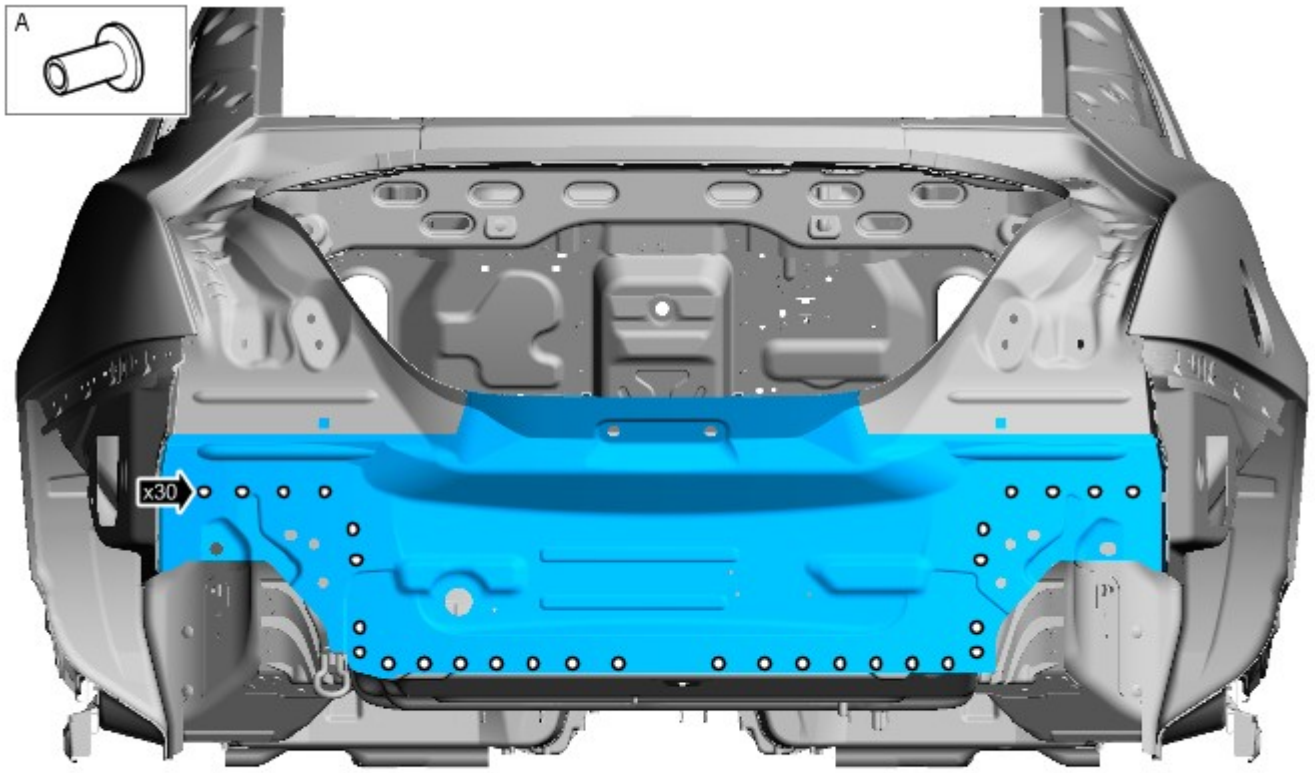
18. Saw cut the old panel along the point shown in the illustration. This allows access to allow the use of the ESN50.



E129308

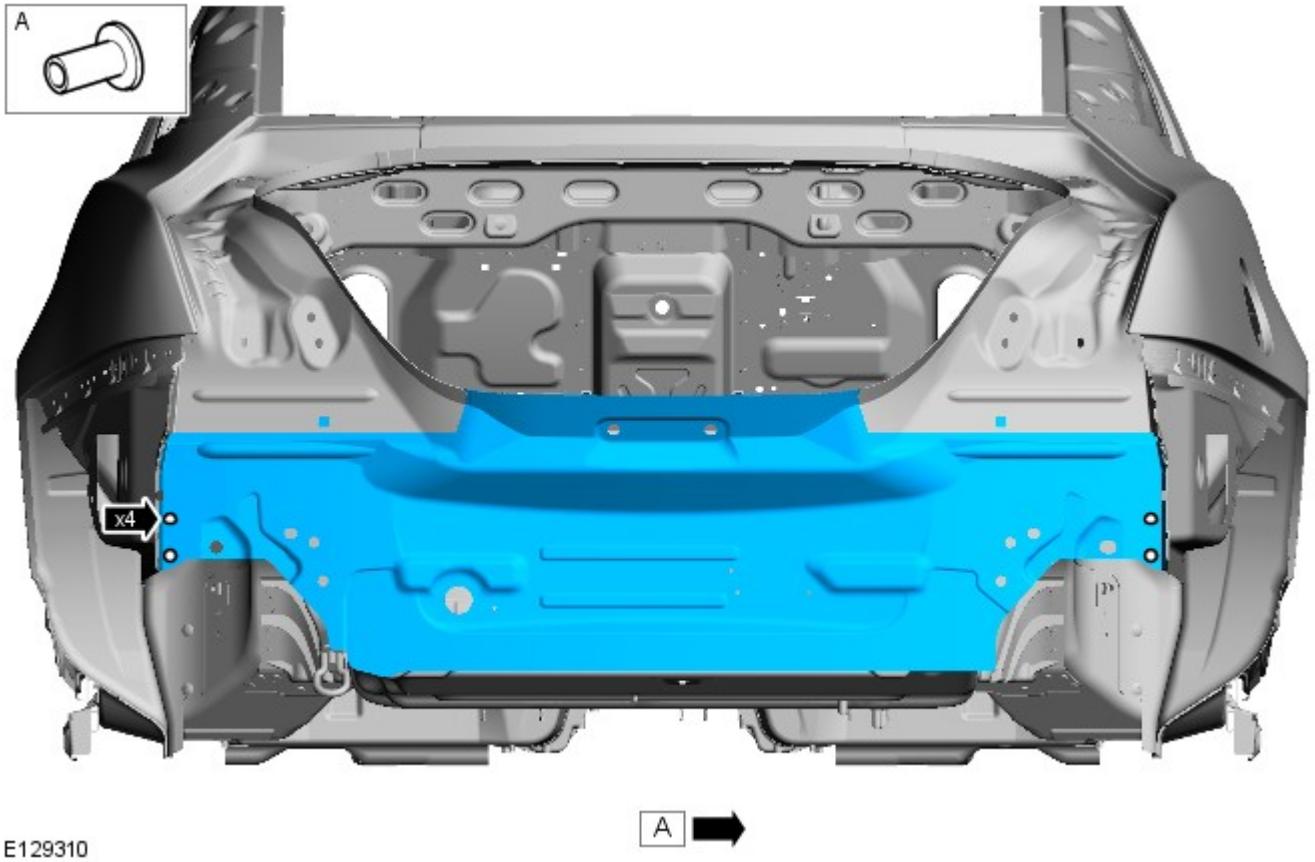
19.

Using the ESN50, remove the self piercing rivets from the spare wheel well and rear side members.

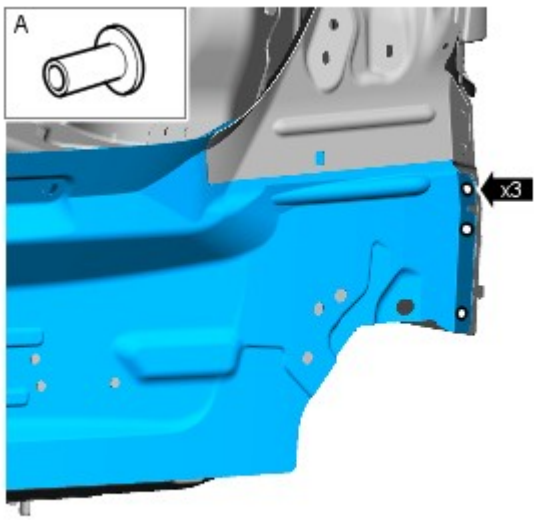


E129309

20. Using the ESN50, remove the self piercing rivets from the rear floor side extensions.

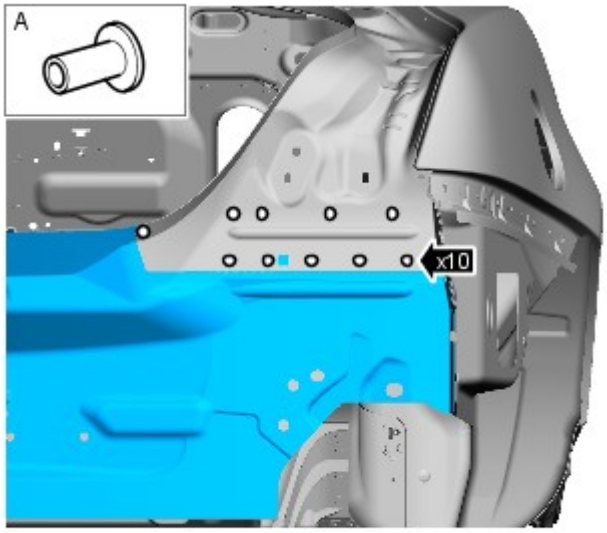


E129310



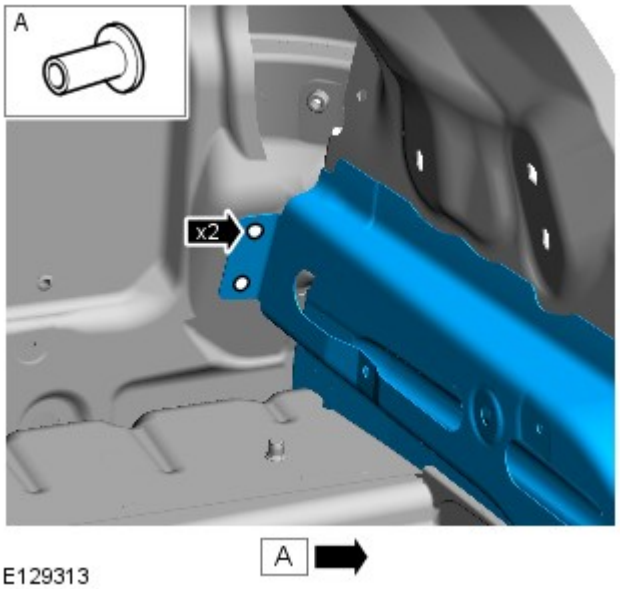
E129311

21. Using the ESN50, remove the self piercing rivets (3 each side) from the quarter panel lower extensions.



E129312

22. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets (10 each side) from the quarter panels.

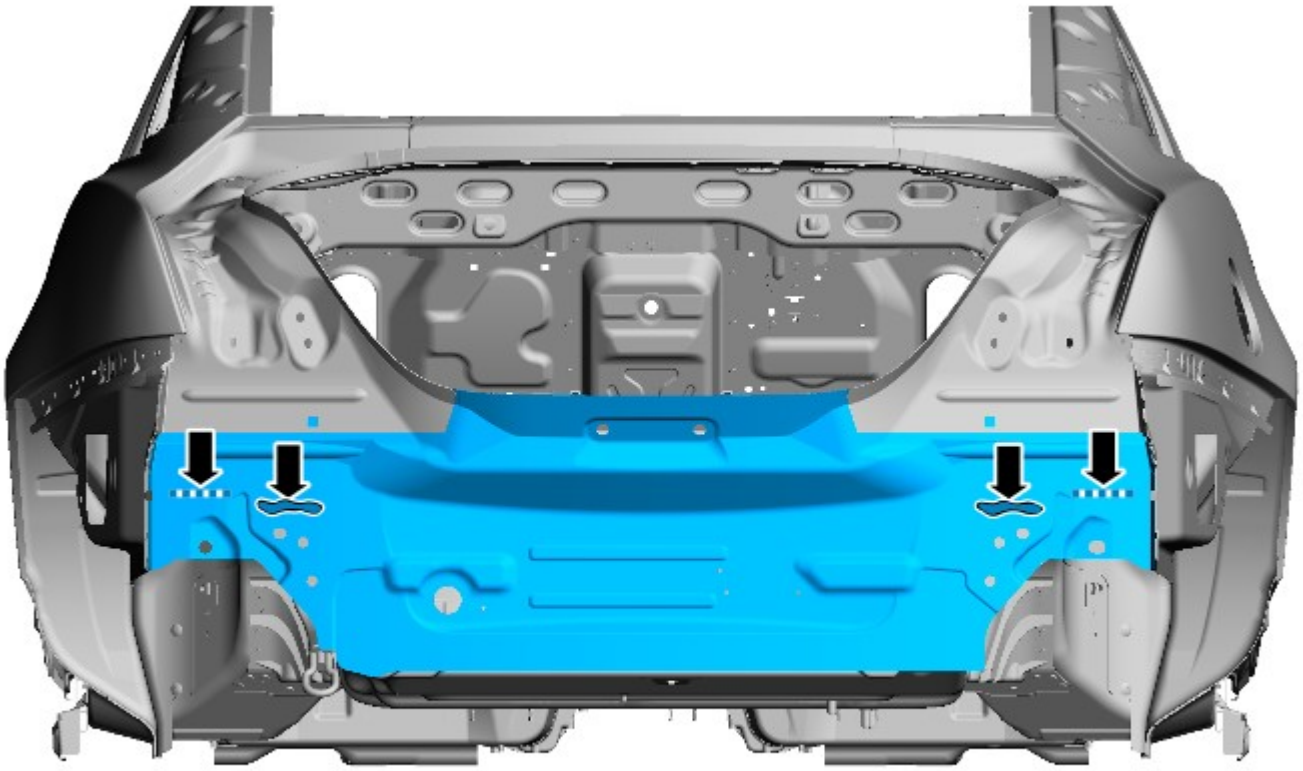


E129313

23. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets (2 each side) from the junction box and modules mounting panels.

24. Separate the joints and remove the old panel, carefully releasing the adhesive at the points illustrated.



E129314

Installation

1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, remove the adhesive residue.

3. Dress flanges where necessary.

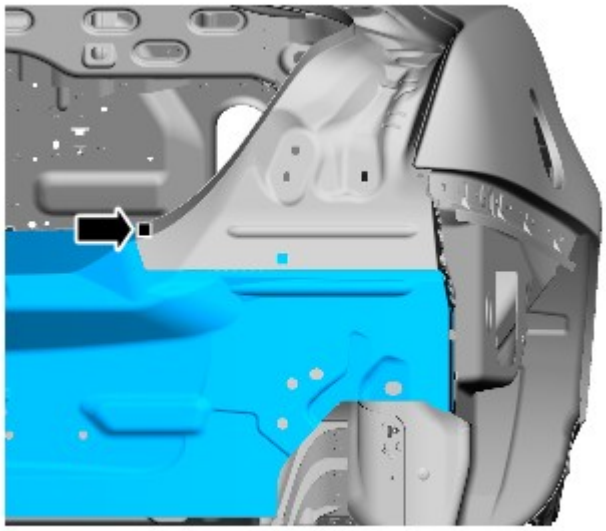
4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

5. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

6. Remove the new panel.

7. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

8. Using a 10mm drill bit, drill 2 holes in the old quarter panel ready for MIG plug welding.



E129612

9. Debur the drilled holes.

10. CAUTION: Use care not to damage the panel.

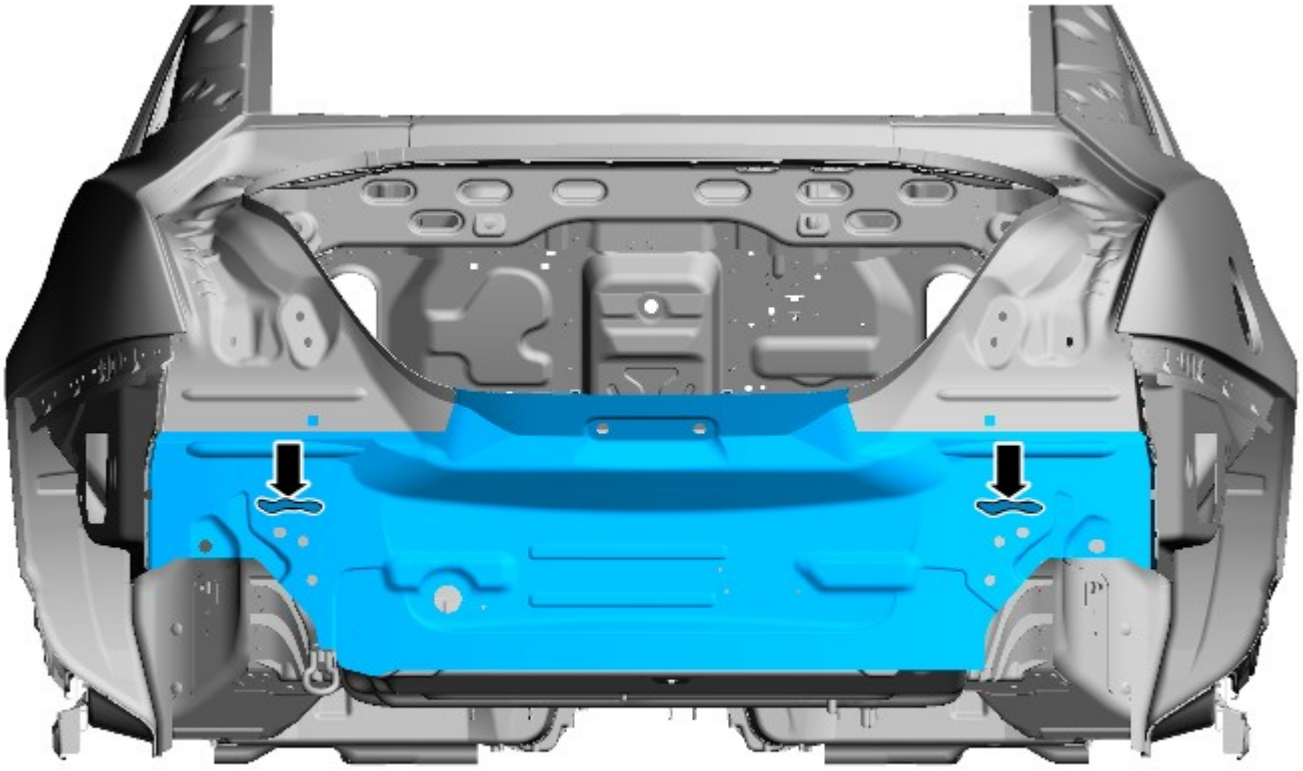
Remove seam sealer where applicable.

11. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

12. Pyrosil the joints.

13. Apply the coupling agent and allow to dry.

14. Apply the semi-rigid sealer at the points illustrated.



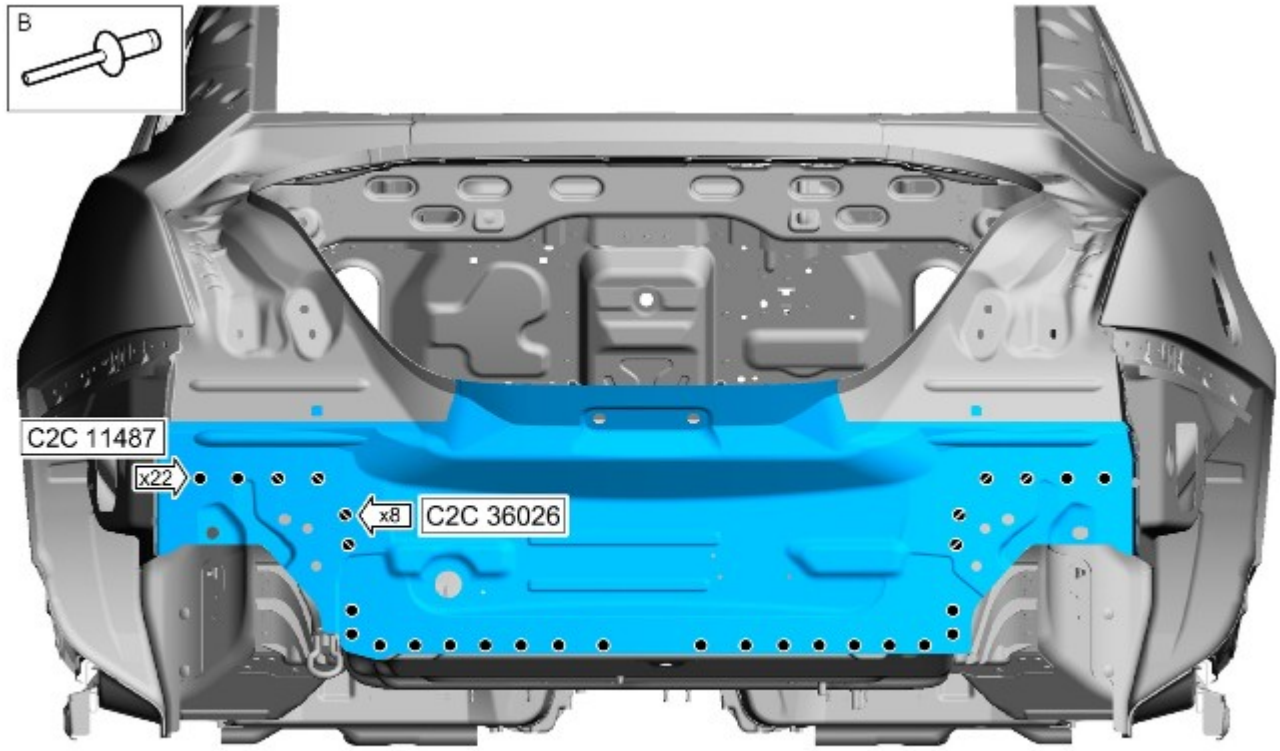
E129315

15. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

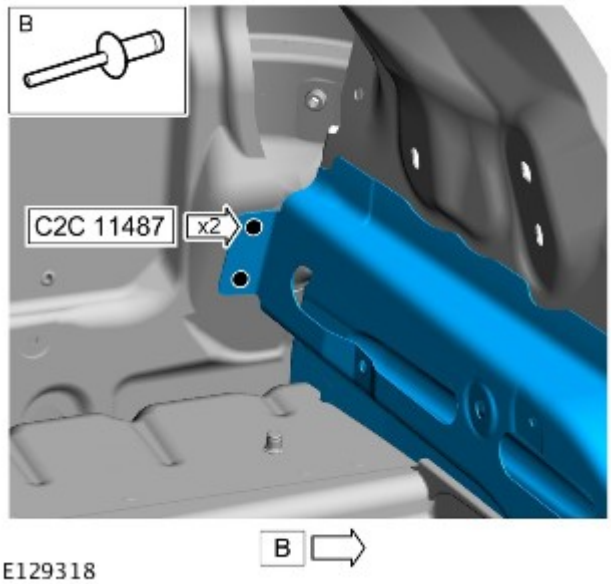
Apply a 5mm zig zag style bead of 3M 8115 adhesive to the body joints.

16. Offer up the new panel and clamp into position.

17. Using the Genesis G4, install 8 Hemloks (4 each side) into the rear side member. Install a further 22 Hemloks (11 each side) into the spare wheel well and rear floor side extension.



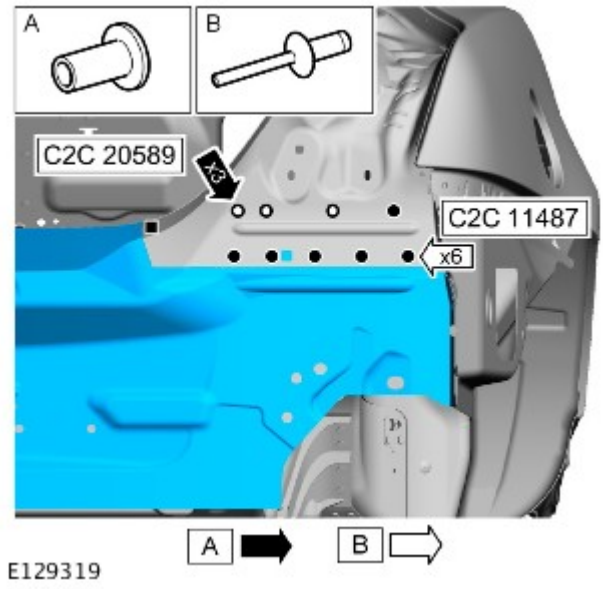
E129317



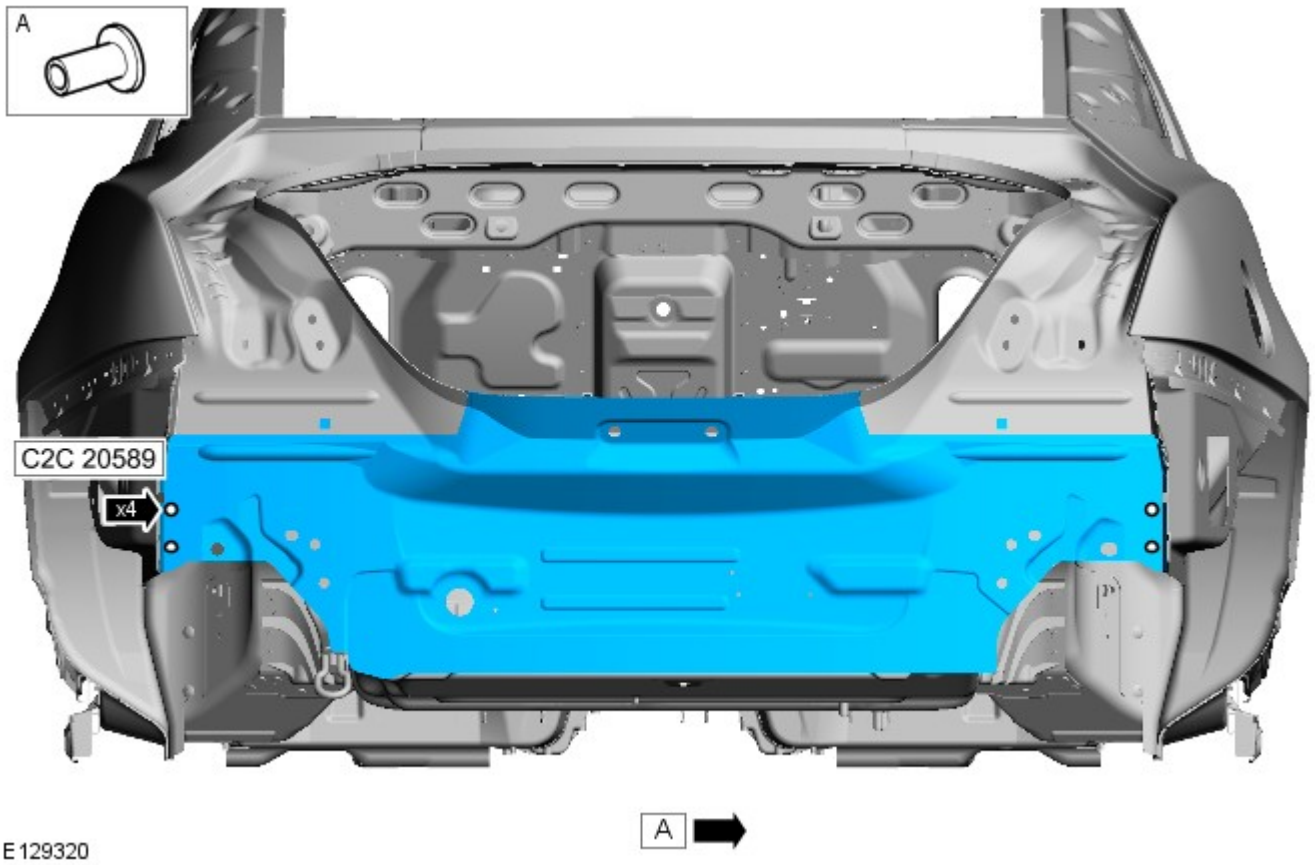
E129318

18. Using the Genesis G4, install the Hemloks (2 each side) into the junction box and modules mounting panels.

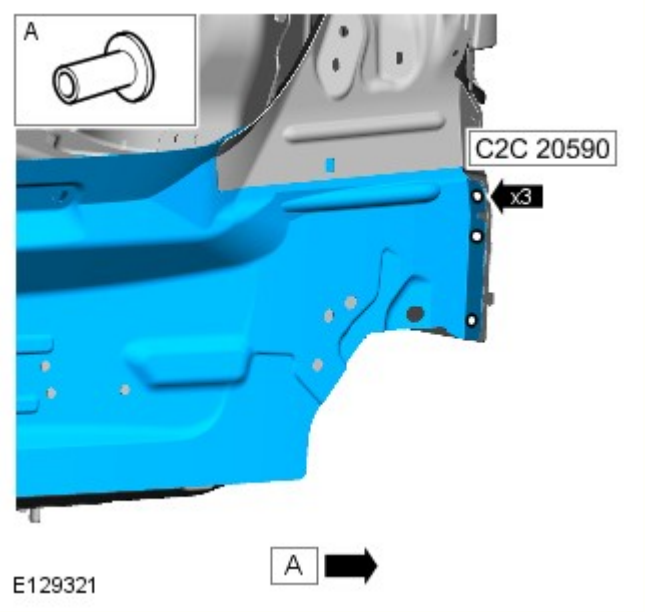
19. Using the Genesis G4, install 12 Hemloks (6 each side) into the quarter panel. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel.



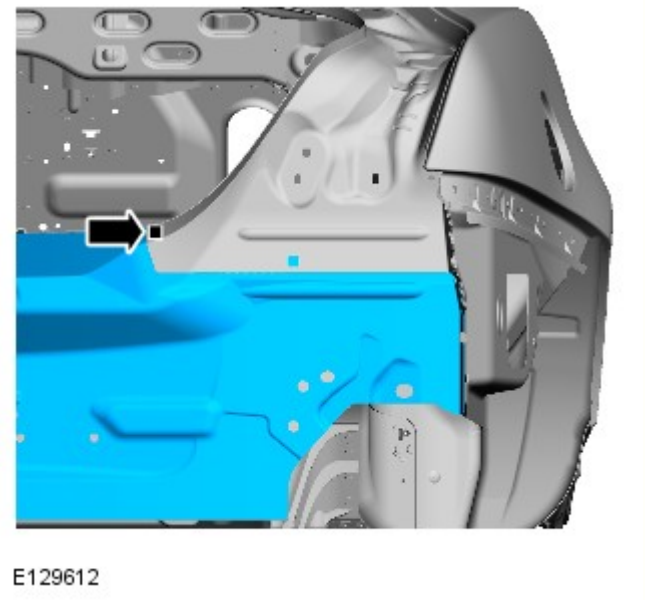
20. Using the ESN50, install the self piercing rivets into the rear floor side extension.



21. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel lower extension.



22. Remove any excess adhesive.



23. Install 2 MIG plug welds (1 each side) into the quarter panel.

24. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis

- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

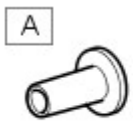
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

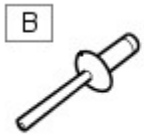
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

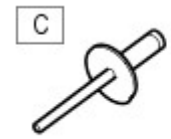
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

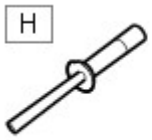
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

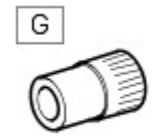
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

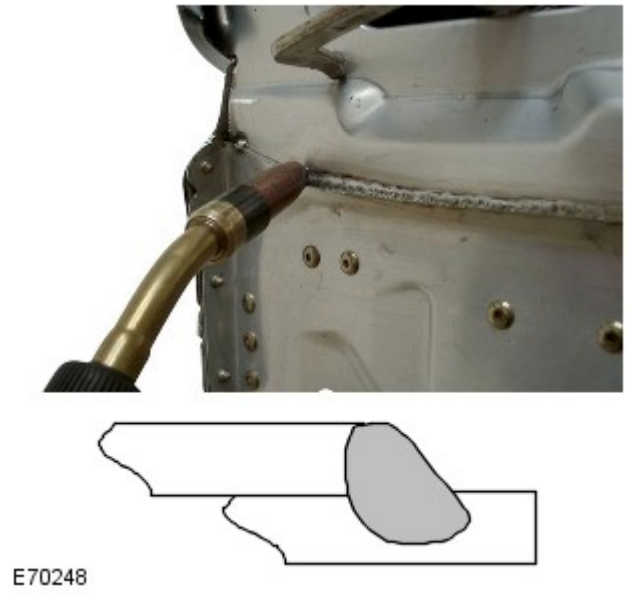
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

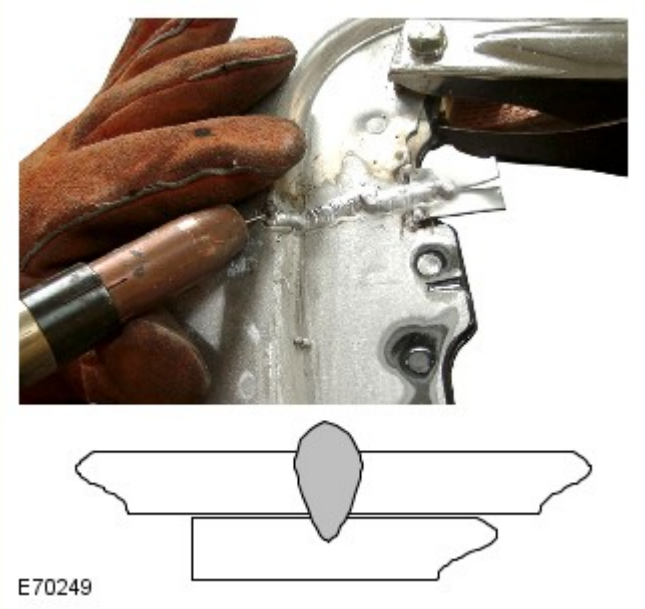
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

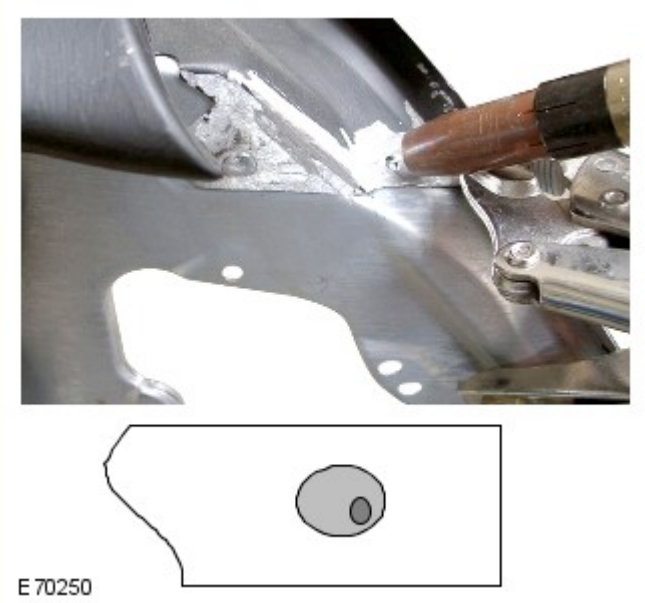
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Repairs - Vehicle Specific Information and Tolerance Checks - Body and Frame

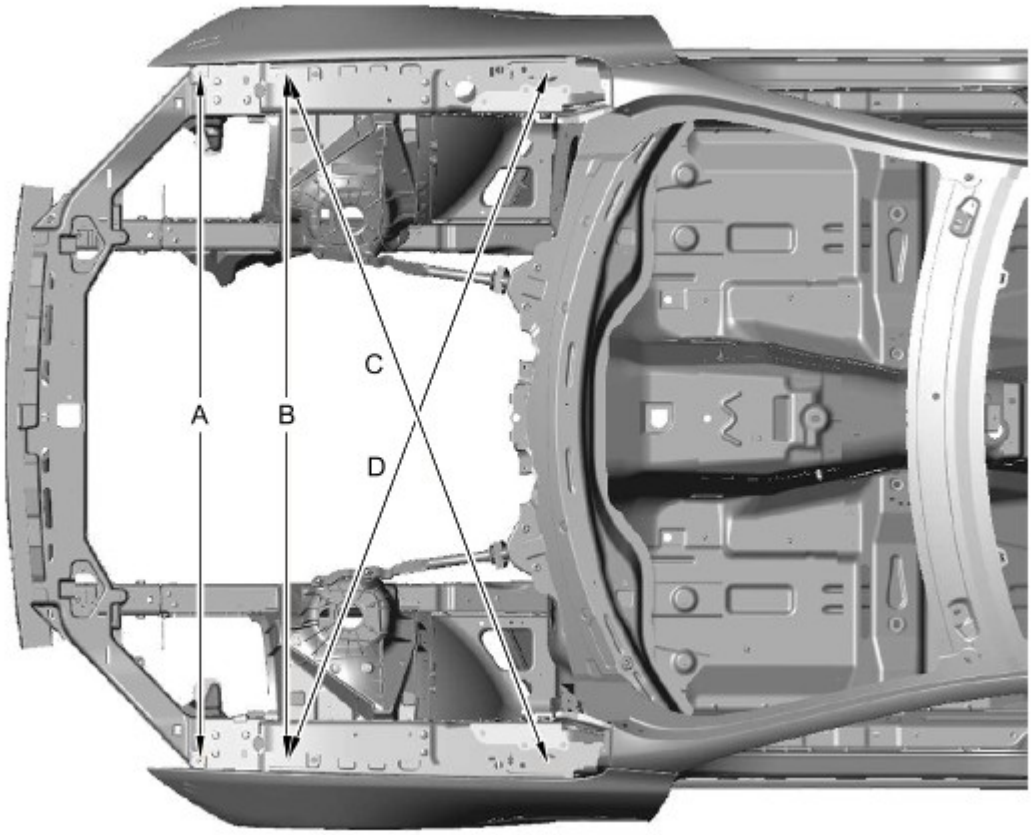
Description and Operation

Front End Body Dimensions

NOTES:

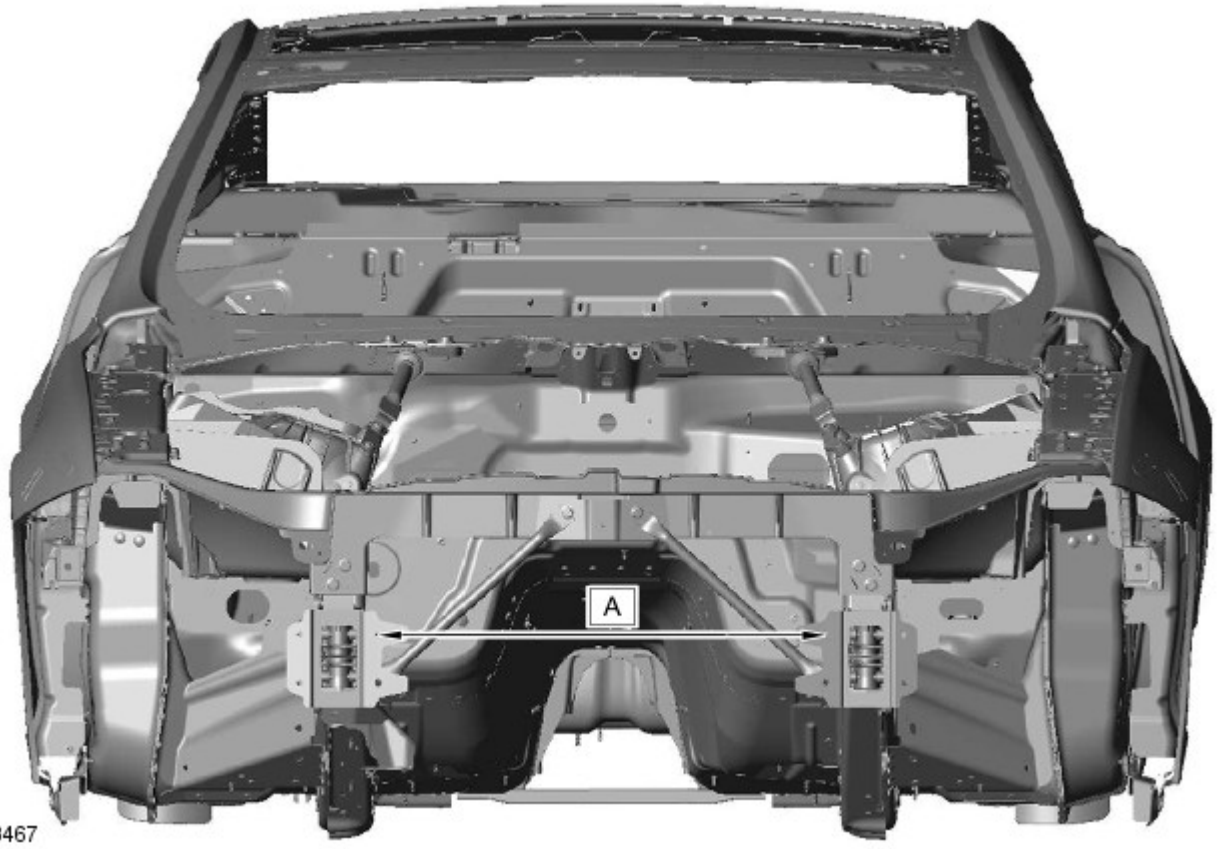
All dimensions shown are in millimetres (mm).

Dimensions shown to holes, are always taken from/to the hole centre. They are also always to the body panel surface, not to the top of bolts or components.



E133463

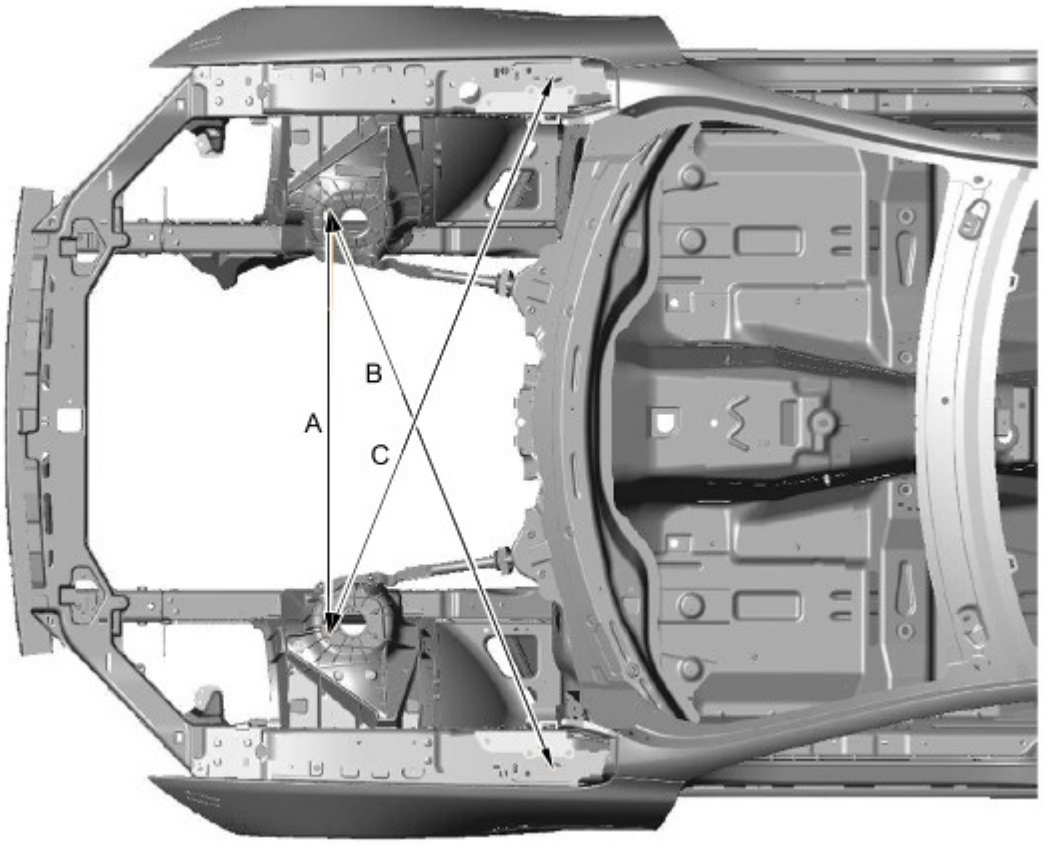
Item	From	To	Dimension
A	Front fender RH, front fixing hole	Front fender LH, front fixing hole	1580.0
B	Front fender RH, second front fixing hole	Front fender LH, second front fixing hole	1570.0
C	Front fender RH, second front fixing hole	Front fender LH, rear fixing hole	1689.4
D	Front fender LH, second front fixing hole	Front fender RH, rear fixing hole	1689.4



E133467

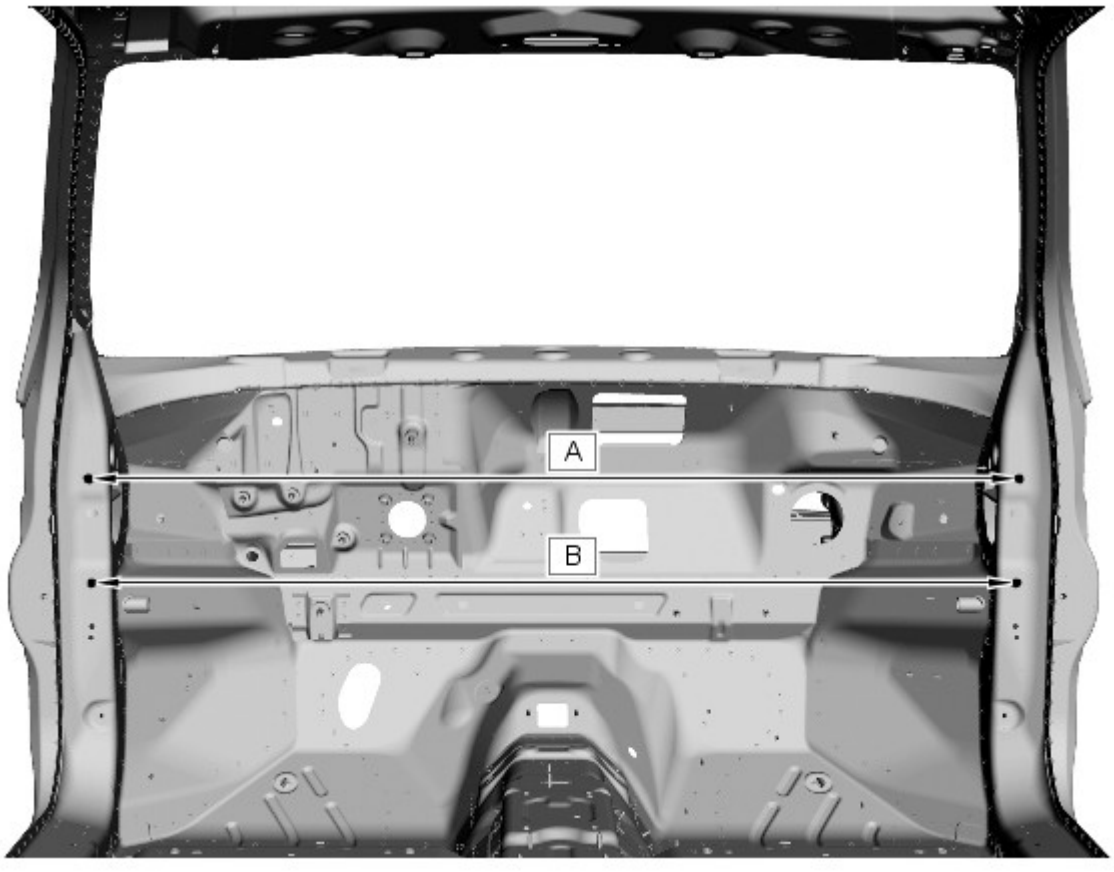
Item	From	To	Dimension

A	Side member deformation element RH, top inboard fixing hole	Side member deformation element LH, top inboard fixing hole	712.5



E133468

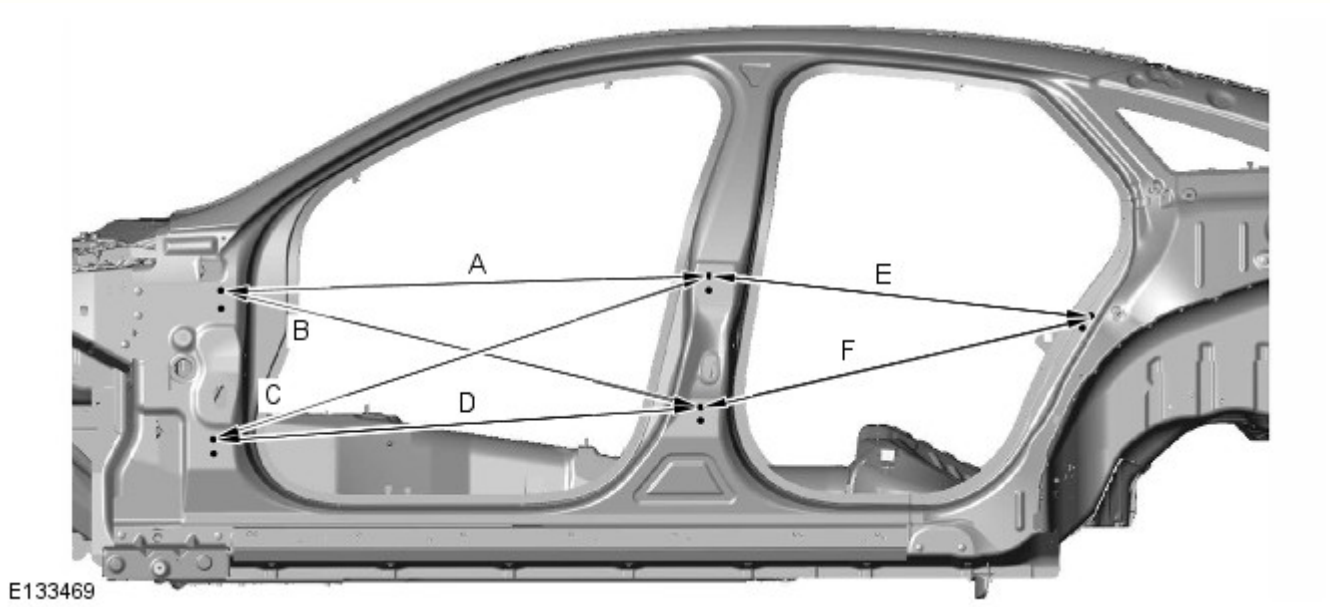
Item	From	To	Dimension
A	Suspension top mount RH, front outboard fixing	Suspension top mount LH, front outboard fixing	986.5
B	Suspension top mount RH, front outboard fixing	Front fender LH, rear fixing	1379.9
C	Suspension top mount LH, front outboard fixing	Front fender RH, rear fixing	1379.9



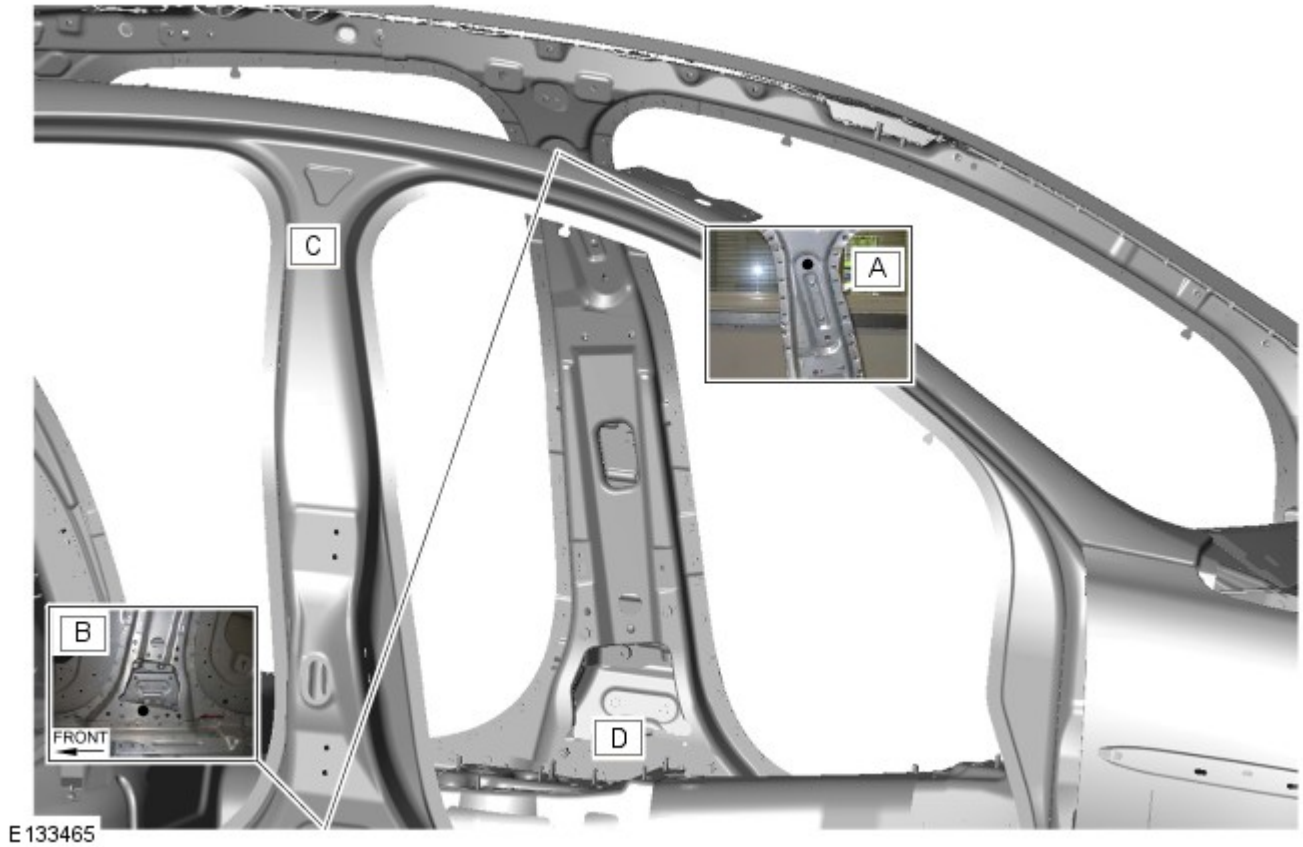
E133476

Item	From	To	Dimension
A	Instrument panel carrier RH top fixing hole	Instrument panel carrier LH top fixing hole	1416
B	Instrument panel carrier RH bottom fixing hole	Instrument panel carrier LH bottom fixing hole	1416

Side Panel Dimensions

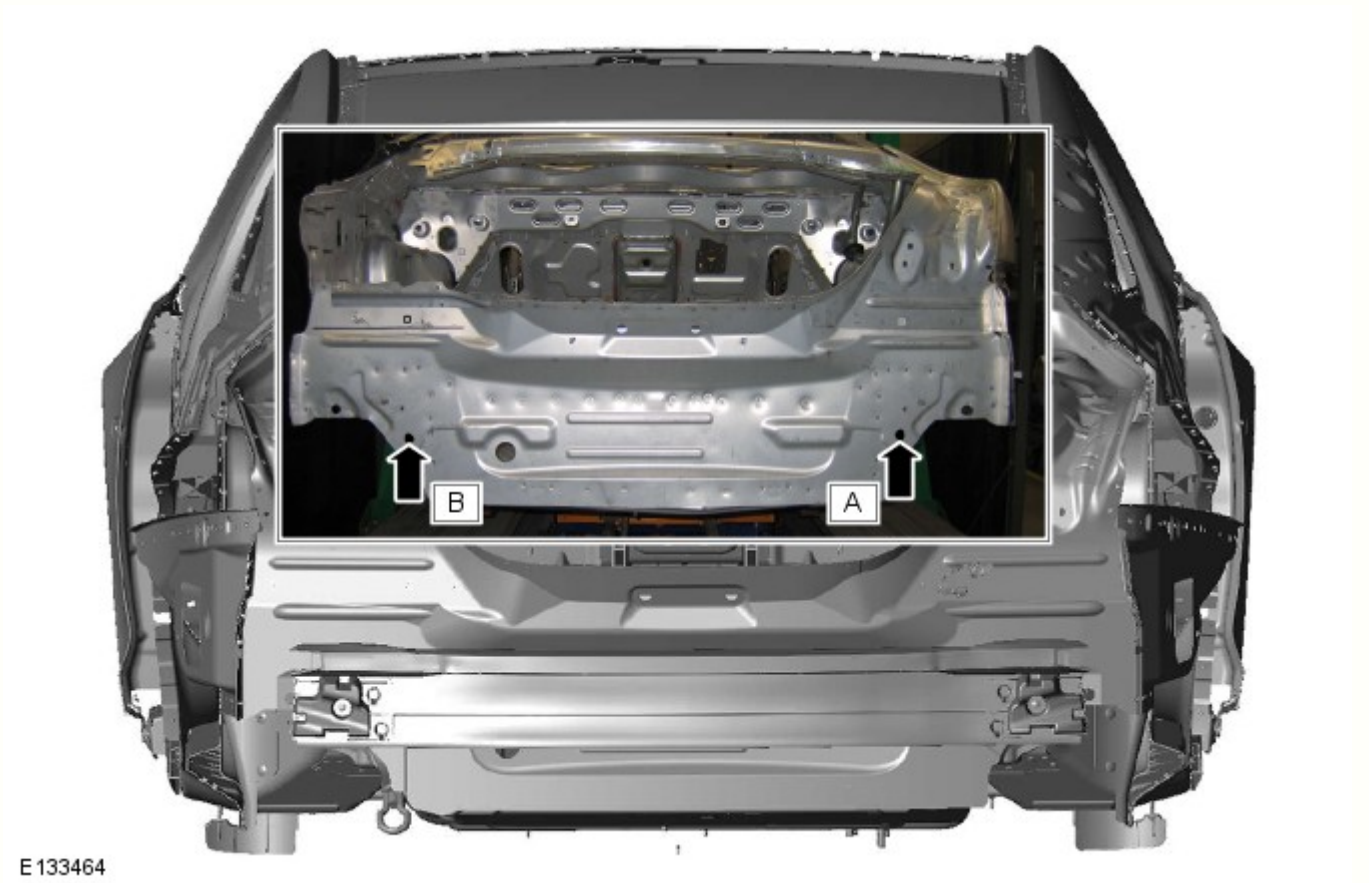


Item	From	To	Dimension
A	Front door top hinge, top fixing hole	Rear door top hinge, top fixing hole	1109.1
B	Front door top hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1119.9
C	Front door bottom hinge, top fixing hole	Rear door top hinge, top fixing hole	1184.8
D	Front door bottom hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1108.9
E (short wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	885.6
E (long wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	1009.5
F (short wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	914.0
F (long wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	1036.8



Item	From	To	Dimension
A-B	Front seat belt adjuster LH, top fixing hole	Front seat belt retractor RH, mounting hole	1606.2
C-D	Front seat belt adjuster RH, top fixing hole	Front seat belt retractor LH, mounting hole	1606.2

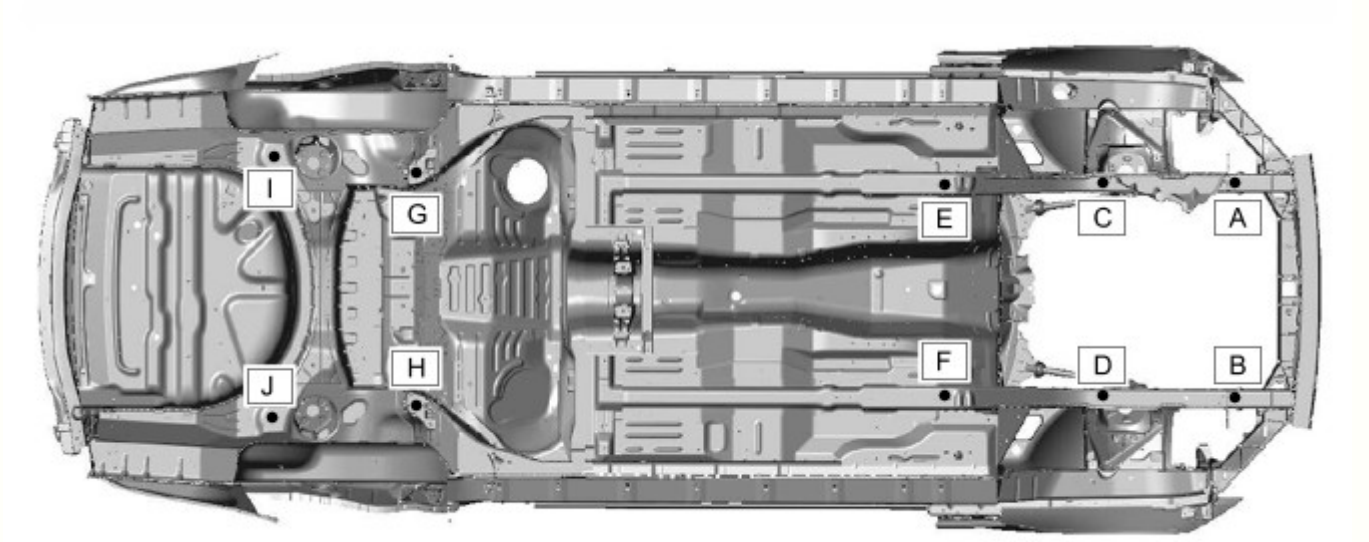
Rear End Body Dimensions



E133464

Item	From	To	Dimension
A	Rear bumper RH lower fixing hole	Rear bumper LH lower fixing hole	995.92

Under Body Dimensions



E133470

Item	From	To	Dimension
A-B	Front subframe, RH front fixing hole	Front subframe, LH front fixing hole	839.0
C-D	Front subframe, RH rear fixing hole	Front subframe, LH rear fixing hole	833.0
E-F	Front side member RH, tooling hole	Front side member LH, tooling hole	820.0
A-D	Front subframe, RH front fixing hole	Front subframe, LH rear fixing hole	982.5

B-C	Front subframe, LH front fixing hole	Front subframe, RH rear fixing hole	982.5

I-J	Rear subframe, RH rear fixing hole	Rear subframe, LH rear fixing hole	1015.3
G-J	Rear subframe, RH front fixing hole	Rear subframe, LH rear fixing hole	1136.9
H-I	Rear subframe, LH front fixing hole	Rear subframe, RH rear fixing hole	1136.9
A-G (short wheel base)	Front subframe, RH front fixing hole	Rear subframe, RH front fixing hole	3181.6
B-H (short wheel base)	Front subframe, LH front fixing hole	Rear subframe, LH front fixing hole	3181.6
A-H (short wheel base)	Front subframe, RH front fixing hole	Rear subframe, LH front fixing hole	3299.3
B-G (short wheel base)	Front subframe, LH front fixing hole	Rear subframe, RH front fixing hole	3299.3
A-G (long wheel base)	Front subframe, RH front fixing hole	Rear subframe, RH front fixing hole	3306.6
B-H (long wheel base)	Front subframe, LH front fixing hole	Rear subframe, LH front fixing hole	3306.6
A-H (long wheel base)	Front subframe, RH front fixing hole	Rear subframe, LH front fixing hole	3419.9
B-G (long wheel base)	Front subframe, LH front fixing hole	Rear subframe, RH front fixing hole	3419.9

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

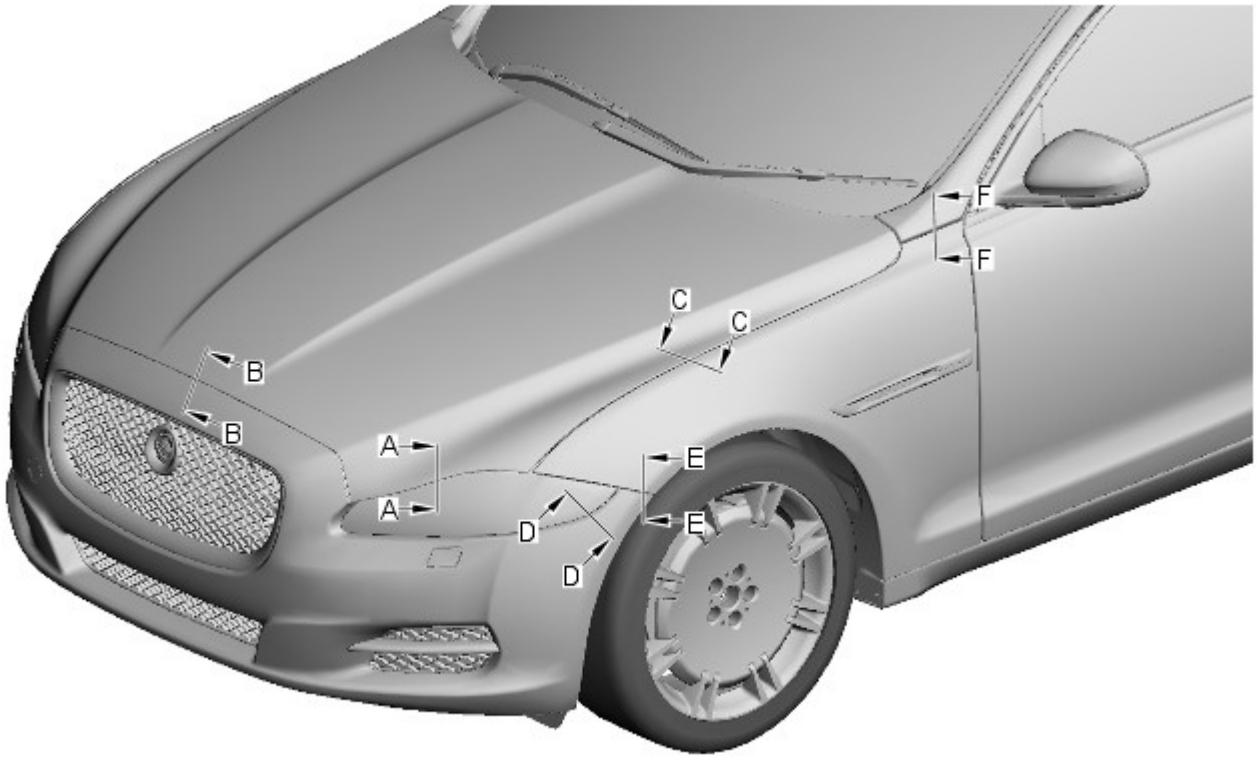
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

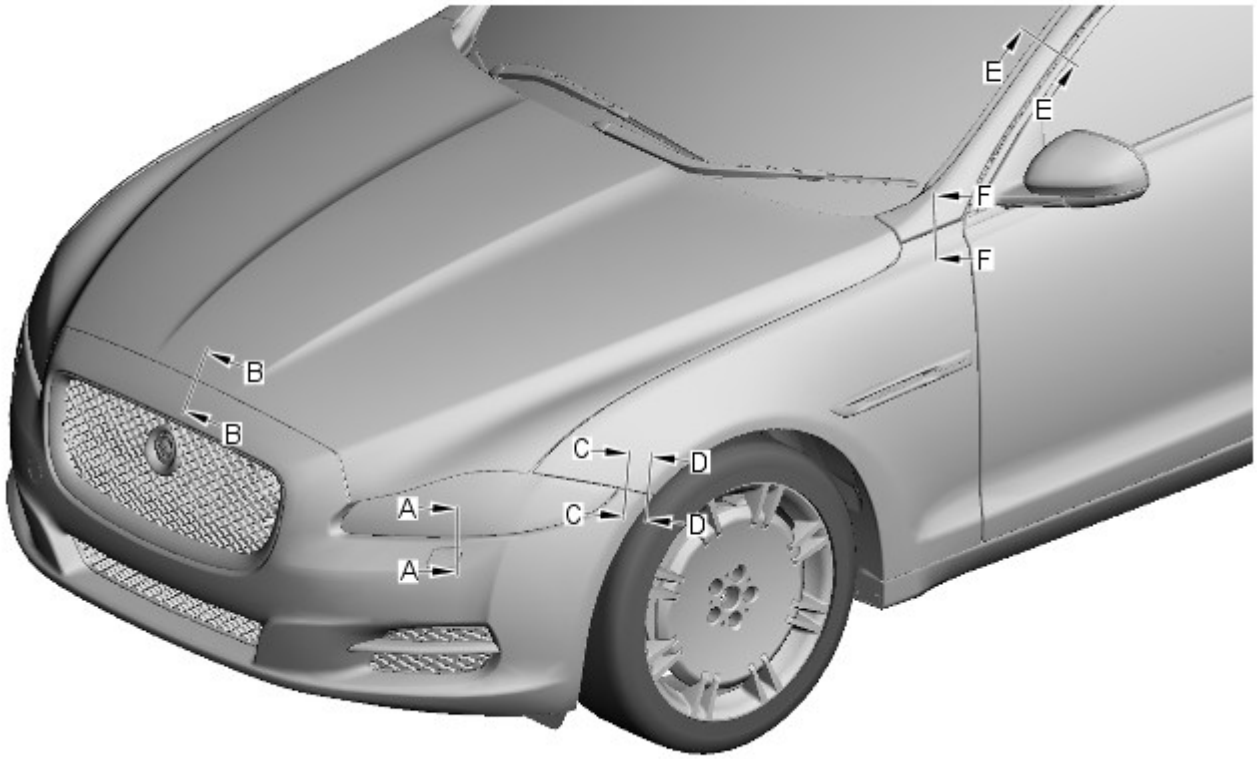
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



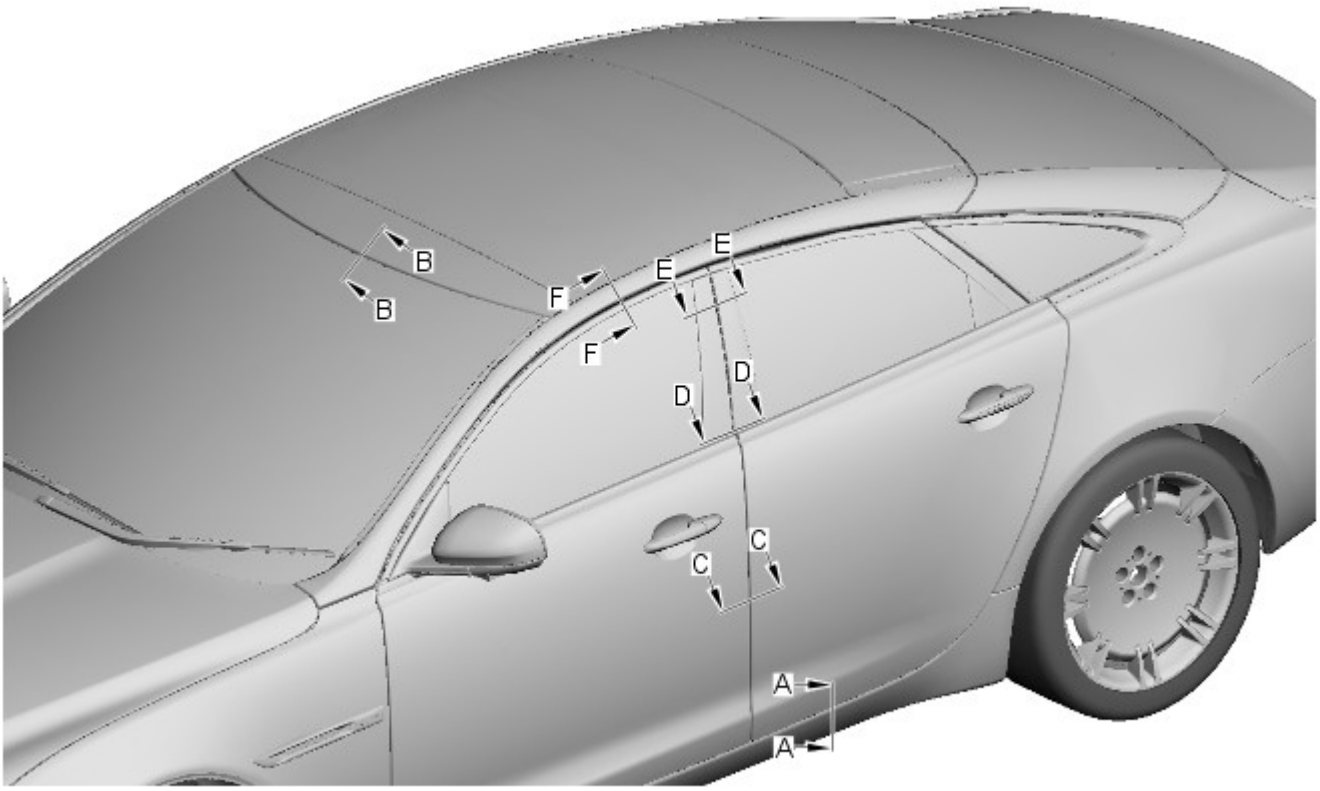
E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



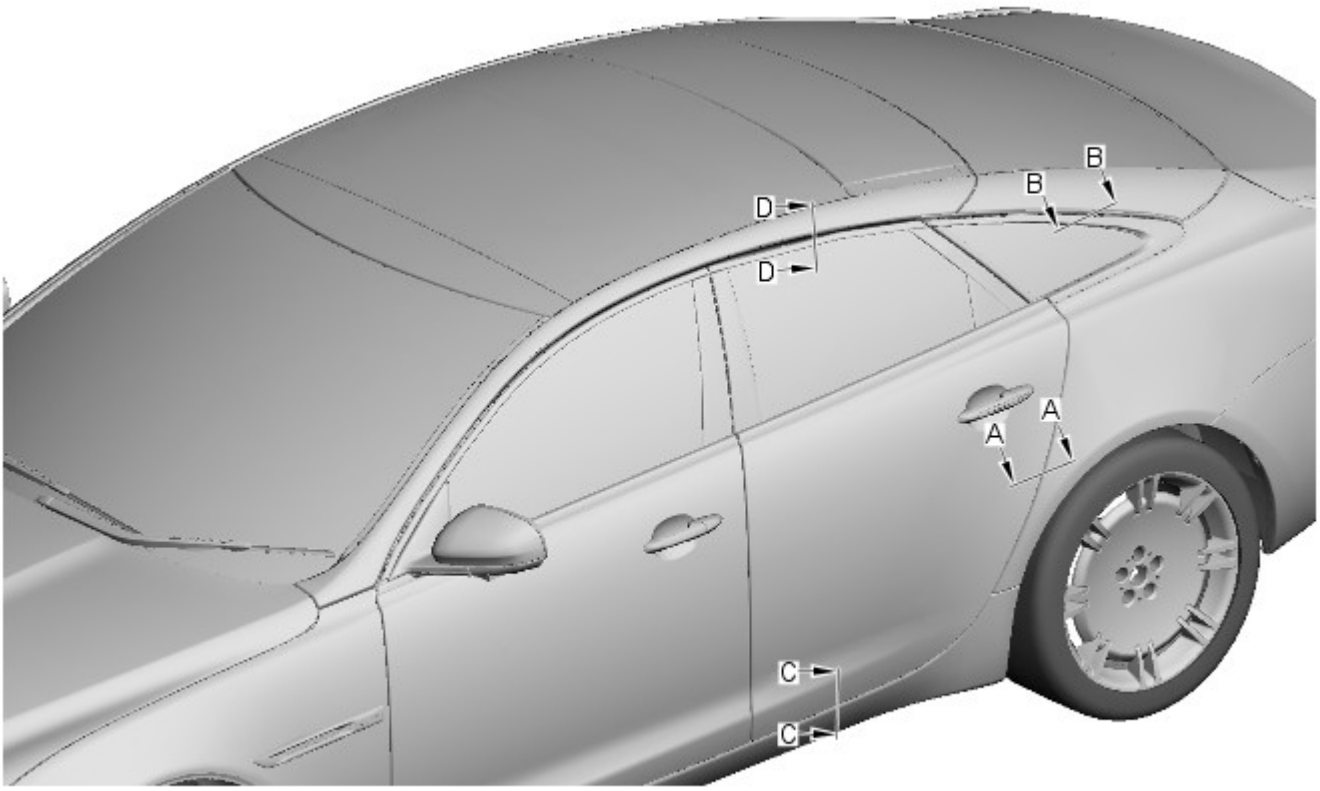
E133472

A-A	Front bumper cover to headlamp	1.0 ± 0.5
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Front bumper cover to front fender	0.0 + 1.0
D-D	Front bumper cover to front fender	0.0 + 1.0
E-E	Front door to A-pillar	4.0 ± 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



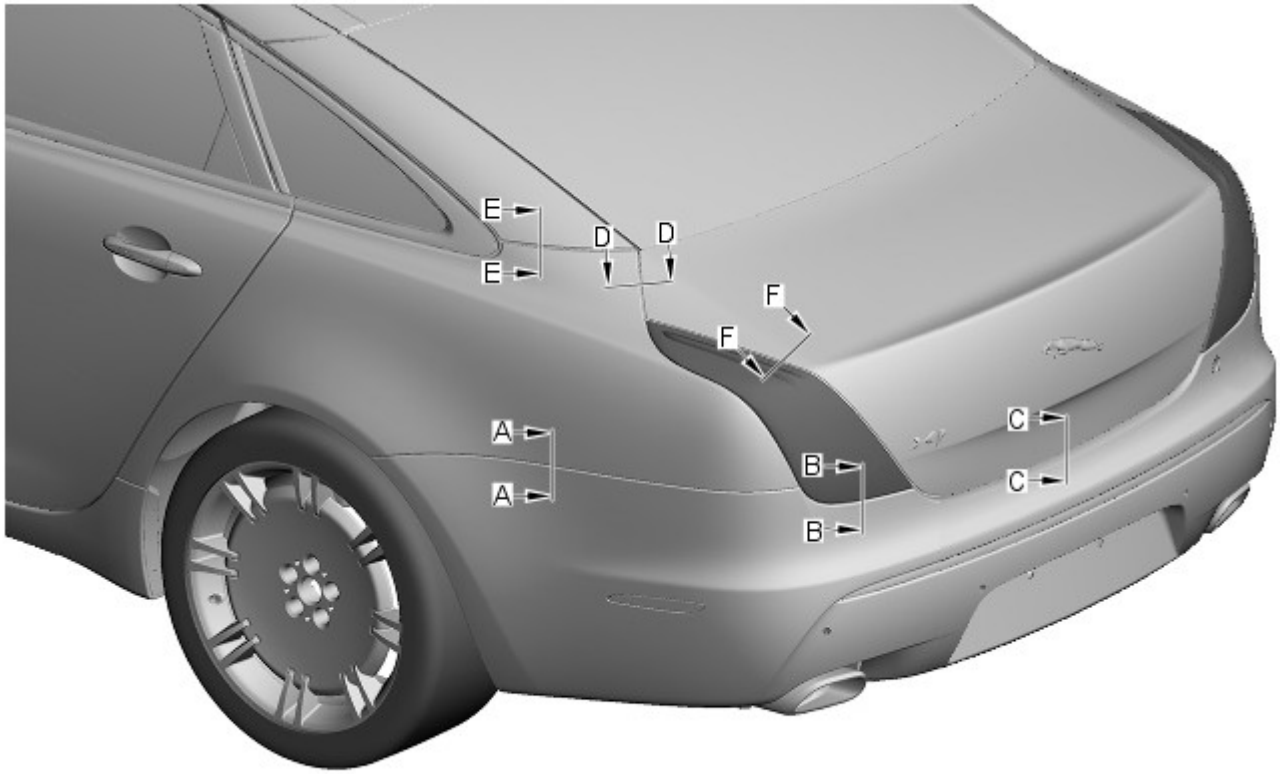
E133473

A-A	Rear door to rocker panel	5.0 ± 1.0
B-B	Windshield encapsulation to front glass roof panel encapsulation	0.0
C-C	Front door to rear door	4.0 ± 1.0
D-D	Front door to rear door	4.0 ± 1.0
E-E	Front door to rear door	4.0 ± 1.0
F-F	Front door to A-pillar / roof panel	6.5 ± 1.0



E133474

A-A	Rear door to quarter panel	4.0 ± 1.0
B-B	Rear quarter window glass encapsulation to quarter panel finisher	0.0
C-C	Rear door to rocker panel	5.0 ± 1.0
D-D	Rear door to roof panel	6.5 ± 1.0



E133475

A-A	Rear bumper cover to quarter panel	0.0 + 1.0
B-B	Rear bumper cover to rear lamp assembly	1.0 ± 0.5
C-C	Rear bumper cover to luggage compartment lid	6.0 ± 1.0
D-D	Quarter panel to luggage compartment lid	6.0 ± 1.0

F-F	Luggage compartment lid to rear lamp assembly	3.5 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules
- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat

- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

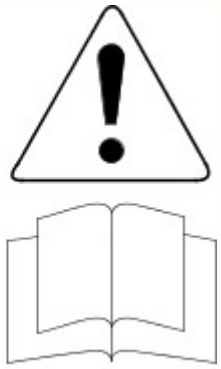
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

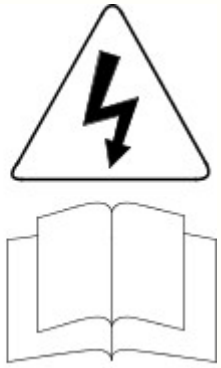
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



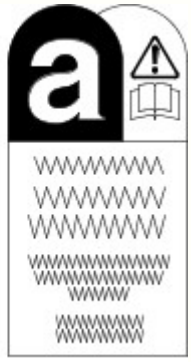
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.

VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing

damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol - Rear Muffler

Removal and Installation

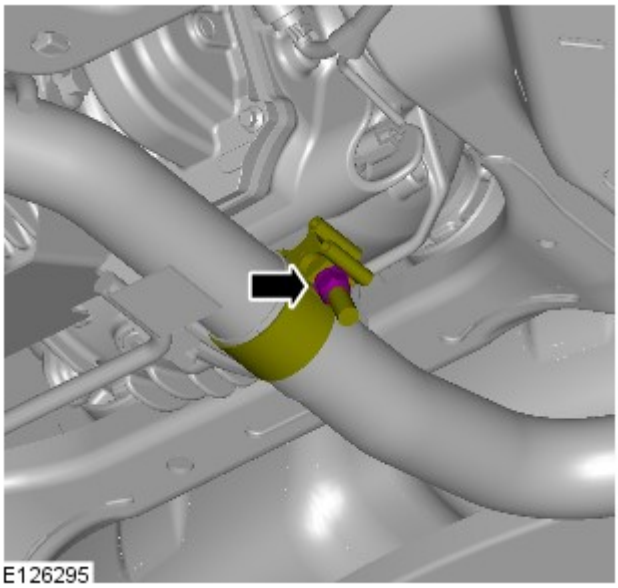
Removal

WARNING: Observe due care when working near a hot exhaust system.

NOTE: Removal steps in this procedure may contain installation details.

1. WARNING: Make sure to support the vehicle with axle stands.

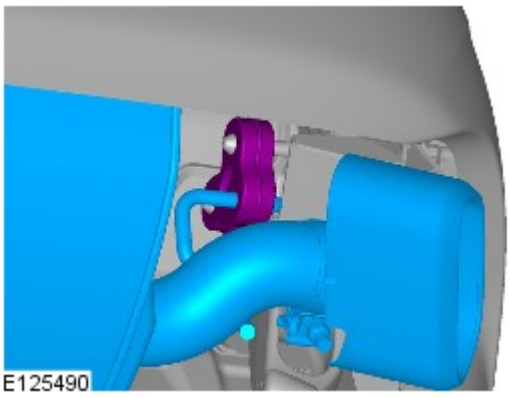
   Raise and support the vehicle.



2. CAUTION: Make sure that these components are installed to the noted removal position.

   NOTE: Left-hand shown, right-hand similar.

   Torque: 55 Nm



3. CAUTION: Make sure that these components are installed to the noted removal position.

   NOTES:

   Left-hand shown, right-hand similar.

   Apply lubricant to the exhaust mount to aid installation.

Installation

1. To install, reverse the removal procedure.

Published: 11-May-2011

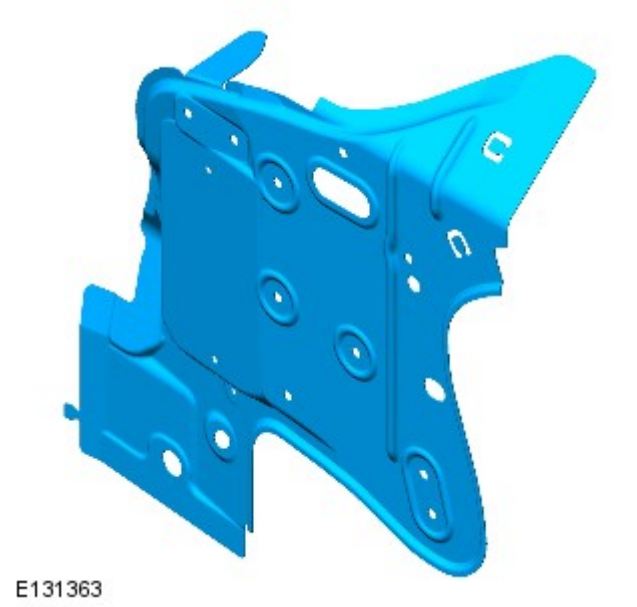
Rear End Sheet Metal Repairs - Inner Quarter Panel Extension

Removal and Installation

Removal

1. NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

The inner quarter panel extension is a category A repair.



2. NOTE: The inner quarter panel extension is manufactured from aluminium alloy 5754-NG.

The inner quarter panel extension is serviced as a separate rivetted and bonded panel.

3. The inner quarter panel extension is installed in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Back panel
   - Luggage compartment lid
   - Luggage compartment lid hinge
   - Quarter panel
   - Rear window glass

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove the quarter panel.
For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

7.

Remove the back panel.
For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

8. Remove the rear suspension vertical accelerometer.
For additional information, refer to: Rear Suspension Vertical Accelerometer (204-05 Vehicle Dynamic Suspension, Removal and Installation).

9. If the right-hand inner quarter panel extension is to be installed, remove the differential locking module.

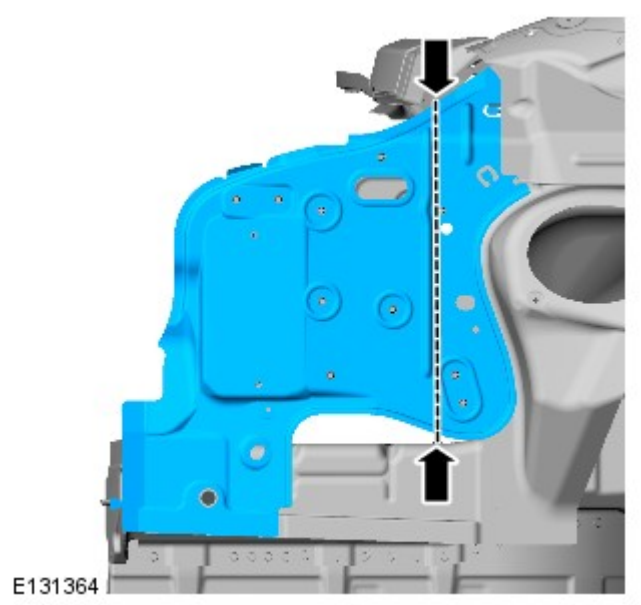
10. If the right-hand inner quarter panel extension is to be installed, remove the adaptive damping module.
For additional information, refer to: Adaptive Damping Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

11. If the right-hand inner quarter panel extension is to be installed, remove the air suspension control module.
For additional information, refer to: Air Suspension Control Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

12. Remove any electrical components in the local area of repair to prevent damage.

13. Release and position the loadspace wiring harness to one side.

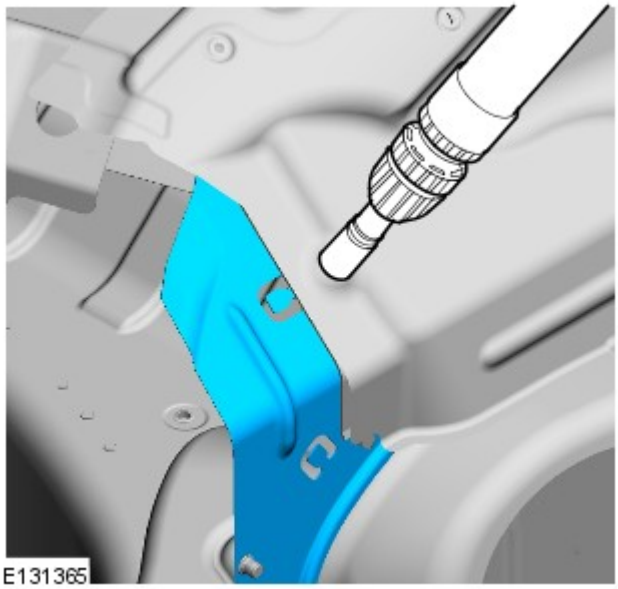
14. Prior to removal, mark the position of the inner quarter panel extension in relation to adjacent panels for ease of alignment on installation.



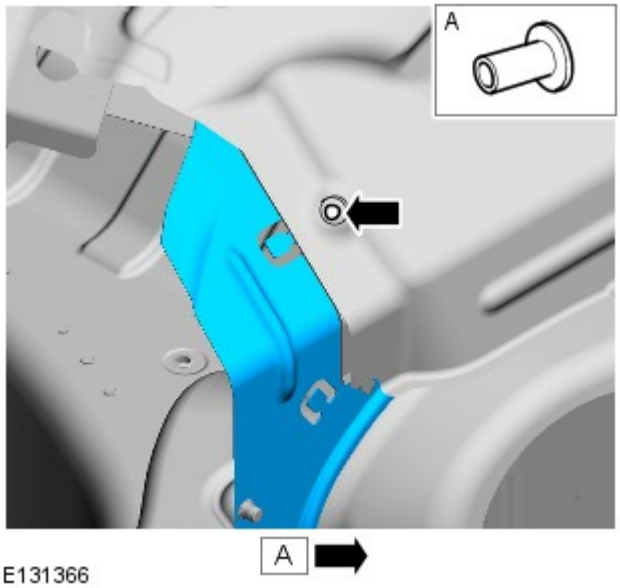
15. CAUTION: Use care not to damage adjacent panels.

Saw cut to remove the panel bulk as indicated.

16. Use a hole saw to cut an access hole to expose the hidden self piercing rivet.

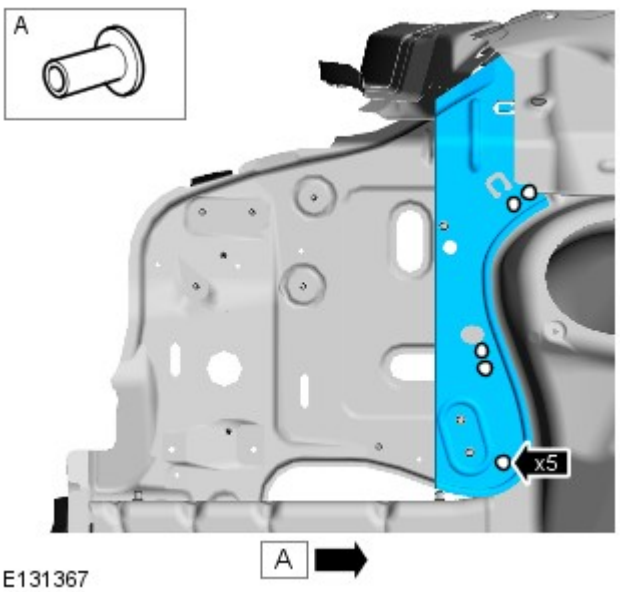


E131365



E131366

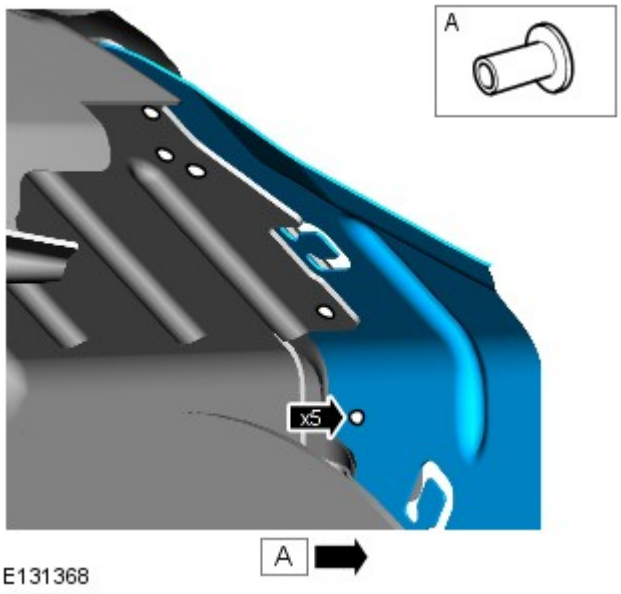
17. Using a 6.5mm Cryobit drill bit, remove the self piercing rivet through the access hole.



E131367

18. NOTE: Drill through all panels as Hemloks will be used for installation.

Using a combination of the ESN50 and a 6.5mm Cryobit drill bit remove the self piercing rivets.



19. NOTE: Drill through all panels as Hemloks will be used for installation.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets.

20. Separate the joints and remove the old panel remnant.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. NOTE: Use the marks made prior to removal to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

4. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed.

5. Remove the new panel.

6. Deburr the drilled holes.

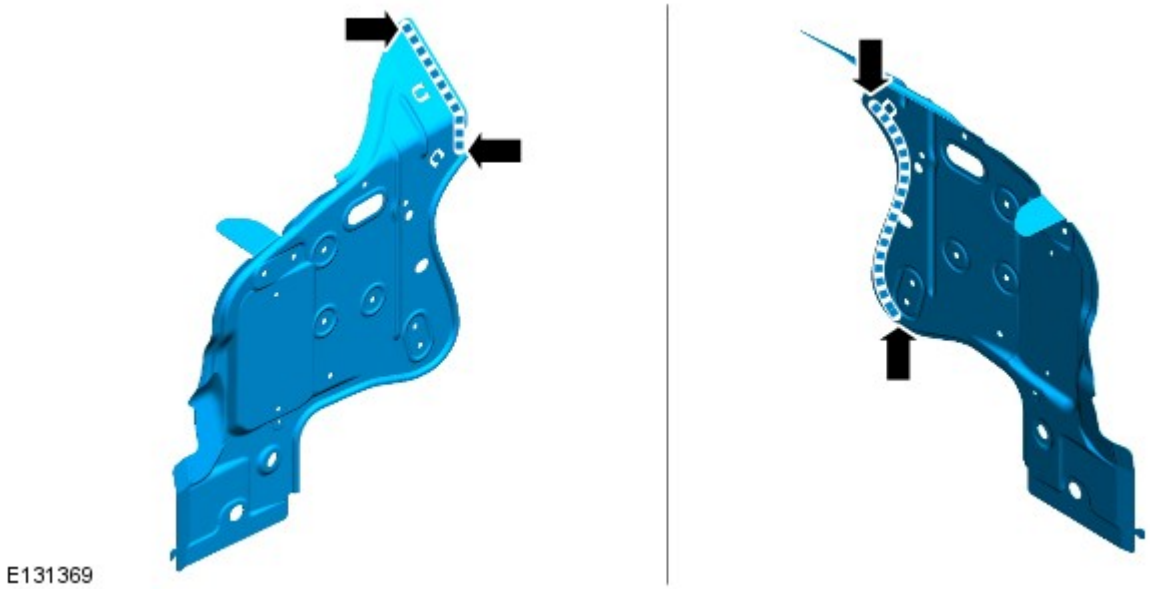
7. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

8. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

9. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

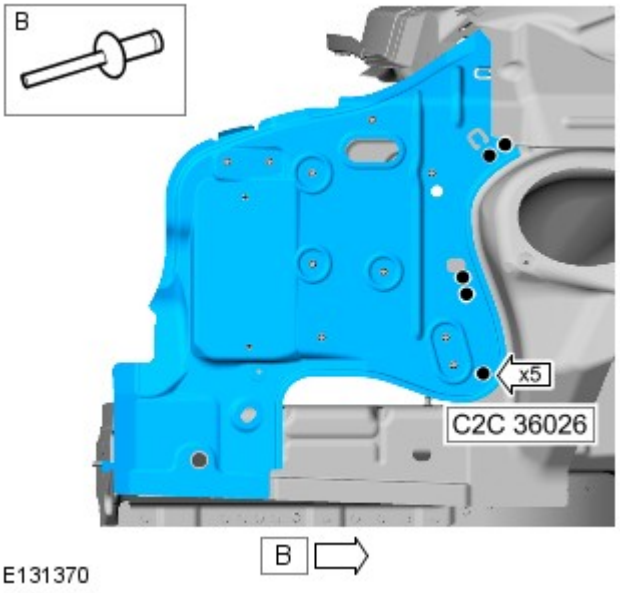
10. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints. Not to the quarter panel or back panel as these will be bonded later.



E131369

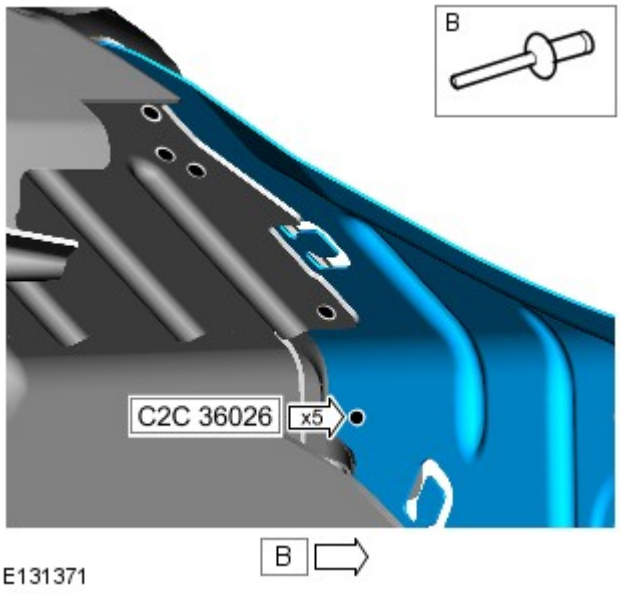
11. Offer up the new panel, align and clamp into position.



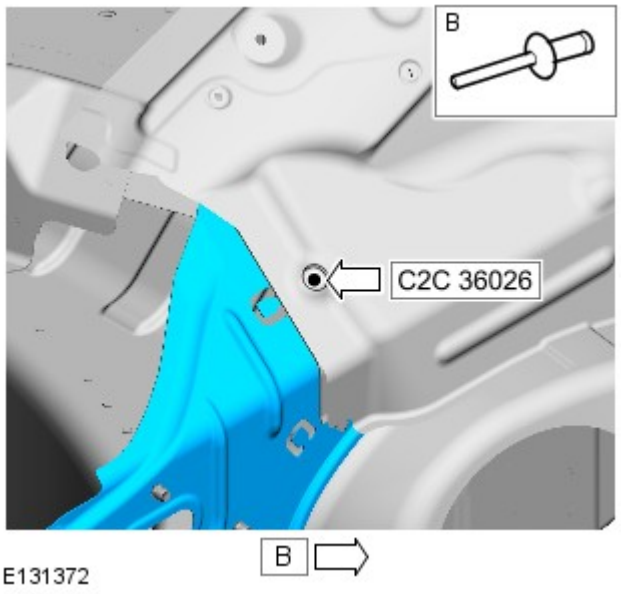
E131370

12. Using the Genesis G4, install the Hemloks.

13. Using the Genesis G4, install the Hemloks.



E131371



E131372

14. Using the Genesis G4, install the Hemloks.

15. Remove any excess adhesive.

16. CAUTION: Make sure that adhesive is applied between the rear floor side extension and the lower flange of the inner quarter panel extension when installing the quarter panel.

The installation of associated panels and components is the reversal of removal procedure.

Vehicle Dynamic Suspension - Adaptive Damping Module

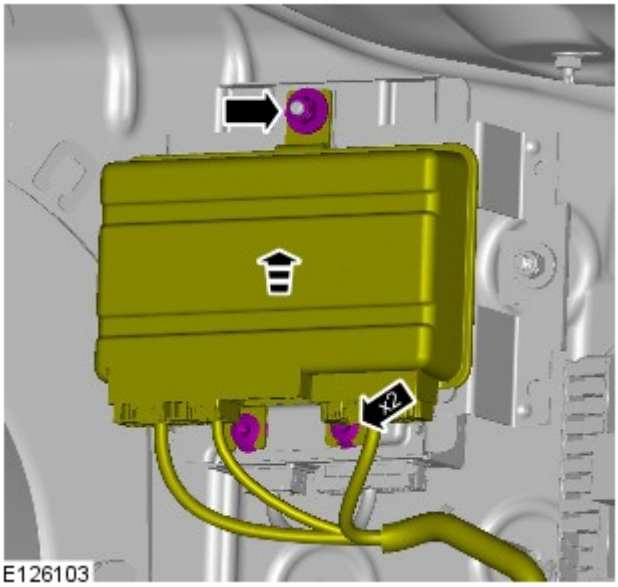
Removal and Installation

Removal

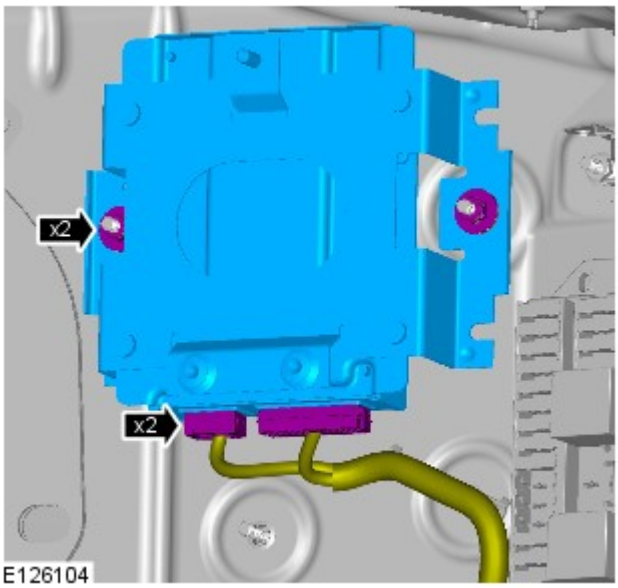
NOTE: Removal steps in this procedure may contain installation details.

1.

Refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation).

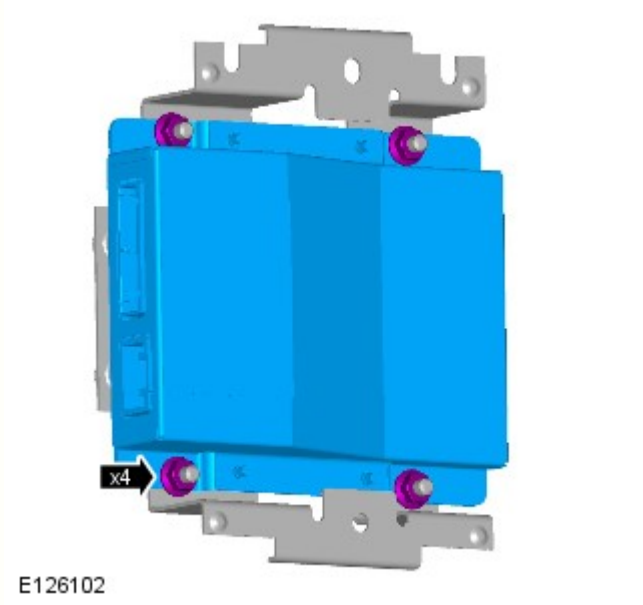


2. *Torque:* 12 Nm



3. *Torque:* 12 Nm

4. *Torque:* 12 Nm



Installation

1. To install, reverse the removal procedure.

Published: 11-May-2011

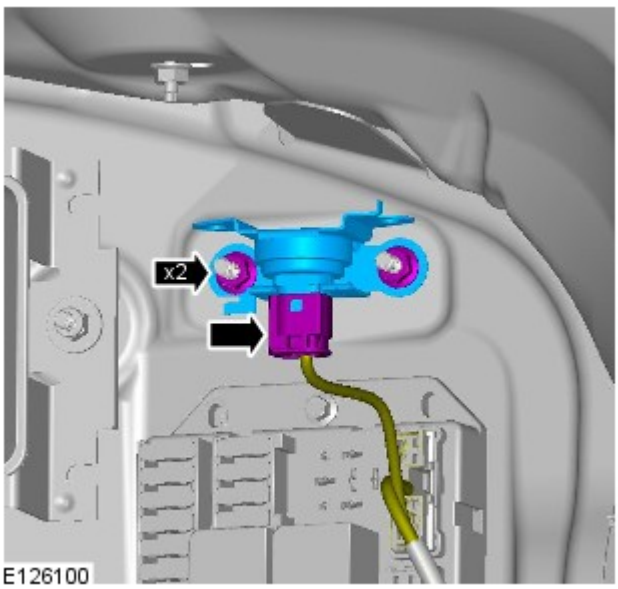
Vehicle Dynamic Suspension - Rear Suspension Vertical Accelerometer

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).



2. CAUTION: The accelerometer is an extremely delicate component and can easily be rendered unserviceable. Never use an accelerometer which has been dropped or subjected to mistreatment of any type.

Torque: 5 Nm

Installation

1. To install, reverse the removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Published: 11-May-2011

Rear End Sheet Metal Repairs - Back Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The back panel is a category A repair.

2. NOTE: The back panel is manufactured from aluminium alloy 5754-NG.

   The back panel is serviced as a separate riveted and bonded panel, it includes the back panel inner.

3. The back panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation) /
Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. Remove the luggage compartment lid weatherstrip.

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove both the rear mufflers.
For additional information, refer to: Rear Muffler (309-00A, Removal and Installation) /
Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the right-hand and left-hand rear muffler heatshields.

12. Remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

13. Remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

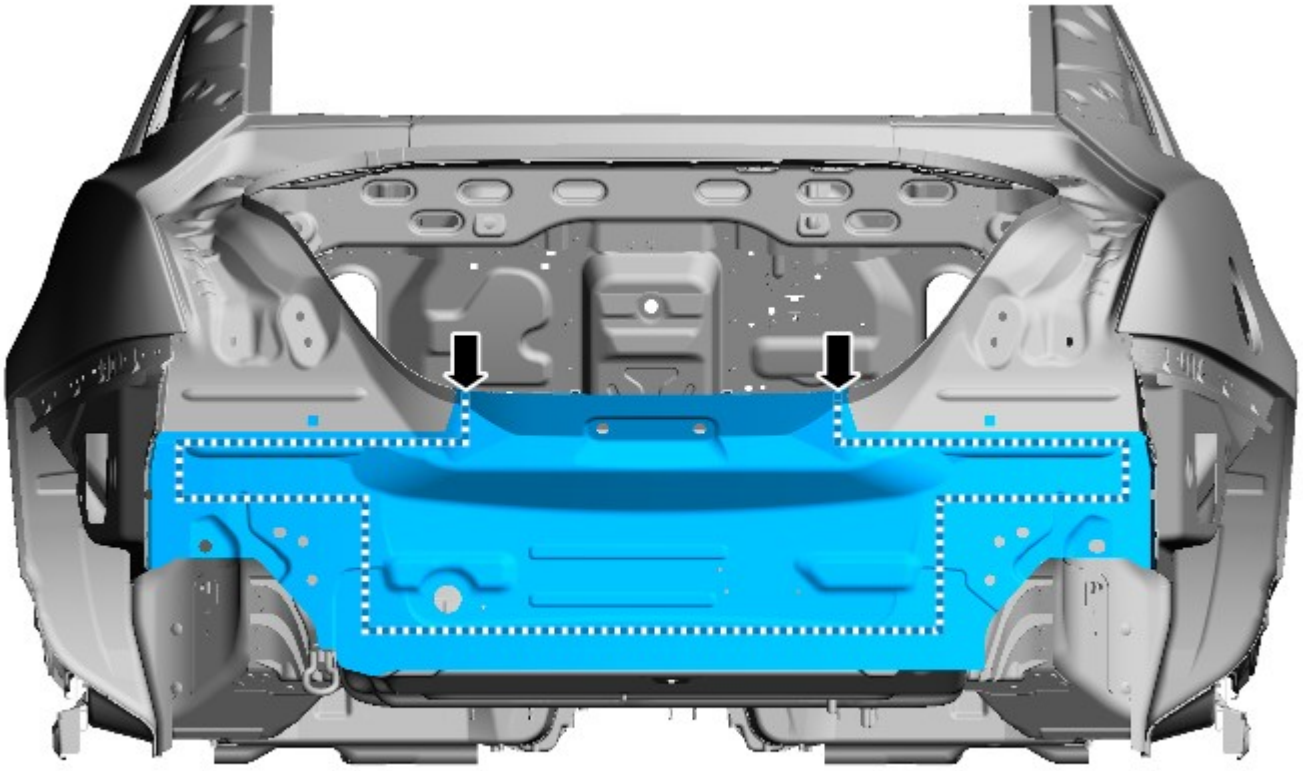
14. Release the back panel and loadspace wiring harness and position it to one side.

15. Remove the luggage compartment latch striker.

16. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

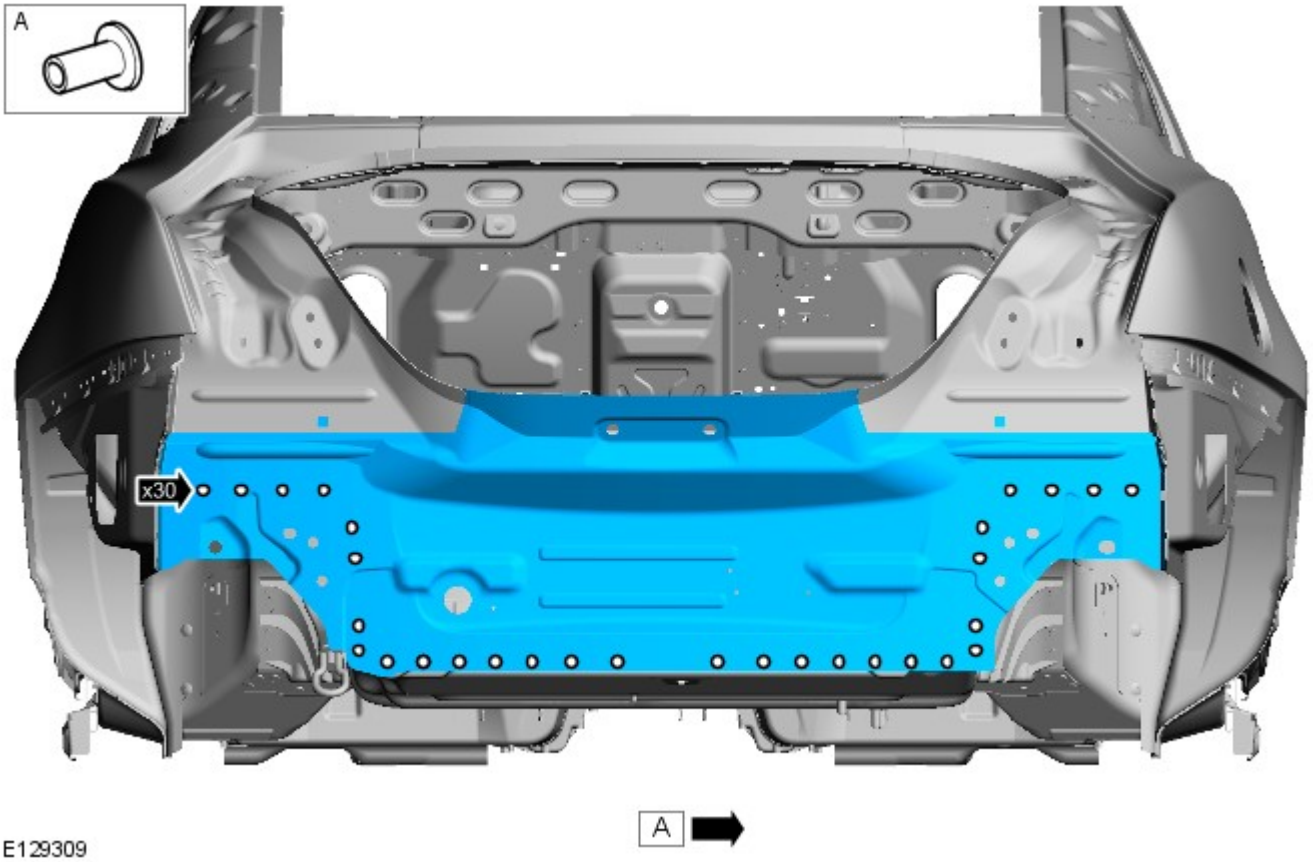
17. Remove any electrical components in the local area of repair to prevent damage.

18. Saw cut the old panel along the point shown in the illustration. This allows access to allow the use of the ESN50.



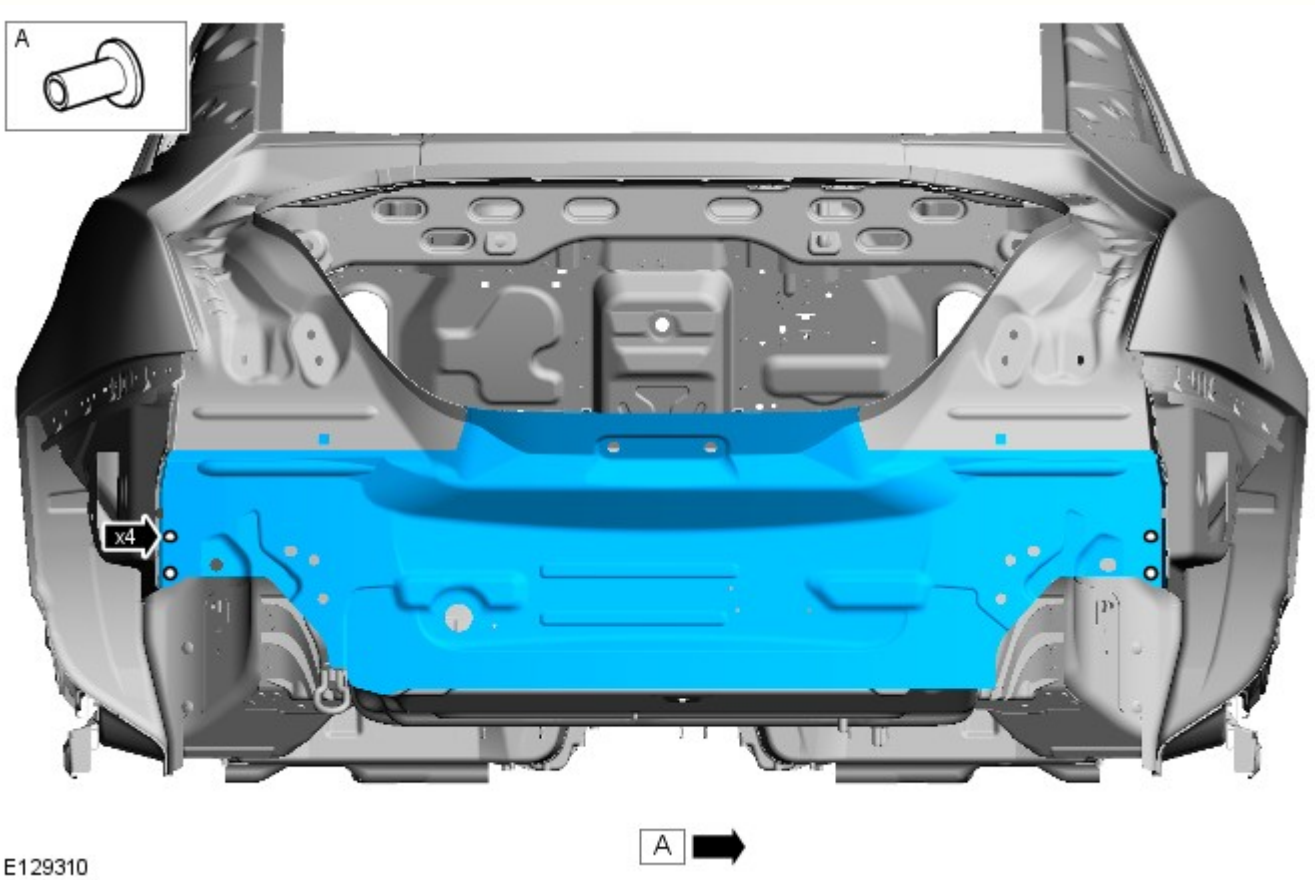
E129308

19. Using the ESN50, remove the self piercing rivets from the spare wheel well and rear side members.



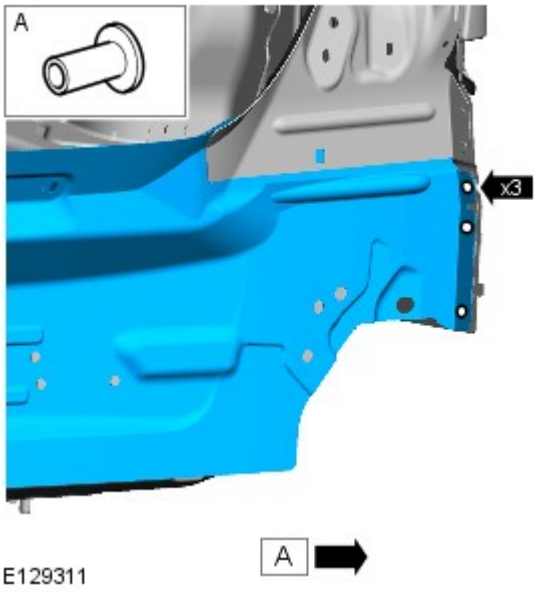
E129309

Using the ESN50, remove the self piercing rivets from the rear floor side extensions.



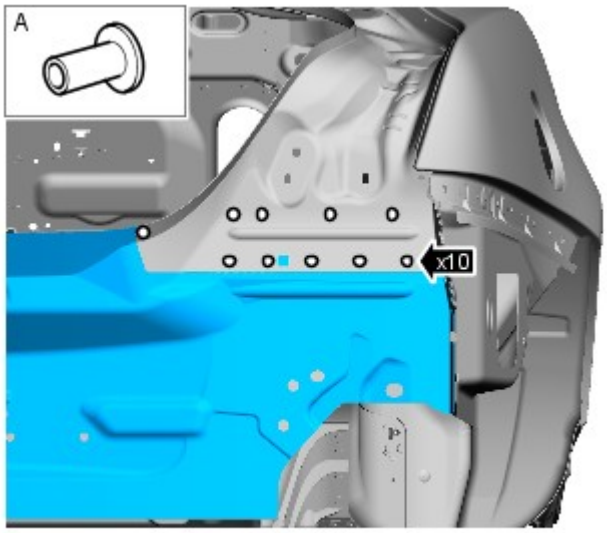
E129310

21. Using the ESN50, remove the self piercing rivets (3 each side) from the quarter panel lower extensions.

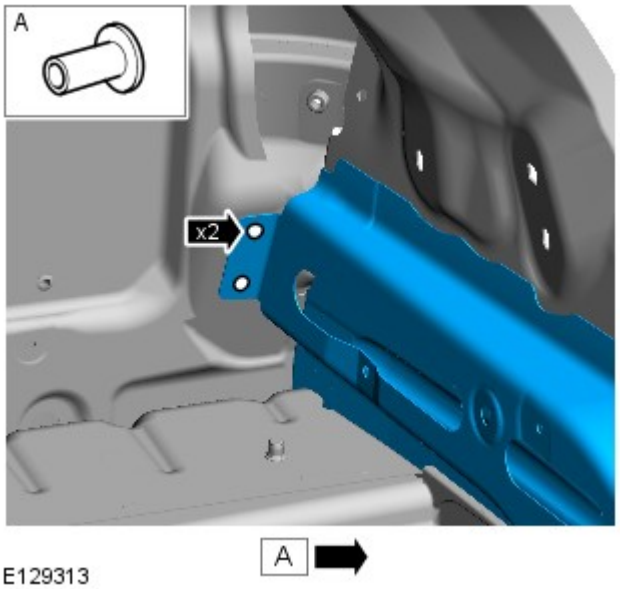


E129311

22. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets (10 each side) from the quarter panels.



E129312

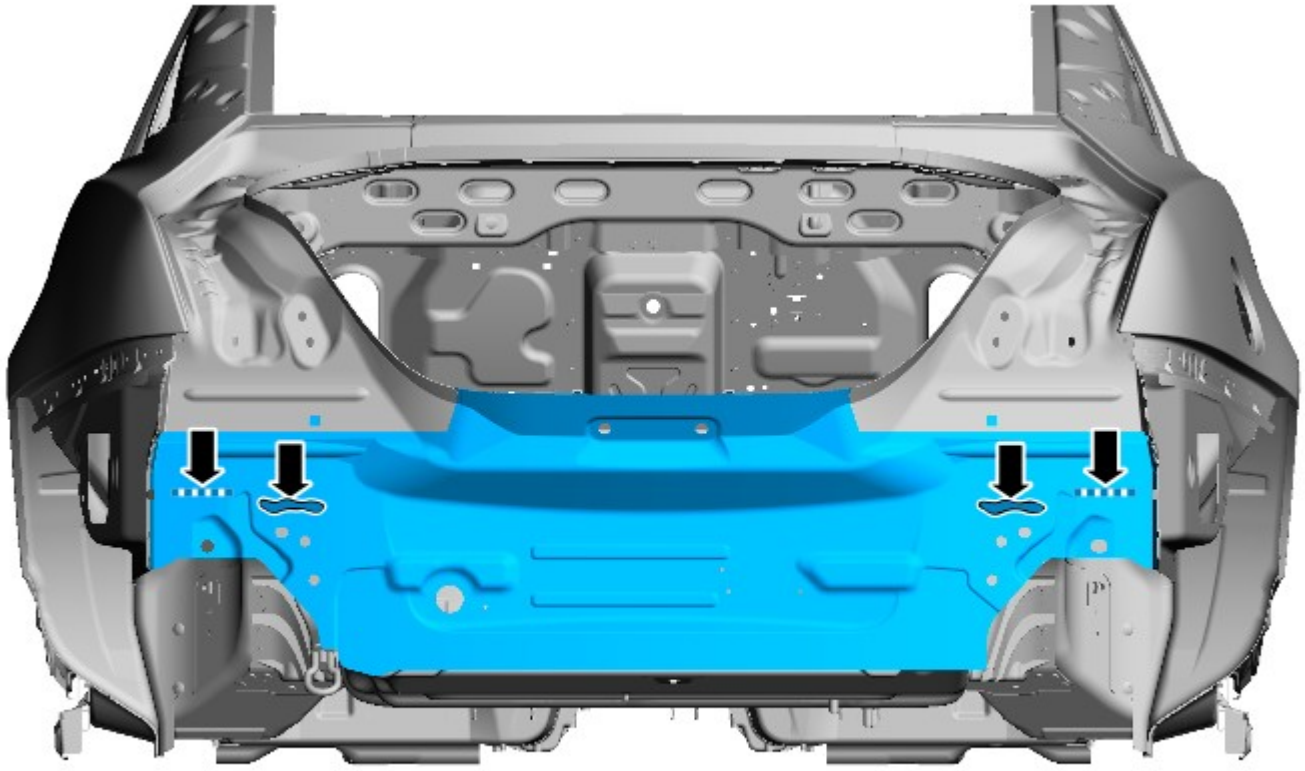


E129313

23. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets (2 each side) from the junction box and modules mounting panels.

24. Separate the joints and remove the old panel, carefully releasing the adhesive at the points illustrated.



E129314

Installation

1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, remove the adhesive residue.

3. Dress flanges where necessary.

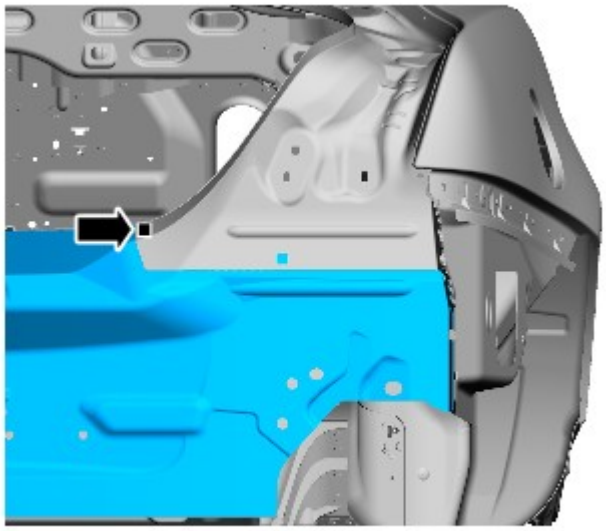
4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

5. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

6. Remove the new panel.

7. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

8. Using a 10mm drill bit, drill 2 holes in the old quarter panel ready for MIG plug welding.



E129612

9. Debur the drilled holes.

10. CAUTION: Use care not to damage the panel.

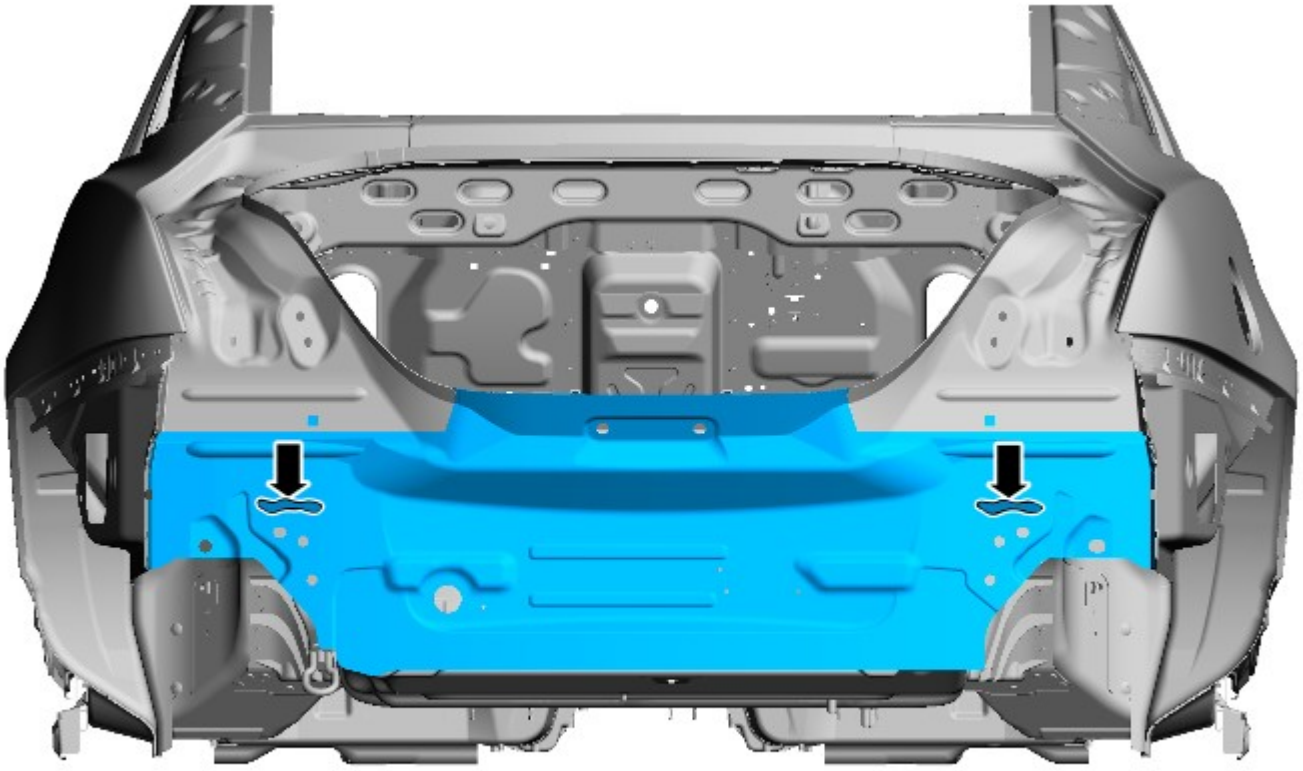
Remove seam sealer where applicable.

11. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

12. Pyrosil the joints.

13. Apply the coupling agent and allow to dry.

14. Apply the semi-rigid sealer at the points illustrated.



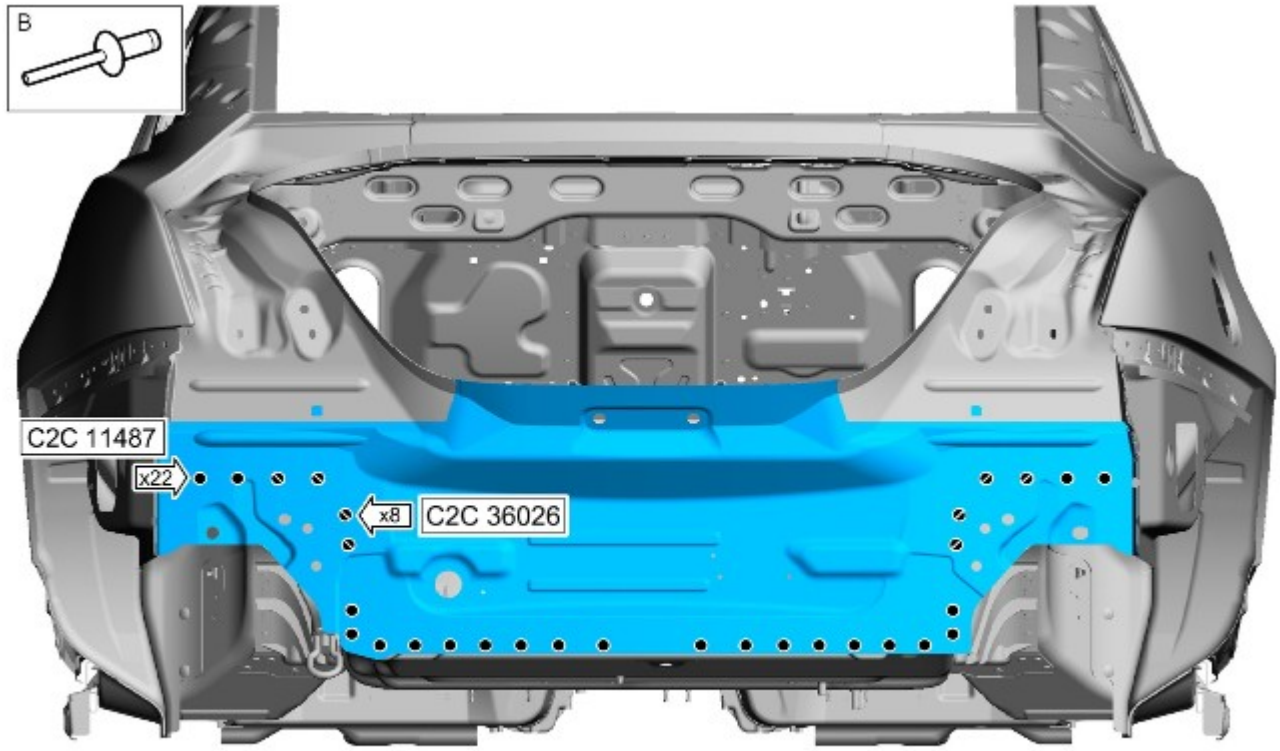
E129315

15. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

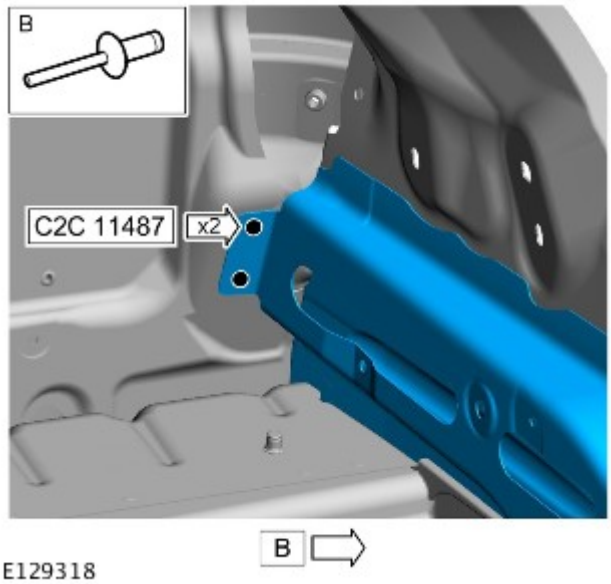
Apply a 5mm zig zag style bead of 3M 8115 adhesive to the body joints.

16. Offer up the new panel and clamp into position.

17. Using the Genesis G4, install 8 Hemloks (4 each side) into the rear side member. Install a further 22 Hemloks (11 each side) into the spare wheel well and rear floor side extension.



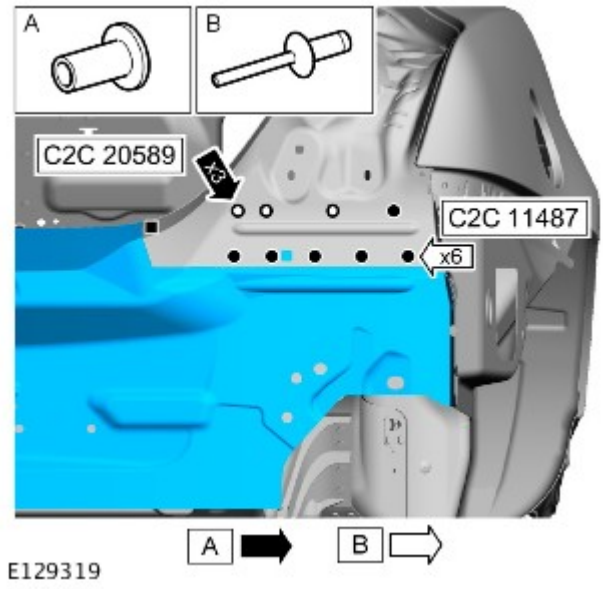
E129317



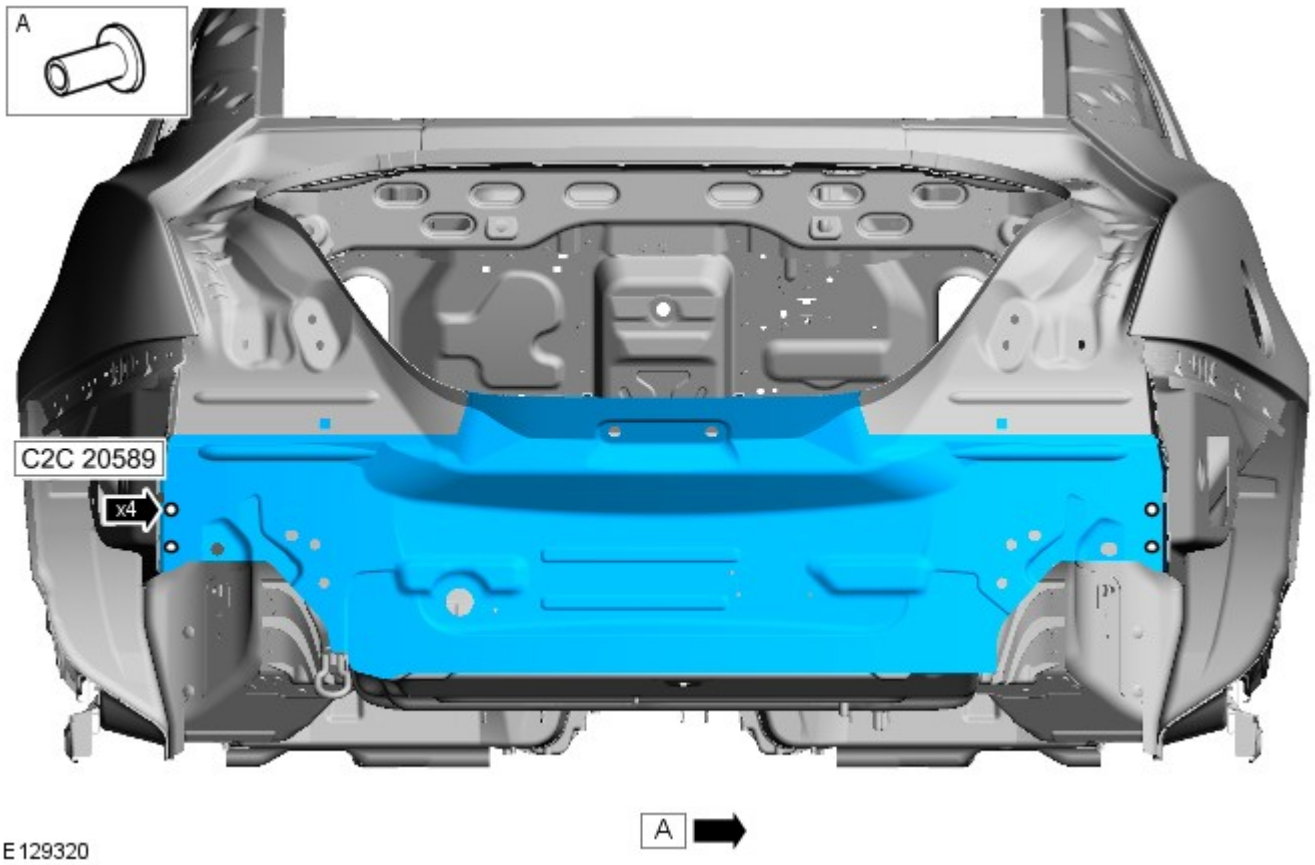
E129318

18. Using the Genesis G4, install the Hemloks (2 each side) into the junction box and modules mounting panels.

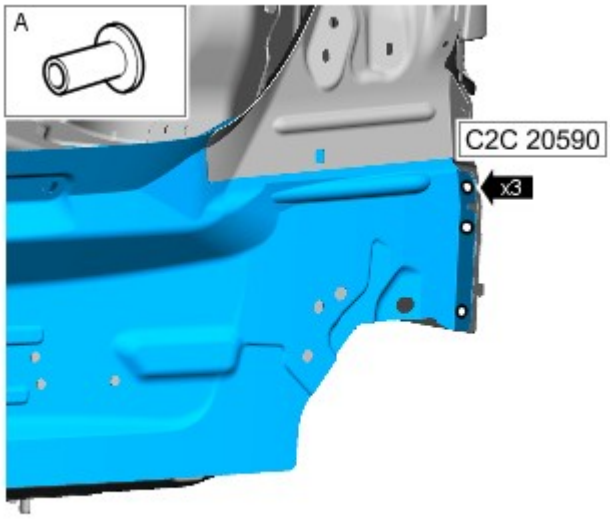
19. Using the Genesis G4, install 12 Hemloks (6 each side) into the quarter panel. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel.



20. Using the ESN50, install the self piercing rivets into the rear floor side extension.

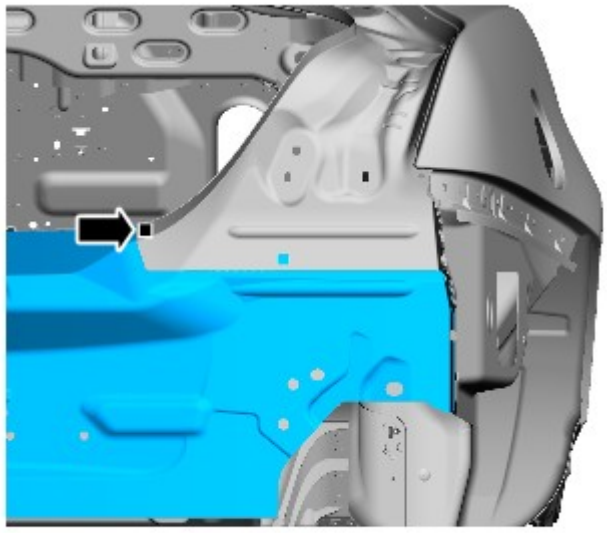


21. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel lower extension.



E129321

22. Remove any excess adhesive.



E129612

23. Install 2 MIG plug welds (1 each side) into the quarter panel.

24. The installation of associated panels and components is the reversal of removal procedure.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

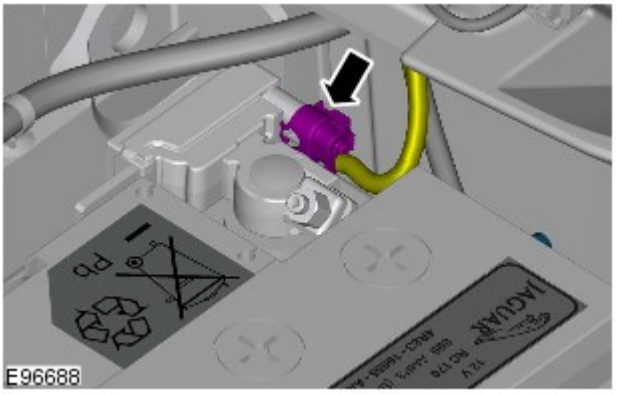
General Procedures

Disconnect

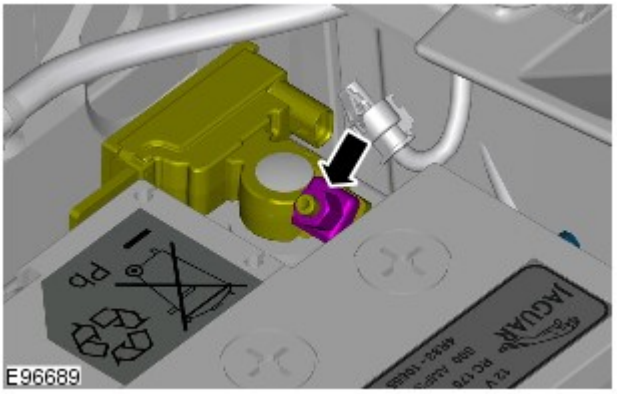
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

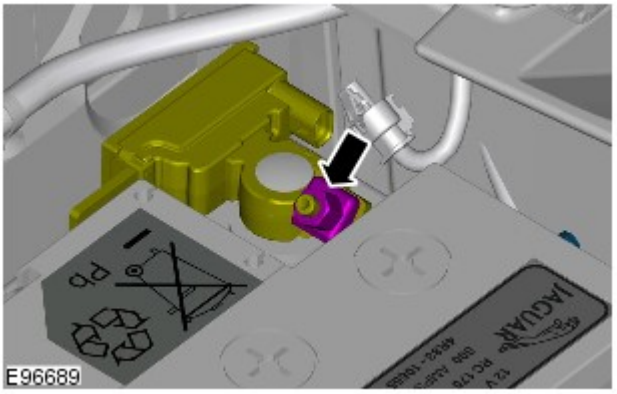


4. CAUTION: Take extra care not to damage the wiring harness.

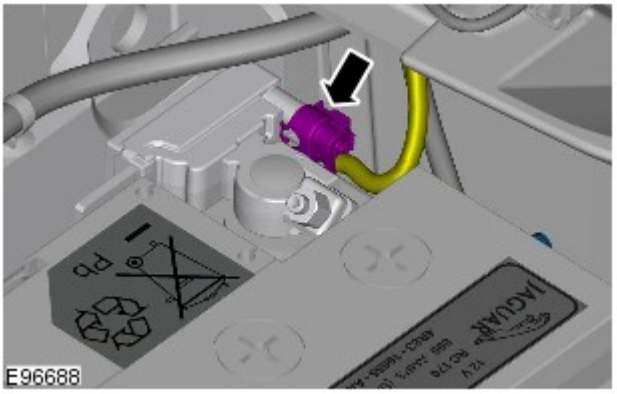


5.

Connect

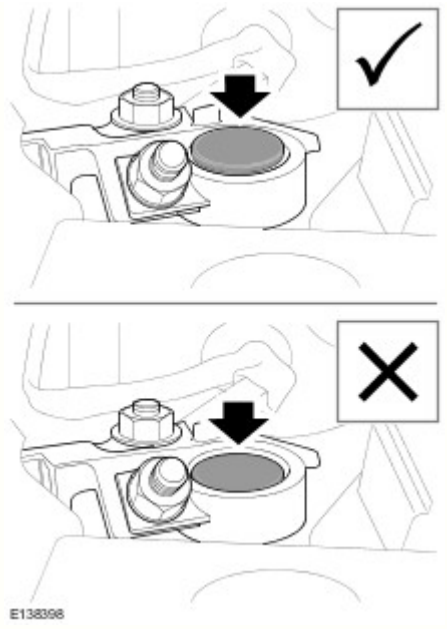


1. *Torque:* 6 Nm



2.

3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Published: 11-May-2011

Vehicle Dynamic Suspension - Air Suspension Control Module

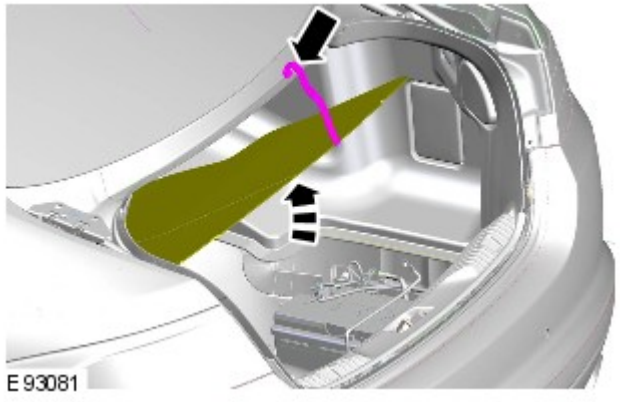
Removal and Installation

Removal

CAUTION: Calibration of the air suspension system must be carried out after the following components have been replaced: air suspension control module, suspension height sensor, suspension components and body panels incorporating suspension fixing points.

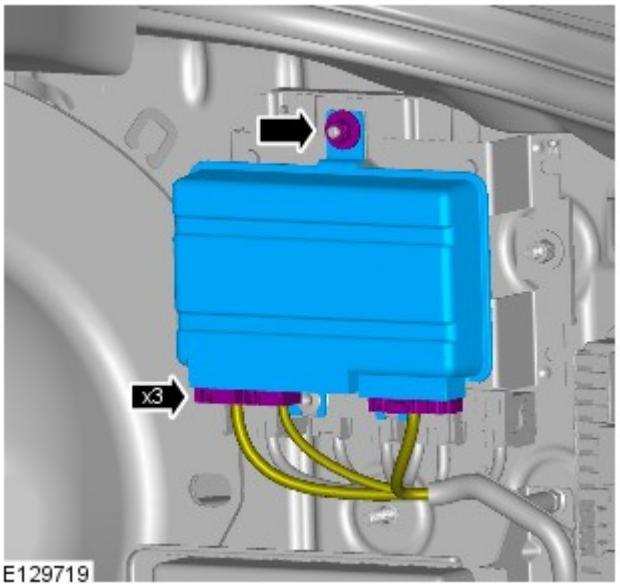
NOTE: Removal steps in this procedure may contain installation details.

1. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.



2. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).



4. *Torque:* 7 Nm

Installation

1. To install, reverse the removal procedure.

2. Refer to: Ride Height Adjustments (204-05 Vehicle Dynamic Suspension, General Procedures).

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).

  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion

- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only.

		Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

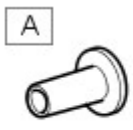
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

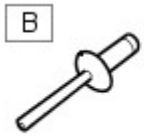
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

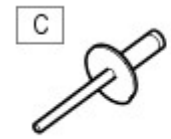
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

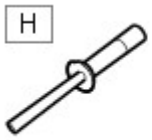
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

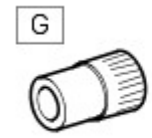
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

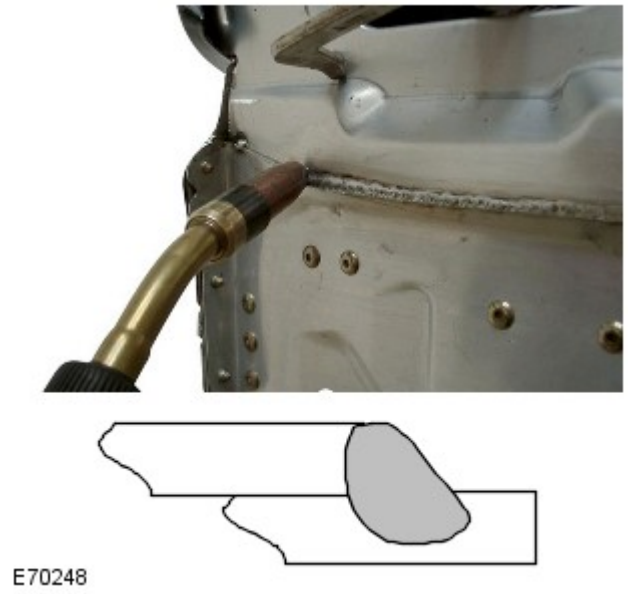
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

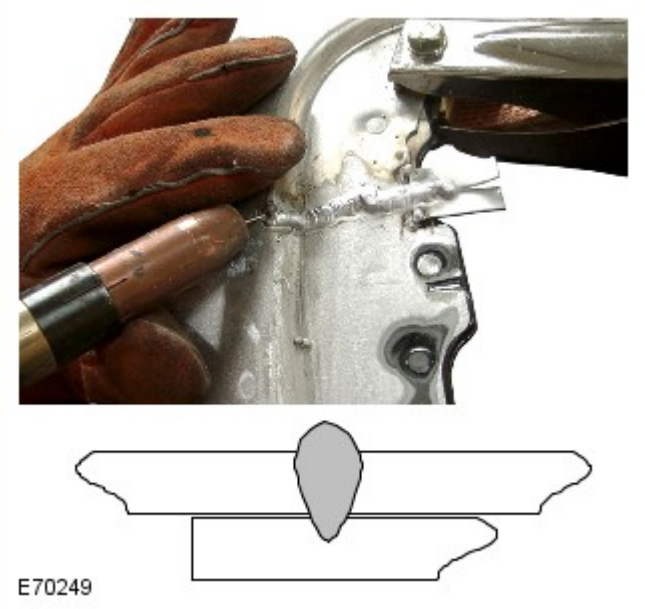
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

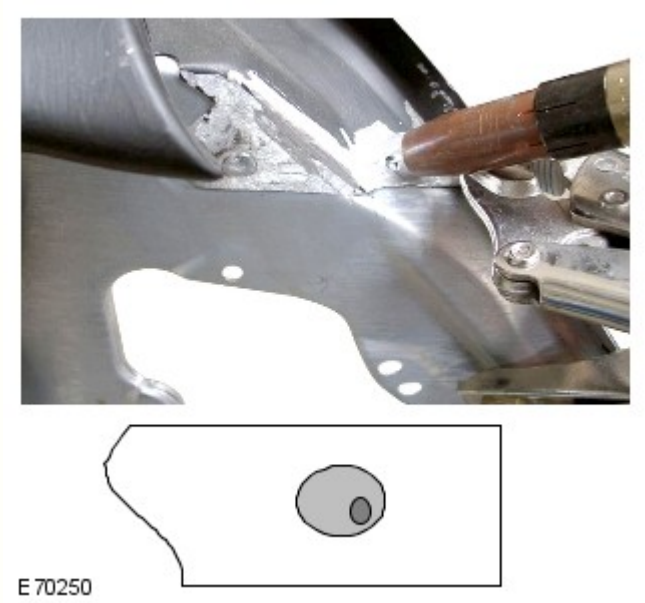
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

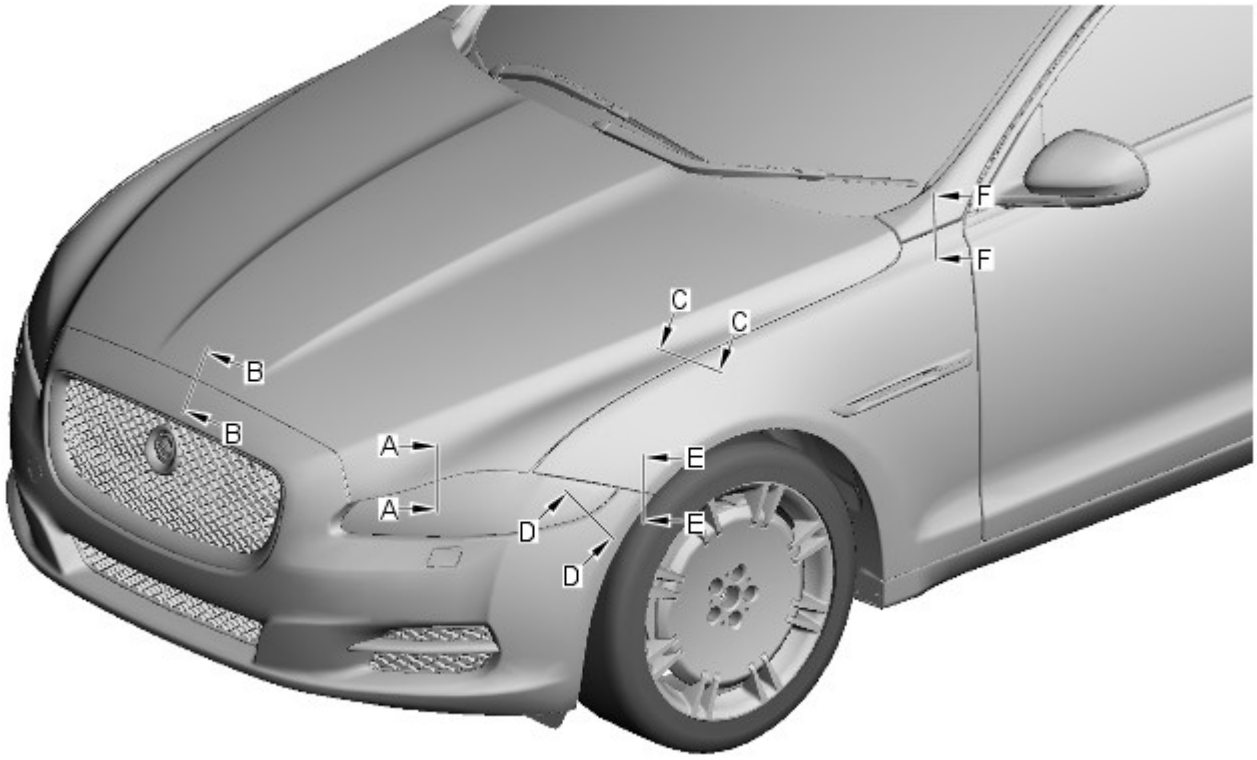
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

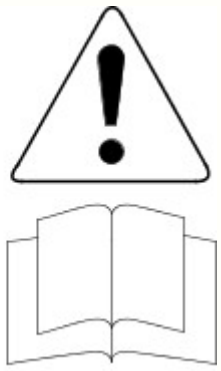
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

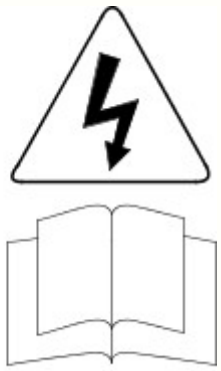
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



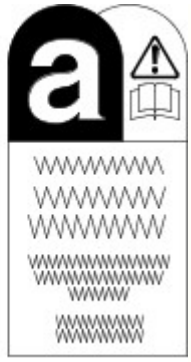
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



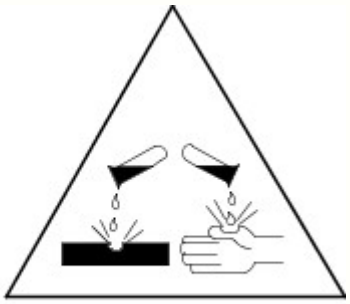
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Published: 11-May-2011

Rear End Sheet Metal Repairs - Quarter Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being installed in isolation or is being installed in combination with panels other than those listed.

1. The quarter panel is a category A repair.

2. NOTE: The quarter panel is manufactured from aluminium alloy 6111-T4.

   The quarter panel is serviced as a separate riveted and bonded panel, it includes the quarter panel lower extension.

E129125

3. The quarter panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Luggage compartment lid
   - Luggage compartment lid hinge
   - Rear window glass

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove the rear window glass.
For additional information, refer to: Rear Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

7. Remove the luggage compartment lid hinge.
For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove the rear muffler.
For additional information, refer to: Rear Muffler (309-00 Exhaust System - 3.0L V6 - TdV6, Removal and Installation) /
Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the rear muffler heatshields.

12. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation) /

Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation).

13. Remove the luggage compartment lid weatherstrip.

14. Remove the parcel shelf.
For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

15. Remove the B-Pillar lower trim panel.
For additional information, refer to: B-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

16. Remove the C-Pillar side impact sensor.
For additional information, refer to: C-Pillar Side Impact Sensor (501-20B Supplemental Restraint System, Removal and Installation).

17. Remove the rear quarter window glass.
For additional information, refer to: Rear Quarter Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

18. Remove the rear safety belt retractor.
For additional information, refer to: Rear Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

19. Remove the rear door striker.

20. Remove the rocker panel outer moulding.

21. Remove the quarter panel splash shield.

22. Remove the forced air extraction grille.

23. Remove the rear bumper cover side retainer.

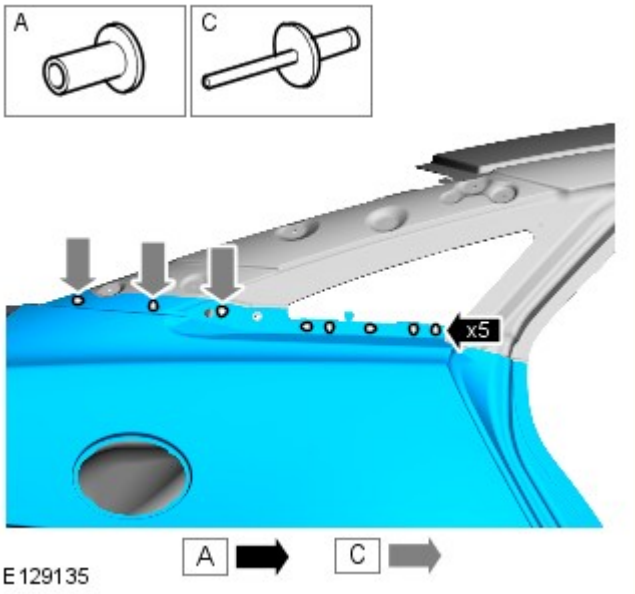
24. If the right-hand quarter panel is to be repaired, remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

25. If the right-hand quarter panel is to be repaired remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

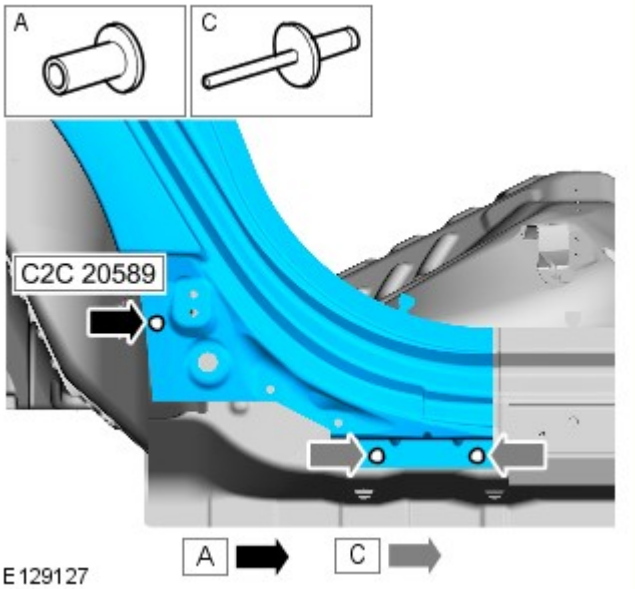
26. If the right-hand quarter panel is to be repaired remove the fuel filler door assembly.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

27. Remove any electrical components in the local area of repair to prevent damage.

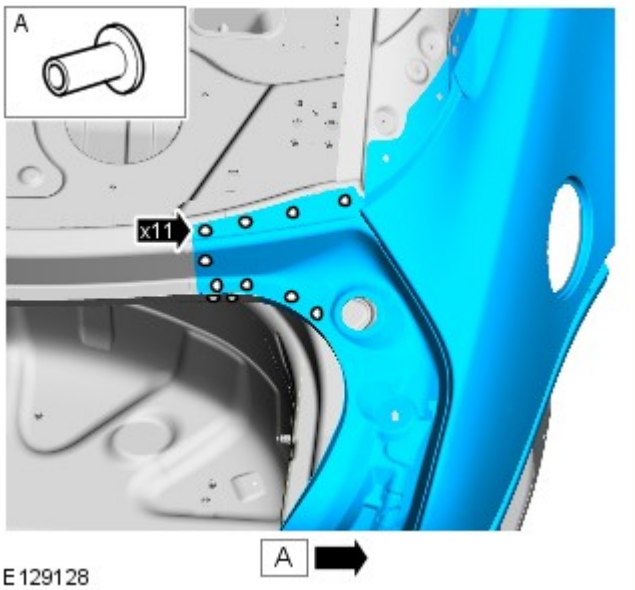
28. Release the back panel and loadspace wiring harness and position it to one side.



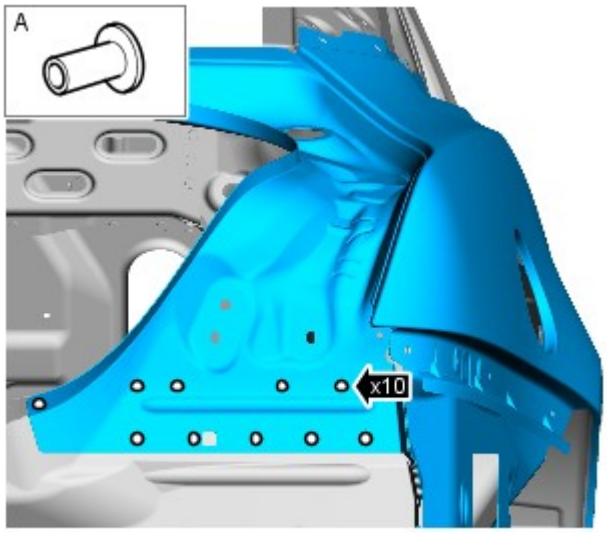
29. Remove the Monobolts from the quarter panel inner. Using the ESN50 remove the self piercing rivets from the quarter panel inner.



30. Remove the Monobolts from the rocker panel. Using the ESN50 remove the self piercing rivet from the rear wheelhouse outer.

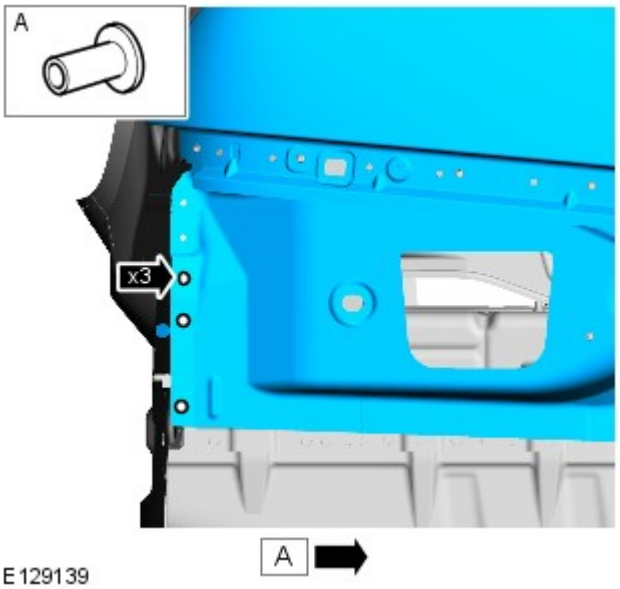


31. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the rear parcel shelf panel.



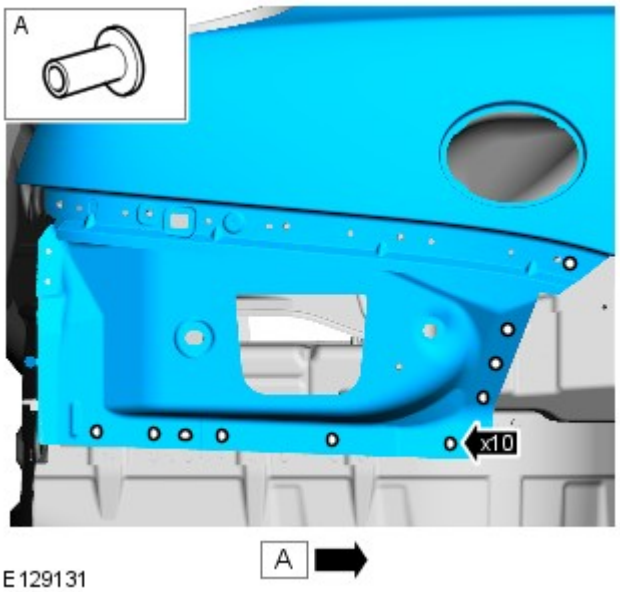
E129129

32. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the back panel.



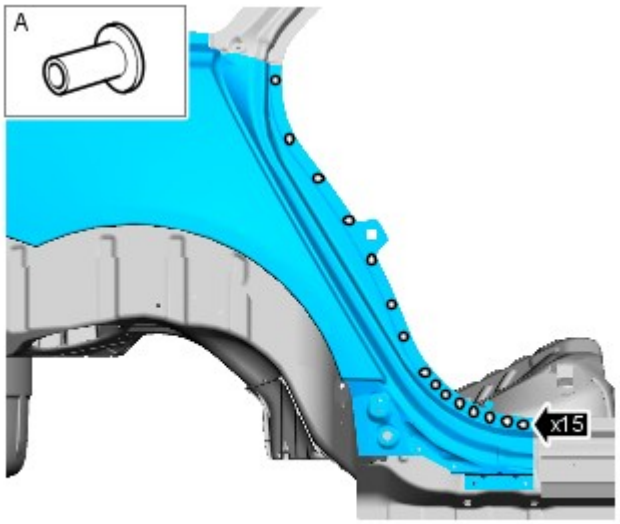
E129139

33. Using the ESN50, remove the self piercing rivets from the back panel.



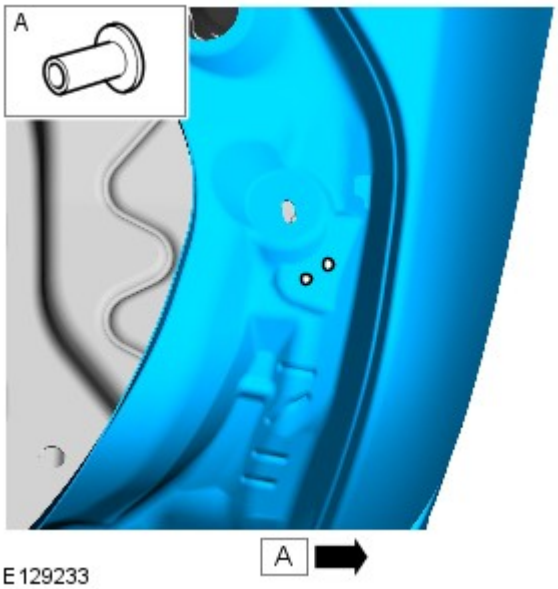
E129131

34. Using the ESN50, the self piercing rivets from the rear floor side extension and rear wheelhouse outer.



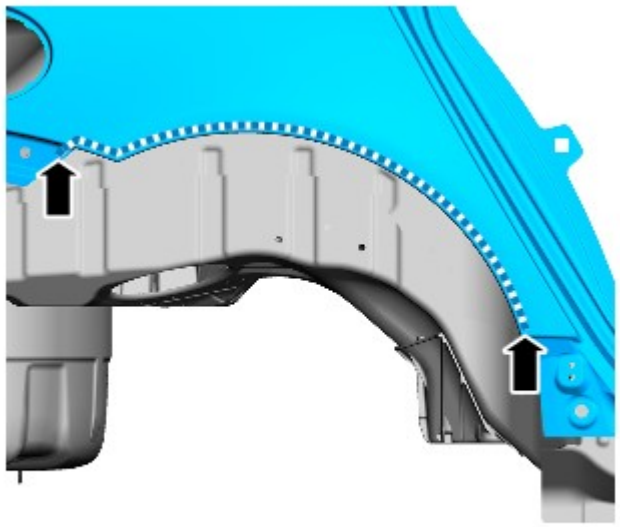
E129132

35. Using the ESN50, remove the self piercing rivets from the rear door aperture.



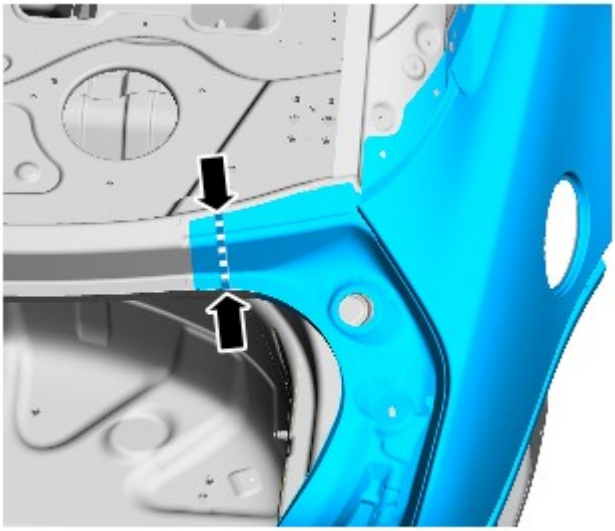
E129233

36. Using the ESN50, remove the self piercing rivets from the junction box and control module mounting panel.



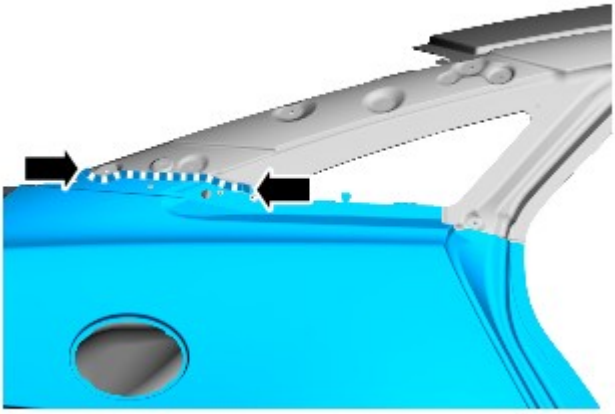
E129134

37. Carefully separate and release the adhesive from the wheelarch outer.



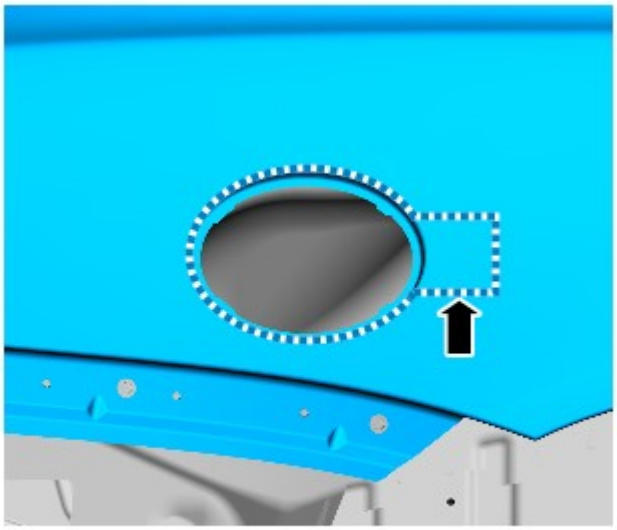
E129717

38. Carefully separate and release the adhesive from the rear parcel shelf panel.



E129743

39. Carefully separate and release the adhesive from the quarter panel inner.



E129133

40. If the right hand quarter panel is to be repaired, carefully separate and release the adhesive from the fuel filler door aperture.

41. Separate the joints and remove the old panel, also releasing the noise, vibration and harshness, (NVH), components.

Installation

1. If necessary, install the NVH components.

2. Remove rivet remnants.

3. Using a Roloc fine bristle disc, remove the adhesive residue.

4. Dress flanges where necessary.

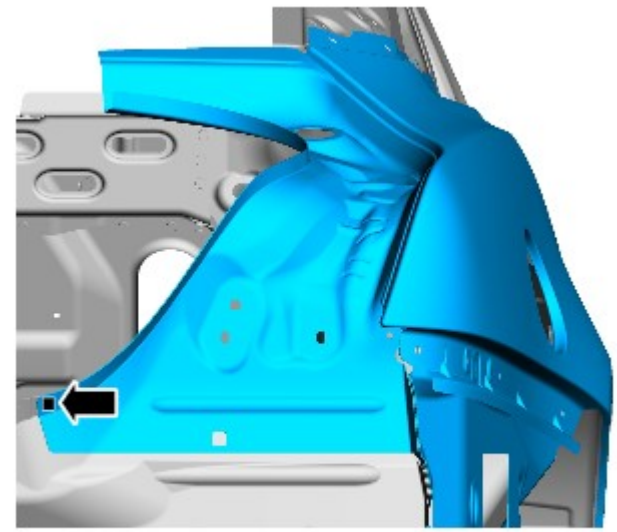
5. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

6. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

7. Remove the transit lug from the new panel.

8. Remove the new panel.

9. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.



E129716

10. Drill 1 10mm hole in the new quarter panel ready for MAG plug welding.

11. Deburr the drilled holes.

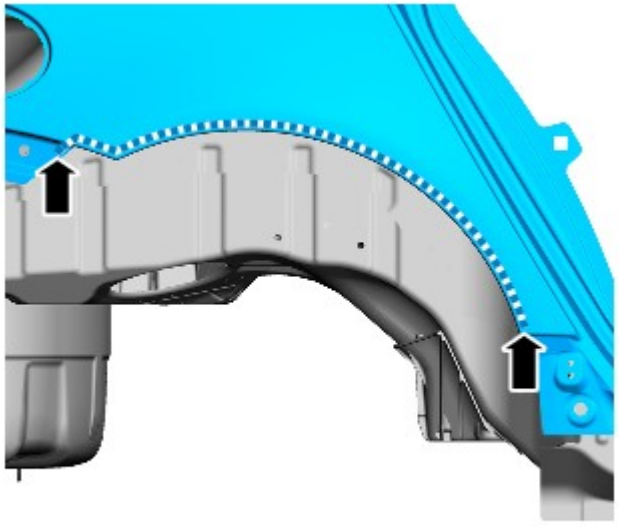
12. CAUTION: Use care not to damage the panel.

Remove seam sealer where applicable.

13. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

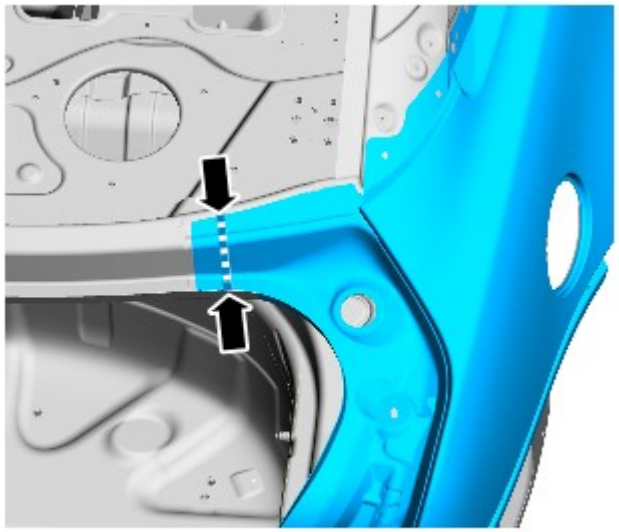
14. Pyrosil the joints.

15. Apply the coupling agent and allow to dry.



E129134

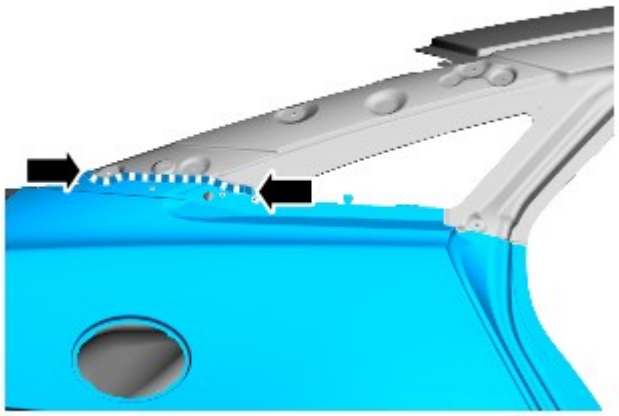
16. Apply semi-rigid sealer to the body at the wheelarch outer.



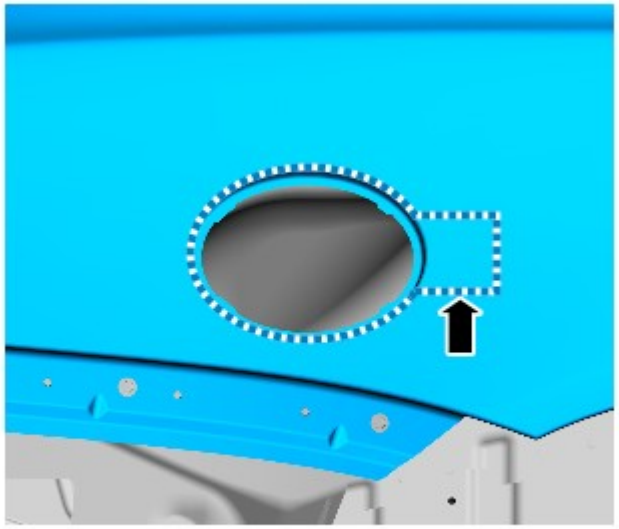
E129717

17. Apply semi-rigid sealer to the body at the rear parcel shelf panel.

18. Apply semi-rigid sealer to the body at the quarter panel inner.



E129743



E129133

19. If the right hand quarter panel is to be repaired, apply semi-rigid sealer to the body at the fuel filler door aperture.

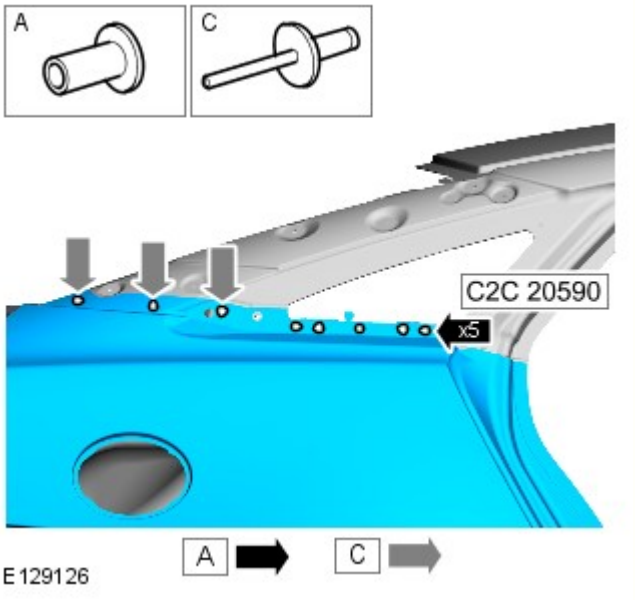
20. Apply semi-rigid sealer to the NVH components.

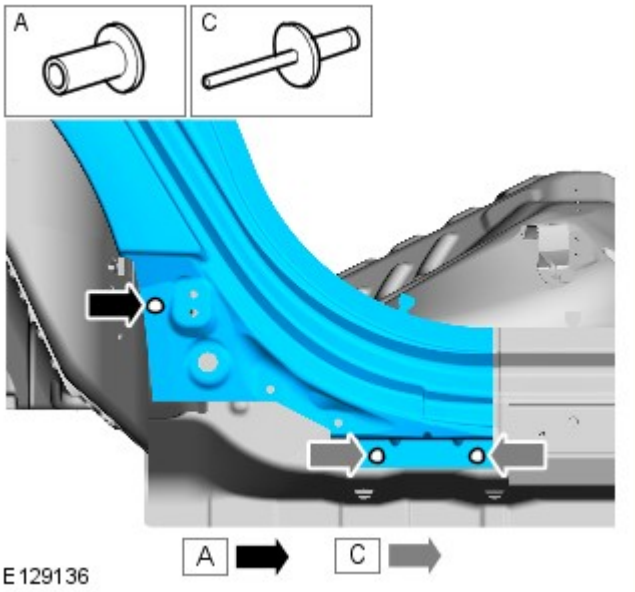
21. NOTE: make sure a continuous bead of adhesive surrounds the fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

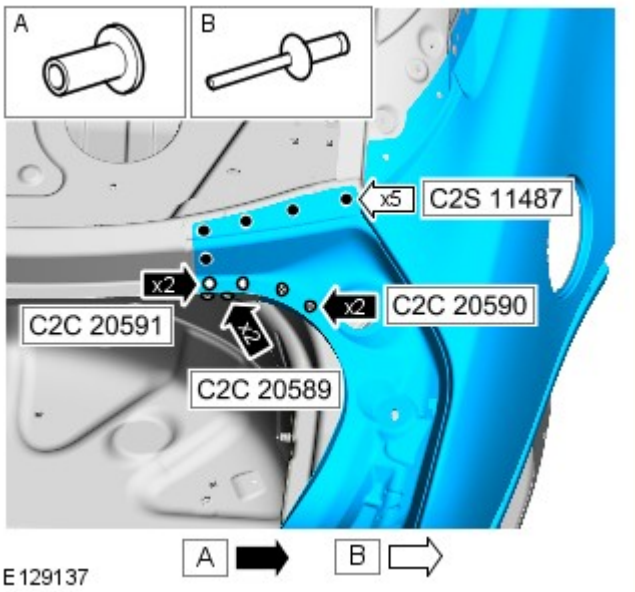
22. Offer up the new panel and clamp into position.

23. Using the Genesis G4, install the Monobolts into the quarter panel inner. Using the ESN50, install the self piercing rivets into the quarter panel inner.

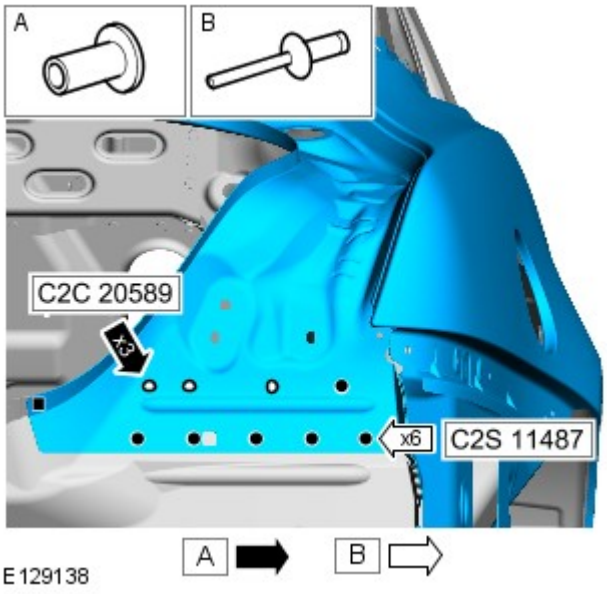




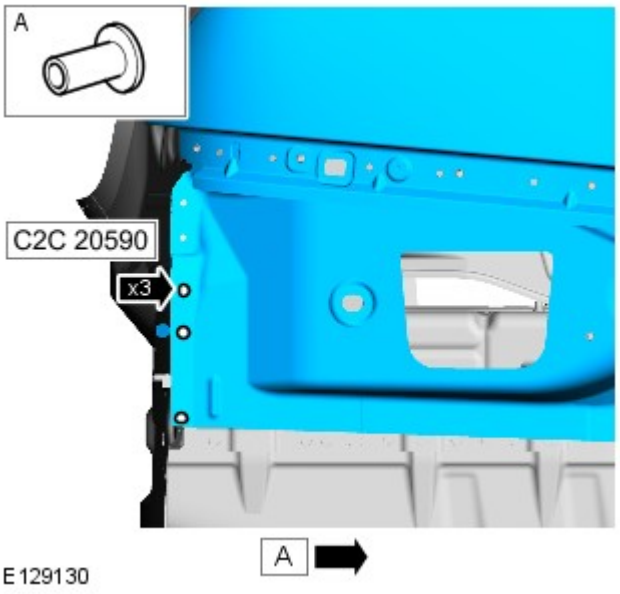
24. Using the Genesis G4, install the Monobolts into the rocker panel. Using the ESN50, install the self piercing rivet into the rear wheelhouse outer.



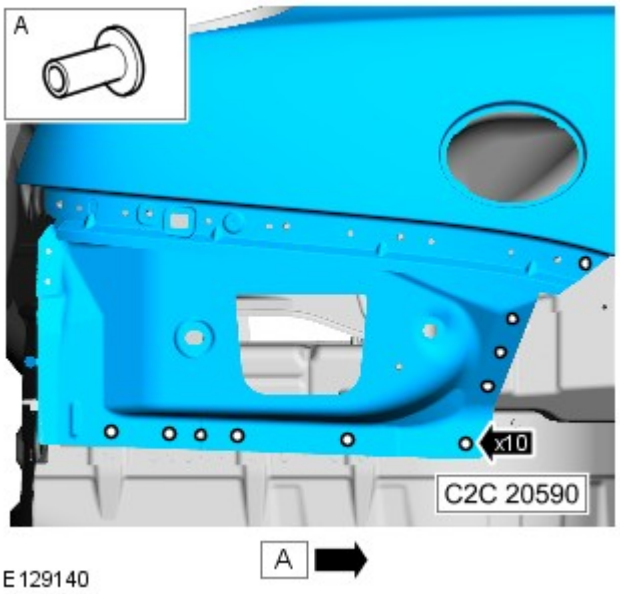
25. Using the Genesis G4, install the Hemloks into the rear parcel shelf panel. Using the ESN50, install the self piercing rivets into the rear parcel shelf panel.



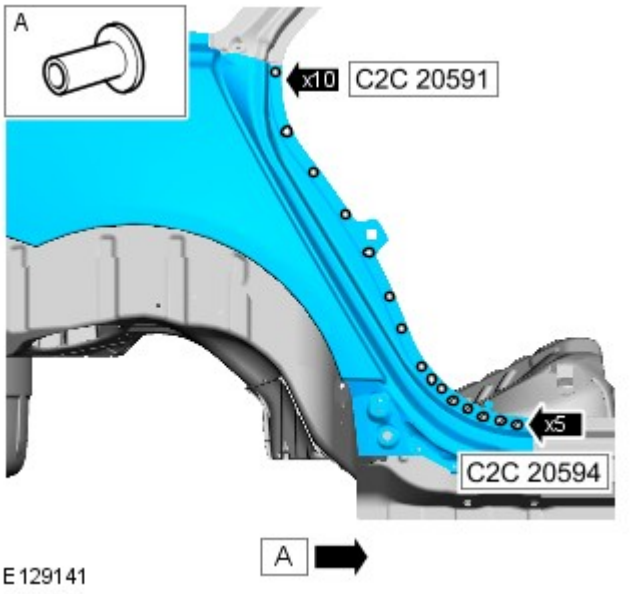
26. Using the Genesis G4, install the Hemloks into the back panel. Using the ESN50, install the self piercing rivets into the back panel.



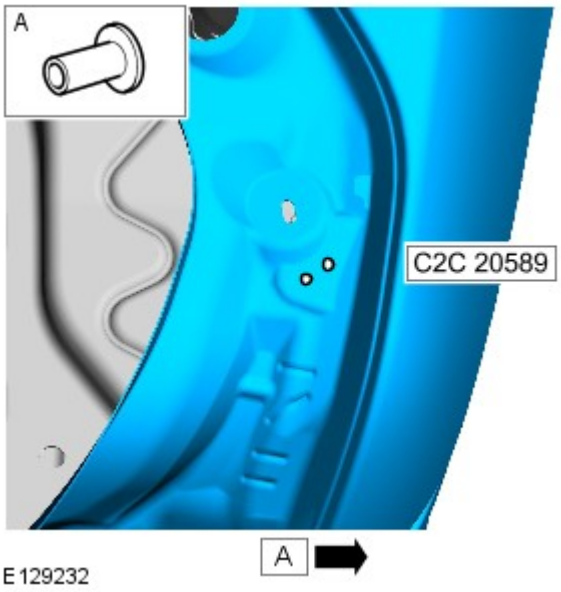
27. Using the ESN50, install the self piercing rivets into the back panel.



28. Using the ESN50, install the self piercing rivets into the rear floor side extension and rear wheelhouse outer.



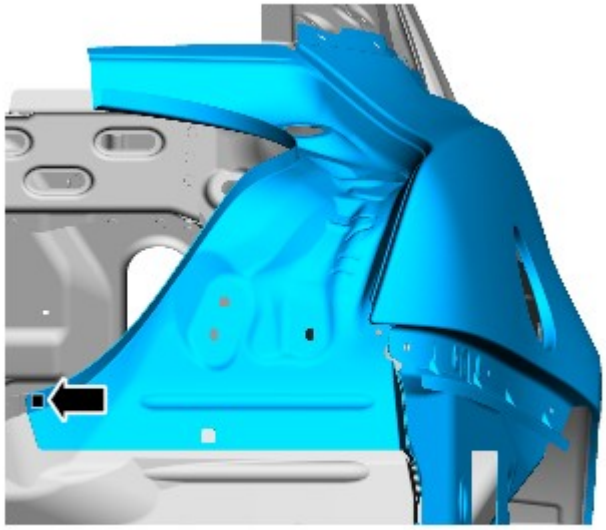
29. Using the ESN50, install the self piercing rivets into the rear door aperture.



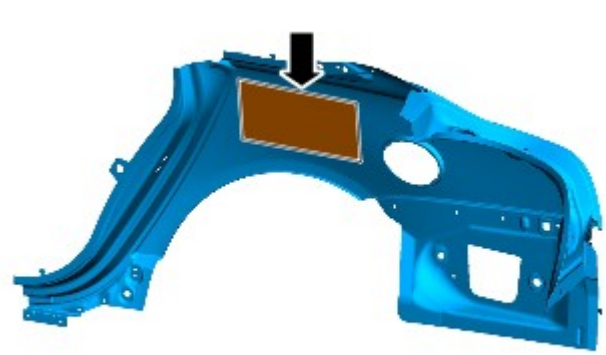
30. Using the ESN50, install the self piercing rivets into the junction box and control module mounting panel.

31. Remove any excess adhesive.

32. Install the MIG plug weld into the back panel.



E129716



E129533

33. Install the NVH material as indicated.

34. The installation of associated panels and components is the reversal of removal procedure.

Rear End Sheet Metal Repairs - Inner Quarter Panel Rear Section

Removal and Installation

Removal

NOTES:

The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

The procedure shown is for the right-hand inner quarter panel rear section, the procedure for the left-hand is similar.

1. The inner quarter panel rear section is a category A repair.

2. The inner quarter panel rear section is serviced as a separate welded, bonded and riveted panel.

E132009

3. The inner quarter panel rear section is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Rear Door
   - Quarter panel
   - Luggage compartment lid
   - Luggage compartment lid hinge
   - Rear window glass
   - Headliner

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the vehicle battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Disconnect the generator electrical connectors.

7. Remove the quarter panel.
For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

8. Remove the rear door.
For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

9. Remove the headliner.
For additional information, refer to: Headliner (501-05 Interior Trim and Ornamentation, Removal and Installation).

10. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20B Supplemental Restraint System, Removal and Installation).

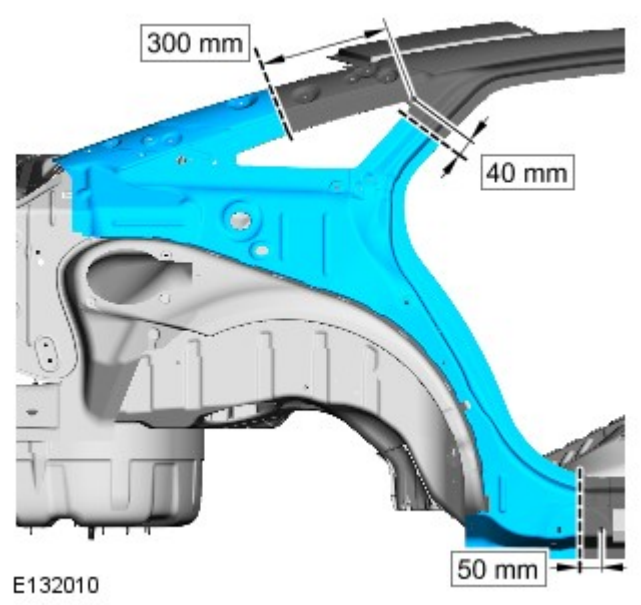
11. If the right-hand rear quarter panel is to be repaired, drain the fuel tank.
For additional information, refer to: Fuel Tank Draining - 3.0L V6 - TdV6 (310-00, General Procedures) / Fuel Tank Draining - V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol (310-00 Fuel System - General Information, General Procedures).

12. If the right-hand rear quarter panel is to be repaired, remove the fuel filler pipe.
For additional information, refer to: Fuel Tank Filler Pipe (310-01A, Removal and Installation).

13. Remove any remaining miscellaneous components from the repair area as necessary.

14. Release the inner quarter panel wiring harness and position to one side.

15. Prior to removal, mark the position of the inner quarter panel rear section in relation to adjacent panels for ease of alignment on installation.



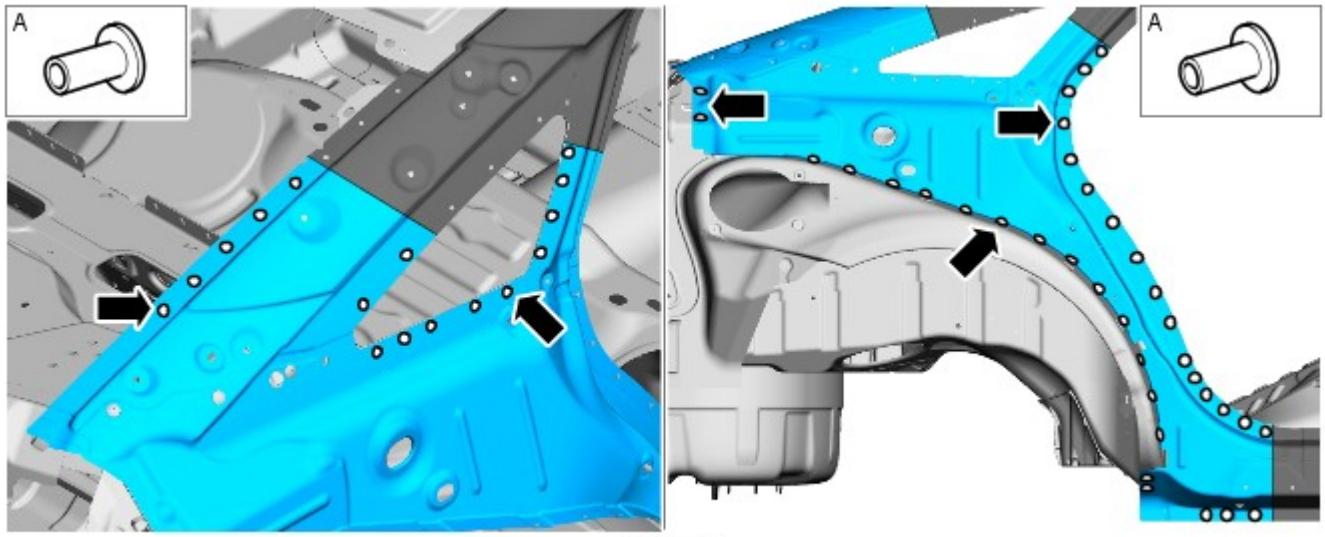
16. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old panel as indicated.

17.

Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove any remaining self piercing rivets to release the inner quarter panel rear section.



E132011

18. NOTES:

Retain the old panel remnant as it will be used in installation.

Remove and retain the noise vibration and harshness (NVH) components if they are to be reused.

Separate the joints and remove the old panel, also releasing the NVH components.

Installation

CAUTION: Installation of rivets should always be referenced against the stack size of the panels, access and the pitch between the original removed rivets locations, to make sure the correct type and size of rivet is installed.

NOTE: Installation of self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivets.

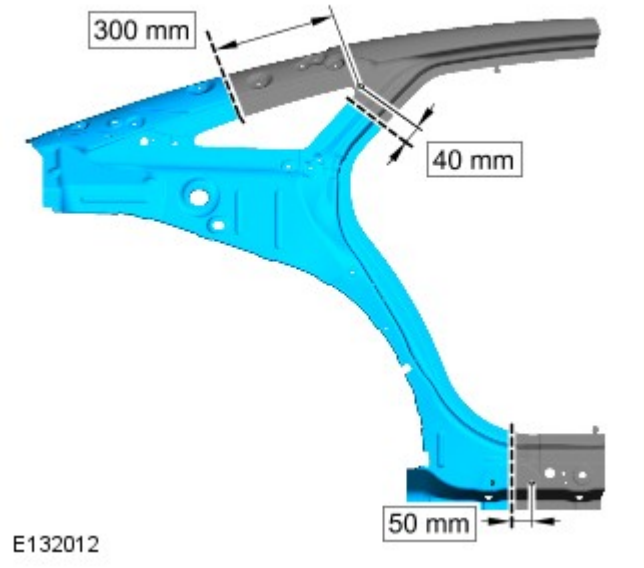
1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, removing any sealer and adhesive residue.

3. Dress flanges where necessary.

4. NOTE: Retain the remnants of the new panel as these may be used for backing strips on installation.

Using the old panel for reference, measure, mark and cut the new inner quarter panel rear section at the points where the MIG butt joints are to be made as indicated.



5. Debur the new panel.

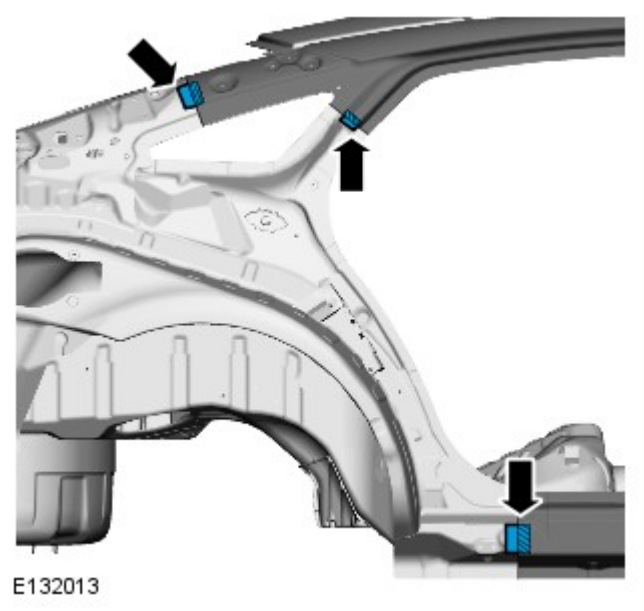
6. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

7. Using a 6.5mm Cryobit drill bit, drill holes at the points where Hemloks are to be installed.

8. Remove the new panel.

9. Debur the drilled holes.

10. Measure and cut backing plates and run on/run off tabs, from the old and new panel remnants.



11. NOTE: The backing plates should be an interference fit.

Offer up the backing plates to the vehicle. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

12. Remove the backing plates.

13. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

14. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

15. NOTE: The backing plates are installed with an interference fit.

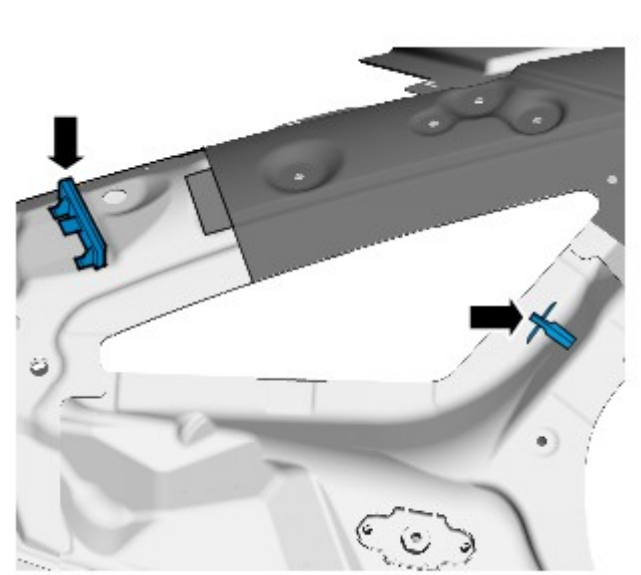
Install and align the backing plates to the vehicle.

16. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

17. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

18. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the new panel where the lower NVH component is to be installed. Install the NVH component to the new panel.



E132014

19. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component as indicated.

20. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the new panel.

21. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

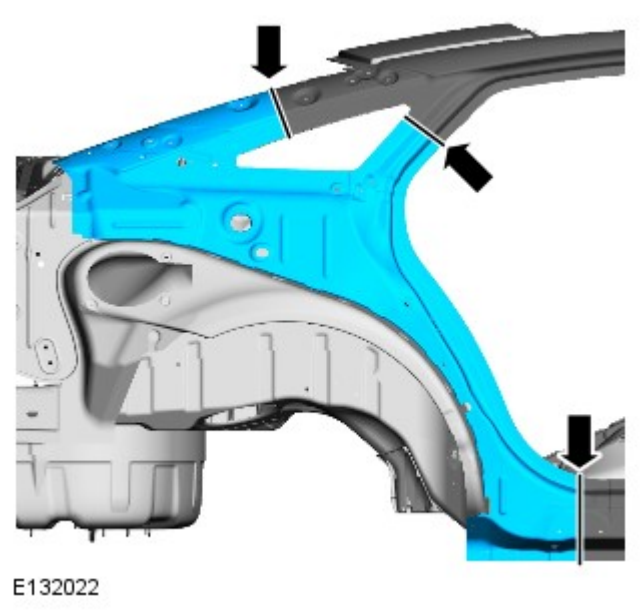
Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

22.

CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

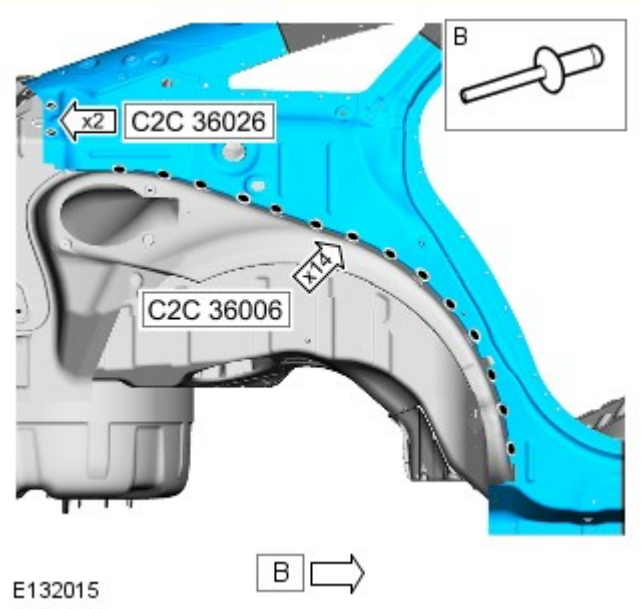
Offer up the new panel, align and clamp into position.

23. Tack weld the run-on/run-off tabs to all MIG butt joints.



E132022

24. MIG weld the MIG butt joints.



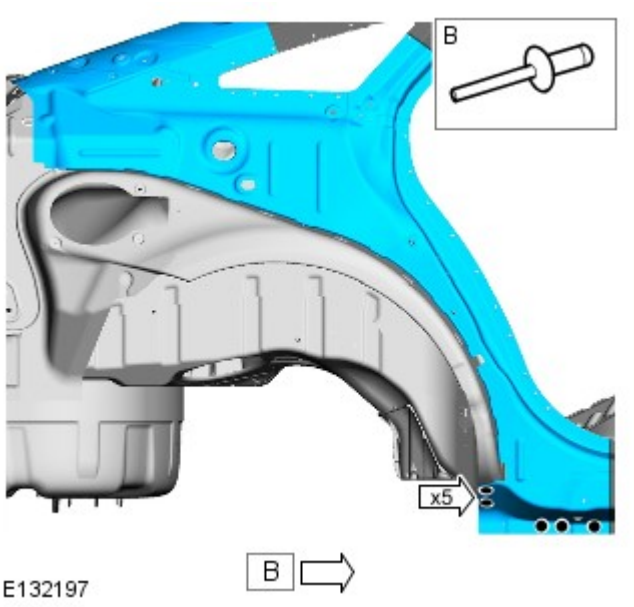
E132015

25. Using the Genesis G4, install the Hemloks.

26. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252

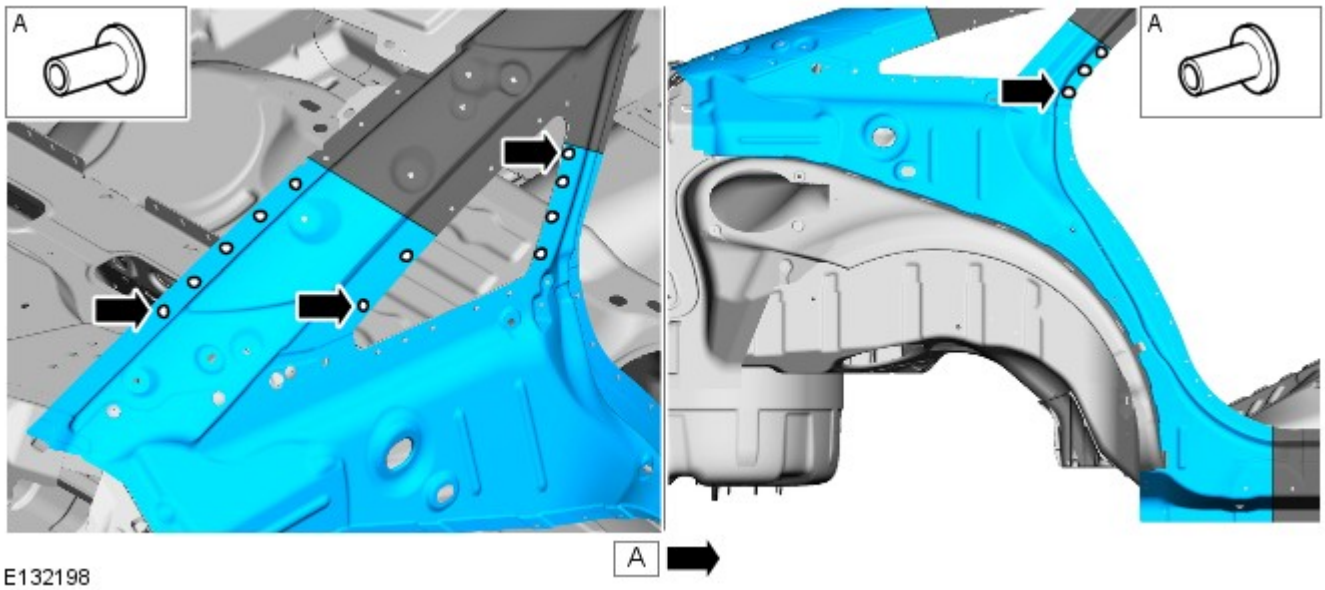


6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

27. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595



28. Remove any excess adhesive.

29. Remove the run-on/run-off tabs.

30. Dress the welded joints.

31. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

32. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

33. The installation of associated panels and components is the reversal of removal procedure.

Fuel System - General Information - Fuel Tank Draining V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol

General Procedures

Special Tool(s)

	310-154 Adapter, Fuel drain

Draining

NOTES:

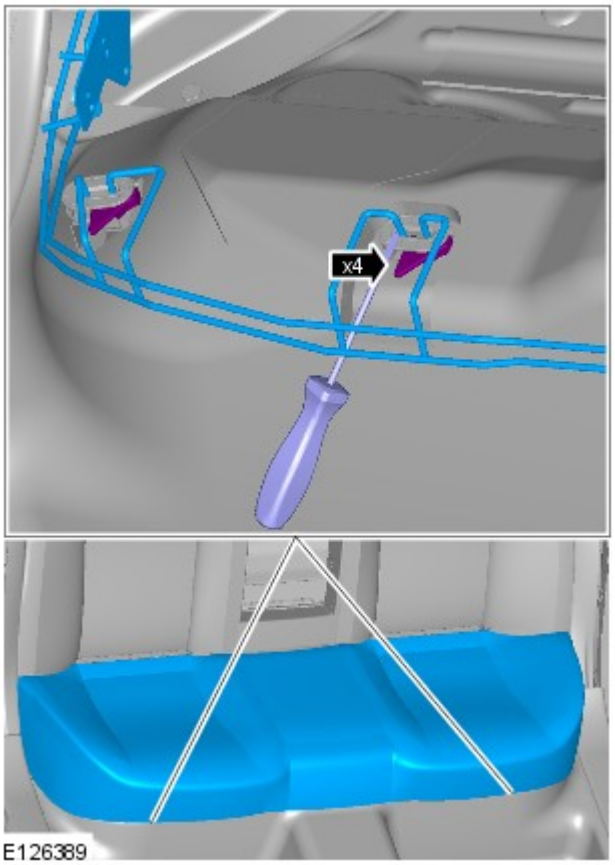
Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

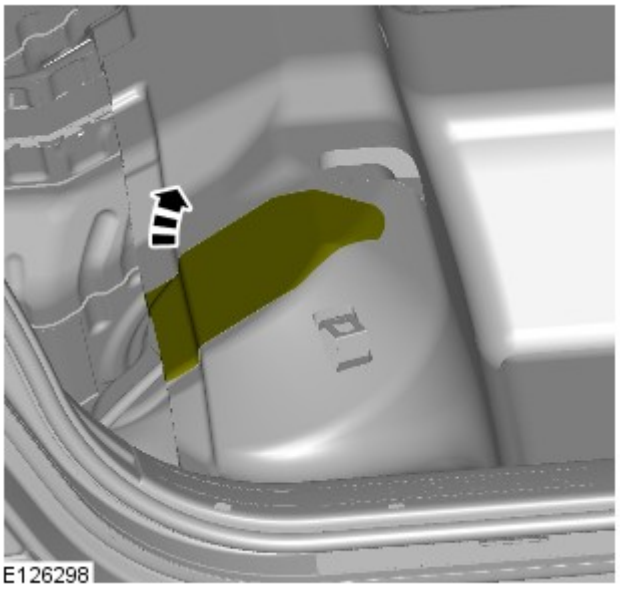
1. Refer to: Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Refer to: Fuel System Pressure Release - V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol (310-00 Fuel System - General Information, General Procedures).

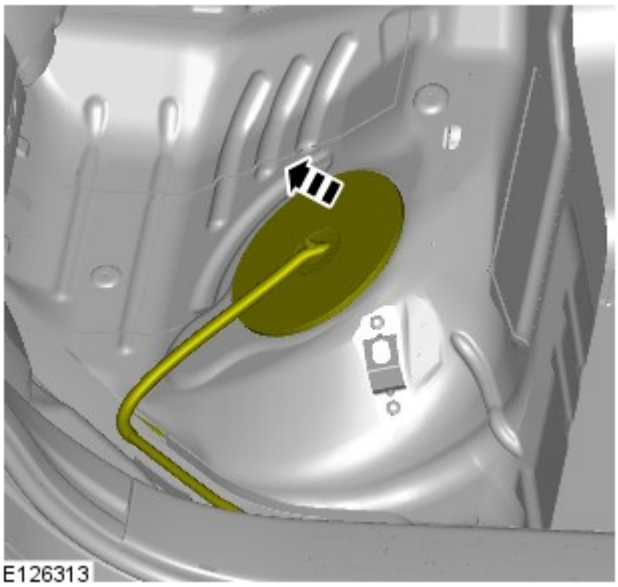
3.

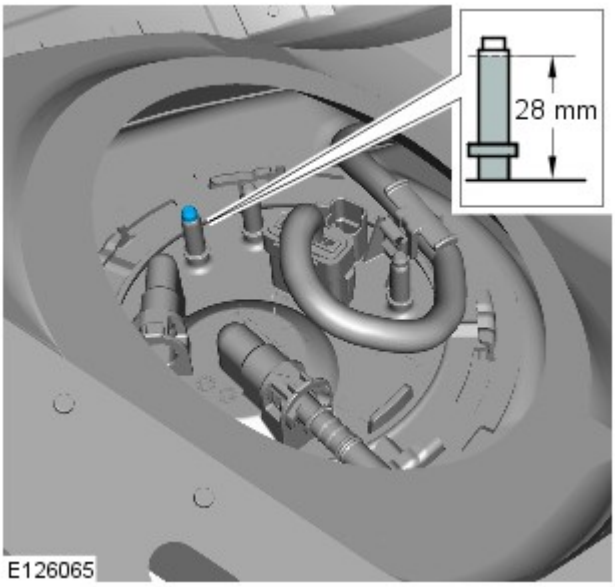


4.



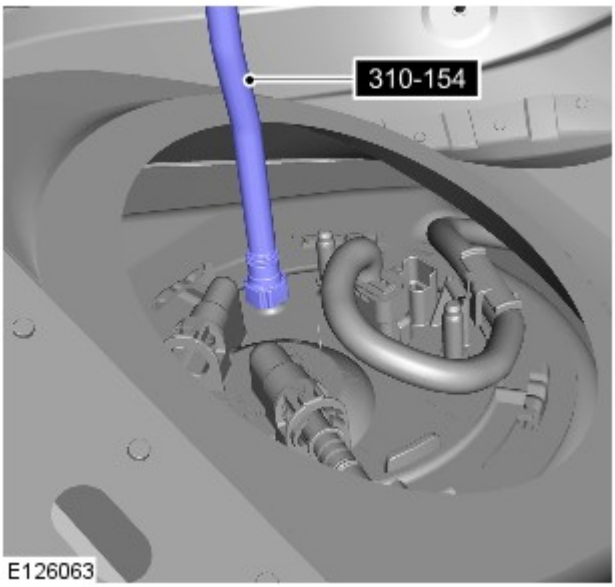
5.





6. CAUTION: The correct measurement must be used to remove the fuel tank drain port top. Failure to follow this instruction may result in damage to the vehicle.

Using a suitable tool, remove the top of the fuel tank drain port.

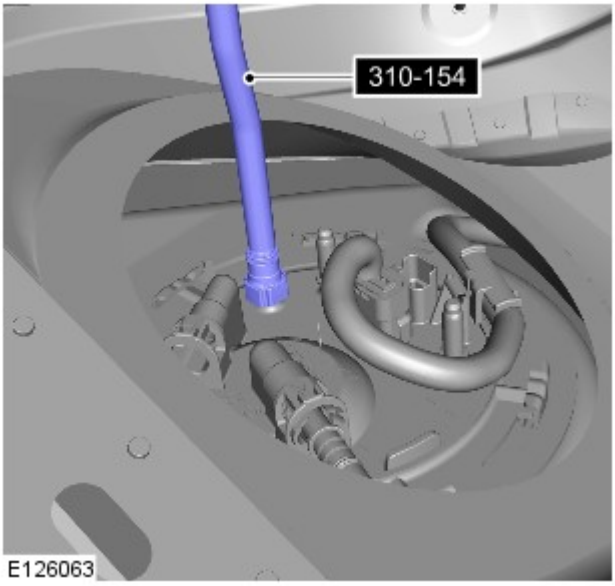


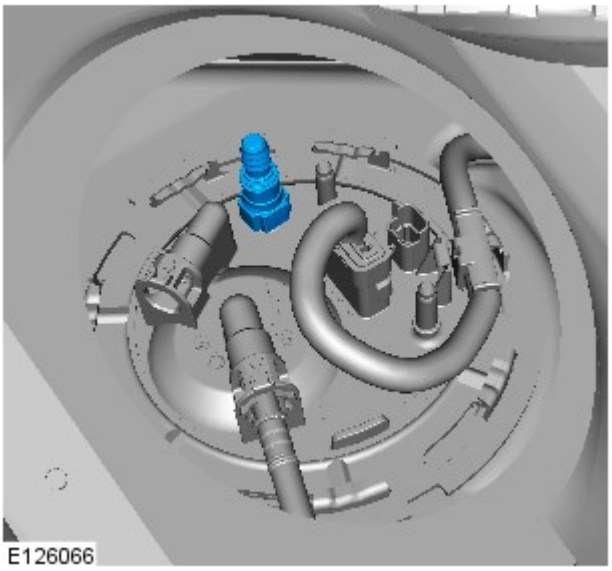
7. NOTE: A fuel vacuum drain unit must be attached to the special tool to achieve full fuel tank drain.

Using the special tool, drain the right-hand side of the fuel tank.

Special Tool(s): 310-154

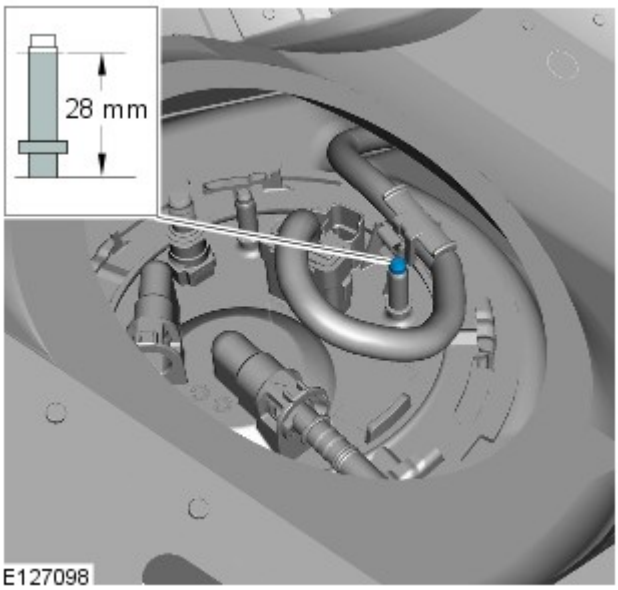
8. Remove the special tool.





9. CAUTION: Make sure the new fuel tank drain port sealing cap is correctly installed. Failure to follow this instruction may result in damage to the vehicle.

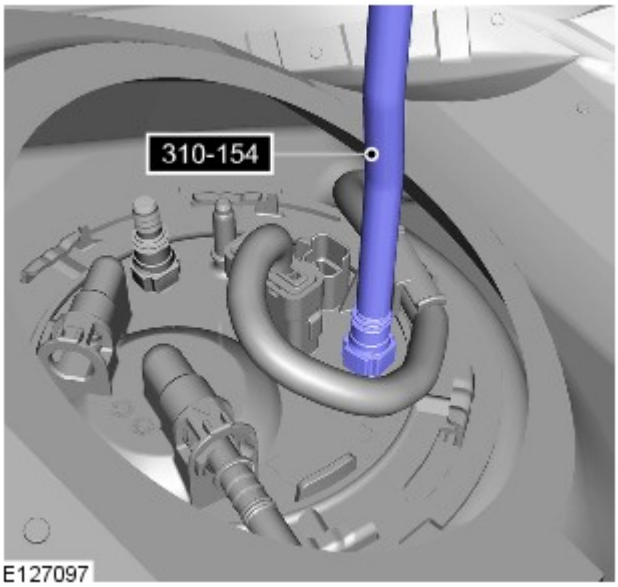
NOTE: An audible click can be heard when the fuel tank draining port sealing cap is correctly installed.



10. CAUTION: The correct measurement must be used to remove the fuel tank drain port top. Failure to follow this instruction may result in damage to the vehicle.

Using a suitable tool, remove the top of the fuel tank drain port.

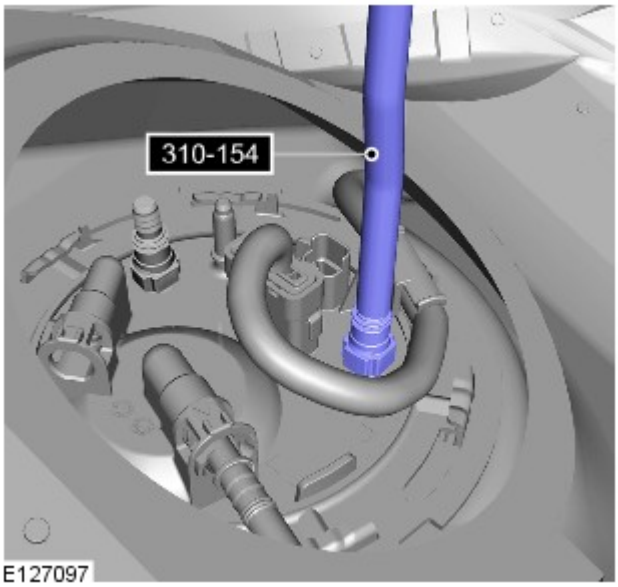
11.



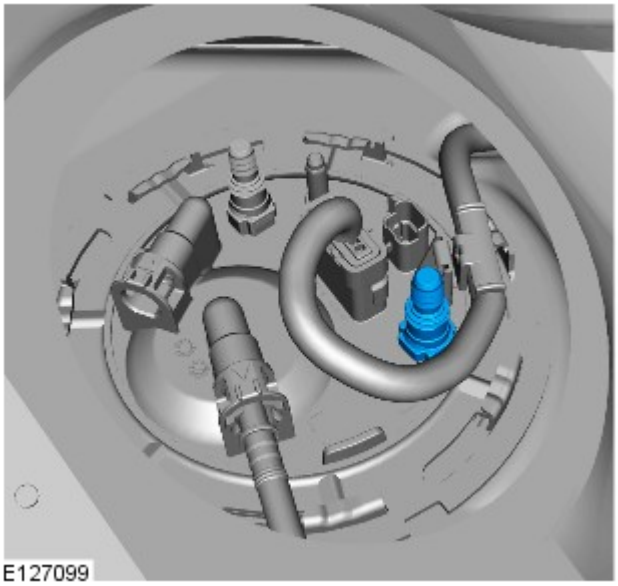
NOTE: A fuel vacuum drain unit must be attached to the special tool to achieve full fuel tank drain.

Using the special tool, drain the left-hand side of the fuel tank.

Special Tool(s): 310-154



12. Remove the special tool.



13. CAUTION: Make sure the new fuel tank drain port sealing cap is correctly installed. Failure to follow this instruction may result in damage to the vehicle.

NOTE: An audible click can be heard when the fuel tank draining port sealing cap is correctly installed.

14. To install, reverse the removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

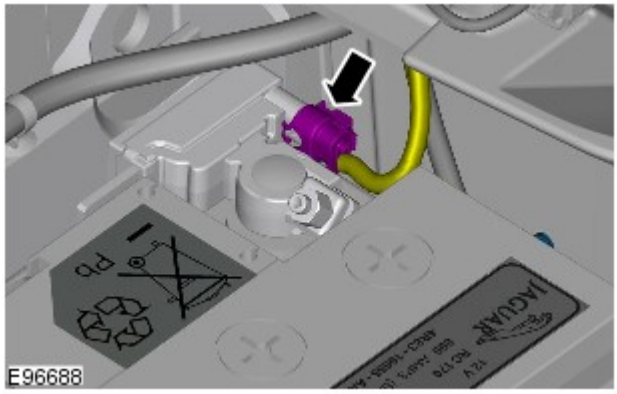
General Procedures

Disconnect

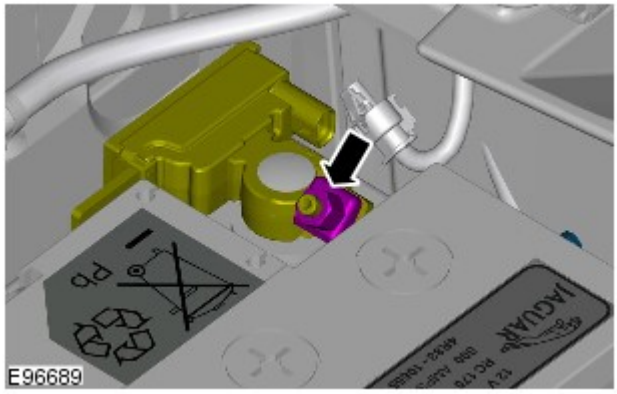
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.



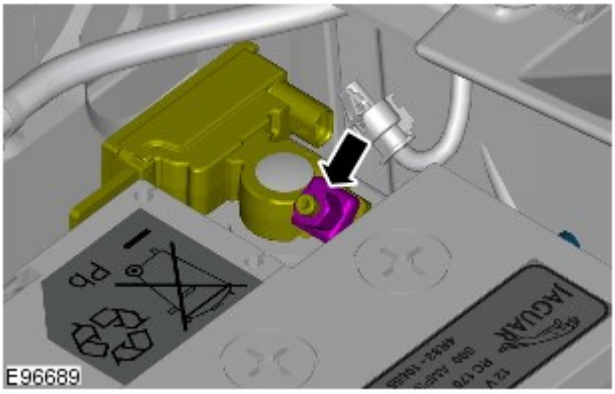
4. CAUTION: Take extra care not to damage the wiring harness.



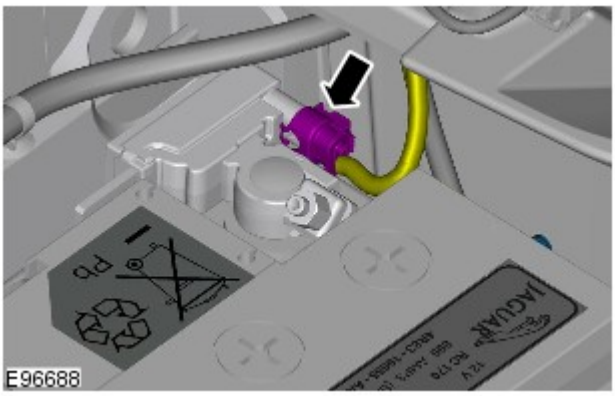
5.

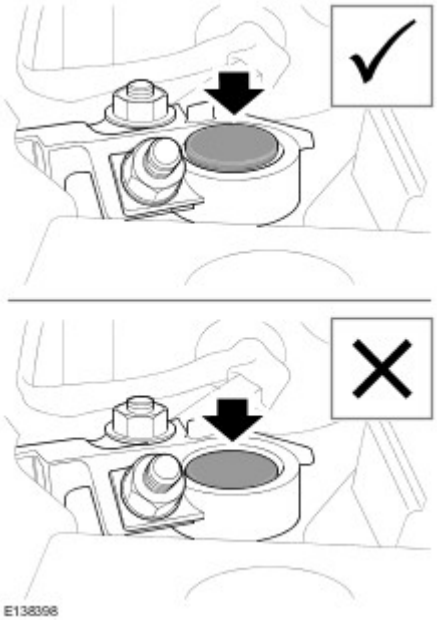
Connect

1. *Torque:* 6 Nm



2.





3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification

- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

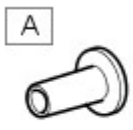
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

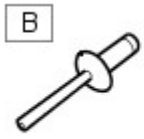
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

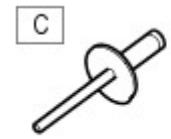
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

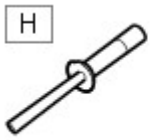
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

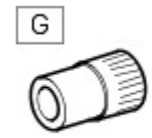
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

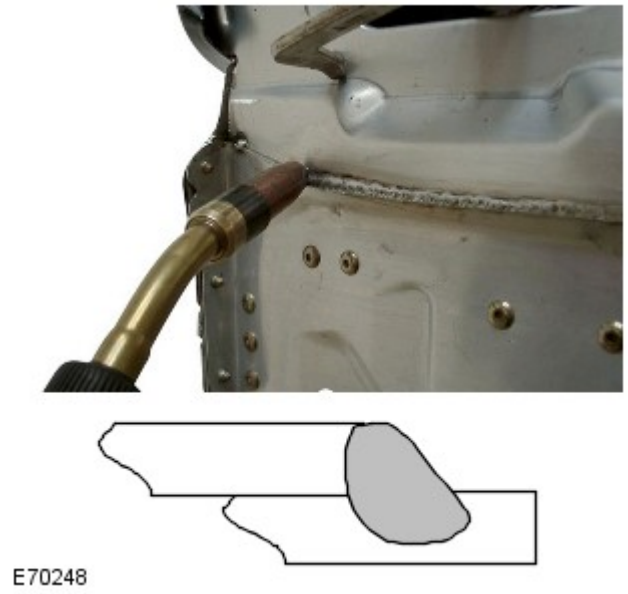
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

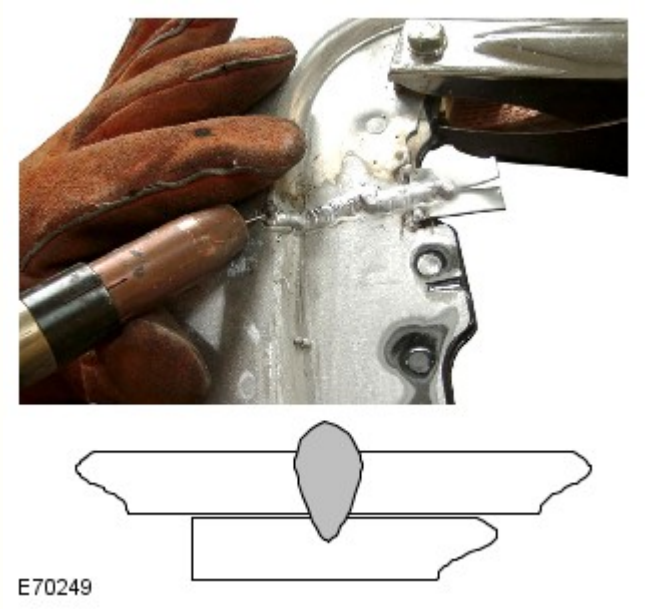
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

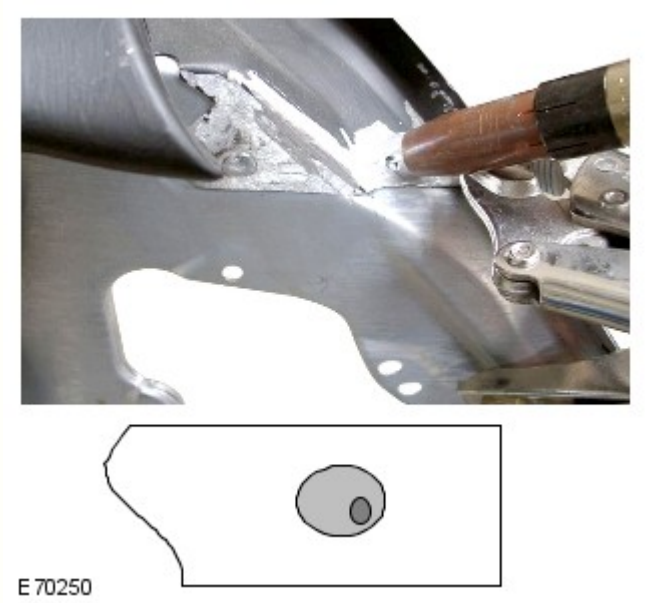
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

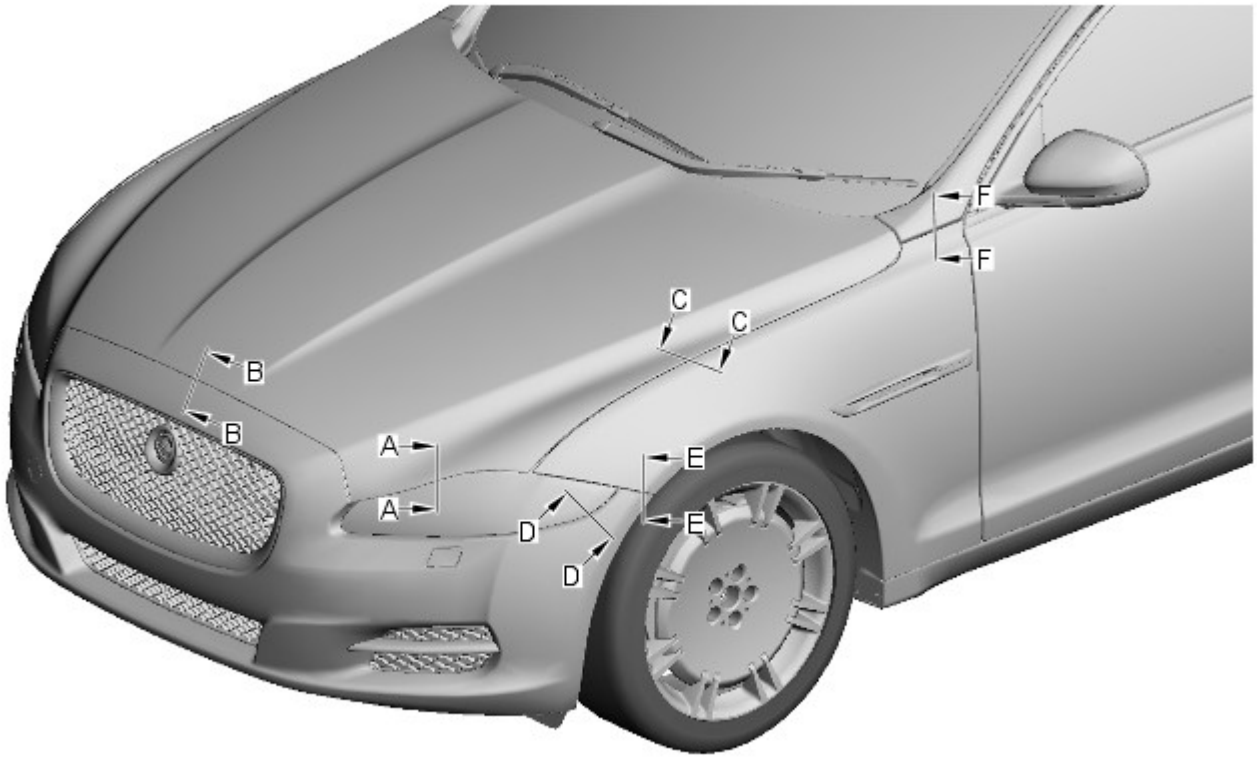
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

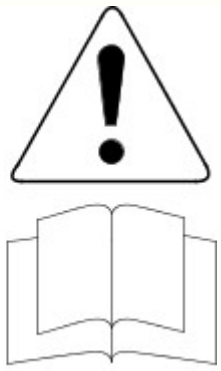
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

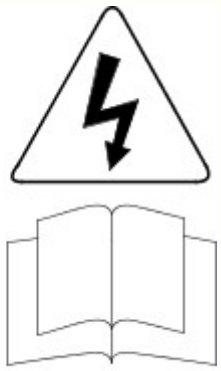
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



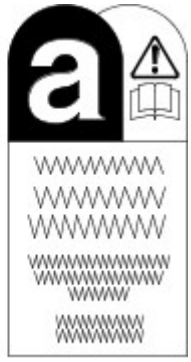
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



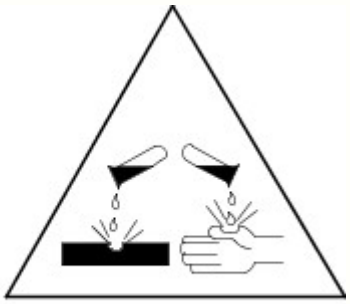
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Published: 10-Feb-2012

Supplemental Restraint System - Side Air Curtain Module

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Take extra care when handling supplemental restraint system (SRS) components.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

Rear End Sheet Metal Repairs - Quarter Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being installed in isolation or is being installed in combination with panels other than those listed.

1. The quarter panel is a category A repair.

2. NOTE: The quarter panel is manufactured from aluminium alloy 6111-T4.

The quarter panel is serviced as a separate riveted and bonded panel, it includes the quarter panel lower extension.

3. The quarter panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Luggage compartment lid
   - Luggage compartment lid hinge
   - Rear window glass

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove the rear window glass.
For additional information, refer to: Rear Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

7. Remove the luggage compartment lid hinge.
For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove the rear muffler.
For additional information, refer to: Rear Muffler (309-00 Exhaust System - 3.0L V6 - TdV6, Removal and Installation) / Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the rear muffler heatshields.

12. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation) / Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation).

13. Remove the luggage compartment lid weatherstrip.

14. Remove the parcel shelf.
For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

15. Remove the B-Pillar lower trim panel.
For additional information, refer to: B-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

16. Remove the C-Pillar side impact sensor.
For additional information, refer to: C-Pillar Side Impact Sensor (501-20B Supplemental Restraint System, Removal and Installation).

17. Remove the rear quarter window glass.
For additional information, refer to: Rear Quarter Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

18. Remove the rear safety belt retractor.
For additional information, refer to: Rear Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

19. Remove the rear door striker.

20. Remove the rocker panel outer moulding.

21. Remove the quarter panel splash shield.

22. Remove the forced air extraction grille.

23. Remove the rear bumper cover side retainer.

24. If the right-hand quarter panel is to be repaired, remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

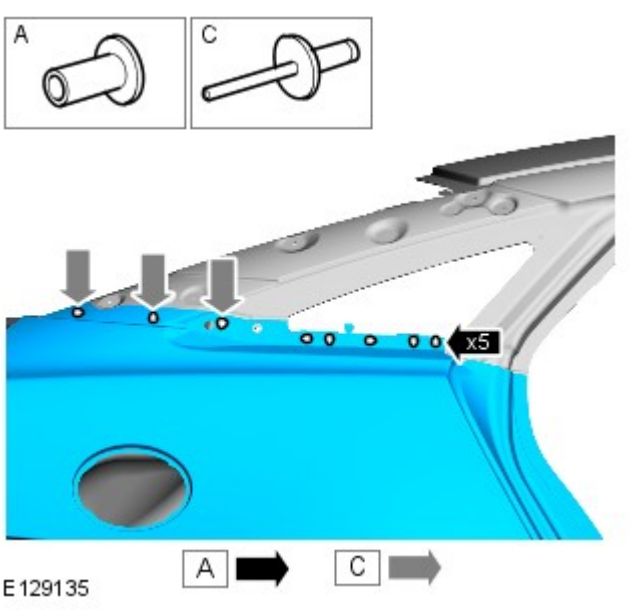
25. If the right-hand quarter panel is to be repaired remove the rear junction box (RJB).

For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

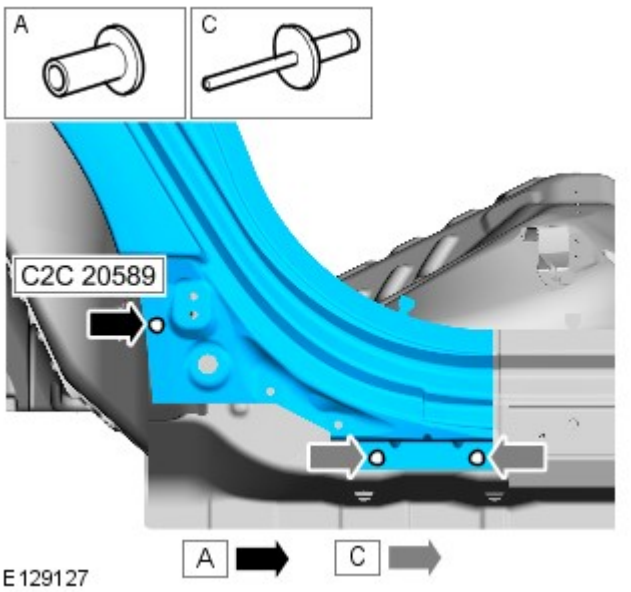
26. If the right-hand quarter panel is to be repaired remove the fuel filler door assembly.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

27. Remove any electrical components in the local area of repair to prevent damage.

28. Release the back panel and loadspace wiring harness and position it to one side.

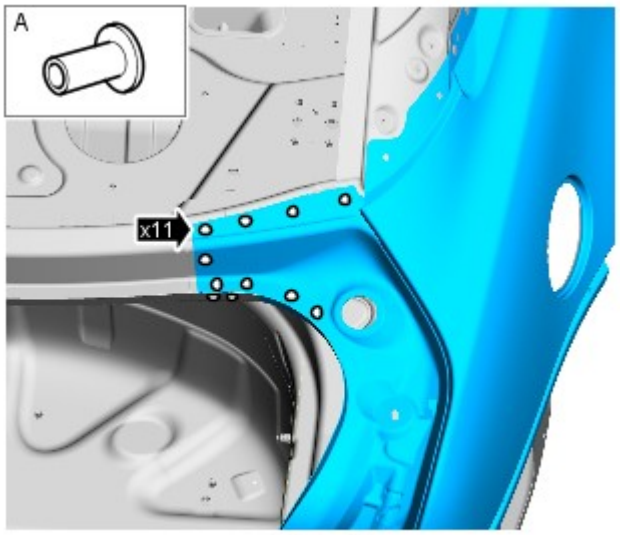


29. Remove the Monobolts from the quarter panel inner. Using the ESN50 remove the self piercing rivets from the quarter panel inner.

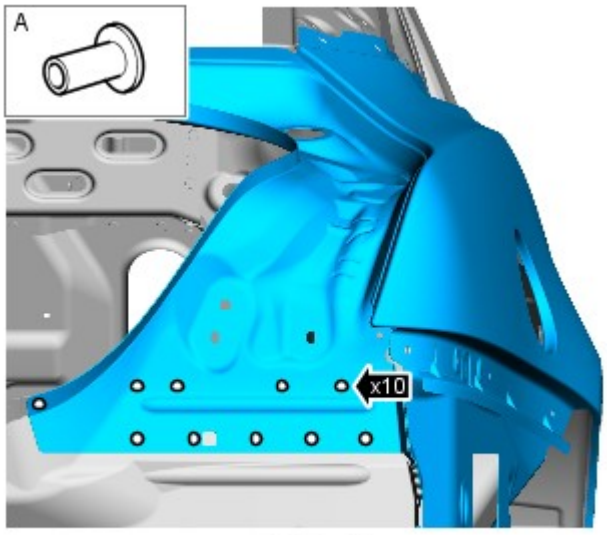


30. Remove the Monobolts from the rocker panel. Using the ESN50 remove the self piercing rivet from the rear wheelhouse outer.

31. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the rear parcel shelf panel.

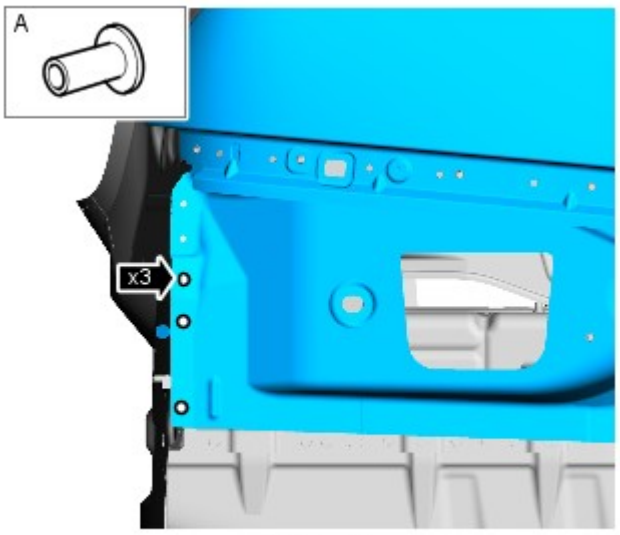


E129128



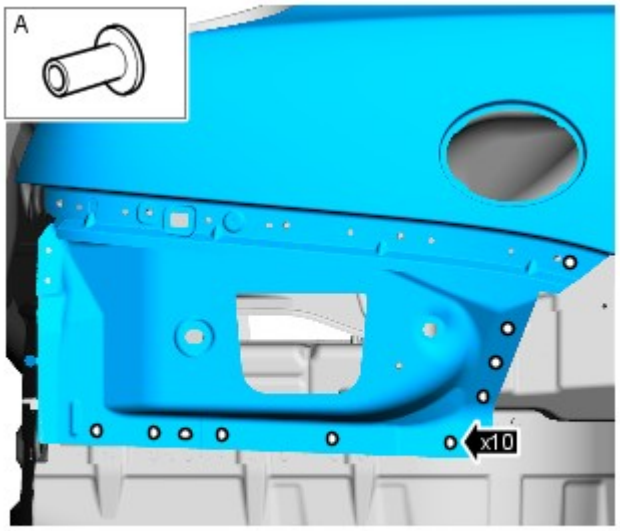
E129129

32. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the back panel.



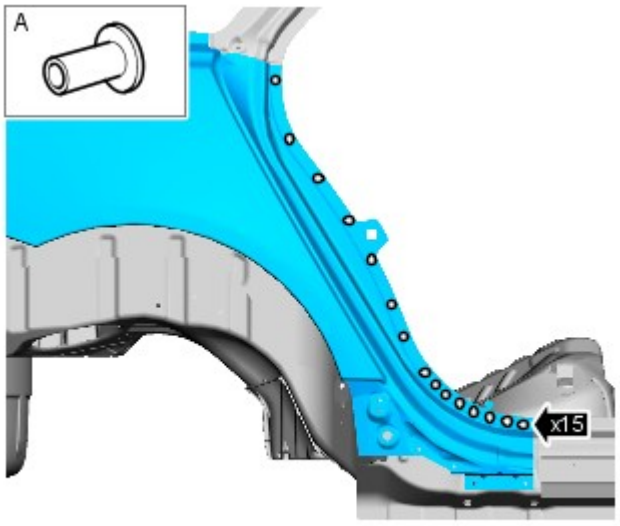
E129139

33. Using the ESN50, remove the self piercing rivets from the back panel.



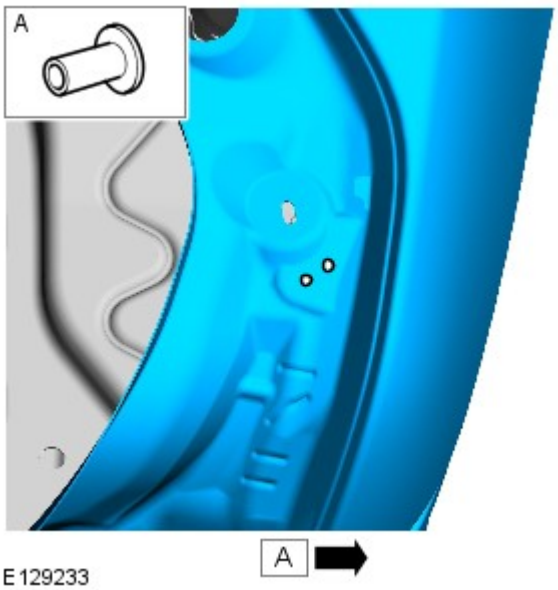
E129131

34. Using the ESN50, the self piercing rivets from the rear floor side extension and rear wheelhouse outer.



E129132

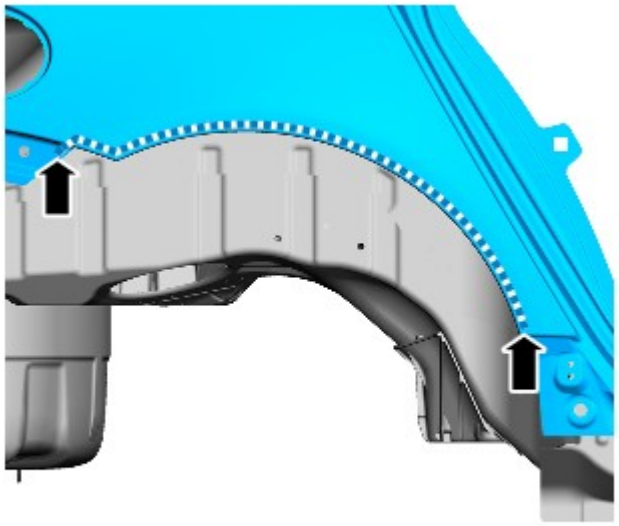
35. Using the ESN50, remove the self piercing rivets from the rear door aperture.



E129233

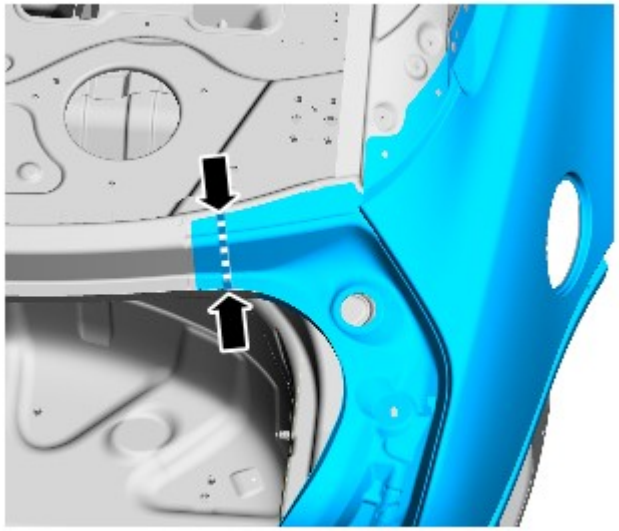
36. Using the ESN50, remove the self piercing rivets from the junction box and control module mounting panel.

37. Carefully separate and release the adhesive from the wheelarch outer.



E129134

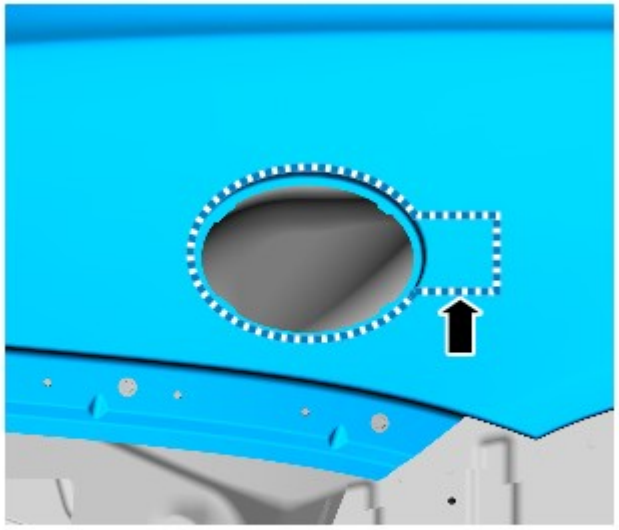
38. Carefully separate and release the adhesive from the rear parcel shelf panel.



E129717

39. Carefully separate and release the adhesive from the quarter panel inner.

E129743



E129133

40. If the right hand quarter panel is to be repaired, carefully separate and release the adhesive from the fuel filler door aperture.

41. Separate the joints and remove the old panel, also releasing the noise, vibration and harshness, (NVH), components.

Installation

1. If necessary, install the NVH components.

2. Remove rivet remnants.

3. Using a Roloc fine bristle disc, remove the adhesive residue.

4. Dress flanges where necessary.

5. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

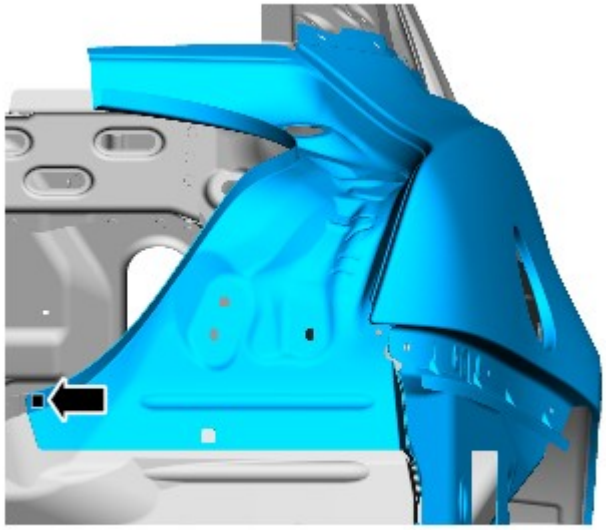
6. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

7. Remove the transit lug from the new panel.

8. Remove the new panel.

9. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

10. Drill 1 10mm hole in the new quarter panel ready for MAG plug welding.



E129716

11. Deburr the drilled holes.

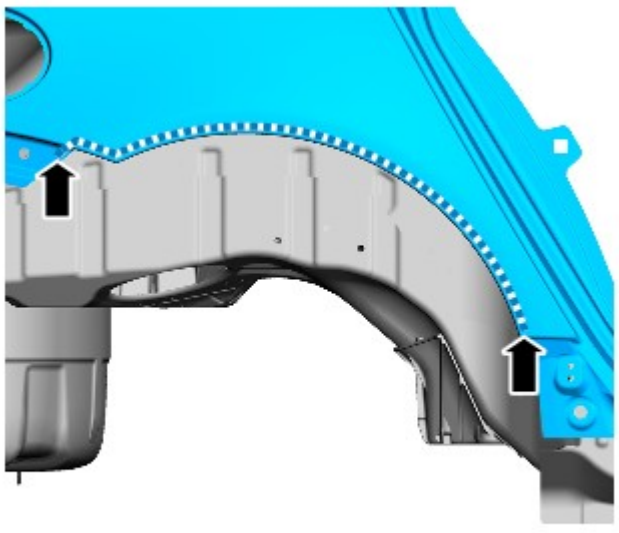
12. CAUTION: Use care not to damage the panel.

Remove seam sealer where applicable.

13. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

14. Pyrosil the joints.

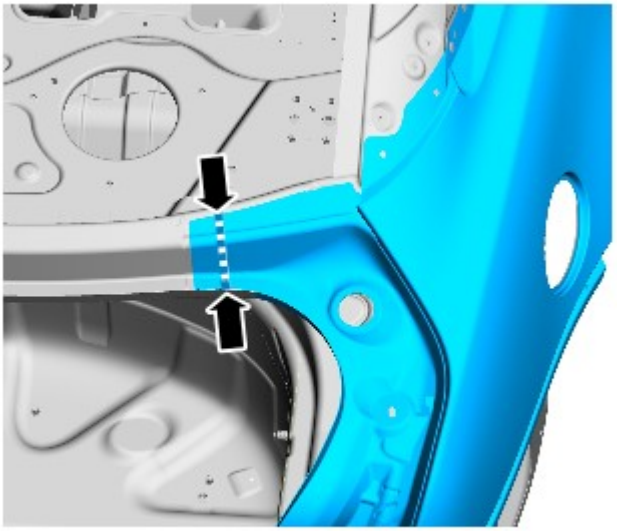
15. Apply the coupling agent and allow to dry.



E129134

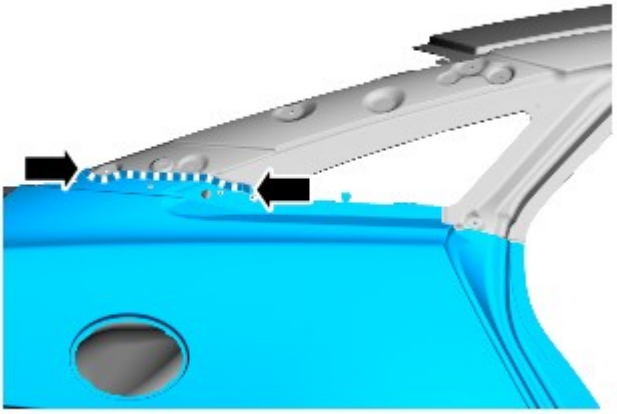
16. Apply semi-rigid sealer to the body at the wheelarch outer.

17. Apply semi-rigid sealer to the body at the rear parcel shelf panel.



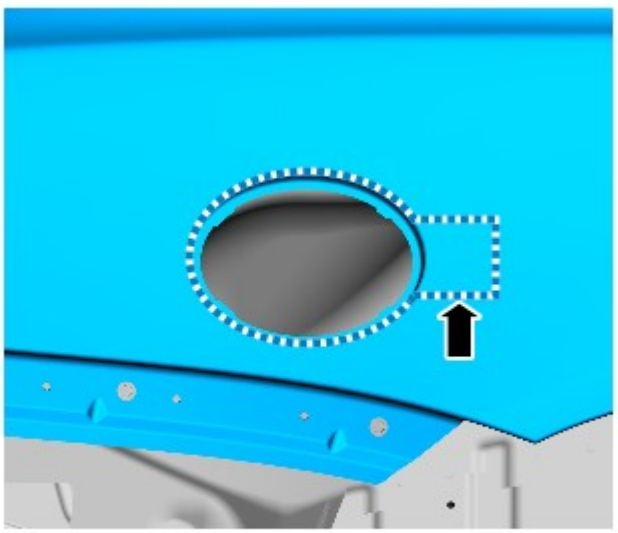
E129717

18. Apply semi-rigid sealer to the body at the quarter panel inner.



E129743

19. If the right hand quarter panel is to be repaired, apply semi-rigid sealer to the body at the fuel filler door aperture.



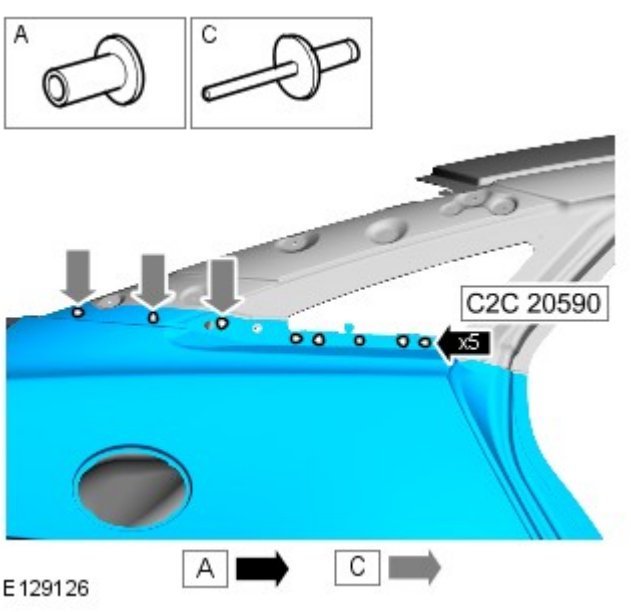
E129133

20. Apply semi-rigid sealer to the NVH components.

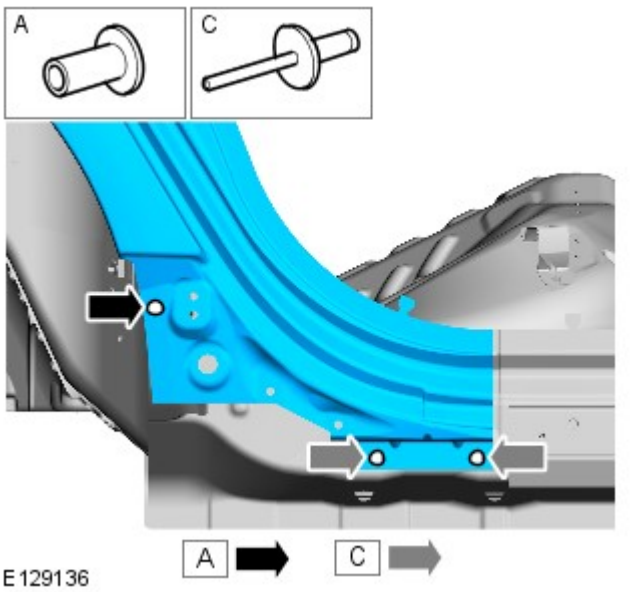
21. NOTE: make sure a continuous bead of adhesive surrounds the fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

22. Offer up the new panel and clamp into position.

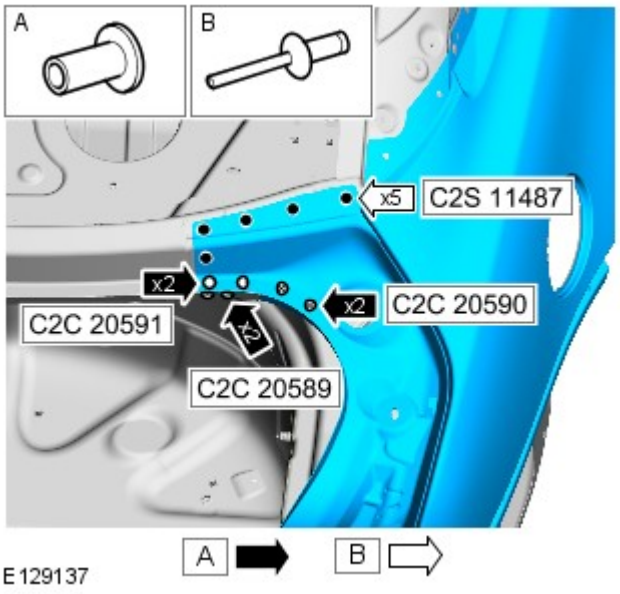


23. Using the Genesis G4, install the Monobolts into the quarter panel inner. Using the ESN50, install the self piercing rivets into the quarter panel inner.

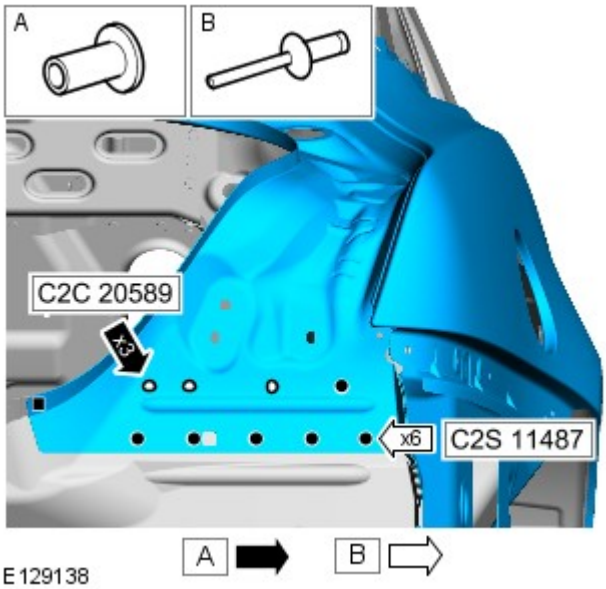


24. Using the Genesis G4, install the Monobolts into the rocker panel. Using the ESN50, install the self piercing rivet into the rear wheelhouse outer.

25. Using the Genesis G4, install the Hemloks into the rear parcel shelf panel. Using the ESN50, install the self piercing rivets into the rear parcel shelf panel.

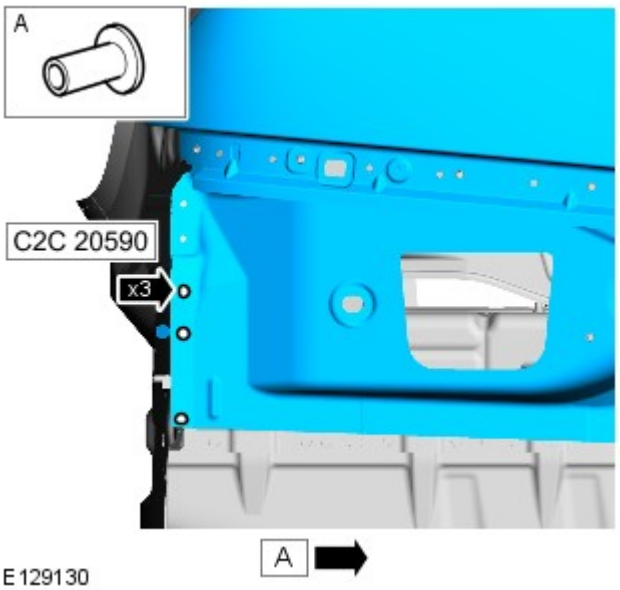


E129137



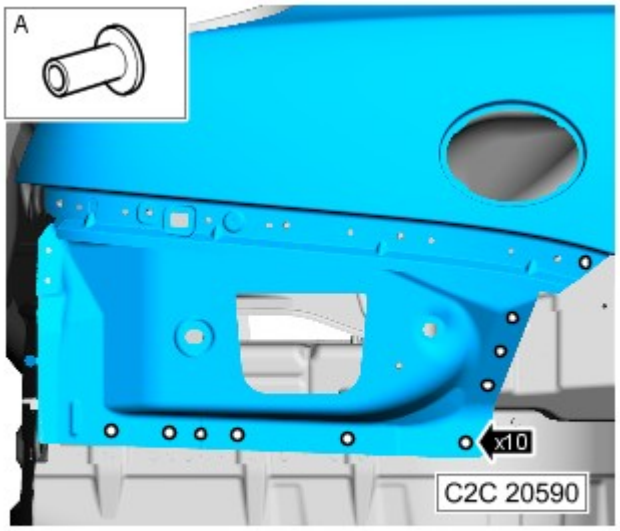
E129138

26. Using the Genesis G4, install the Hemloks into the back panel. Using the ESN50, install the self piercing rivets into the back panel.



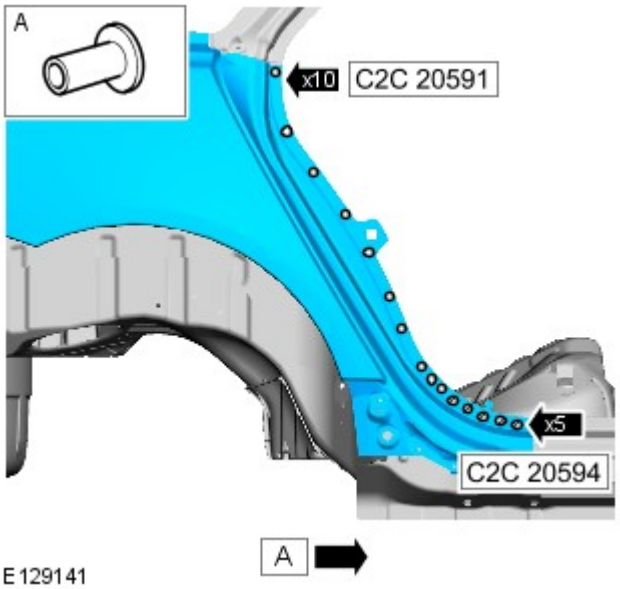
E129130

27. Using the ESN50, install the self piercing rivets into the back panel.



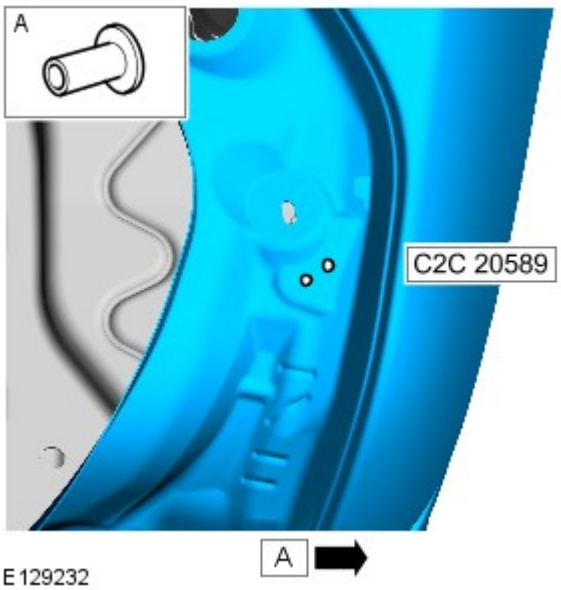
E129140

28. Using the ESN50, install the self piercing rivets into the rear floor side extension and rear wheelhouse outer.



E129141

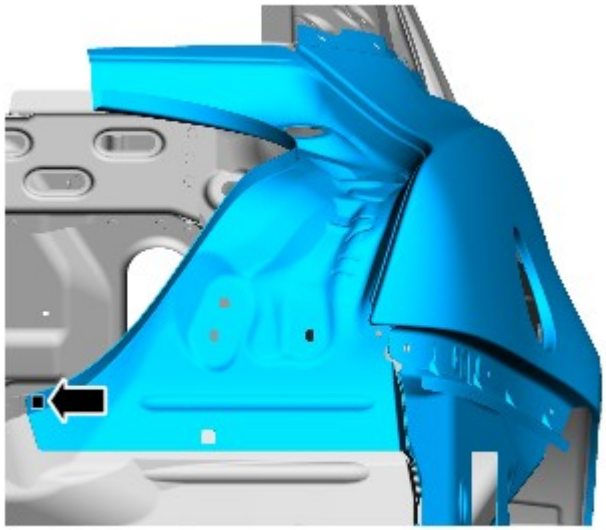
29. Using the ESN50, install the self piercing rivets into the rear door aperture.



E129232

30. Using the ESN50, install the self piercing rivets into the junction box and control module mounting panel.

31. Remove any excess adhesive.



E129716

32. Install the MIG plug weld into the back panel.

E129533

33. Install the NVH material as indicated.

34. The installation of associated panels and components is the reversal of removal procedure.

Rear End Sheet Metal Repairs - Quarter Panel Lower Extension

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being installed in isolation or is being installed in combination with panels other than those listed.

1. The quarter panel lower extension is a category A repair.

E129234

2. NOTE: The quarter panel lower extension is manufactured from aluminium alloy 5754-NG

The quarter panel lower extension is serviced as a separate riveted and bonded panel, it is also serviced as part of the quarter panel.

3. The quarter panel lower extension is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove the Rear Bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

7. Remove the muffler and tailpipe.
For additional information, refer to: Rear Muffler (309-00A, Removal and Installation) /
Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

8. Remove the rear bumper cover side retainer.

9. Remove the rear wheel and tire.
For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

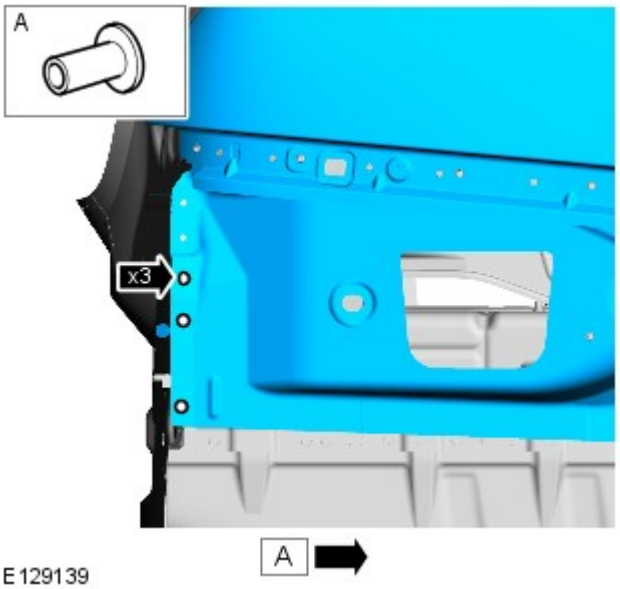
10. Remove the rear fender splash shield.

11. Remove the forced air extraction grille.

12. If the right-hand quarter panel is to be repaired remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

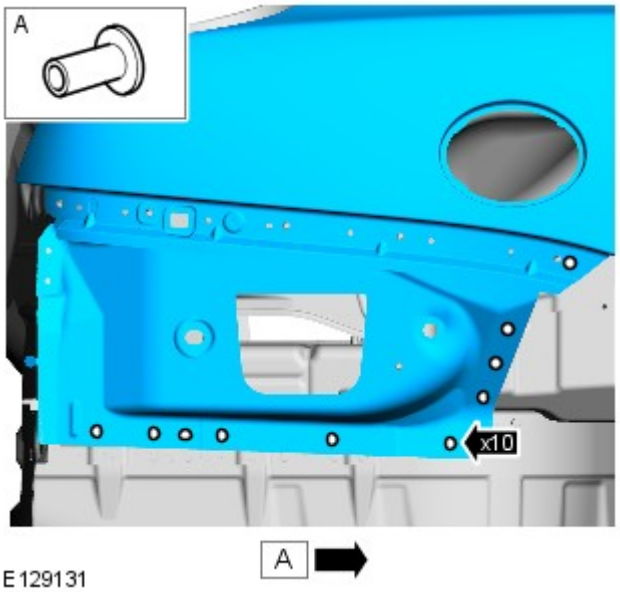
13. Release the back panel and loadspace wiring harness and position it to one side.

14. Remove any electrical components in the local area of repair to prevent damage.



E129139

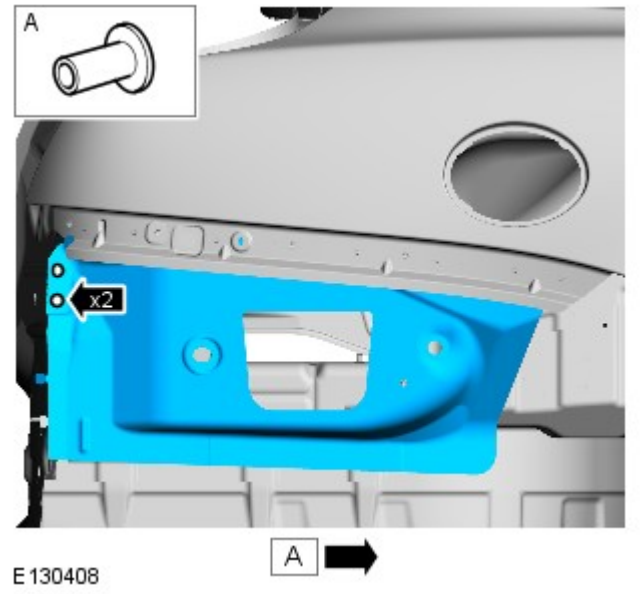
15. Using the ESN50, remove the self piercing rivets from the back panel.

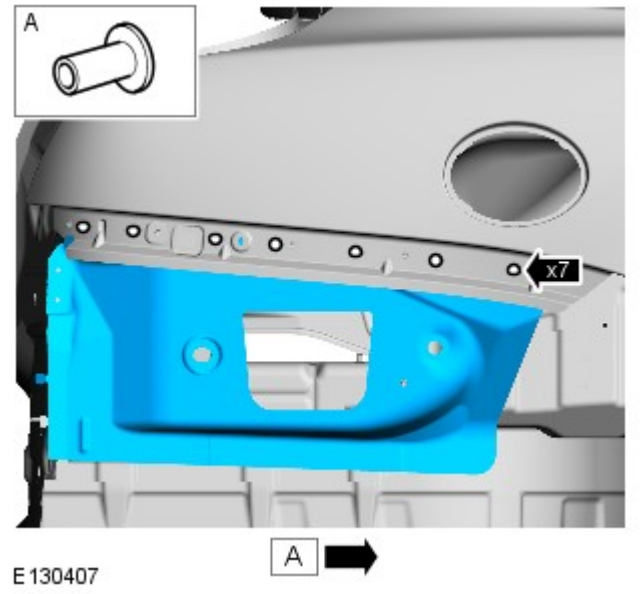


E129131

16. Using the ESN50, remove the self piercing rivets from the rear floor side extension and wheelhouse outer.

17. Using the ESN50, remove the self piercing rivets from the quarter panel.





18. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets from the quarter panel.

19. CAUTION: Use care when separating the joints to avoid distorting adjacent panels.

Separate the joints and remove the old panel, also releasing the noise, vibration and harshness, (NVH) component.

Installation

NOTES:

Self Piercing Rivets should be installed adjacent to their original positions and not into any holes made during removal.

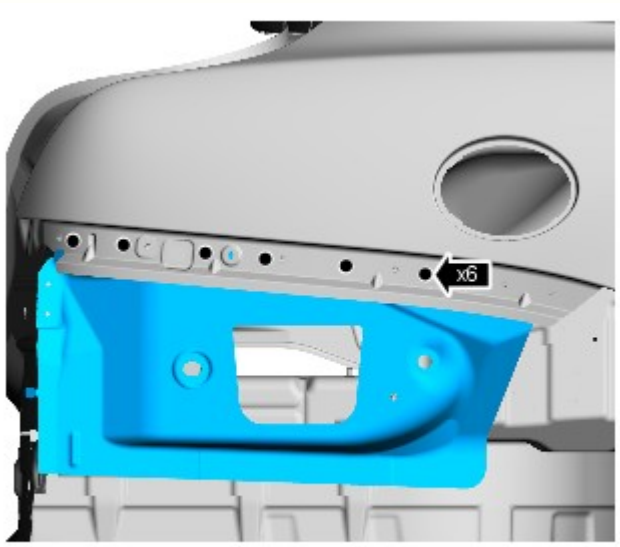
Self piercing rivets should be installed adjacent to their original positions and not into any holes made during removal.

1. Remove the rivet remnants.

2. Using a Roloc fine bristle disc, remove the adhesive residue.

3. Dress flanges where necessary.

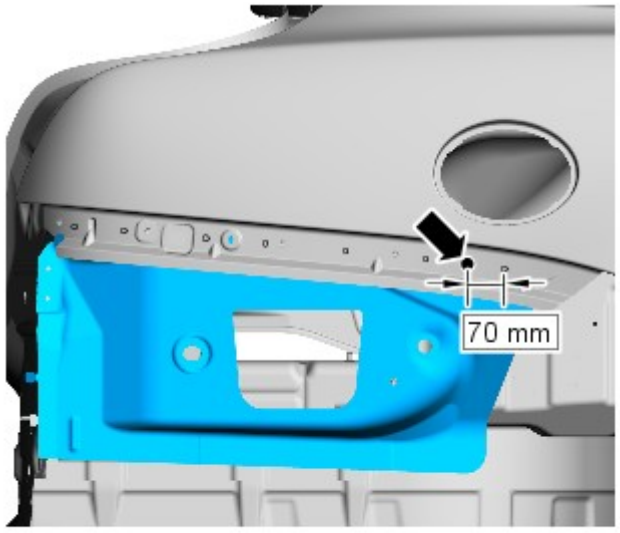
4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



E130409

5. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed.



E130410

6. NOTE: Due to the proximity of inner panels, it is not possible to install a Hemlok in the same location as the original self piercing rivet. In this case the Hemlok is installed approximately 70mm rearward.

Using a 6.5mm Cryobit drill bit, drill 1 hole as indicated.

7. Remove the new panel.

8. Debur the drilled holes.

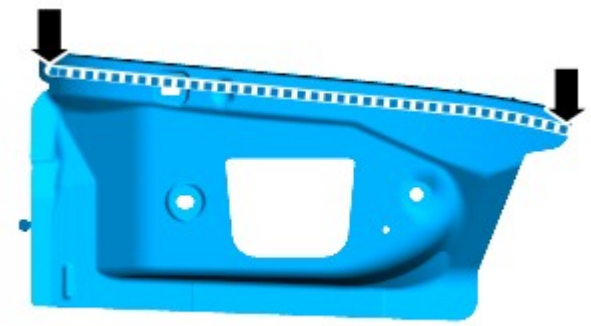
9. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

10. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

11. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

E130413

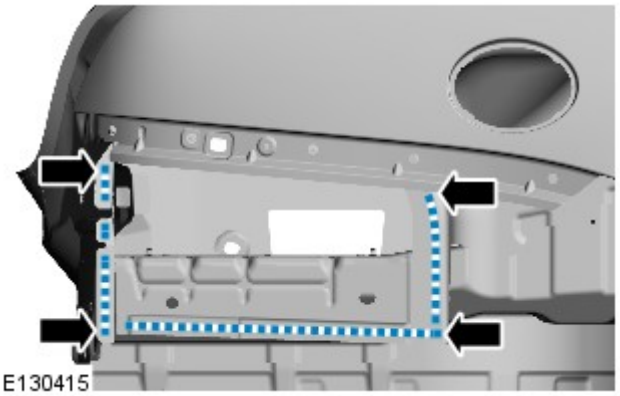
12. Apply semi-rigid sealer to the new panel as indicated.



E130414

13. NOTE: Make sure that a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the new panel as indicated.



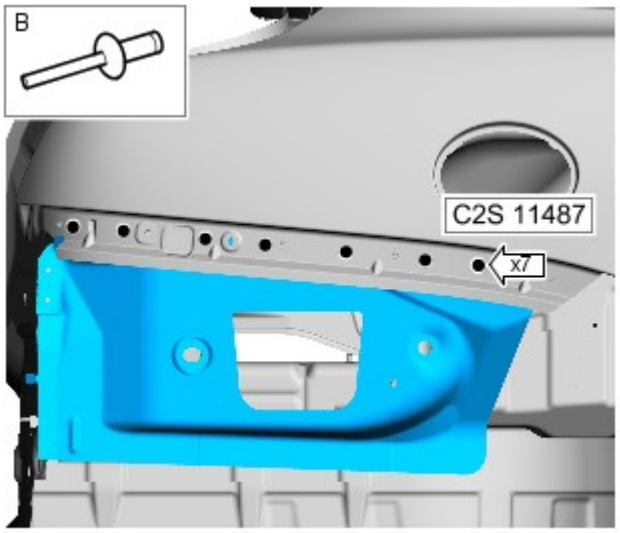
E130415

14. NOTE: Make sure that a continuous bead of adhesive surrounds fixing holes.

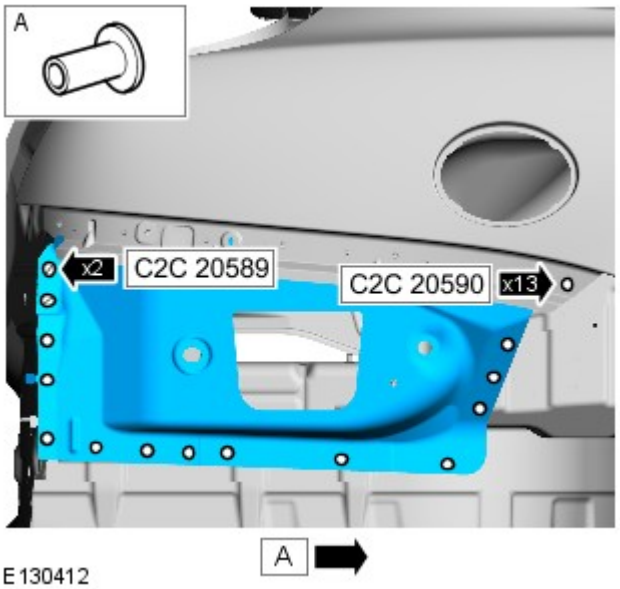
Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints as indicated.

15. Offer up the new panel, align and clamp into position.

16. Using the Genesis G4, install the Hemloks.



E130411

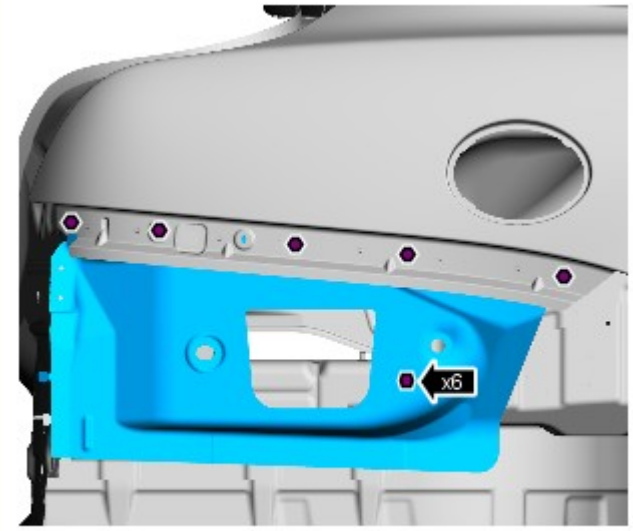


E130412

17. Using the ESN50, install the self piercing rivets.

18. Remove any excess adhesive.

19. Using the HES 412 Rivet Nut Tool, insert the rivet nuts.



E130416

20. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

21. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection
Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

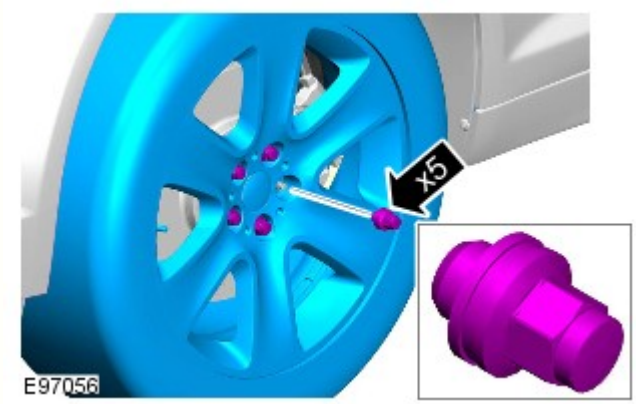
Wheels and Tires - Wheel and Tire
Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1. WARNING: Make sure to support the vehicle with axle stands.

   Raise and support the vehicle.



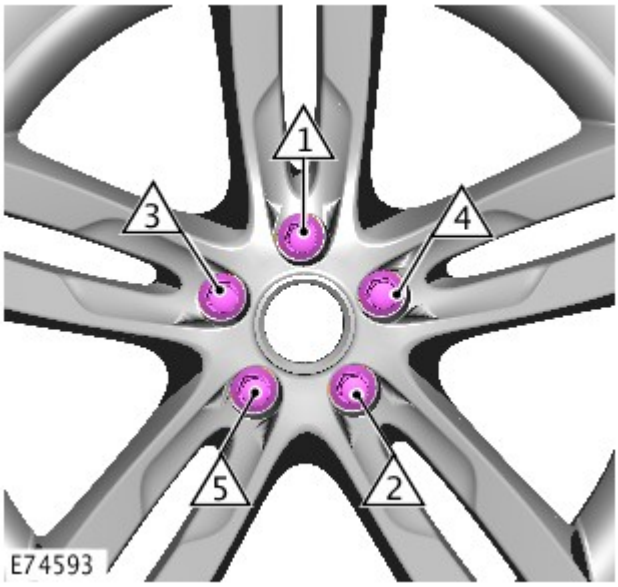
2. CAUTION: Using power tools may result in damage to the wheel nuts. Make sure the wheel nuts are released using hand tools only.

   Remove the wheel and tire.

   Torque: 125 Nm

Installation

1. CAUTIONS:



Apply a small amount of grease to the hub and wheel mating surfaces before installation. Make sure the grease does not come into contact with the vehicles braking components and the wheel stud threads. Failure to follow these instructions may result in personal injury.

Using power tools may result in damage to the wheel nuts. Make sure the wheel nuts are installed using hand tools only.

Install the wheel and tire.

Battery, Mounting and Cables - Battery Disconnect and Connect

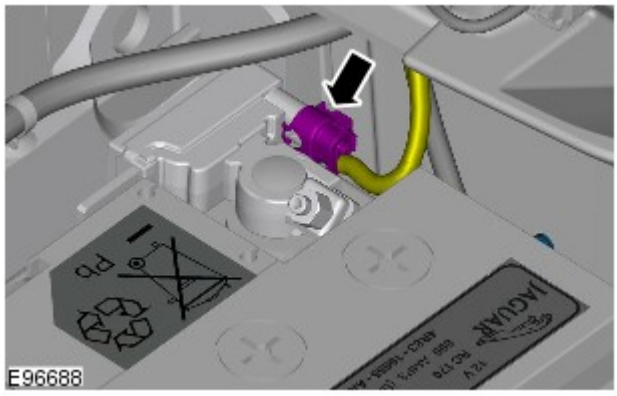
General Procedures

Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

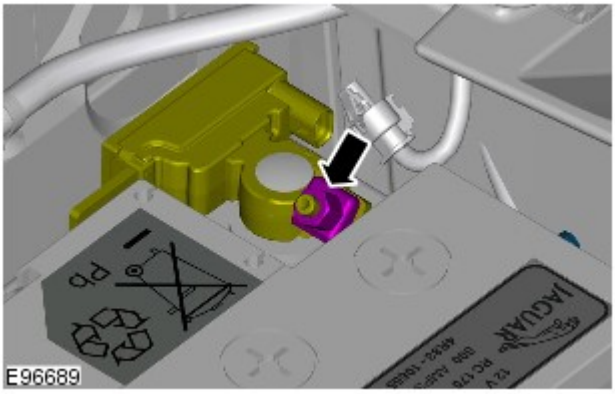
3. Raise and secure the luggage compartment floor covering.



E96688

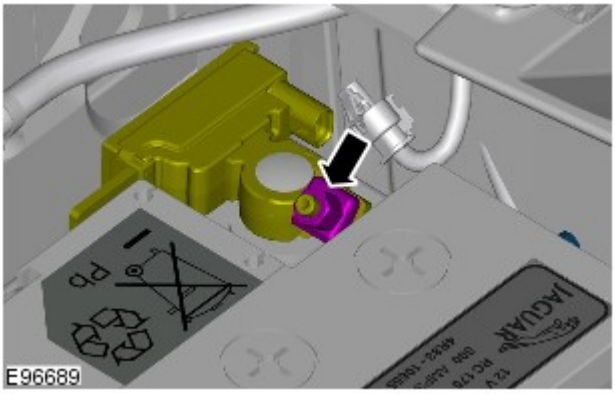
4. CAUTION: Take extra care not to damage the wiring harness.

5.

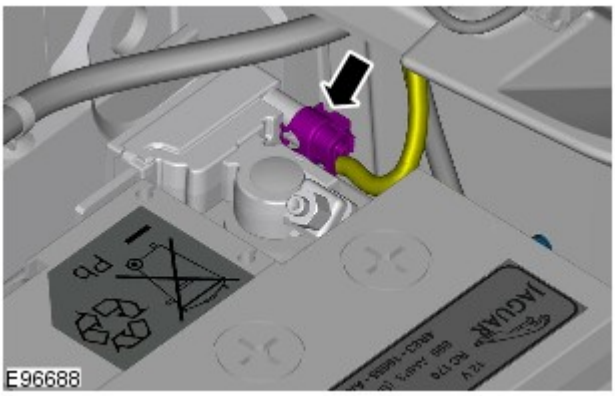


Connect

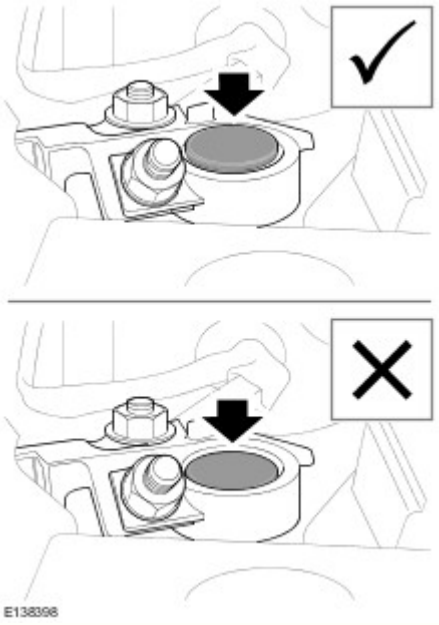
1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.



4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places

particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel

- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual

- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A

- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During	Yes - **caution** material sensitive to heat.	Yes - **must** be heated to maintain original alloy properties. Ideal

Repair	Range: 140 - 160°C Ideal panel temperature: **150°C**	panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

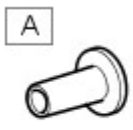
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

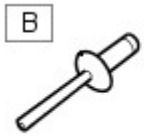
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

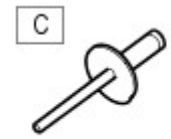
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

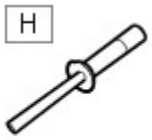
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

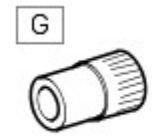
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

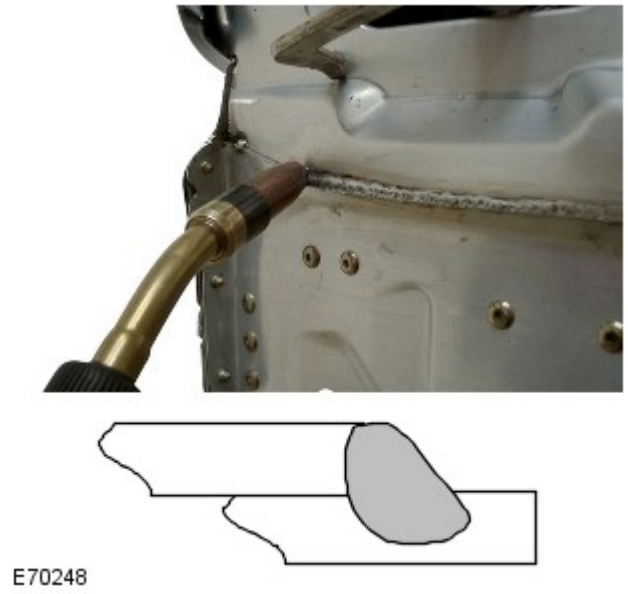
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

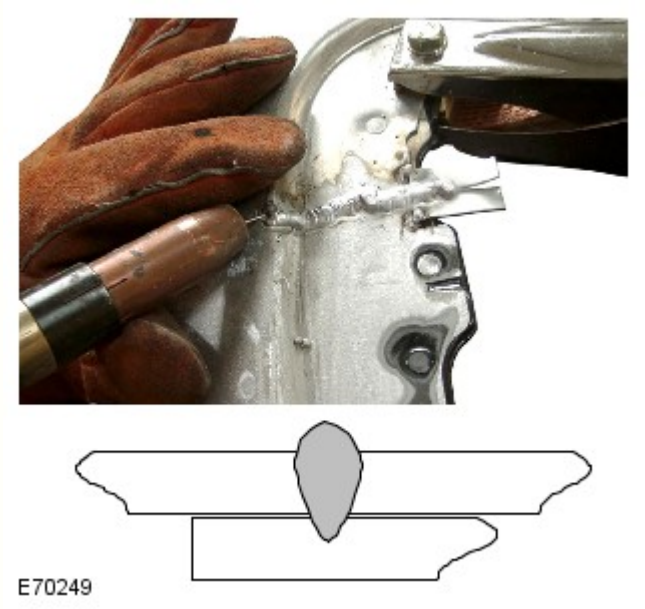
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

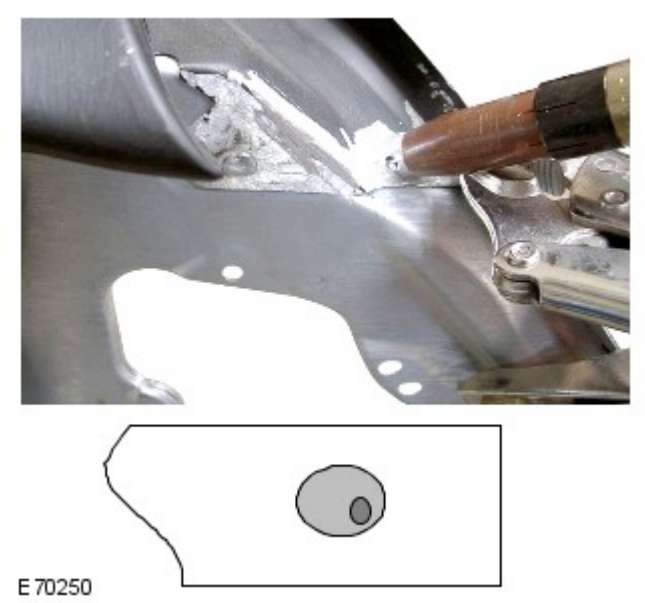
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

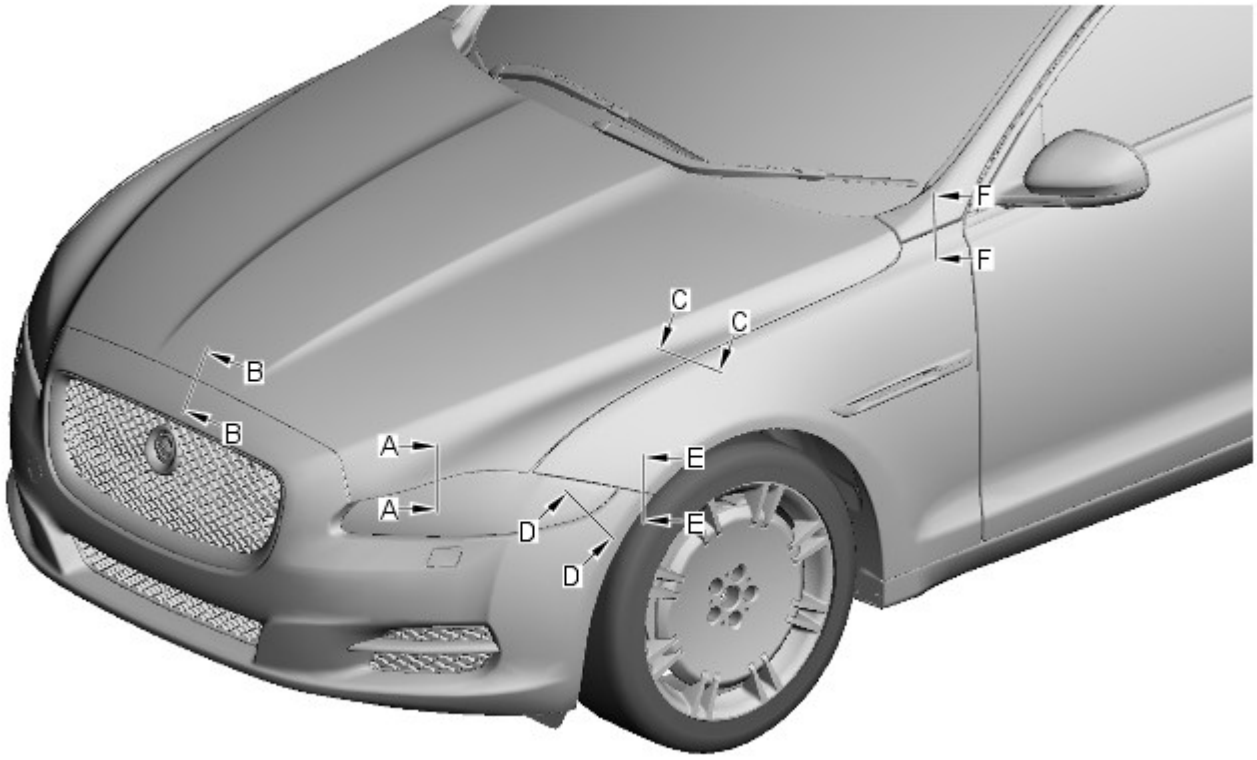
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

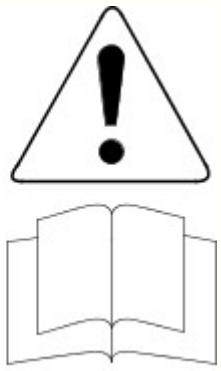
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

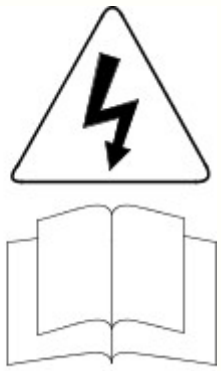
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



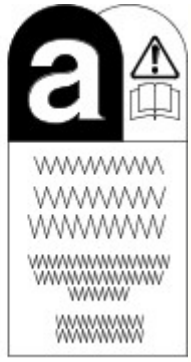
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



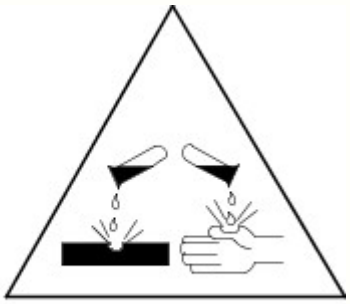
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Rear End Sheet Metal Repairs - Quarter Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being installed in isolation or is being installed in combination with panels other than those listed.

1. The quarter panel is a category A repair.

2. NOTE: The quarter panel is manufactured from aluminium alloy 6111-T4.

The quarter panel is serviced as a separate riveted and bonded panel, it includes the quarter panel lower extension.

3. The quarter panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Luggage compartment lid
   - Luggage compartment lid hinge
   - Rear window glass

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove the rear window glass.
For additional information, refer to: Rear Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

7. Remove the luggage compartment lid hinge.
For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove the rear muffler.
For additional information, refer to: Rear Muffler (309-00 Exhaust System - 3.0L V6 - TdV6, Removal and Installation) / Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the rear muffler heatshields.

12. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation) / Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation).

13. Remove the luggage compartment lid weatherstrip.

14. Remove the parcel shelf.
For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

15. Remove the B-Pillar lower trim panel.
For additional information, refer to: B-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

16. Remove the C-Pillar side impact sensor.
For additional information, refer to: C-Pillar Side Impact Sensor (501-20B Supplemental Restraint System, Removal and Installation).

17. Remove the rear quarter window glass.
For additional information, refer to: Rear Quarter Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

18. Remove the rear safety belt retractor.
For additional information, refer to: Rear Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

19. Remove the rear door striker.

20. Remove the rocker panel outer moulding.

21. Remove the quarter panel splash shield.

22. Remove the forced air extraction grille.

23. Remove the rear bumper cover side retainer.

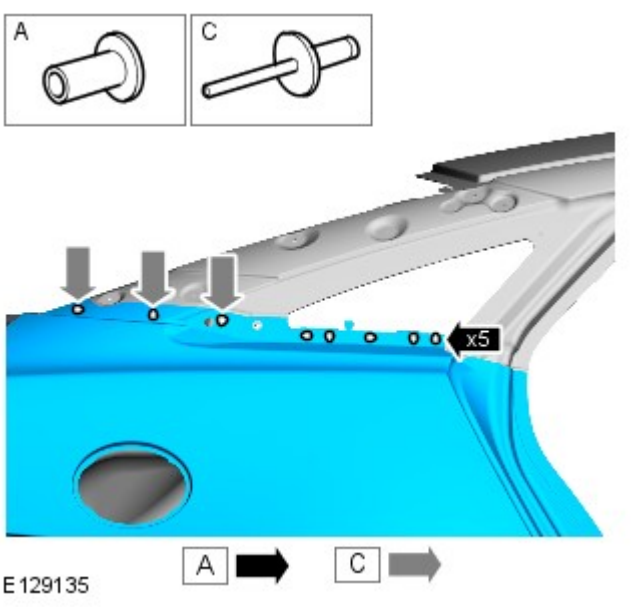
24. If the right-hand quarter panel is to be repaired, remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

25. If the right-hand quarter panel is to be repaired remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

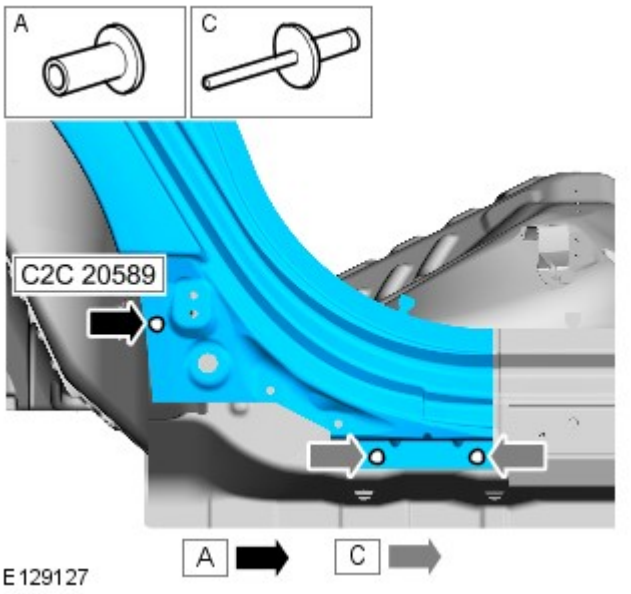
26. If the right-hand quarter panel is to be repaired remove the fuel filler door assembly.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

27. Remove any electrical components in the local area of repair to prevent damage.

28. Release the back panel and loadspace wiring harness and position it to one side.

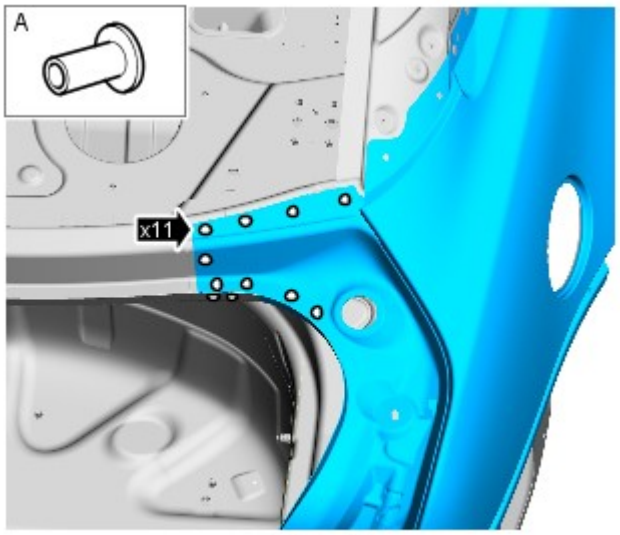


29. Remove the Monobolts from the quarter panel inner. Using the ESN50 remove the self piercing rivets from the quarter panel inner.

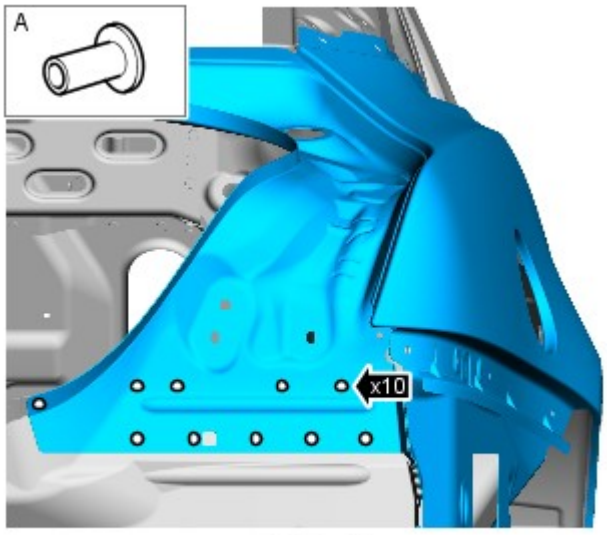


30. Remove the Monobolts from the rocker panel. Using the ESN50 remove the self piercing rivet from the rear wheelhouse outer.

31. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the rear parcel shelf panel.

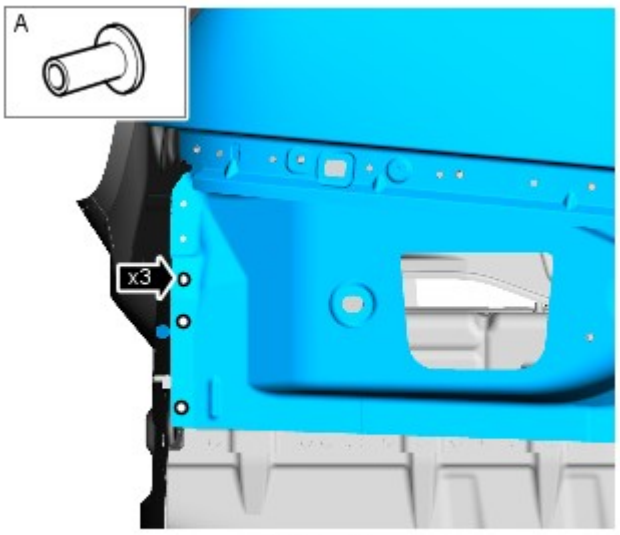


E129128



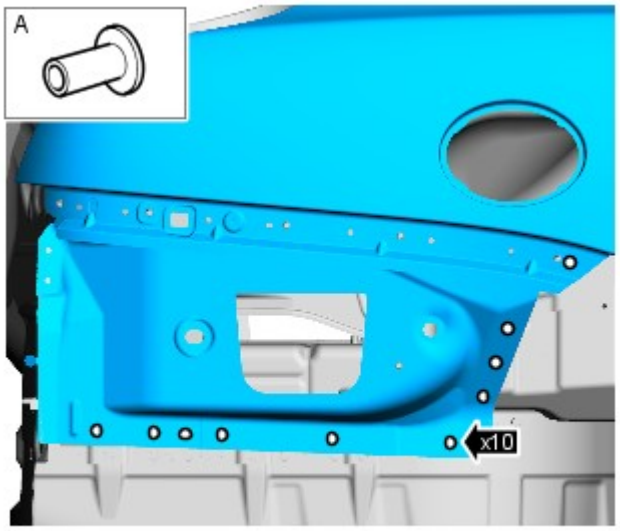
E129129

32. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the back panel.



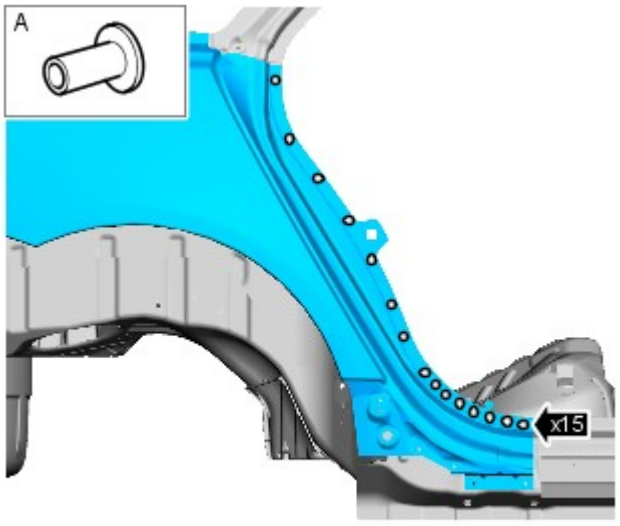
E129139

33. Using the ESN50, remove the self piercing rivets from the back panel.



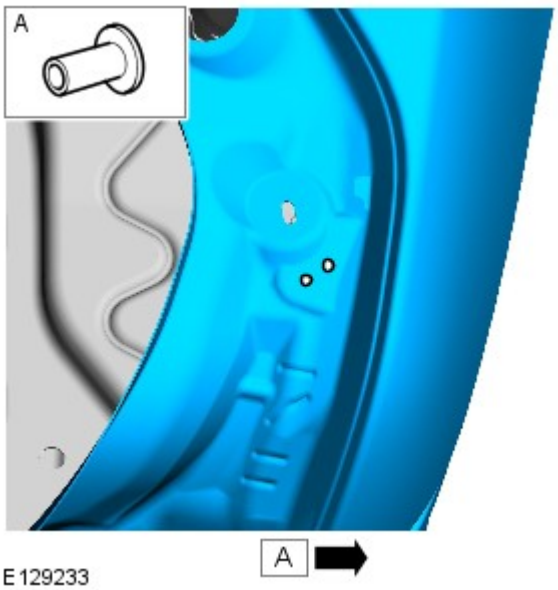
E129131

34. Using the ESN50, the self piercing rivets from the rear floor side extension and rear wheelhouse outer.



E129132

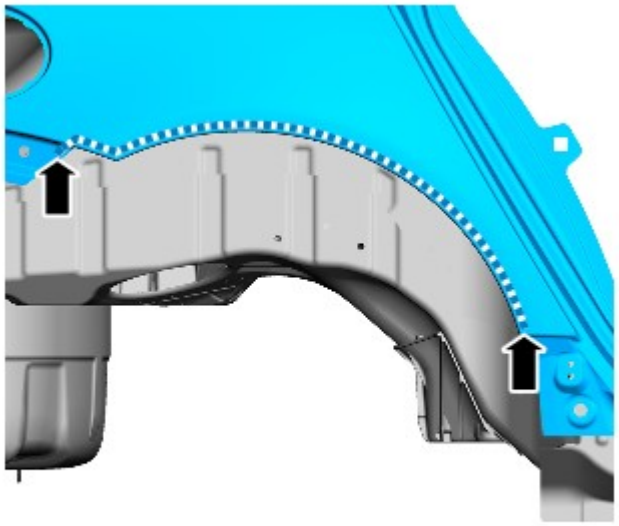
35. Using the ESN50, remove the self piercing rivets from the rear door aperture.



E129233

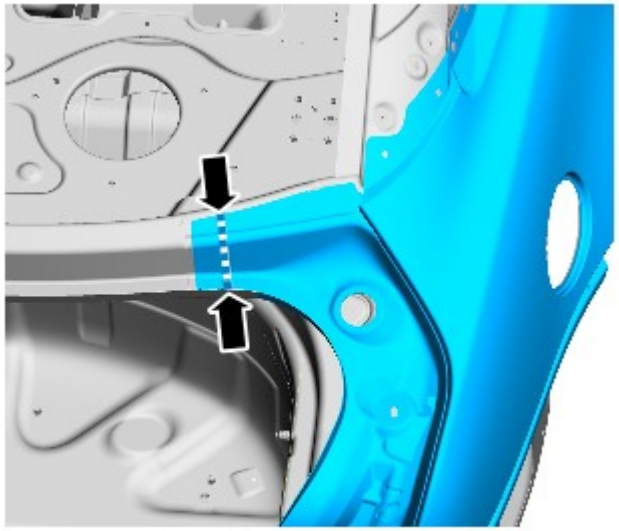
36. Using the ESN50, remove the self piercing rivets from the junction box and control module mounting panel.

37. Carefully separate and release the adhesive from the wheelarch outer.



E129134

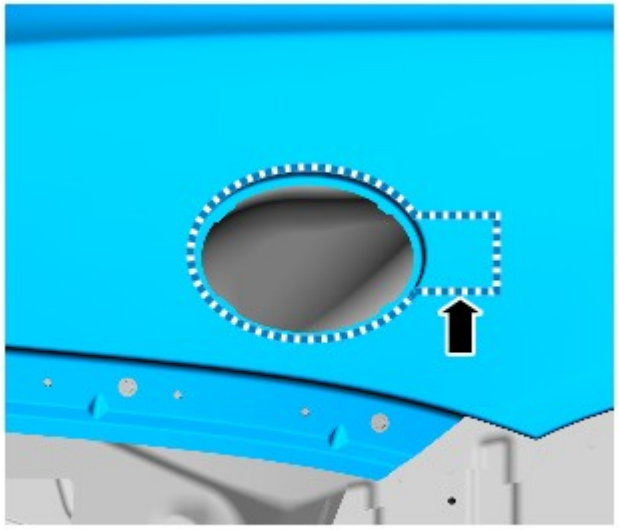
38. Carefully separate and release the adhesive from the rear parcel shelf panel.



E129717

39. Carefully separate and release the adhesive from the quarter panel inner.

E129743



E129133

40. If the right hand quarter panel is to be repaired, carefully separate and release the adhesive from the fuel filler door aperture.

41. Separate the joints and remove the old panel, also releasing the noise, vibration and harshness, (NVH), components.

Installation

1. If necessary, install the NVH components.

2. Remove rivet remnants.

3. Using a Roloc fine bristle disc, remove the adhesive residue.

4. Dress flanges where necessary.

5. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

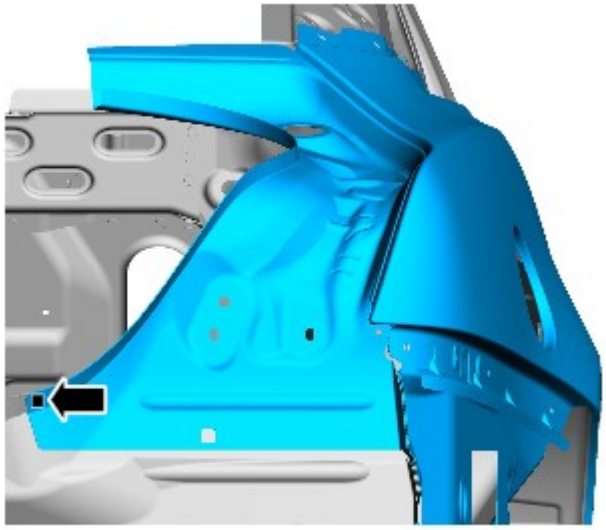
6. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

7. Remove the transit lug from the new panel.

8. Remove the new panel.

9. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

10. Drill 1 10mm hole in the new quarter panel ready for MAG plug welding.



E129716

11. Deburr the drilled holes.

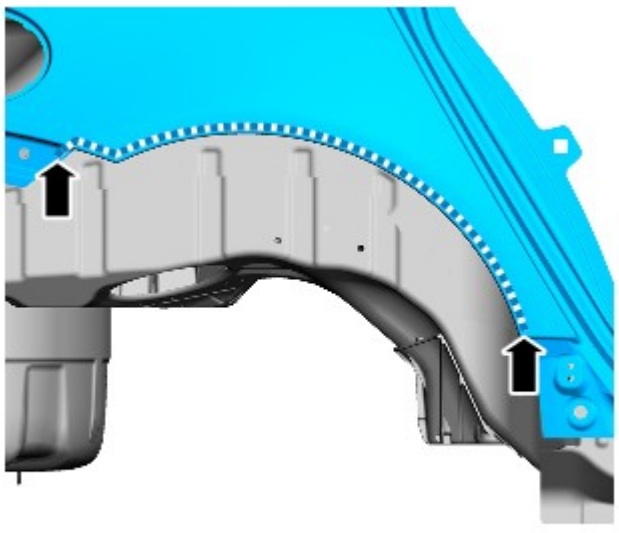
12. CAUTION: Use care not to damage the panel.

Remove seam sealer where applicable.

13. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

14. Pyrosil the joints.

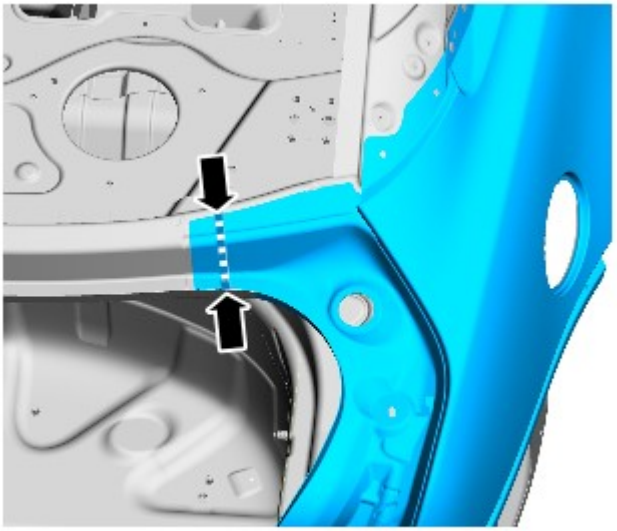
15. Apply the coupling agent and allow to dry.



E129134

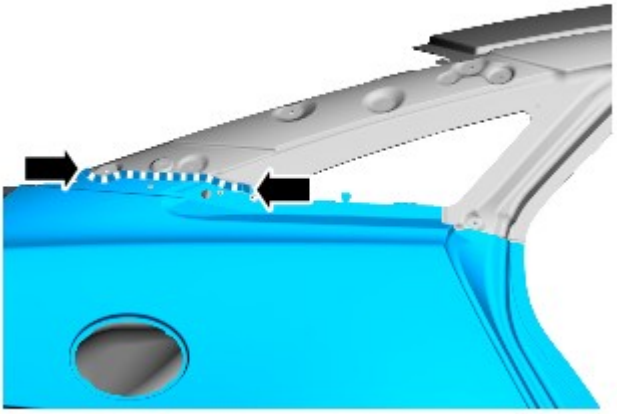
16. Apply semi-rigid sealer to the body at the wheelarch outer.

17. Apply semi-rigid sealer to the body at the rear parcel shelf panel.



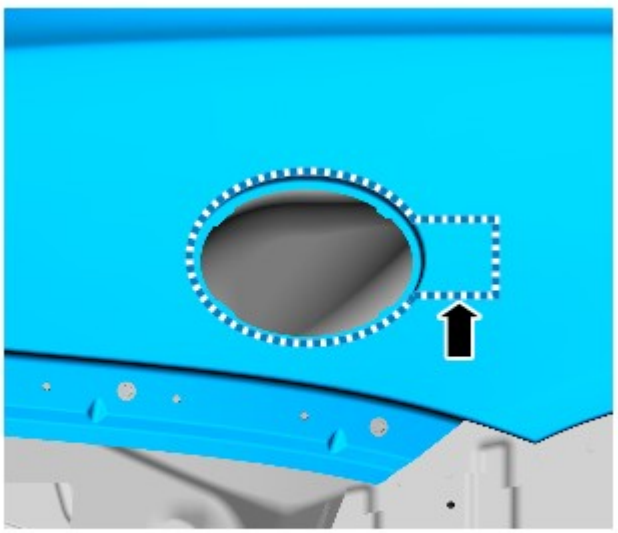
E129717

18. Apply semi-rigid sealer to the body at the quarter panel inner.



E129743

19. If the right hand quarter panel is to be repaired, apply semi-rigid sealer to the body at the fuel filler door aperture.



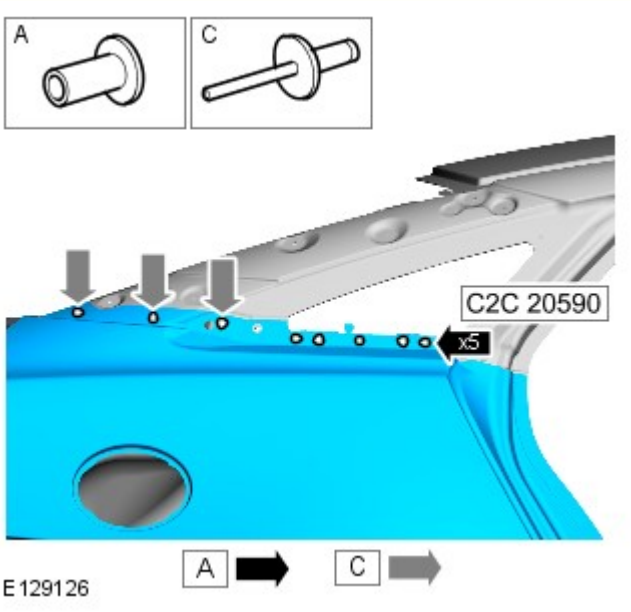
E129133

20. Apply semi-rigid sealer to the NVH components.

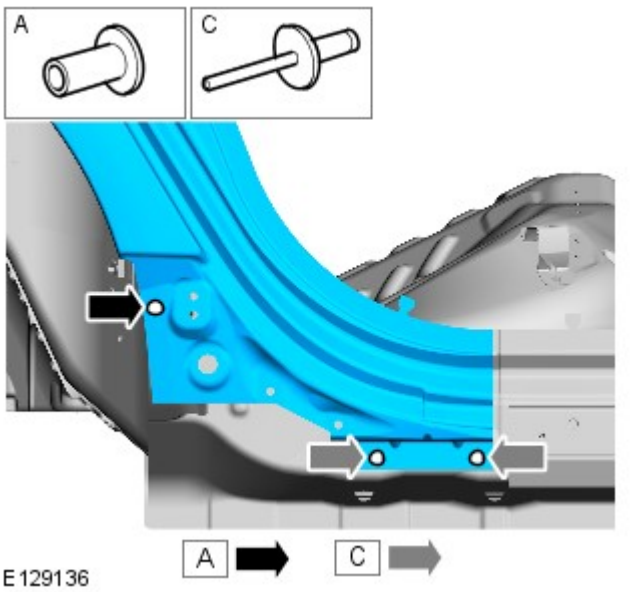
21. NOTE: make sure a continuous bead of adhesive surrounds the fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

22. Offer up the new panel and clamp into position.

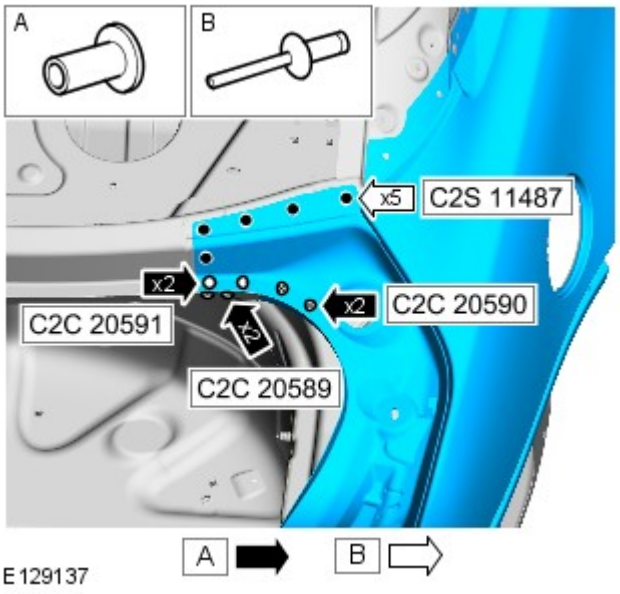


23. Using the Genesis G4, install the Monobolts into the quarter panel inner. Using the ESN50, install the self piercing rivets into the quarter panel inner.

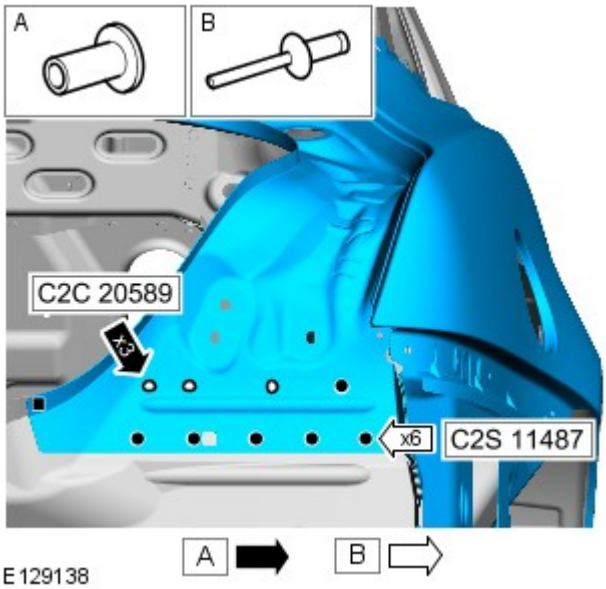


24. Using the Genesis G4, install the Monobolts into the rocker panel. Using the ESN50, install the self piercing rivet into the rear wheelhouse outer.

25. Using the Genesis G4, install the Hemloks into the rear parcel shelf panel. Using the ESN50, install the self piercing rivets into the rear parcel shelf panel.

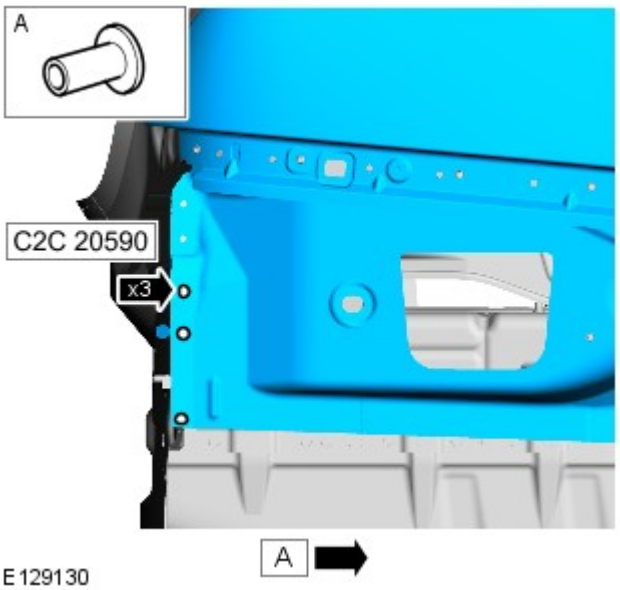


E129137



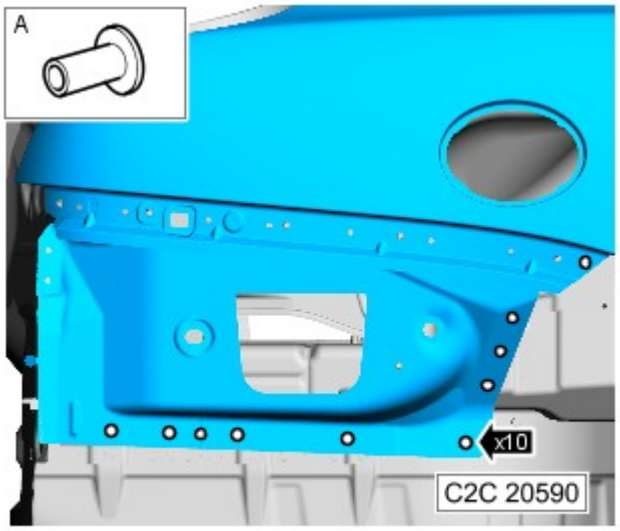
E129138

26. Using the Genesis G4, install the Hemloks into the back panel. Using the ESN50, install the self piercing rivets into the back panel.



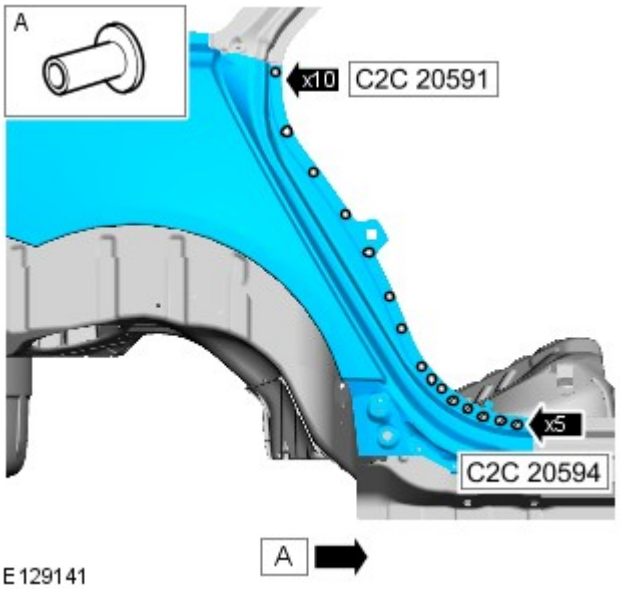
E129130

27. Using the ESN50, install the self piercing rivets into the back panel.



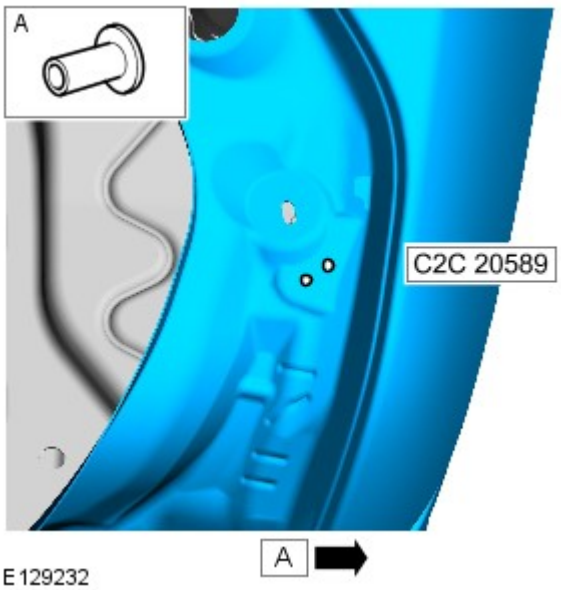
E129140

28. Using the ESN50, install the self piercing rivets into the rear floor side extension and rear wheelhouse outer.



E129141

29. Using the ESN50, install the self piercing rivets into the rear door aperture.

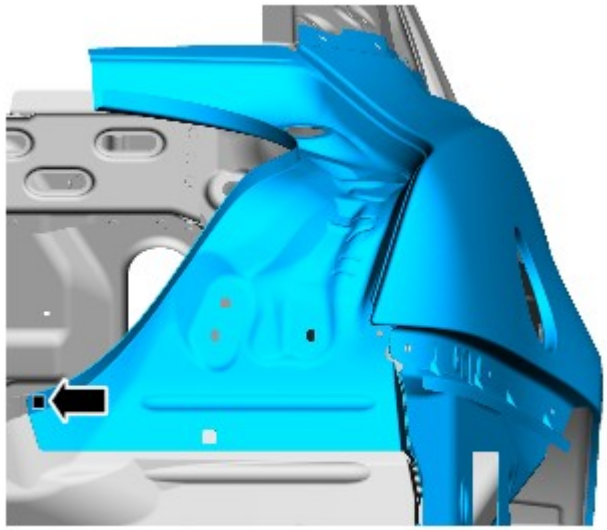


E129232

30. Using the ESN50, install the self piercing rivets into the junction box and control module mounting panel.

31. Remove any excess adhesive.

32. Install the MIG plug weld into the back panel.



E129716

33. Install the NVH material as indicated.

E129533

34. The installation of associated panels and components is the reversal of removal procedure.

Supplemental Restraint System - C-Pillar Side Impact Sensor

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. Make the air bag supplemental restraint system (SRS) safe.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

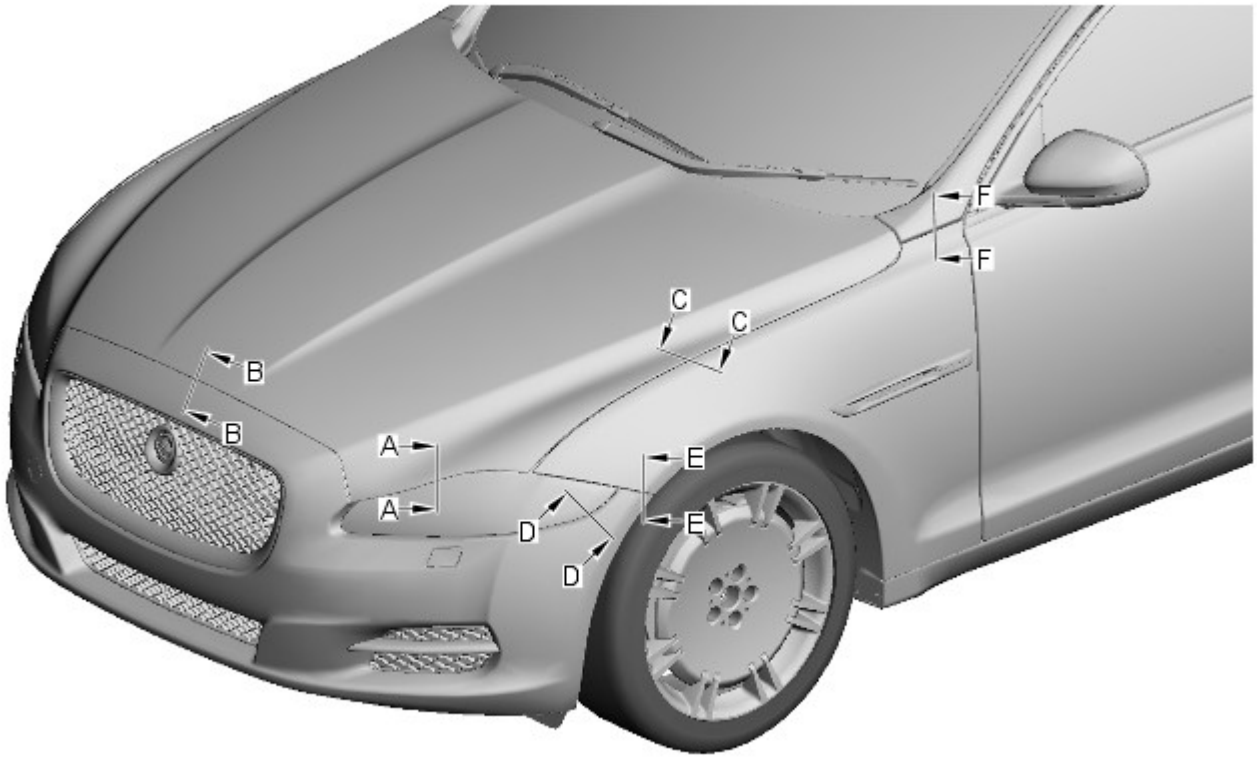
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0

B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0

Glass, Frames and Mechanisms - Rear Quarter Window Glass

Removal and Installation

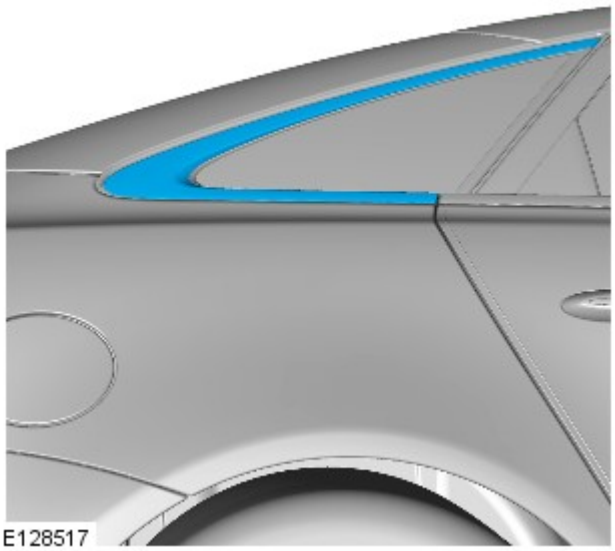
Removal

NOTE: RH illustration shown, LH is similar.

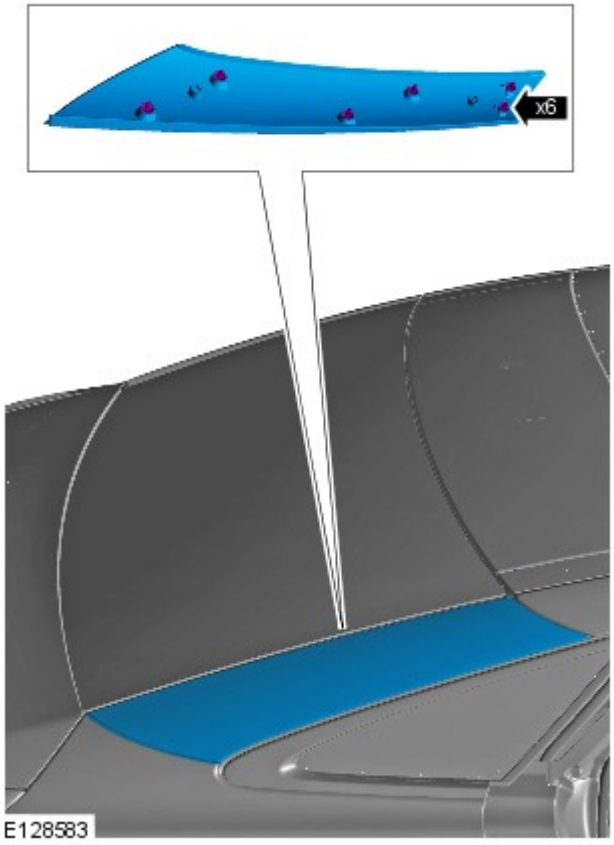
1. Refer to: C-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.
   - Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

3. CAUTION: Discard the component.



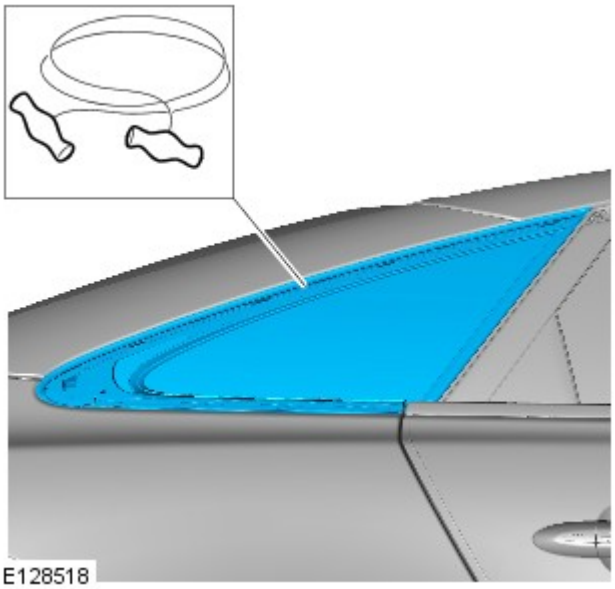
4.



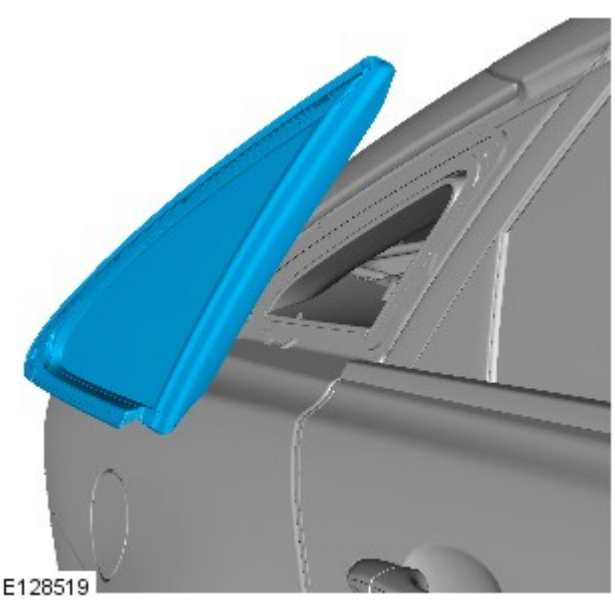
5. CAUTIONS:

Protect the surrounding components.

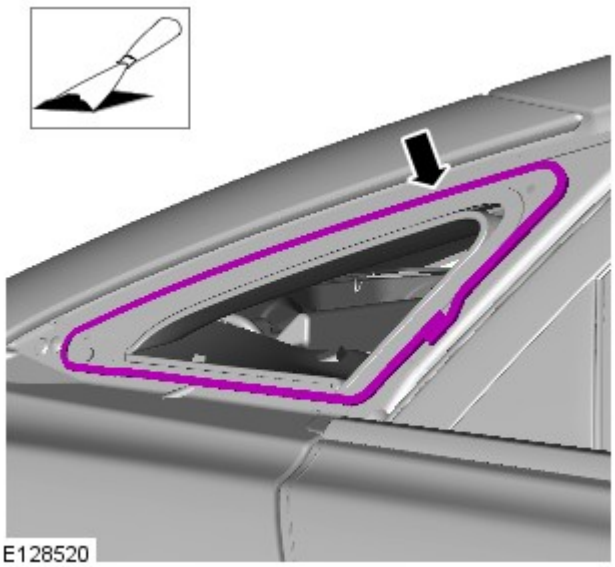
Protect the surrounding paintwork to avoid damage.



6.



Installation

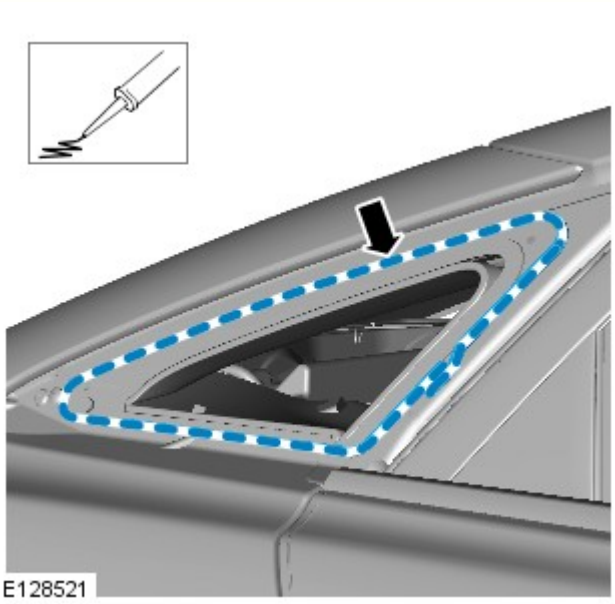


1. CAUTIONS:

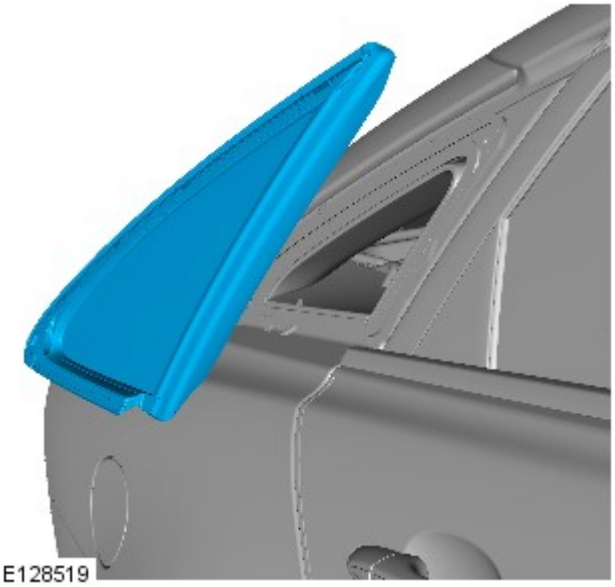
Make sure that the mating faces are clean and free of foreign material.

Correct preparation of body apertures “post painting” to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.



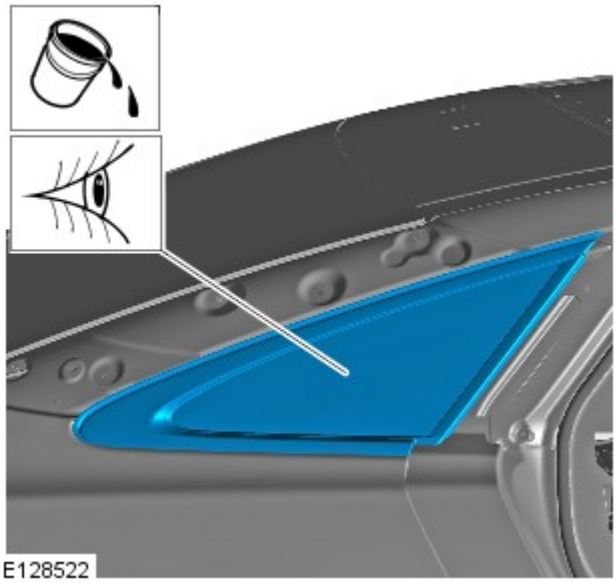
2. CAUTION: Touching the adhesive surface will impair rebonding.



3. CAUTION: Make sure that equal pressure is applied to the full length of the component.

NOTE: Align to the orientation noted on removal.

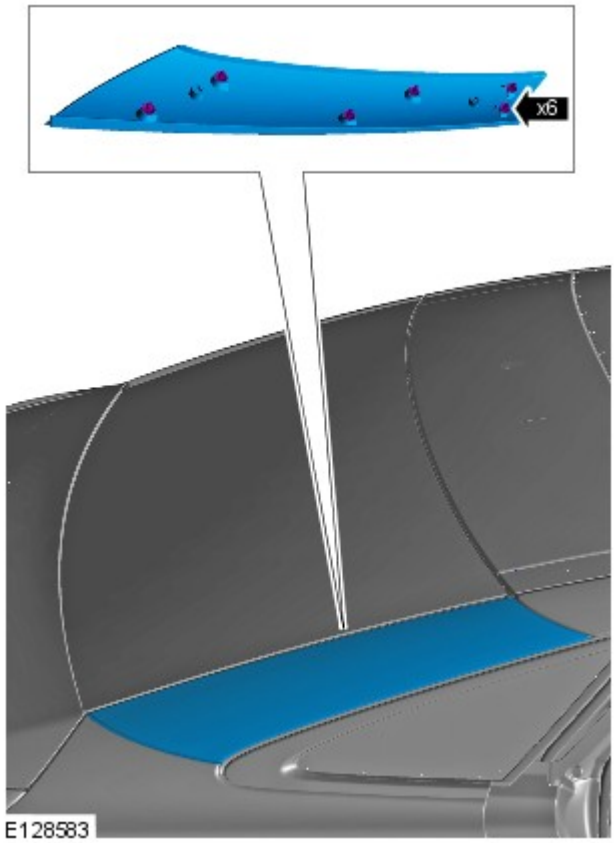
- Install the rear quarter window glass.
- If the ambient temperature falls below 10 degrees C, apply warm air (25 degrees C) continuously for 15 minutes.



4. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.

5.



6. Refer to: C-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Body Closures - Luggage Compartment Lid Hinge

Removal and Installation

Removal

1. The luggage compartment lid hinge is a category B repair.

E129123

2. NOTE: The luggage compartment lid hinge is manufactured from steel.

The luggage compartment lid hinge is serviced as a separate bolt-on panel.

3. The luggage compartment lid hinge is replaced in conjunction with:
   - Luggage compartment lid

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

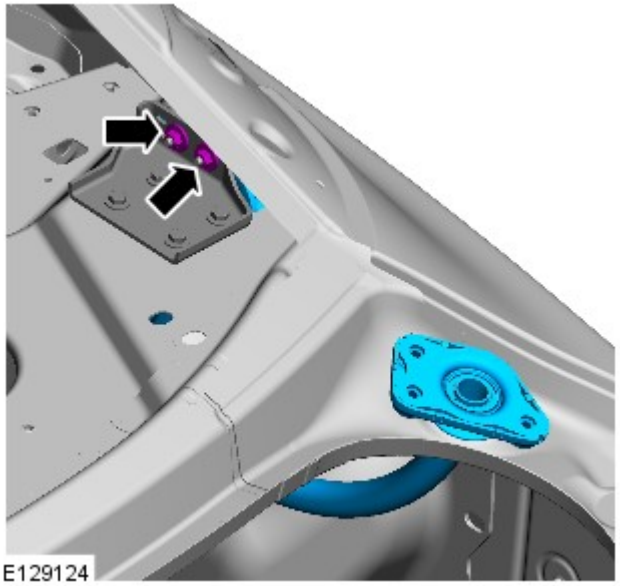
6. Remove the luggage compartment lid.
For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

7. Remove the parcel shelf.
For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

8. Remove the back panel inner trim.

9. Remove the loadspace trim panel.
For additional information, refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation) / Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).

10. Remove the retaining nuts to the luggage compartment lid hinge mounting.



Installation

1. NOTE: Make sure the gasket is installed between the luggage compartment lid and the luggage compartment lid hinge.

Offer up the luggage compartment lid hinge. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

2. Tighten the luggage compartment lid hinge retaining nuts.

CAUTION: Apply a suitable sealent to the luggage compartment hinge mounting plate to prevent water ingress.

NOTE: Bolts are pre-coated to inhibit galvanic corrosion and can be reused only if the coating is not damaged.

- Tighten to 17 Nm.

3. The installation of associated panels and components is the reversal of removal procedure.

Glass, Frames and Mechanisms - Rear Window Glass

Removal and Installation

Removal

CAUTIONS:

Always protect paintwork and glass when removing exterior components.

Always protect the interior components when removing body glass.

Lay the glass on felt covered supports. Do not stand on edge as this can cause chips which subsequently develop into cracks.

NOTES:

The following equipment is required: l Cutting wire and handles l Kent knife l Glazing knife l Windshield replacement kit l Sealant applicator gun l Suction cups l A felt covered table or stand to support glass

Removal steps in this procedure may contain installation details.

1. NOTE: The procedure must be carried out on both sides.

Refer to: C-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.

- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

3.

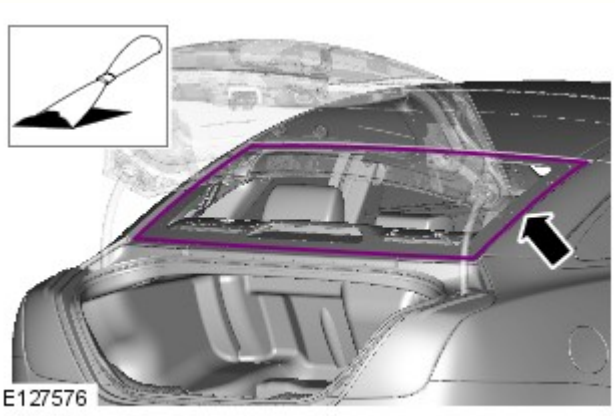
8. WARNING: This step requires the aid of another technician.

Installation

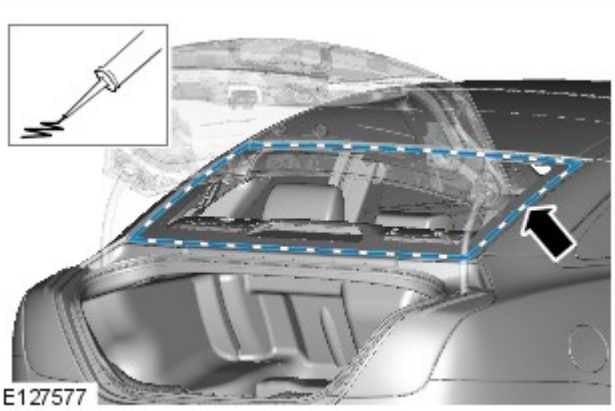


1. CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

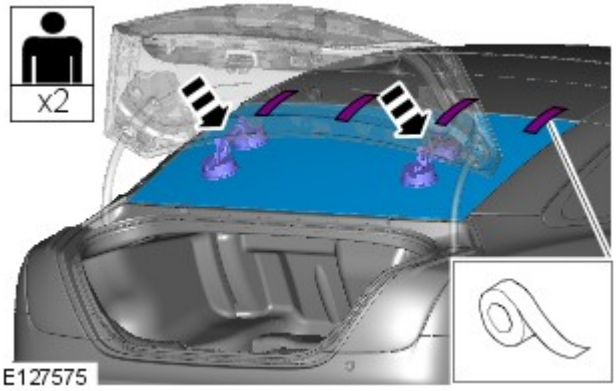
Correct preparation of body apertures "post painting" to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.



2. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.



3. WARNING: This step requires the aid of another technician.

CAUTIONS:

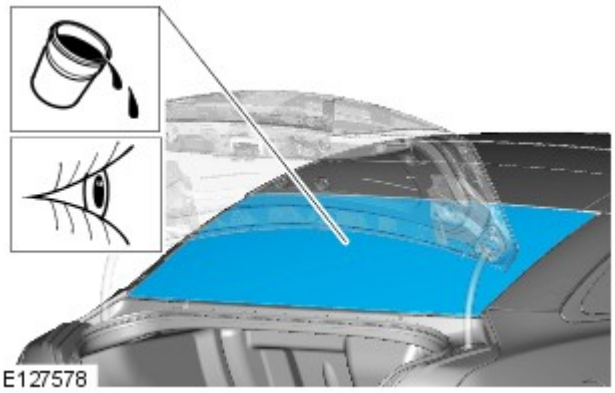
Make sure that the component is correctly located on the locating dowels.

Make sure that equal pressure is applied to the full length of the component.

- With assistance, install and align the windshield glass.
- If the ambient temperature falls below 10 degrees C, apply warm air (25 degrees C) continuously for 15 minutes.

4. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.



5.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform

- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability

Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

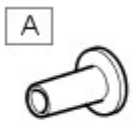
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

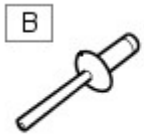
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

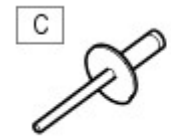
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

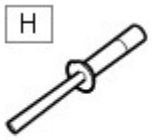
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

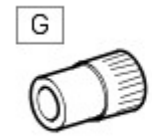
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

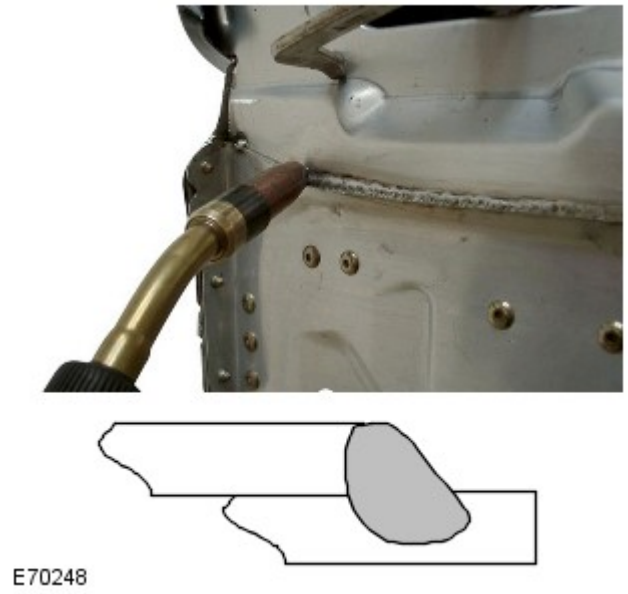
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

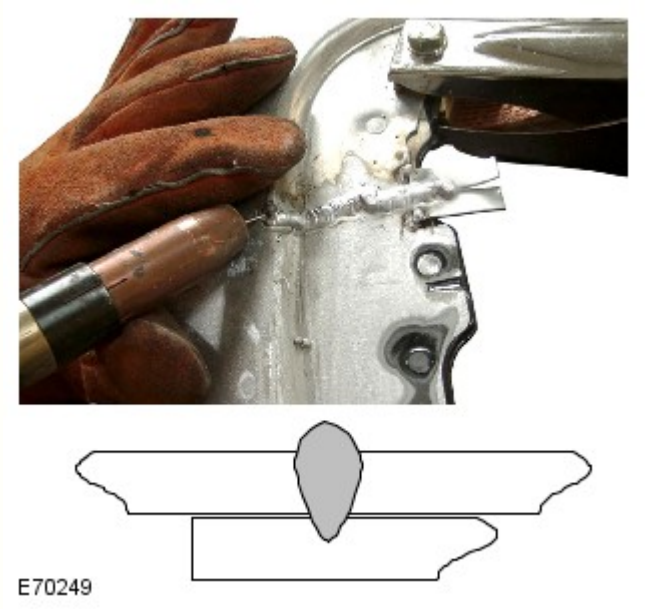
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

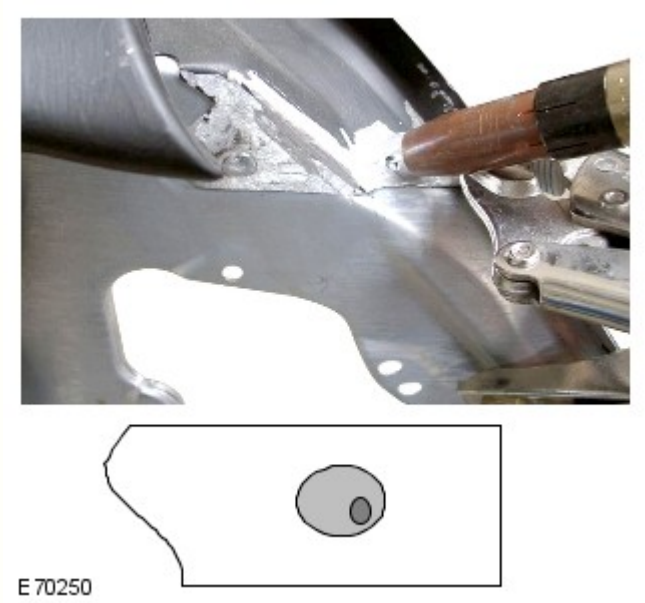
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules
- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed

- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these

should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

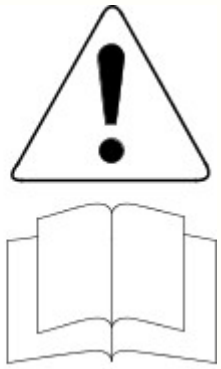
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

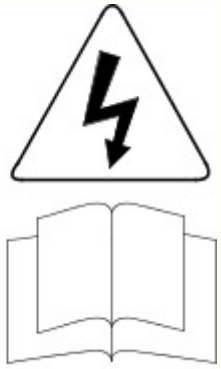
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



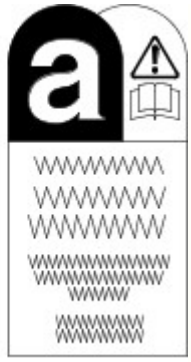
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



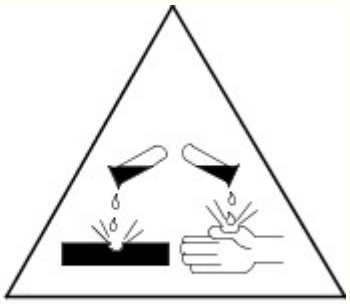
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol - Rear Muffler

Removal and Installation

Removal

WARNING: Observe due care when working near a hot exhaust system.

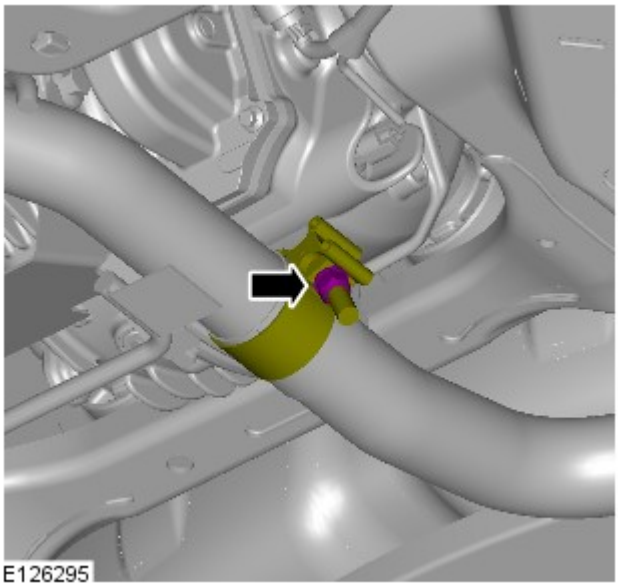
NOTE: Removal steps in this procedure may contain installation details.

1. WARNING: Make sure to support the vehicle with axle stands.

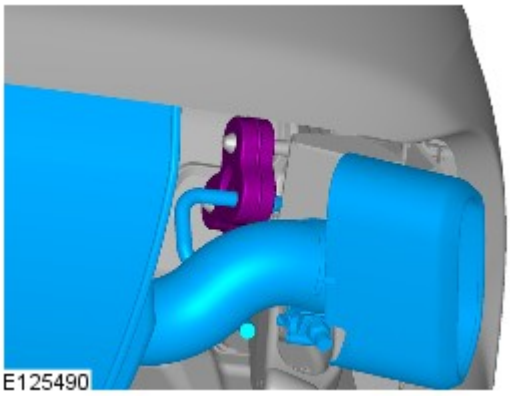
   Raise and support the vehicle.

2. CAUTION: Make sure that these components are installed to the noted removal position.

   NOTE: Left-hand shown, right-hand similar.



Torque: 55 Nm



3. CAUTION: Make sure that these components are installed to the noted removal position.

NOTES:

Left-hand shown, right-hand similar.

Apply lubricant to the exhaust mount to aid installation.

Installation

1. To install, reverse the removal procedure.

Published: 11-May-2011

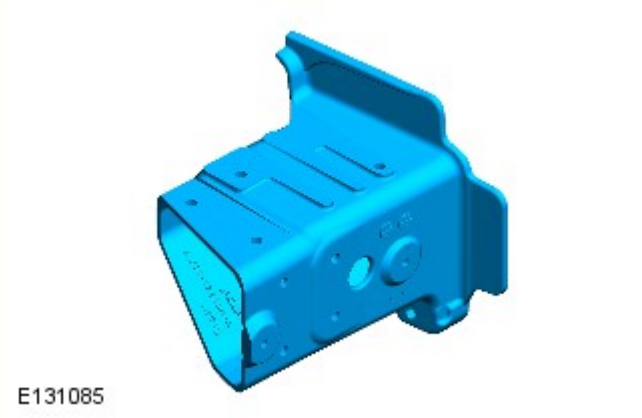
Rear End Sheet Metal Repairs - Rear Bumper Mounting

Removal and Installation

Removal

1. NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

The rear bumper mounting is a category A repair.



2. NOTE: The rear bumper mounting is manufactured from gravity die-cast aluminium (GDC).

The rear bumper mounting is serviced as a separate riveted and bonded panel, it is also on the rear side member service panel.

3. In this procedure, to make sure that the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The rear bumper mounting is replaced in conjunction with:
- Rear bumper cover
- Rear bumper
- Back panel

NOTE: A new rear side member closing panel service panel will be required

- A section of the rear side member closing panel is required for access
- The adjoining flanges of the spare wheel well and the rear floor side extension will need to be opened up to enable welding access

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Disconnect the generator electrical connectors.

8.

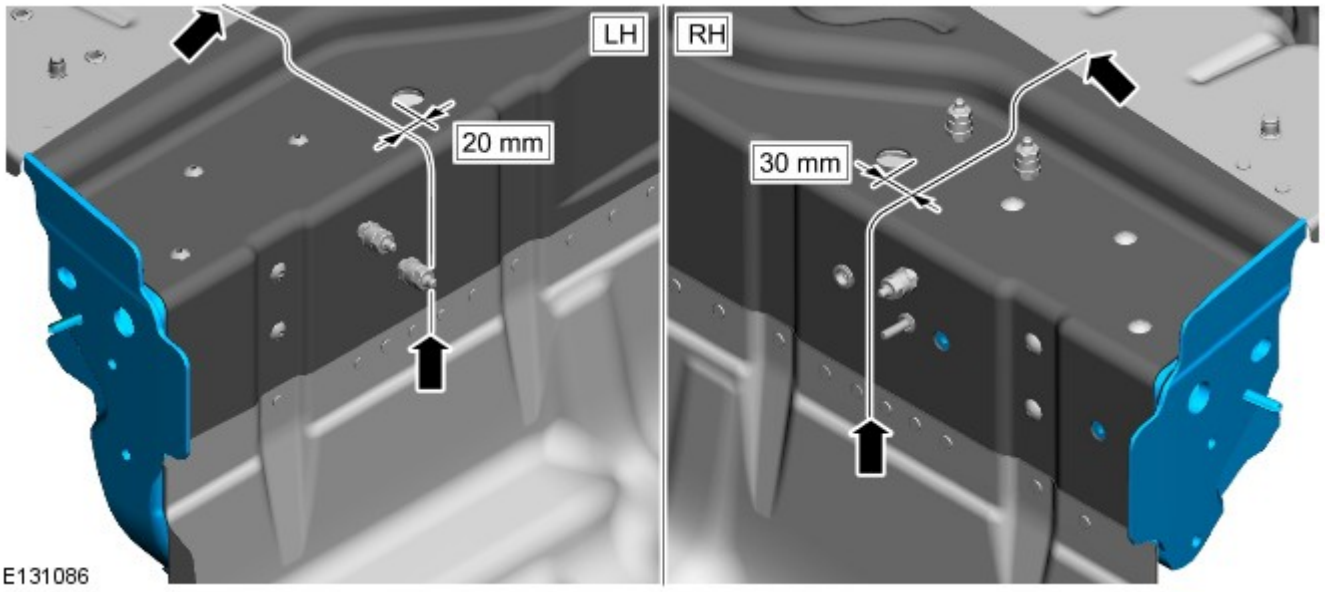
Remove the back panel.
For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

9. If the right-hand rear bumper mounting is to be replaced, remove the battery and battery tray.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

10. If the right-hand rear bumper mounting is to be replaced, remove the insulating material from the luggage compartment floor.

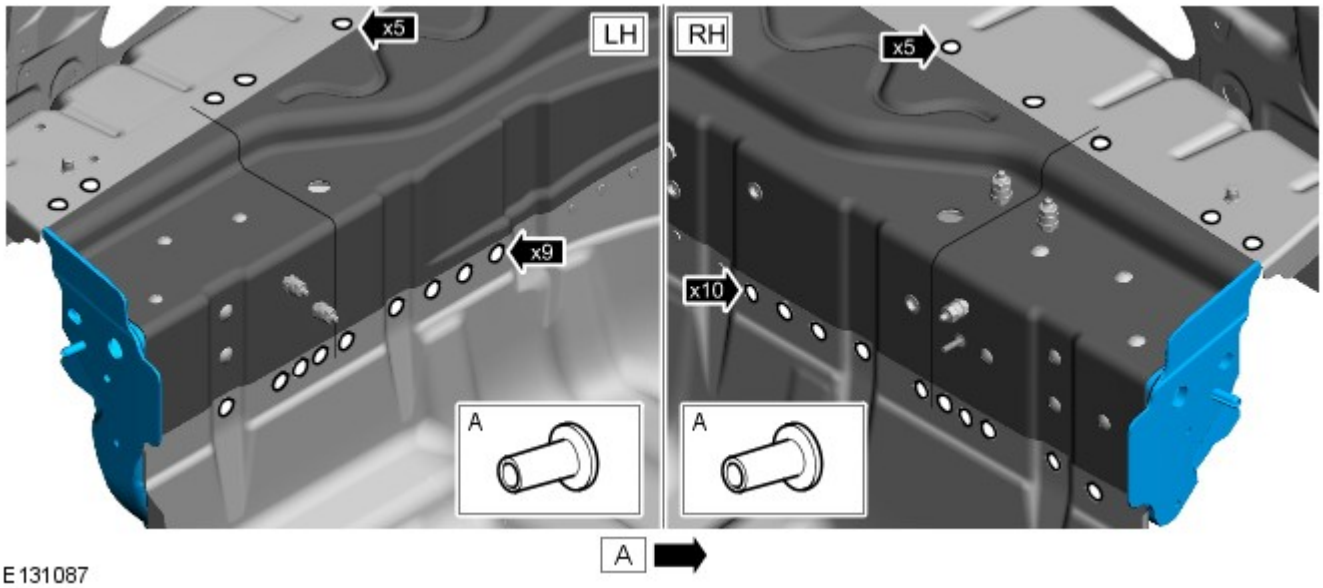
11. Remove any electrical components in the local area of repair to prevent damage.

12. Release and position the back panel and loadspace wiring harness to one side.

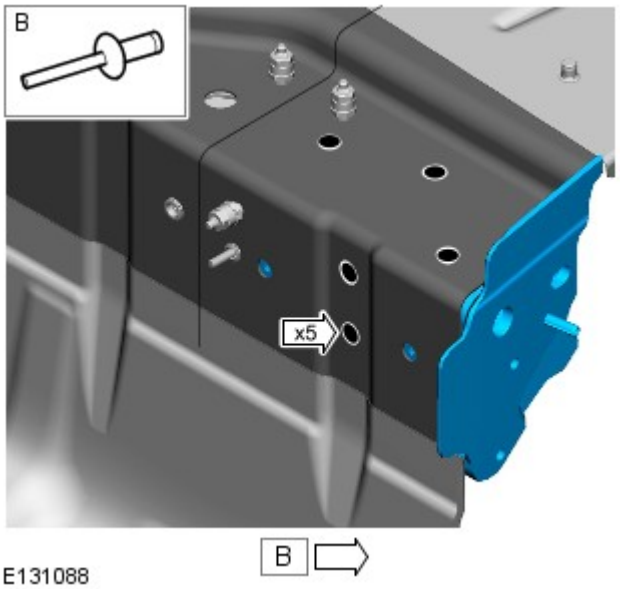


14. Remove sealer from the area of repair as required, to reveal the panel joints.

15. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets from the spare wheel well and from the rear floor side extension.

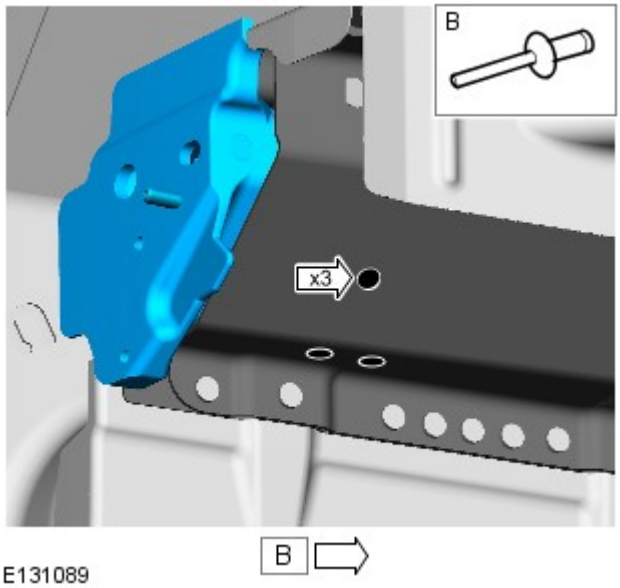


E131087



E131088

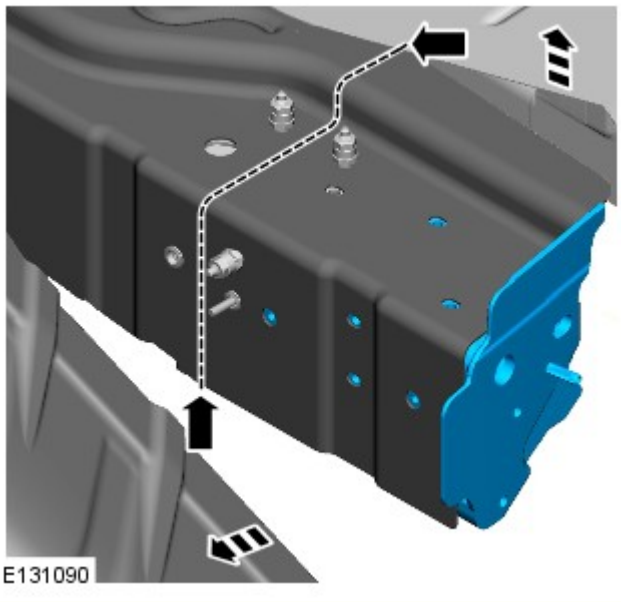
16. Remove the Hemloks from the rear side member closing panel.



E131089

17. Remove the Hemloks from the rear side member panel.

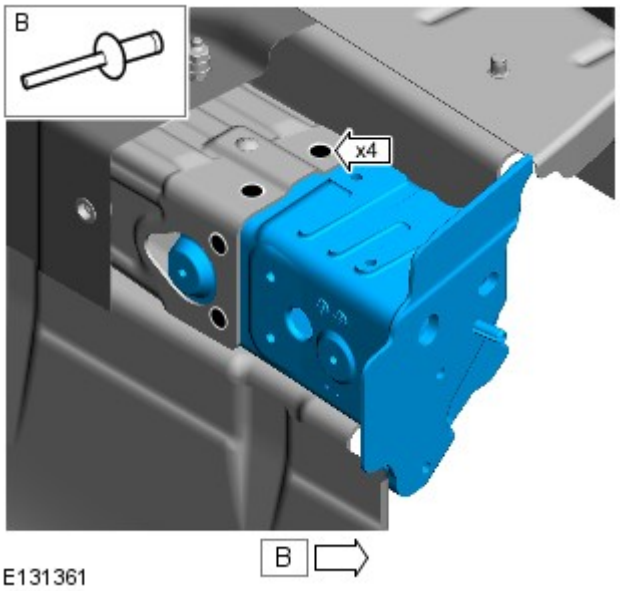
Carefully separate the flanges of the spare wheel well and the rear floor side extension to allow access to where the rear side member closing panel is to be sectioned.



19. CAUTION: Care should be taken not to cut through into the inner reinforcement.

Cut through the rear side member closing panel as indicated.

20. Separate the joints and remove the rear side member closing panel section.



21. Using a 6.5mm Cryobit drill bit, remove the Hemloks from the rear bumper mounting.

22. Separate the joints and remove the rear bumper mounting.

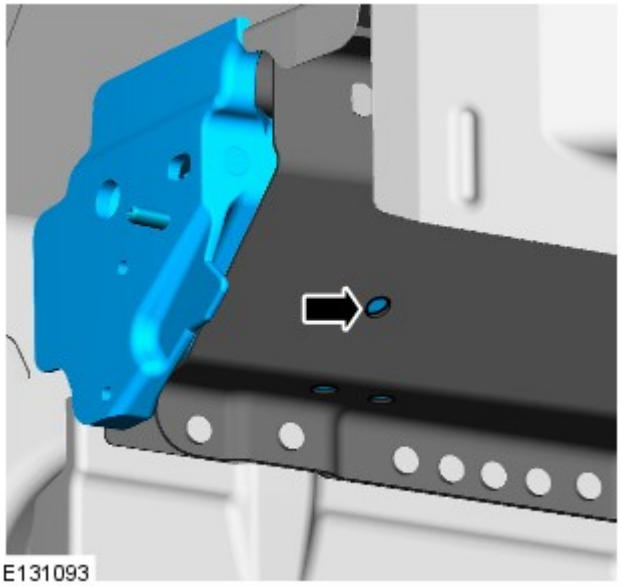
Installation

1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, clean and prepare the panel surfaces removing any sealer and adhesive residue.

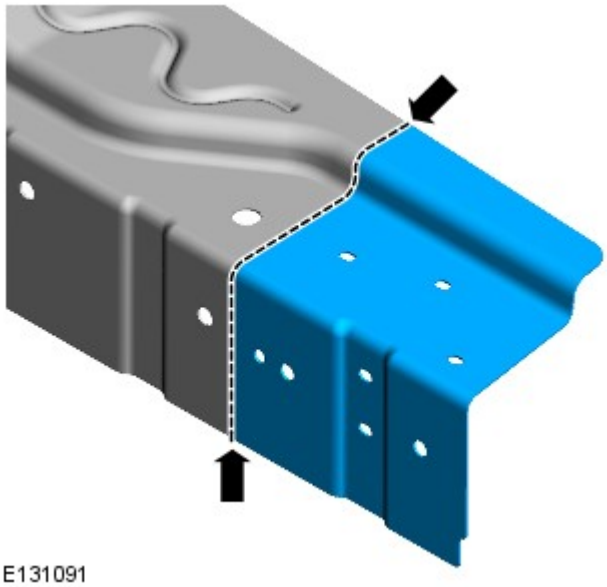
3. Dress flanges where necessary.

4. Offer up the new rear bumper mounting and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



E131093

5. Using a 6.5mm Cryobit drill bit, drill a hole through the rear side member panel into the rear bumper mounting.

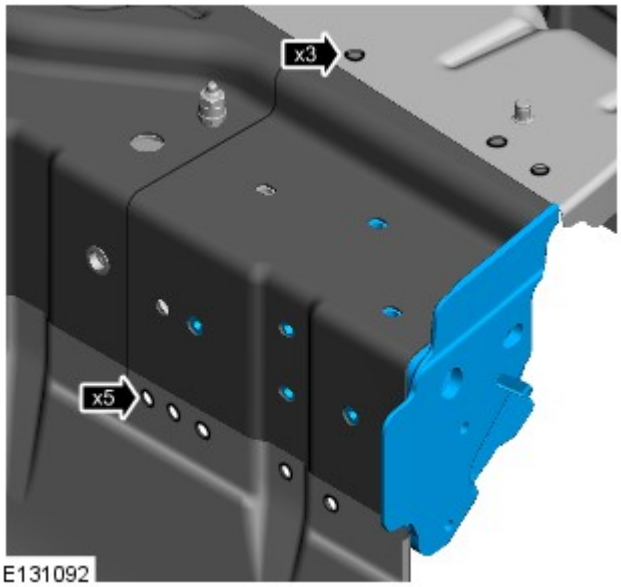


E131091

6. Mark out the position on the rear side member closing panel service panel, where the section MIG butt joint is to be made and cut the panel at this point as indicated.

7. Offer up the new rear side member closing panel section and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

8. Using a 6.5mm Cryobit drill bit, drill holes at the points where Hemloks are to be installed.



9. Remove the new panel.

10. Deburr the drilled holes.

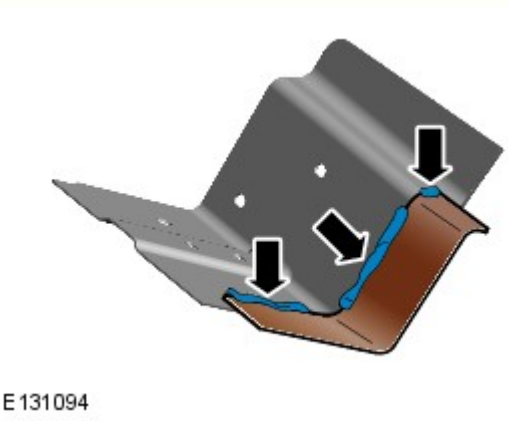
11. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, including the inner panel surfaces where backing plates are to be welded.

12. NOTE: The backing plate may need to be trimmed to fit around holes and rivet-studs.

Measure and cut a backing plate, approxinately 50mm wide (25mm each side of the MIG butt joint), from the unused part of the new rear side member closing panel or from similar material.

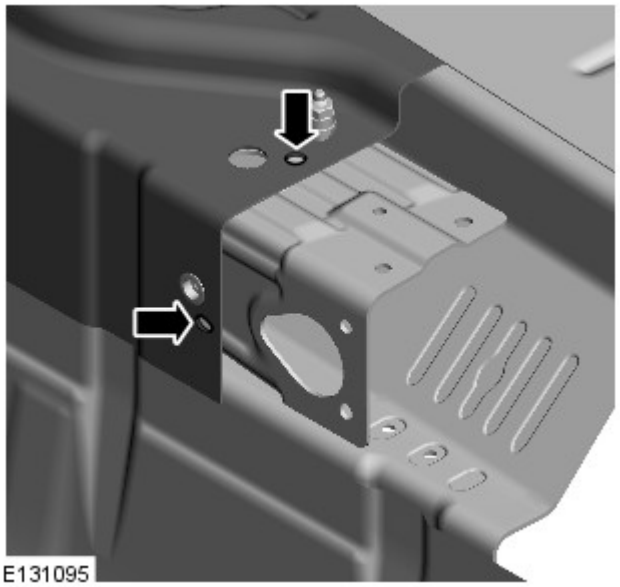
13. Cut a run on/run off tab from the unused part of the new rear side member closing panel, or from similar material.

14. Using a Roloc fine bristle disc, clean and prepare the backing plates and the run on/run off tab.



15. MIG weld the backing plate onto the new rear side member closing panel section.

16. Drill 2 10mm holes through the rear side member closing panel, where the backing plate is to be MIG plug welded.



17. Deburr drilled holes.

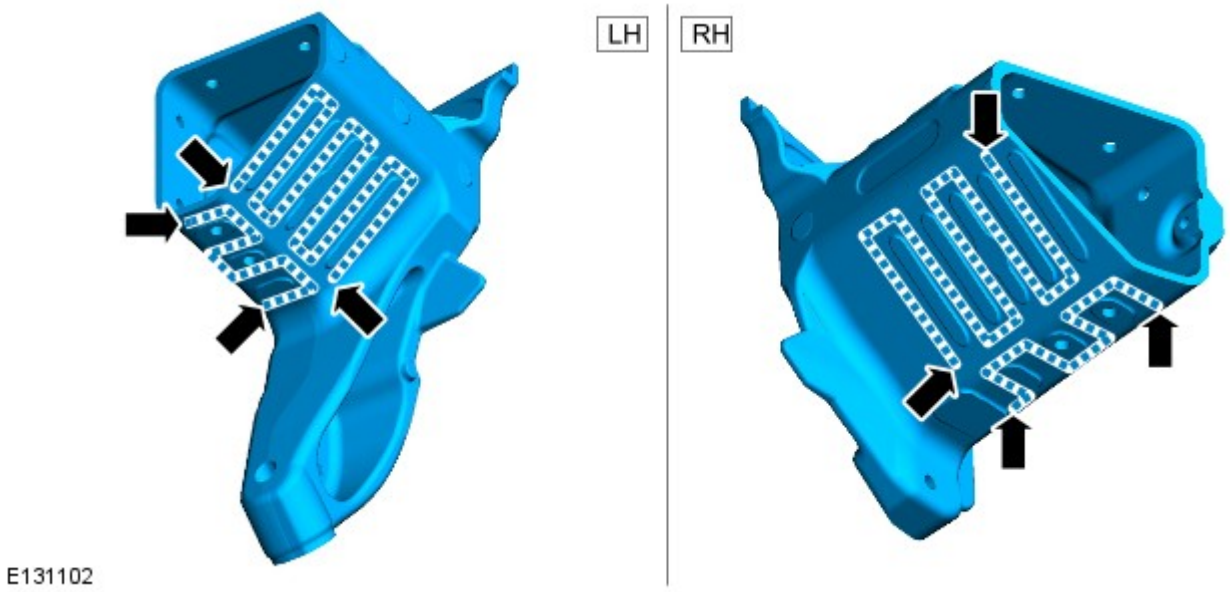
18. Using a Roloc fine bristle disc, clean and prepare the panel joints.

19. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

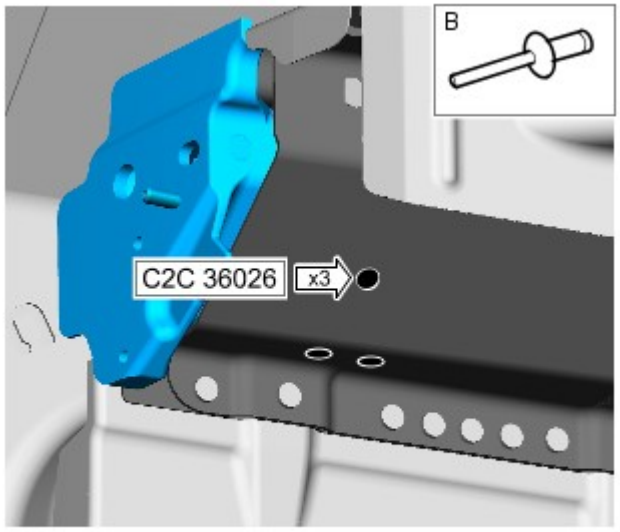
20. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

21. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the rear bumper mounting.

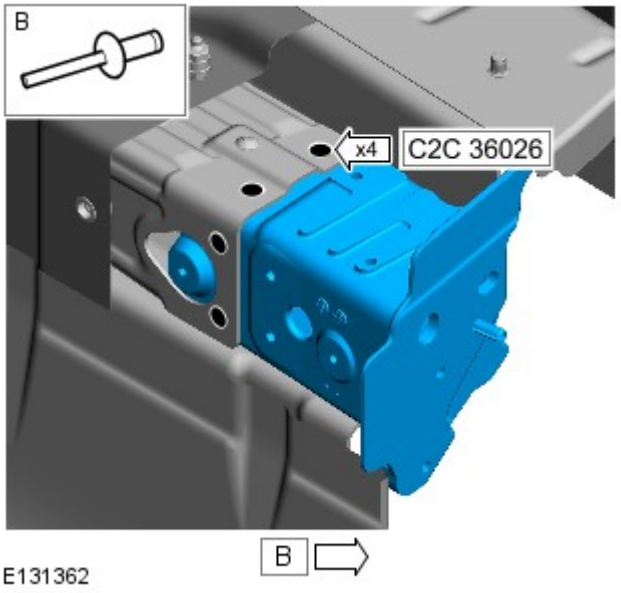


22. Offer up the new rear bumper mounting, align and clamp into position.



E131096

23. Using the Genesis G4, install the Hemloks.



E131362

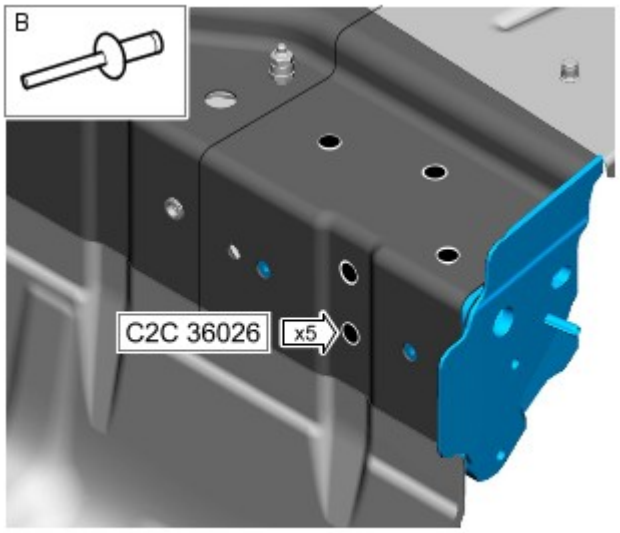
24. Using the Genesis G4, install the Hemloks.

25. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG weld.

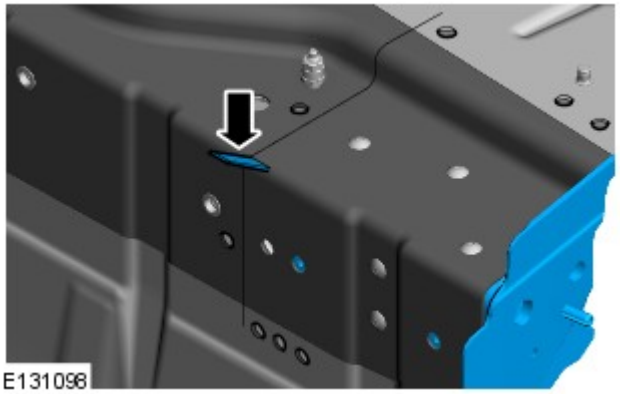
Apply a 5mm zig zag bead of 3M 8115 adhesive to the rear side member and the rear bumper mounting.

26. Offer up the new rear side member closing panel section, align and clamp into position.

27. Using the Genesis G4, install the Hemloks.

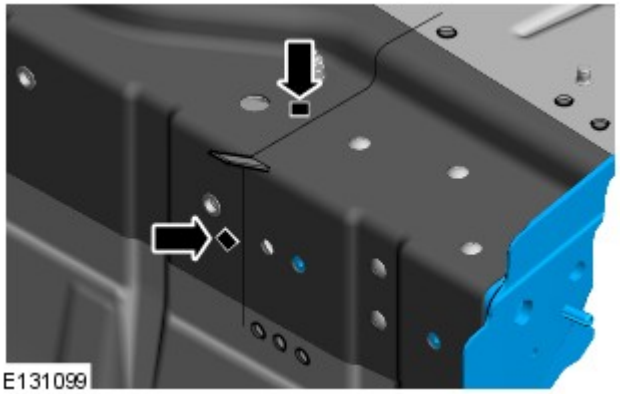


E131097



E131098

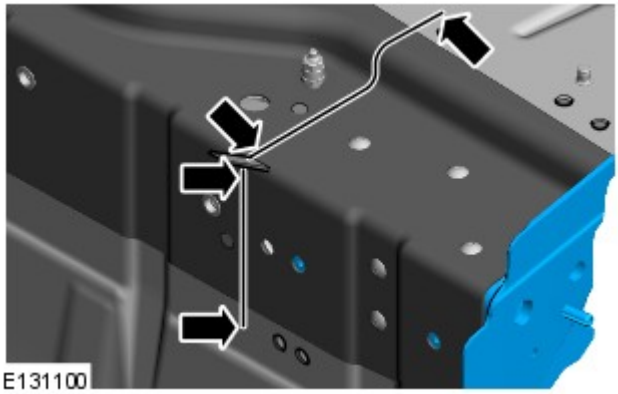
28. Tack weld the run-on/run-off tab to the rear side member closing panel section.



E131099

29. Install 2 MIG plug welds.

30. MIG weld the rear side member section butt joint.



31. Cut off the run on/run off tab.

32. Dress the welded joints.

33. Pyrosil the flanges of the spare wheel well and rear floor side extension, at the points where 3M 8115 adhesive is to be applied.

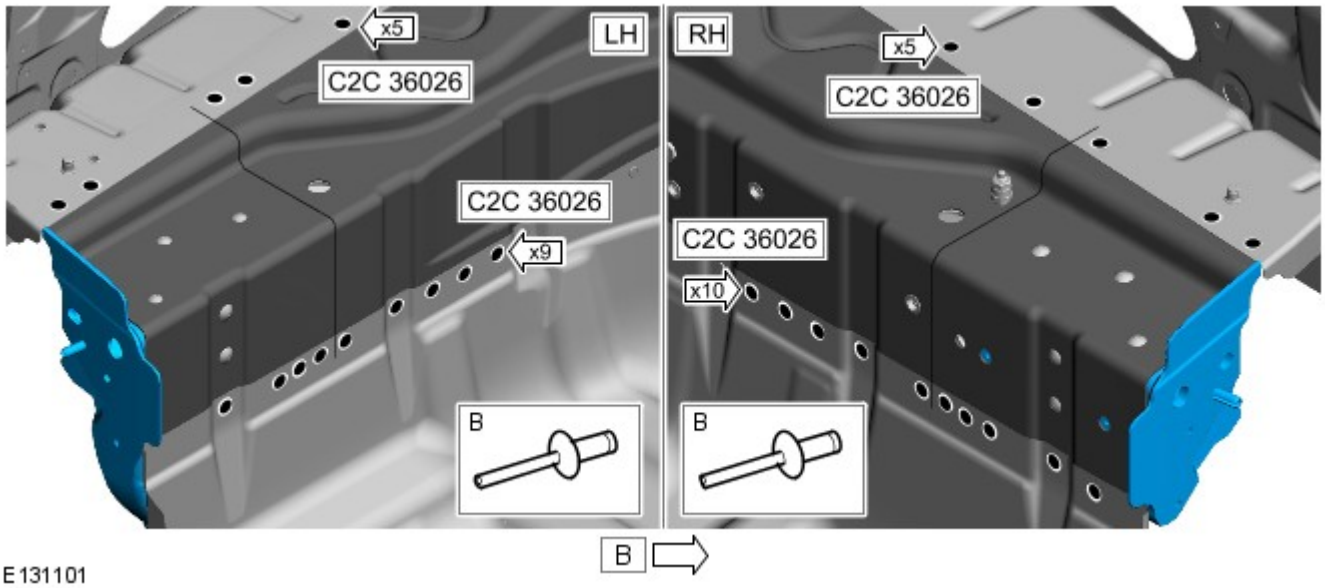
34. Apply the coupling agent to the flanges of the spare wheel well and rear floor side extension where 3M 8115 adhesive is to be applied and allow to dry.

35. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the flanges of the spare wheel well and rear floor side extension.

36. Re-align the flanges of the spare wheel well and rear floor side extension and clamp into position.

37. Using the Genesis G4, install the Hemloks.



38. Remove any excess adhesive.

39. Using the old panel for reference, install the rivet-studs into the new rear side member closing panel section.

40. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

41. The installation of associated panels and components is the reversal of removal procedure.

Published: 28-Dec-2012

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Battery, Mounting and Cables - Battery

Removal and Installation

Removal

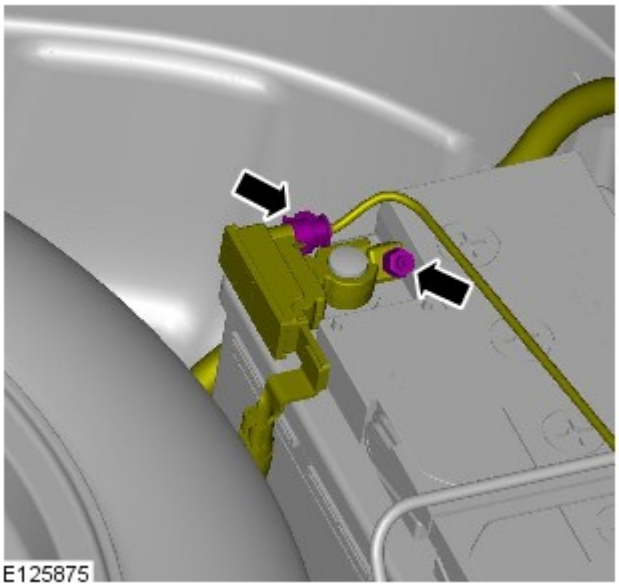
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

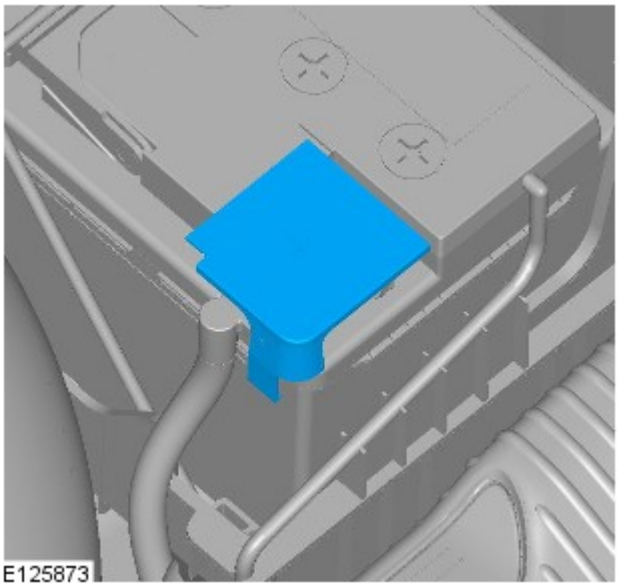
3. Raise and secure the luggage compartment floor covering.

4. CAUTION: Take extra care not to damage the wiring harness.

Torque: 6 Nm

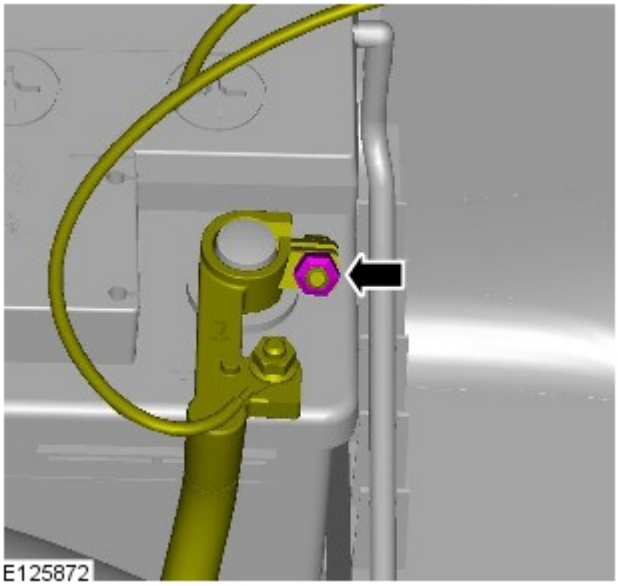


5.

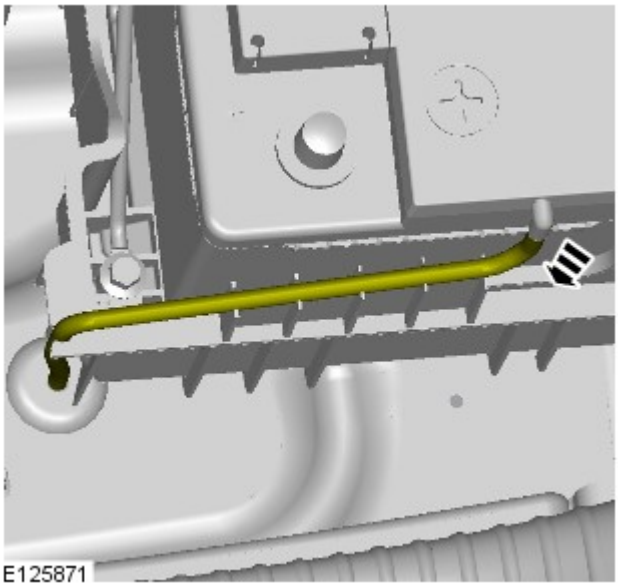


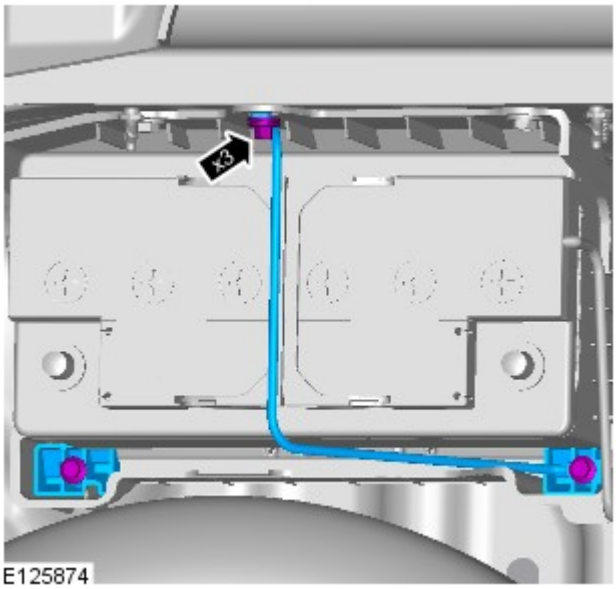
6. CAUTION: Take extra care not to damage the wiring harness.

Torque: 6 Nm

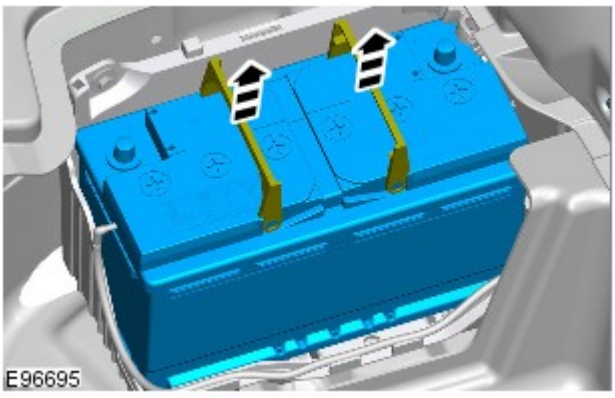


7.





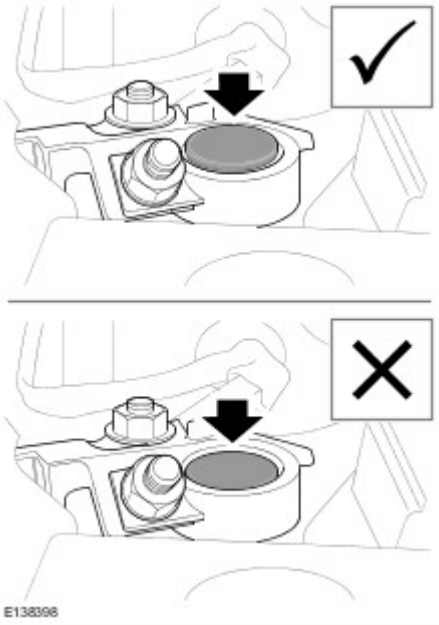
8. *Torque:* 13 Nm



9. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Installation

1. CAUTION: Make sure the battery monitoring system (BMS) electrical connector is connected to the module, before installing the BMS on to the battery terminal.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

To install, reverse the removal procedure.

2. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system .

3. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

4. Enter the audio unit preset radio frequencies.

5. Reset the clock to the correct time.

6. Start the engine and allow to idle until the engine reaches normal operating temperature.

7. Switch the engine off.

Published: 11-May-2011

Rear End Sheet Metal Repairs - Back Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The back panel is a category A repair.

2. NOTE: The back panel is manufactured from aluminium alloy 5754-NG.

The back panel is serviced as a separate riveted and bonded panel, it includes the back panel inner.

E129307

3. The back panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation) /
Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. Remove the luggage compartment lid weatherstrip.

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove both the rear mufflers.
For additional information, refer to: Rear Muffler (309-00A, Removal and Installation) /
Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the right-hand and left-hand rear muffler heatshields.

12. Remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

13.

Remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

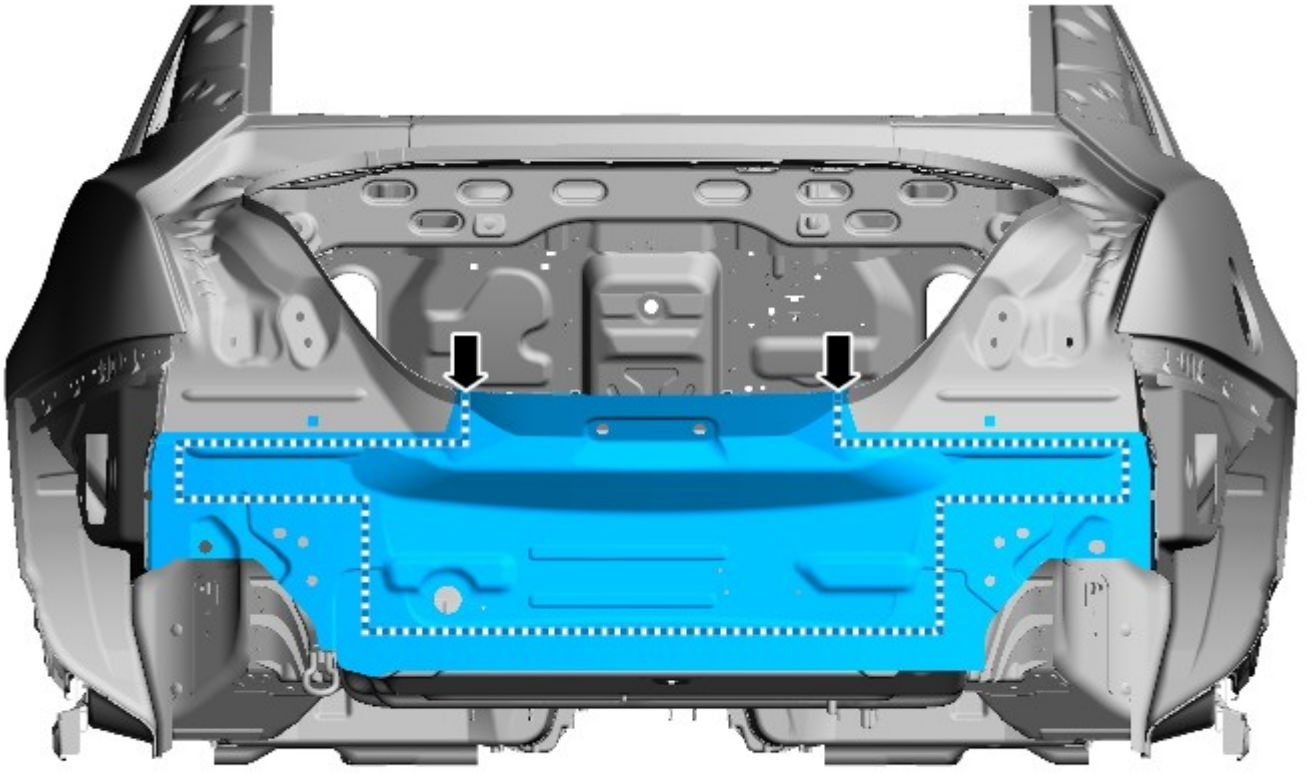
14. Release the back panel and loadspace wiring harness and position it to one side.

15. Remove the luggage compartment latch striker.

16. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

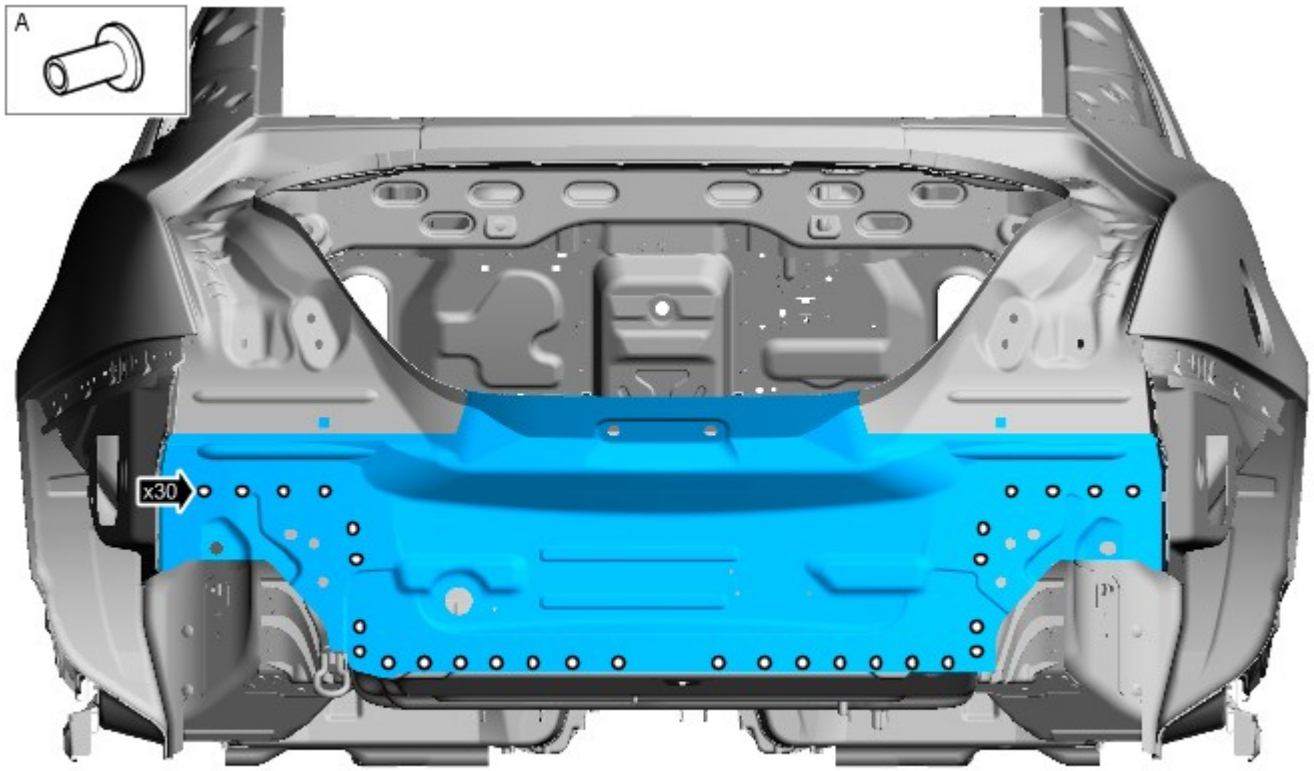
17. Remove any electrical components in the local area of repair to prevent damage.

18. Saw cut the old panel along the point shown in the illustration. This allows access to allow the use of the ESN50.



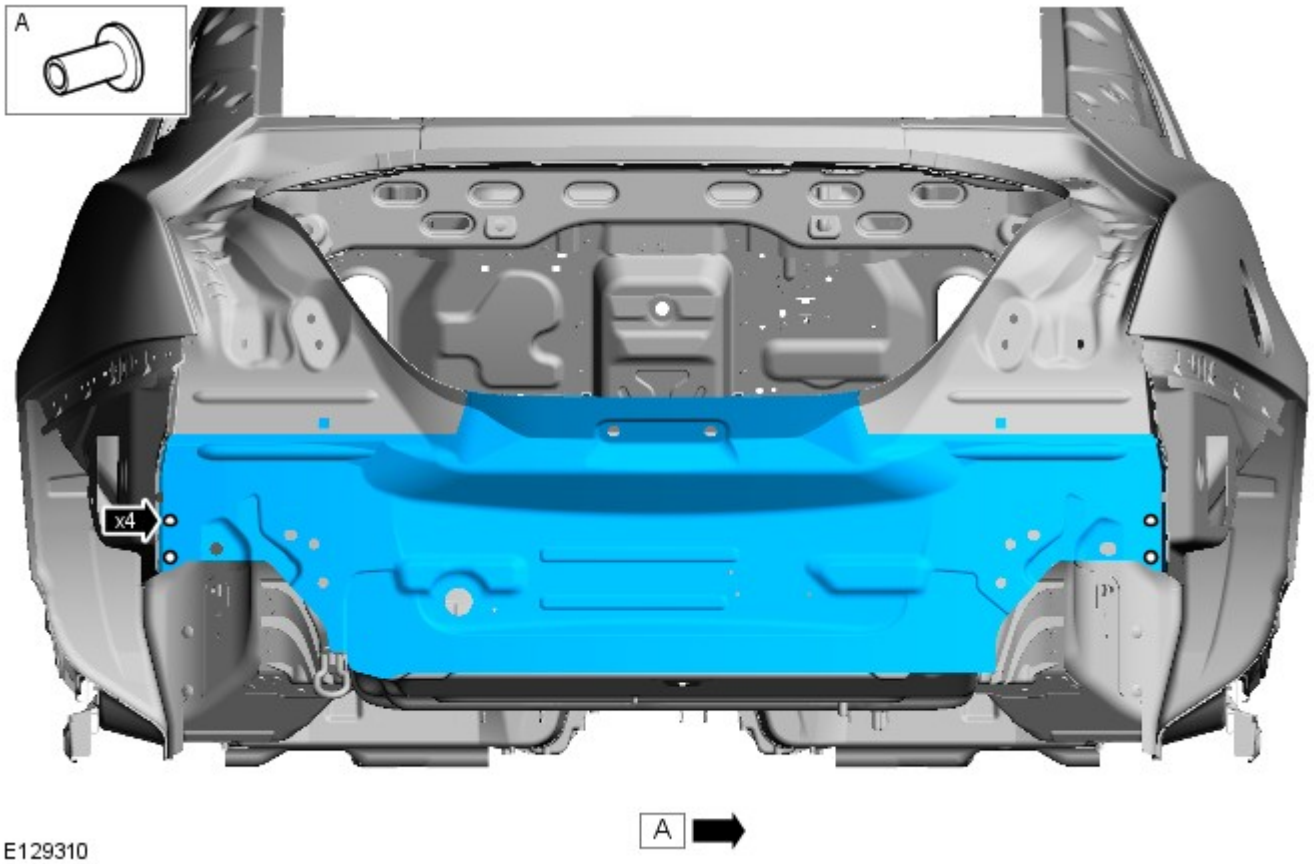
E129308

19. Using the ESN50, remove the self piercing rivets from the spare wheel well and rear side members.



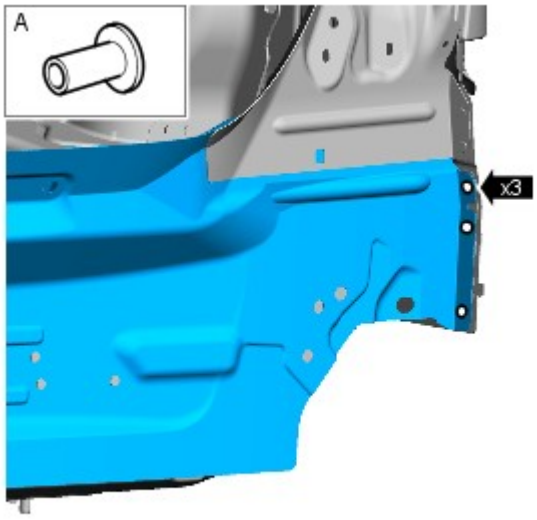
E129309

20. Using the ESN50, remove the self piercing rivets from the rear floor side extensions.

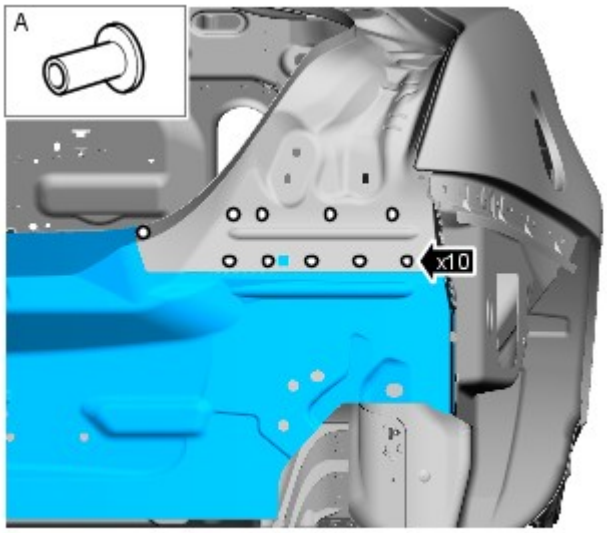


E129310

21. Using the ESN50, remove the self piercing rivets (3 each side) from the quarter panel lower extensions.

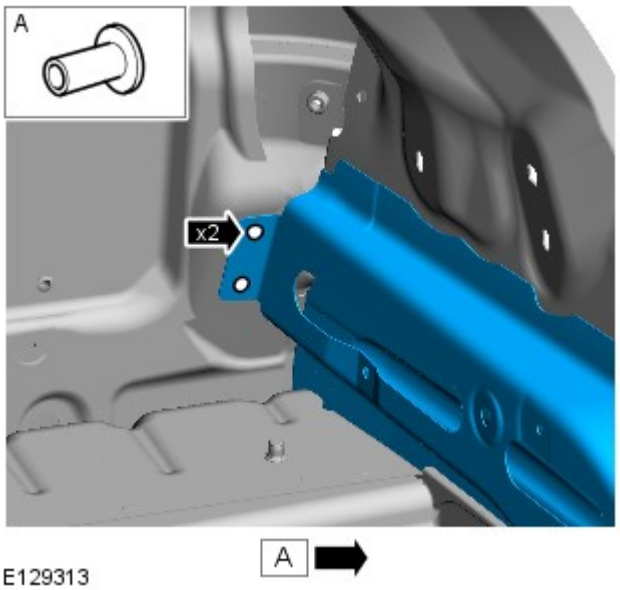


E129311



E129312

22. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets (10 each side) from the quarter panels.

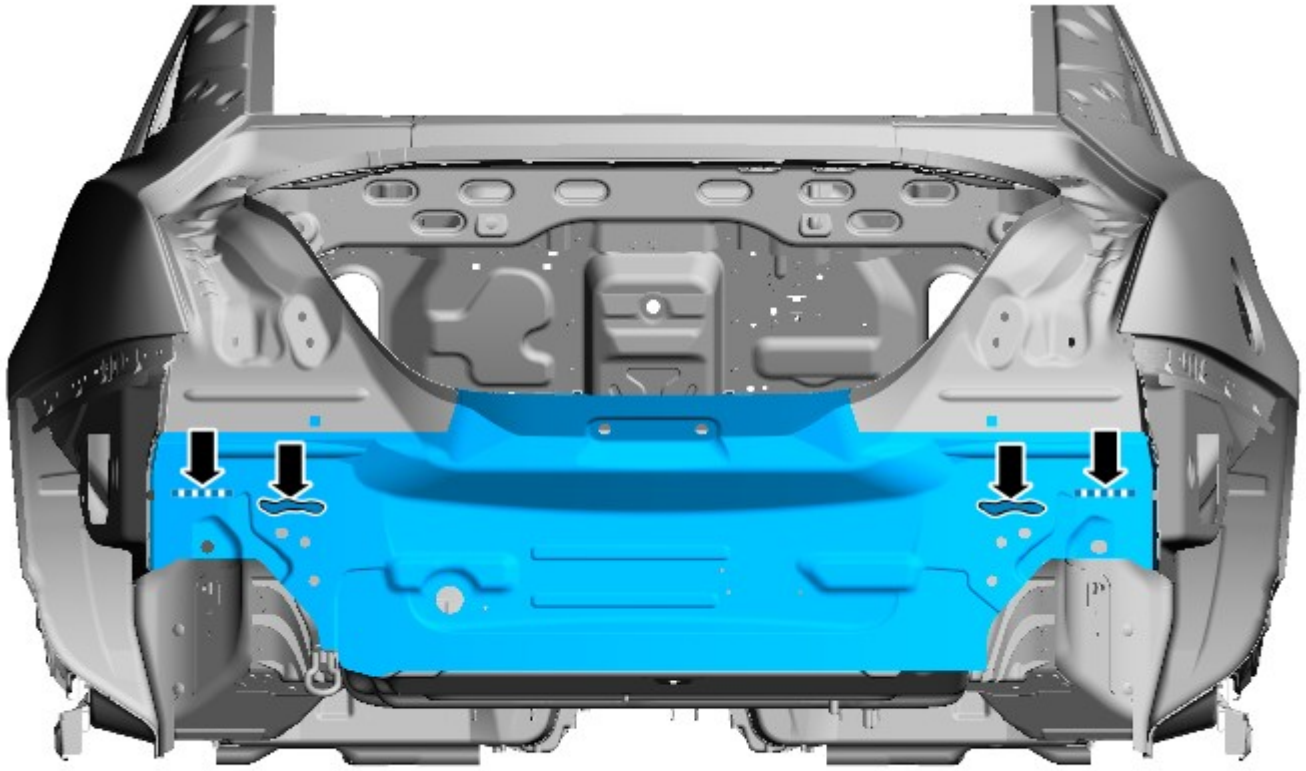


E129313

23. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets (2 each side) from the junction box and modules mounting panels.

24. Separate the joints and remove the old panel, carefully releasing the adhesive at the points illustrated.



E129314

Installation

1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, remove the adhesive residue.

3. Dress flanges where necessary.

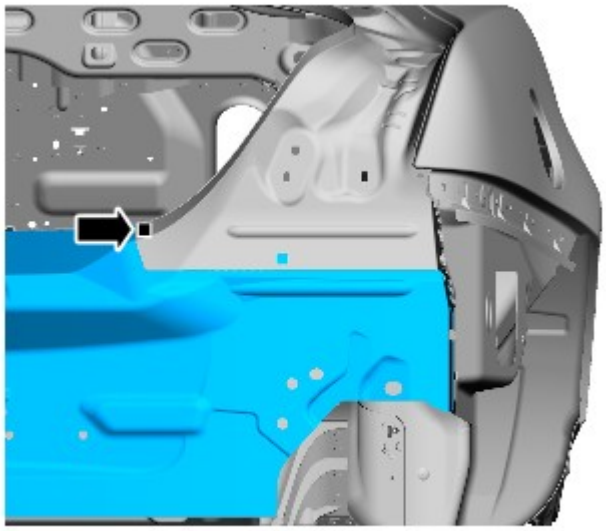
4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

5. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

6. Remove the new panel.

7. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

8. Using a 10mm drill bit, drill 2 holes in the old quarter panel ready for MIG plug welding.



E129612

9. Debur the drilled holes.

10. CAUTION: Use care not to damage the panel.

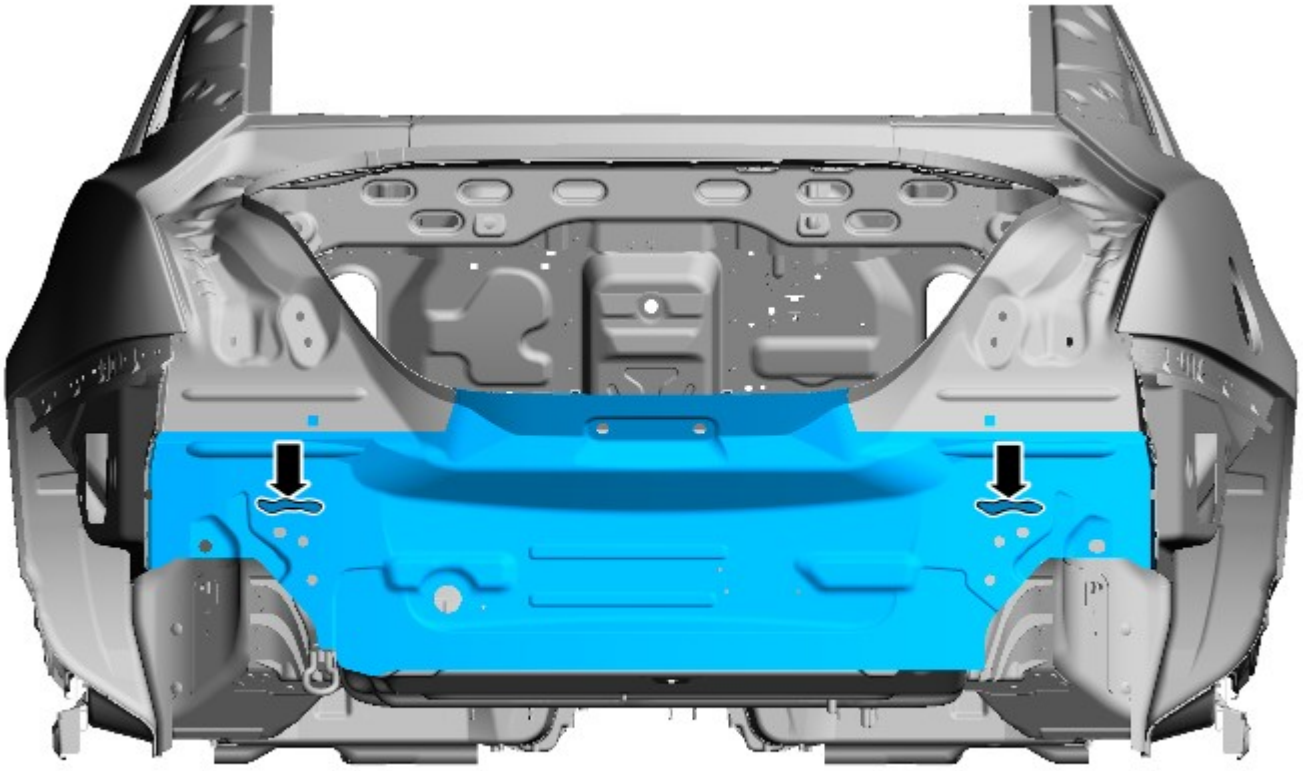
Remove seam sealer where applicable.

11. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

12. Pyrosil the joints.

13. Apply the coupling agent and allow to dry.

14. Apply the semi-rigid sealer at the points illustrated.



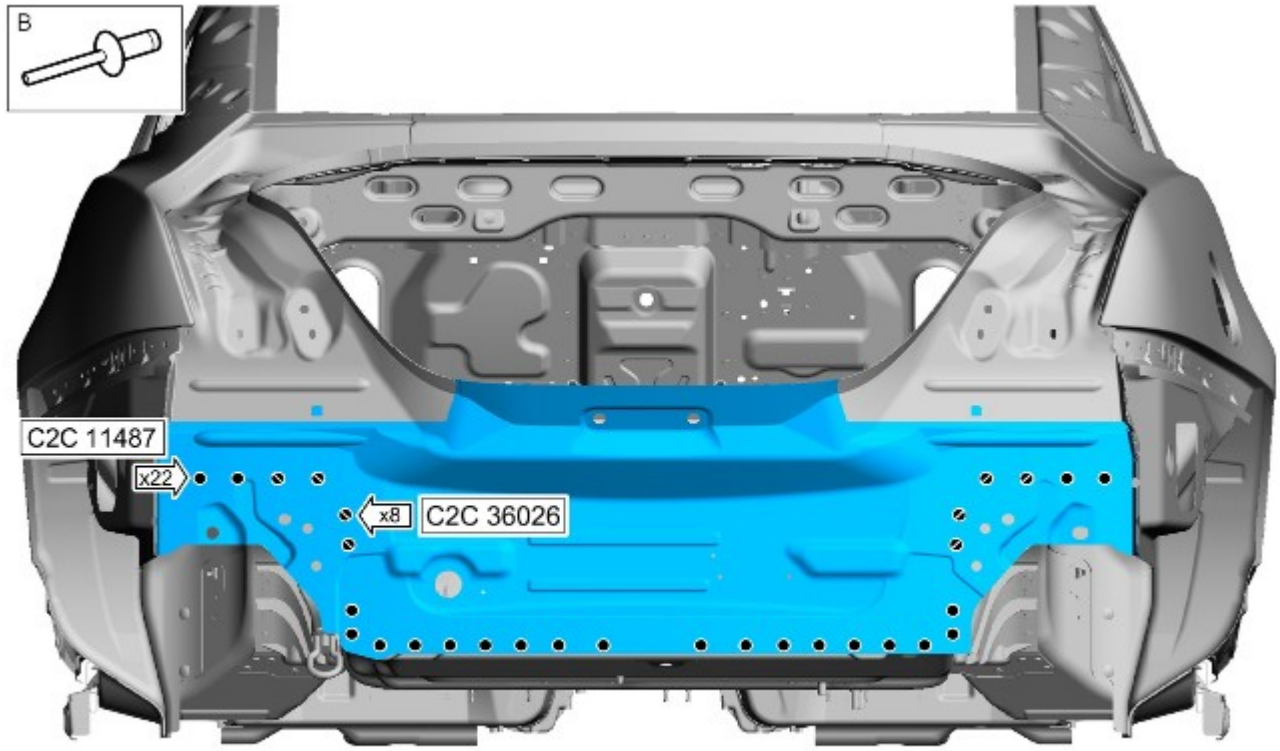
E129315

15. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

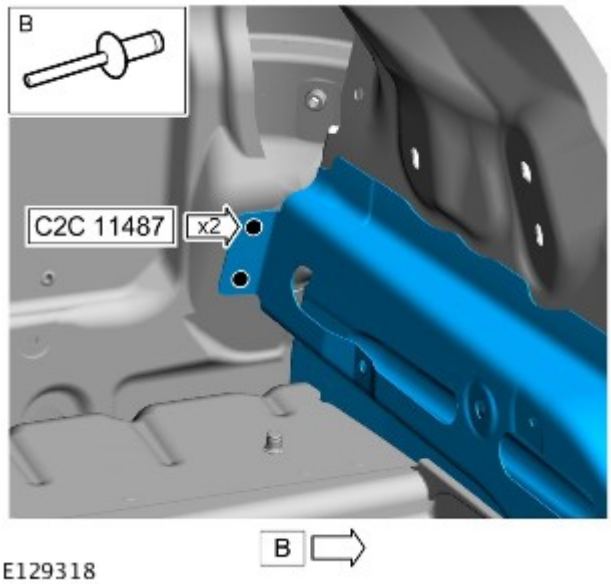
Apply a 5mm zig zag style bead of 3M 8115 adhesive to the body joints.

16. Offer up the new panel and clamp into position.

17. Using the Genesis G4, install 8 Hemloks (4 each side) into the rear side member. Install a further 22 Hemloks (11 each side) into the spare wheel well and rear floor side extension.



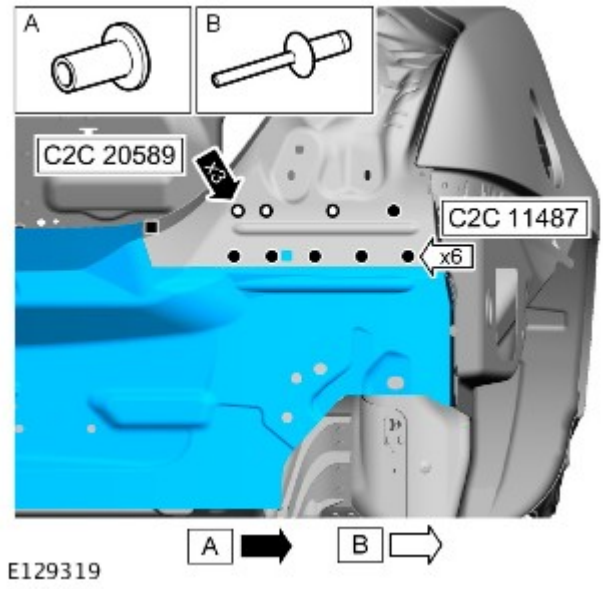
E129317



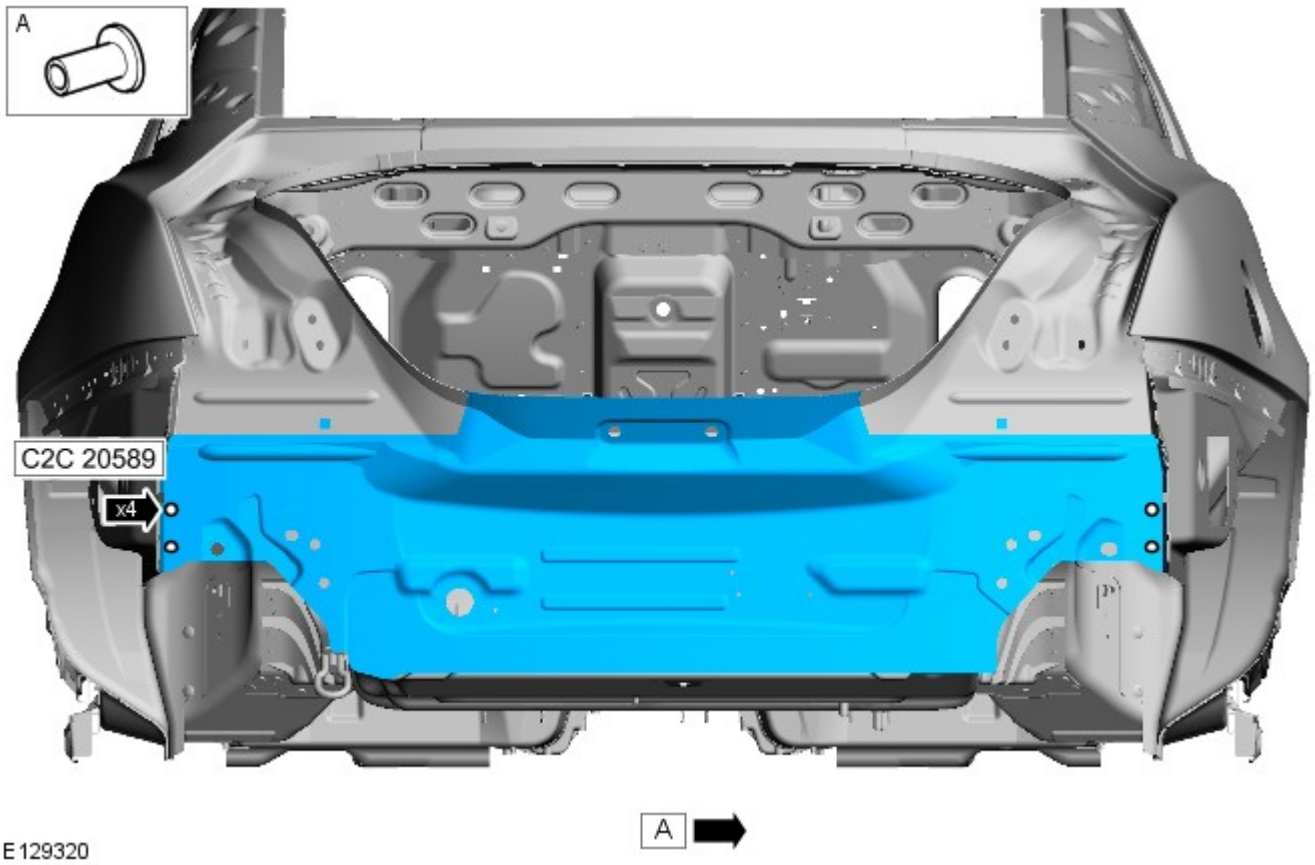
E129318

18. Using the Genesis G4, install the Hemloks (2 each side) into the junction box and modules mounting panels.

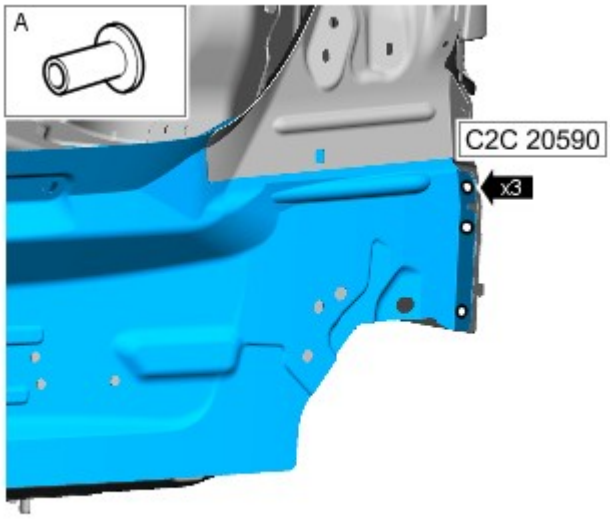
19. Using the Genesis G4, install 12 Hemloks (6 each side) into the quarter panel. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel.



20. Using the ESN50, install the self piercing rivets into the rear floor side extension.

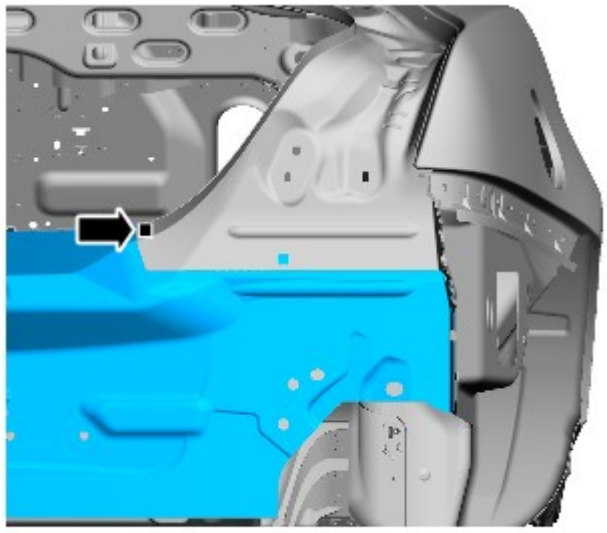


21. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel lower extension.



E129321

22. Remove any excess adhesive.



E129612

23. Install 2 MIG plug welds (1 each side) into the quarter panel.

24. The installation of associated panels and components is the reversal of removal procedure.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

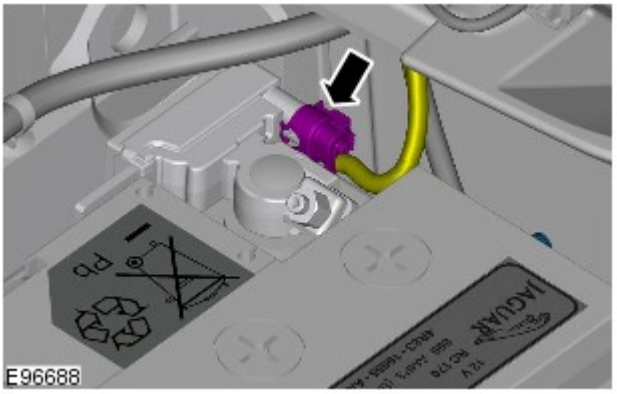
General Procedures

Disconnect

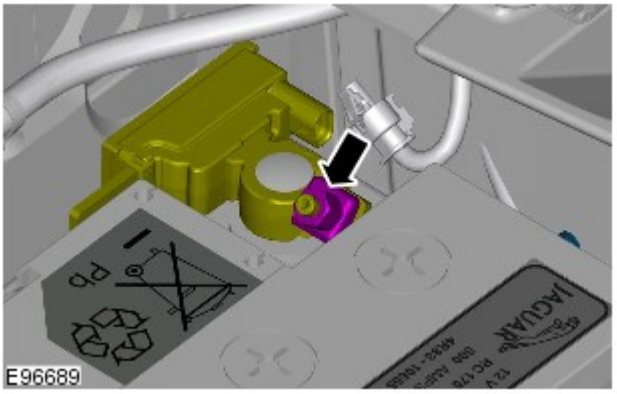
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

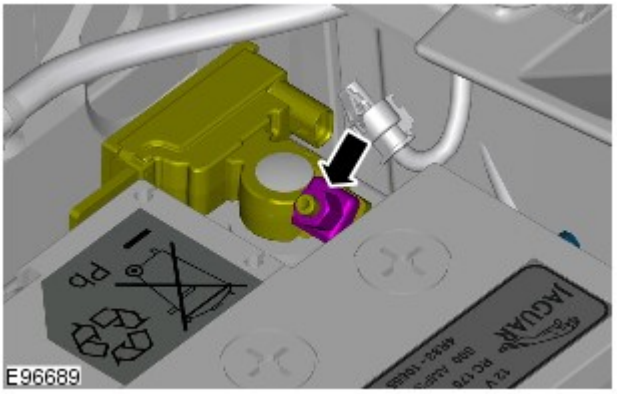


4. CAUTION: Take extra care not to damage the wiring harness.

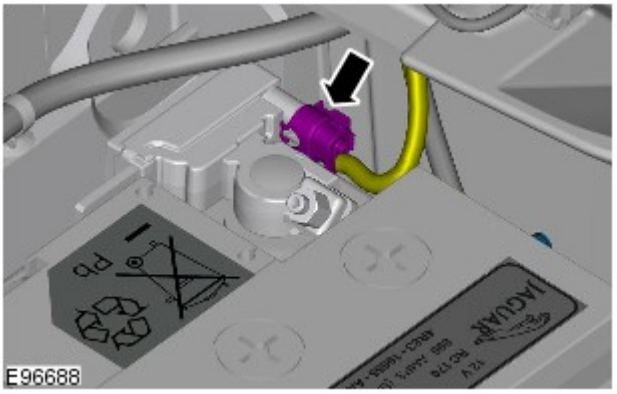


5.

Connect

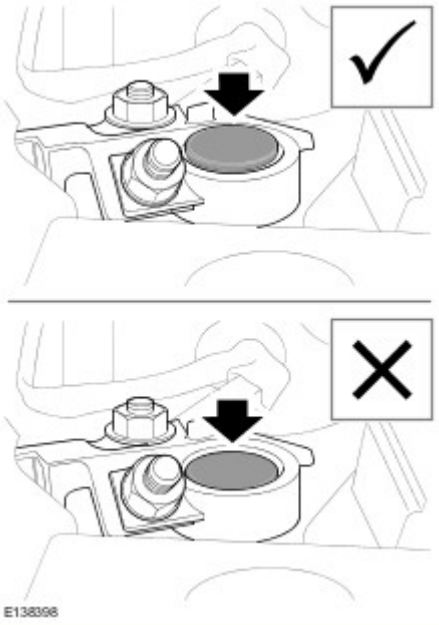


1. *Torque:* 6 Nm



2.

3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places

particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel

- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual

- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A

- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During	Yes - **caution** material sensitive to heat.	Yes - **must** be heated to maintain original alloy properties. Ideal

Repair	Range: 140 - 160°C Ideal panel temperature: **150°C**	panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

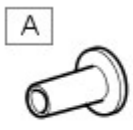
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

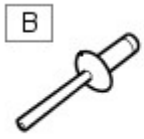
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

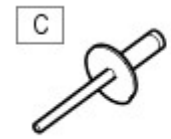
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

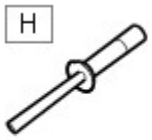
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

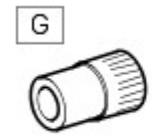
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

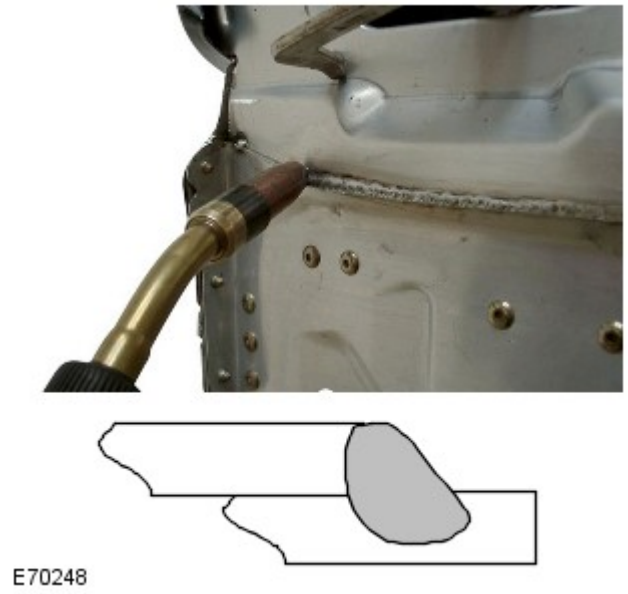
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

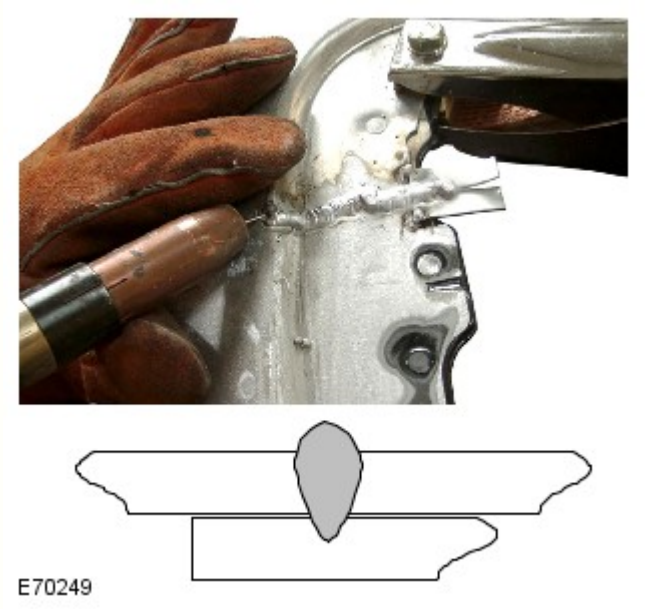
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

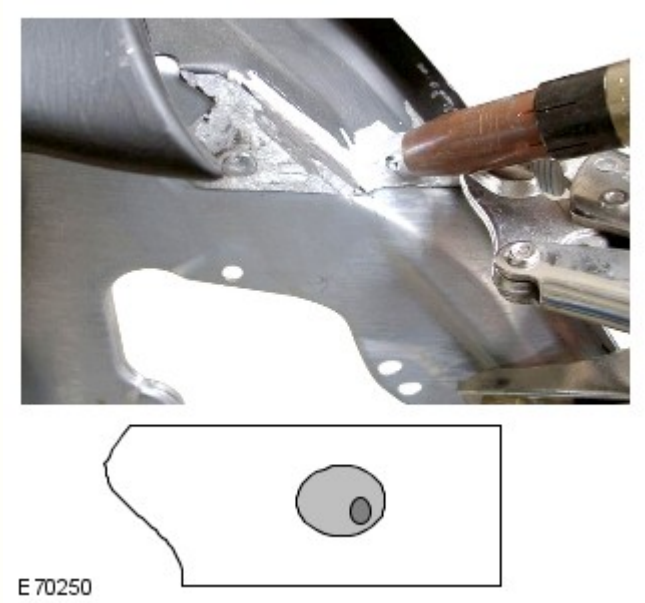
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

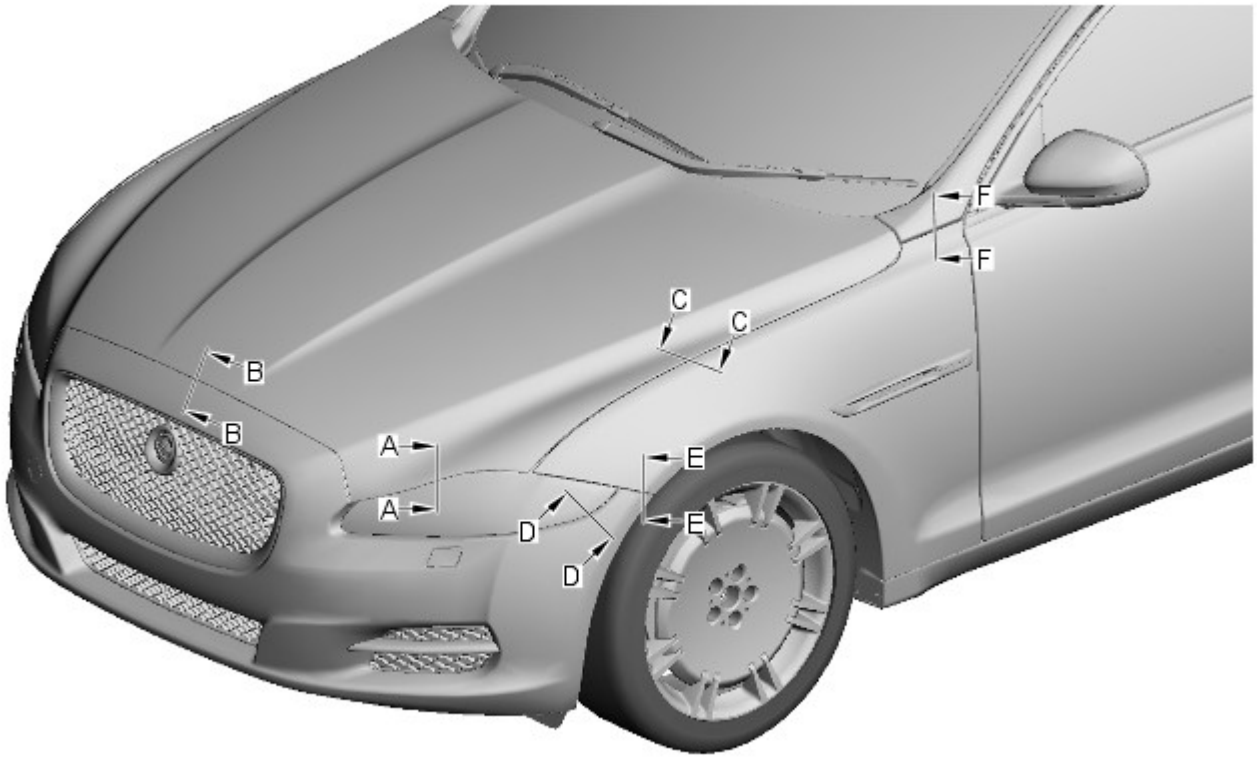
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

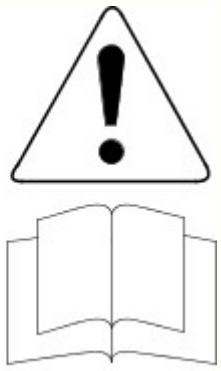
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

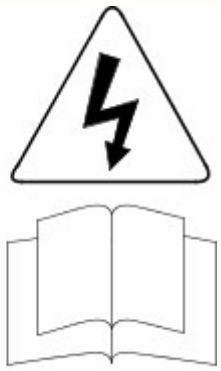
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



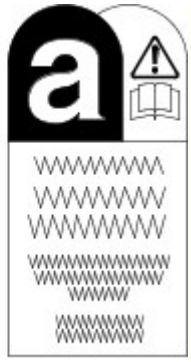
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



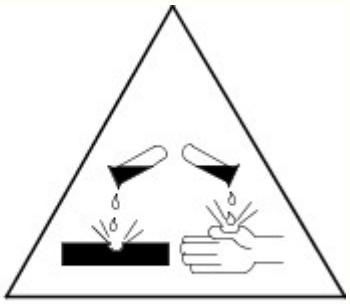
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

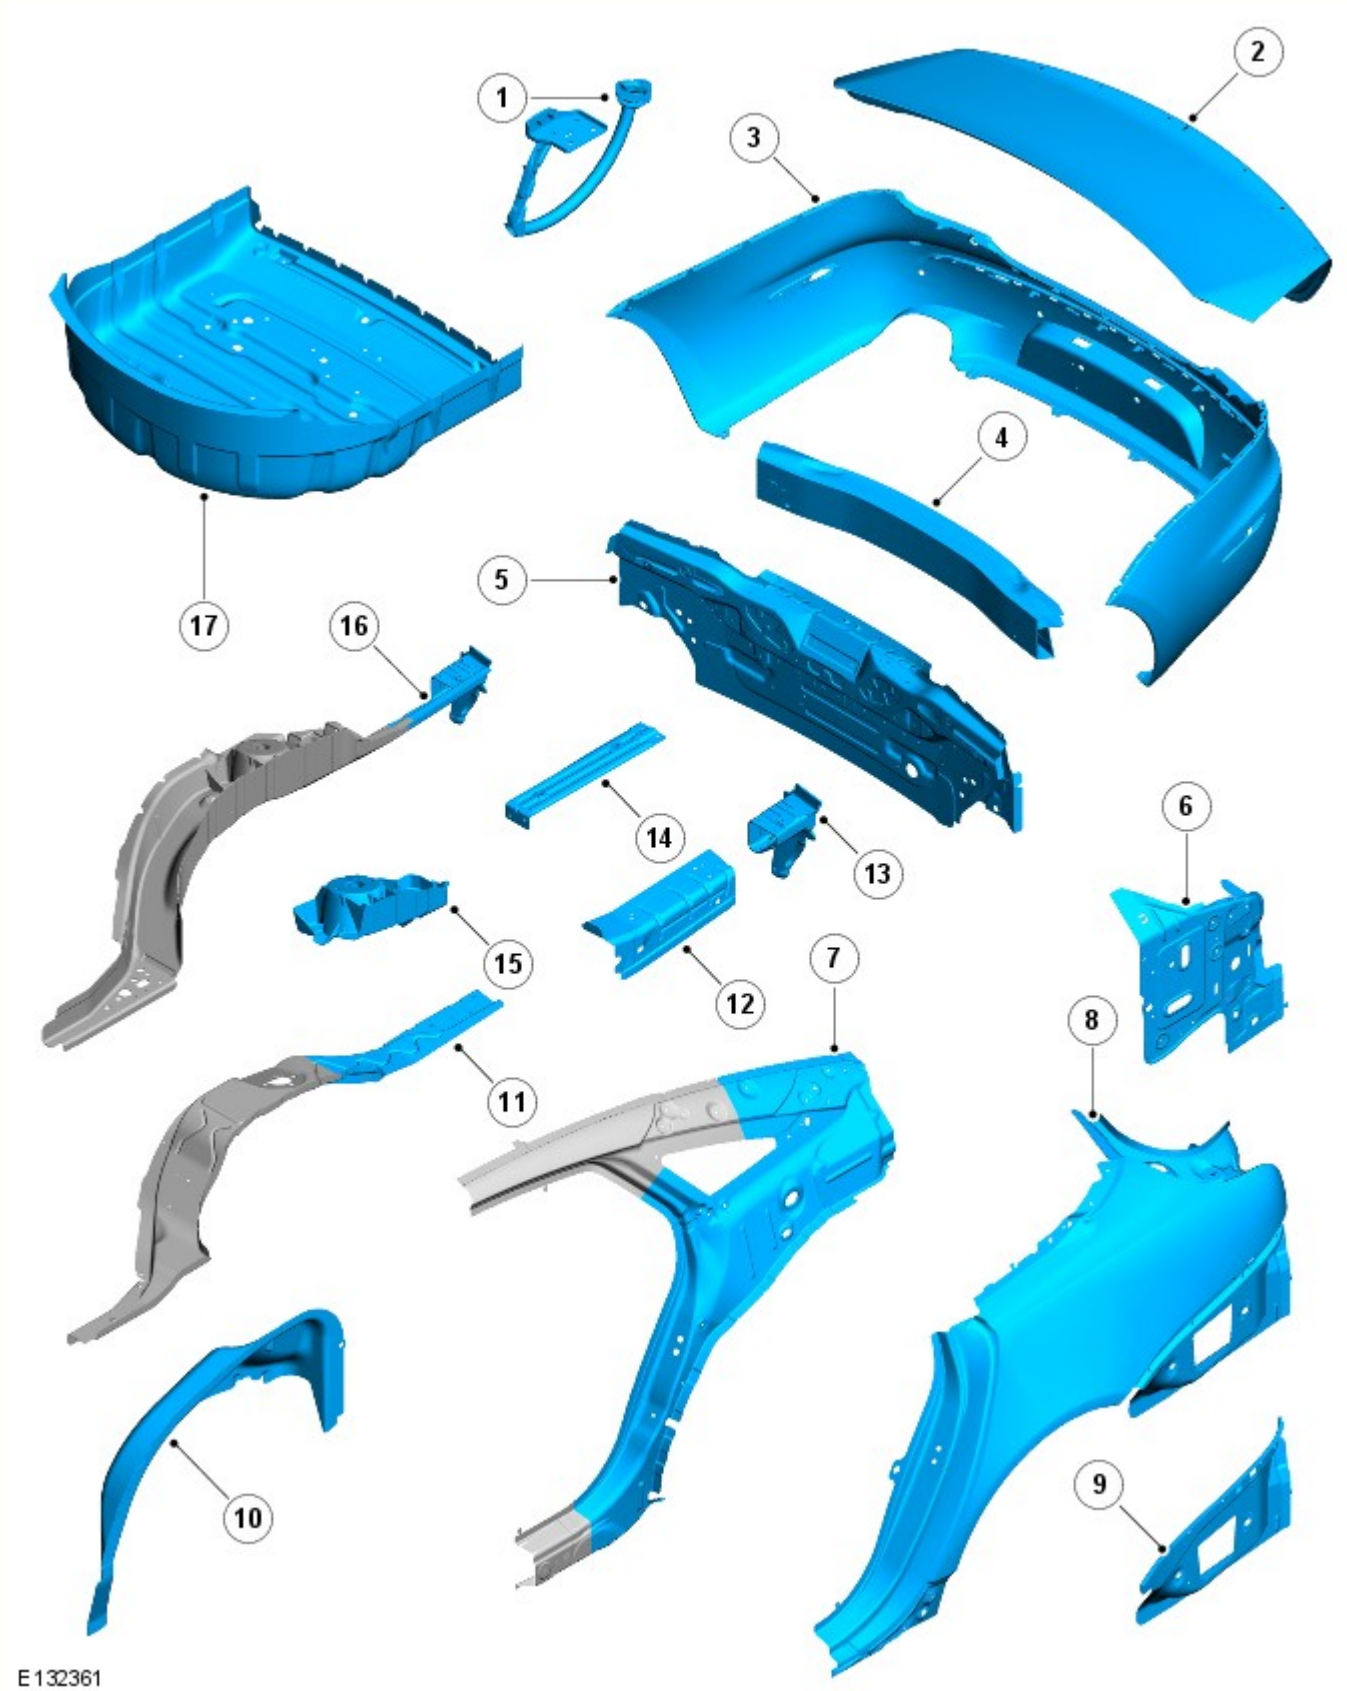
Rear End Sheet Metal Repairs - Rear End Sheet Metal

Description and Operation

Rear end service panels



NOTE: The illustration may indicate either hand of the service panel, the opposite hand will be similar.

Item	Description

1	Luggage compartment lid hinge L/H and R/H
2	Luggage compartment lid
3	Rear bumper cover
4	Rear bumper
5	Back panel
6	Inner quarter panel extension
7	Inner quarter panel rear section
8	Quarter panel
9	Quarter panel lower extension
10	Rear wheelhouse outer
11	Rear side member closing panel section
12	Rear floor side extension
13	Rear bumper mounting
14	Rear side member inner reinforcement
15	Rear suspension cast aluminium mounting
16	Rear side member section
17	Spare wheel well

Time Schedules, Front End Sheet Metal

The following information shows the total time taken to replace single panels. This time includes removal of Mechanical, Electrical and Trim, (MET), items, plus paint times based on Metallic Clear Over Base Paint, (blends for adjacent panels not included).

The times shown are to be used as a guide only.

Single panel times

Panel Description	Hours
Back Panel	**10.70**
Inner Quarter Panel Extension	**1.90**
Inner Quarter Panel Section	**9.30**
Quarter Panel	**11.40**

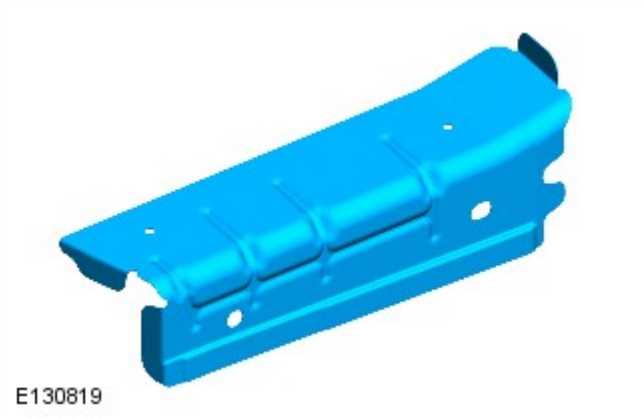
Rear End Sheet Metal Repairs - Rear Floor Side Extension

Removal and Installation

Removal

1. NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

The rear floor side extension is a category A repair.



2. NOTE: The rear floor side extension is manufactured from aluminium alloy 5754-NG.

The rear floor side extension is serviced as a separate rivetted and bonded panel.

3. The rear floor side extension is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Back panel

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

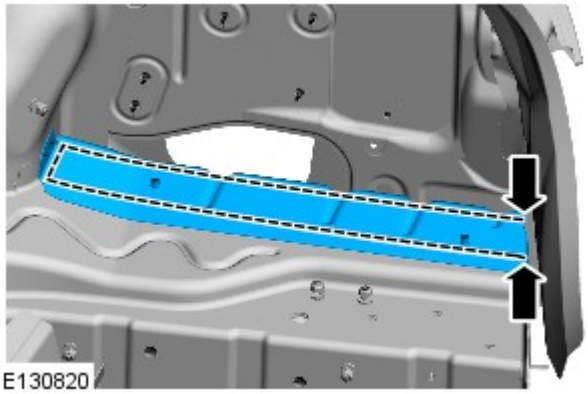
5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove the back panel.
For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

7. If the right-hand rear floor side extension is to be replaced, remove the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

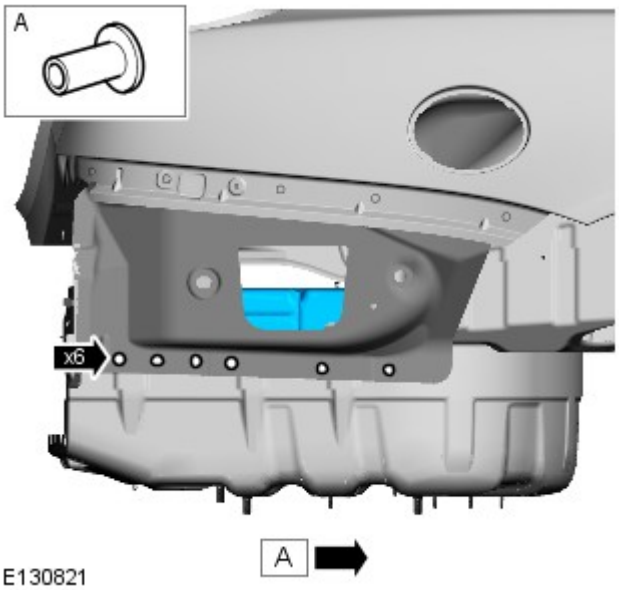
8. Remove sealer from the area of repair as required, to reveal the panel joints.

9. Prior to removal, mark the position of the rear floor side extension in relation to adjacent panels, for ease of alignment on installation.

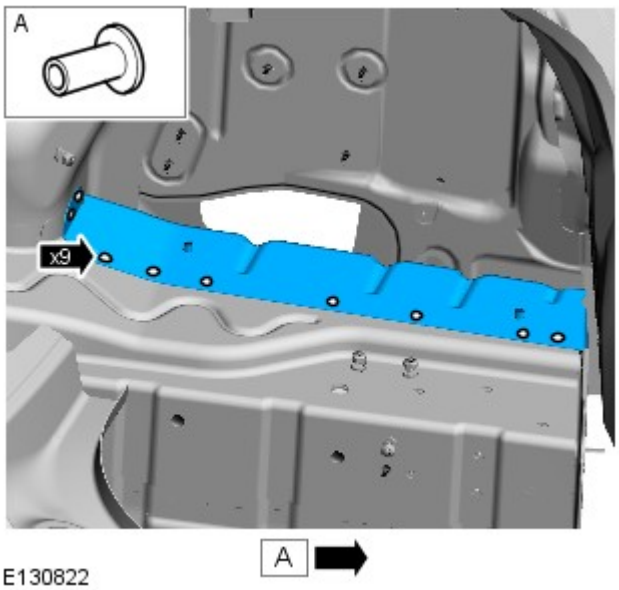


10. CAUTION: Use care not to damage adjacent panels.

Saw cut to remove the panel bulk as indicated.



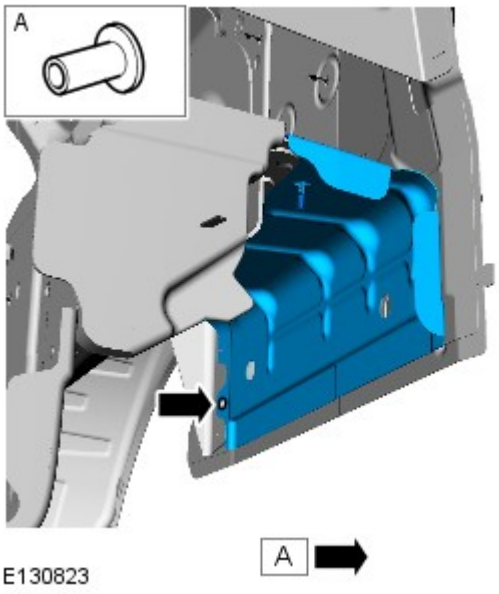
11. Using the ESN50, remove the self piercing rivets.

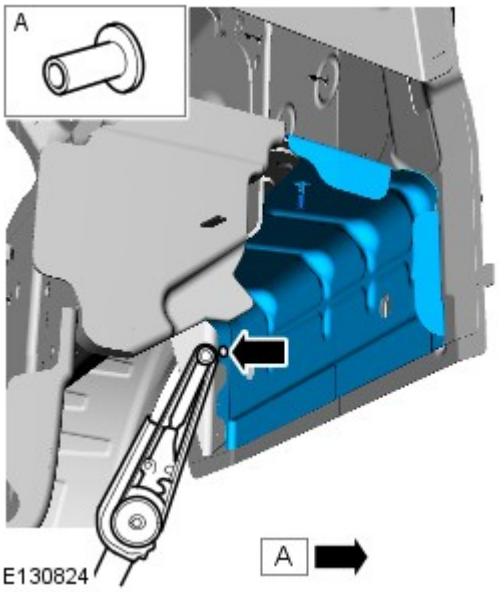


12. Using the ESN50, remove the self piercing rivets.

13. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivet from the wheelhouse.





14. NOTE: This fixing is not replaced on installation, due to restricted access.

Using a belt sander, remove the self piercing rivet from the wheelhouse.

15. Separate the joints and remove the old panel remnant.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. NOTE: Use the marks made prior to removal to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

4. NOTE: The joint to the quarter panel lower extension uses self piercing rivets.

Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed.

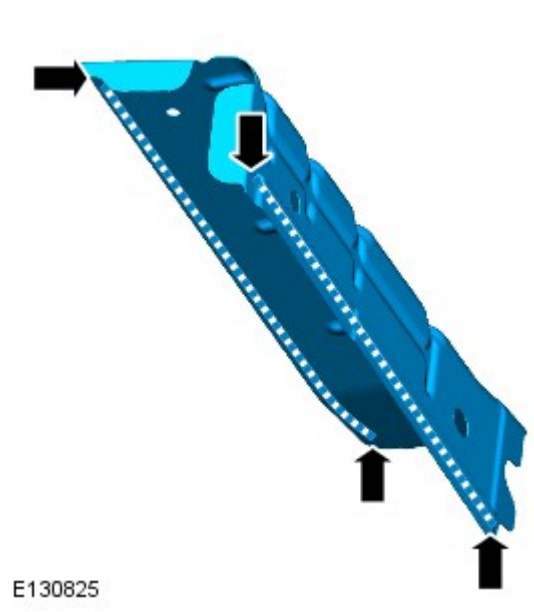
5. Remove the new panel.

6. Debur the drilled holes.

7. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

8. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

9. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

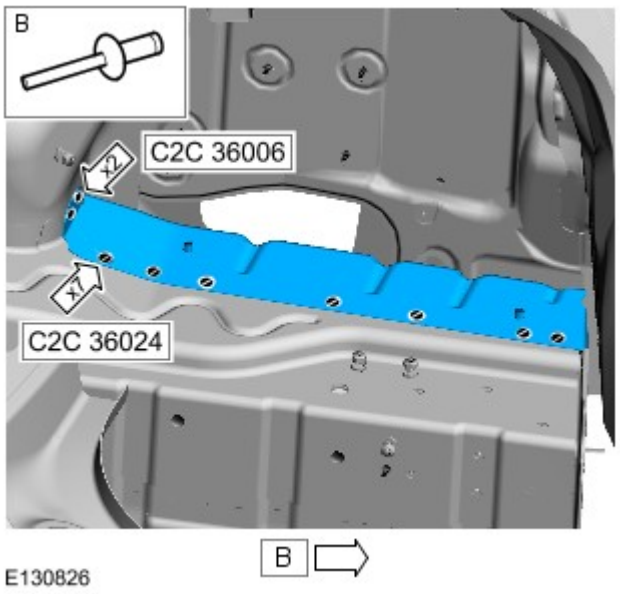


E130825

10. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

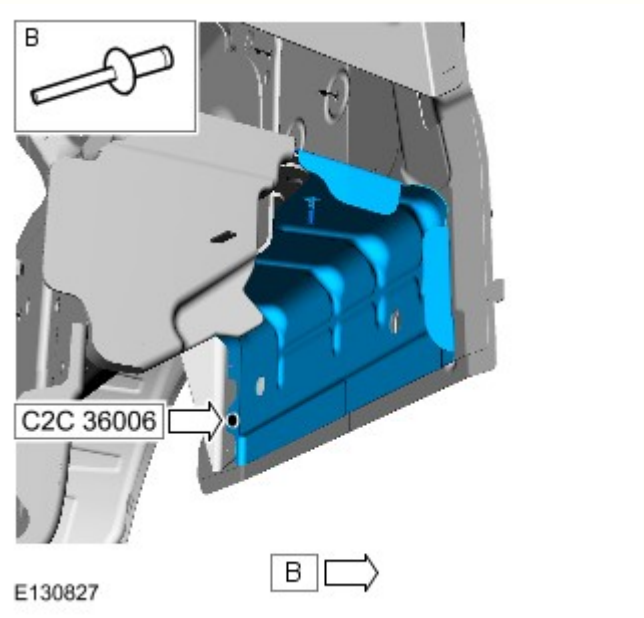
Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

11. Offer up the new panel, align and clamp into position.

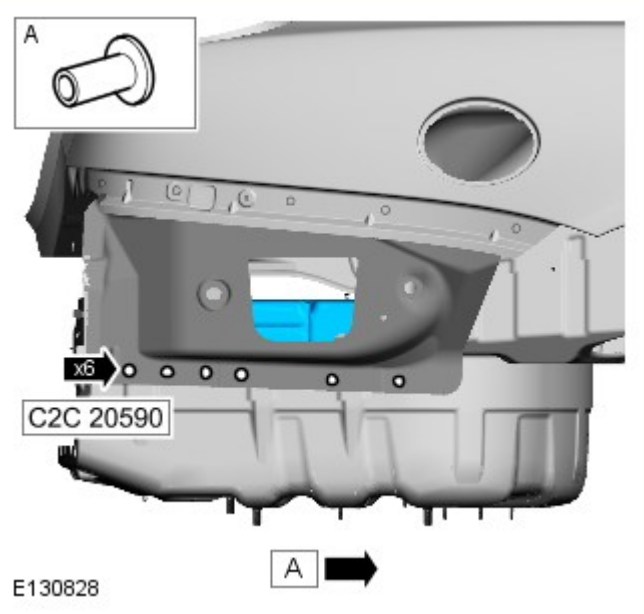


E130826

12. Using the Genesis G4, install the Hemloks.



13. Using the Genesis G4, install the Hemloks.



14. Using the ESN50, install the self piercing rivets into the quarter panel lower extension.

15. Remove any excess adhesive.

16. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

17. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Battery, Mounting and Cables - Battery

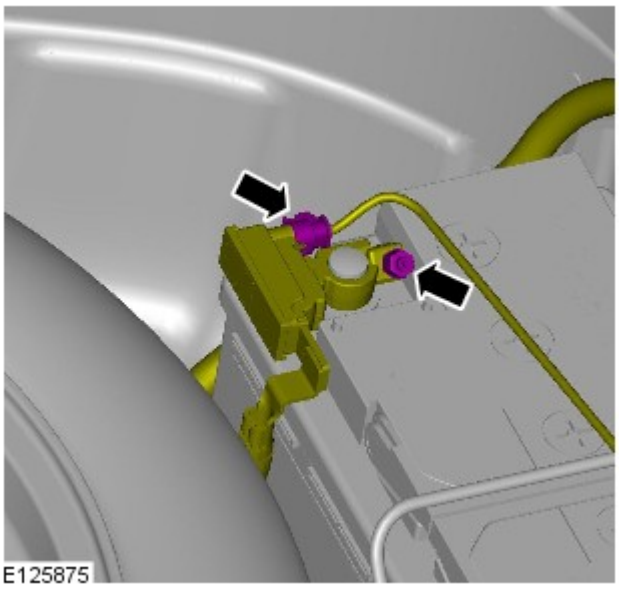
Removal and Installation

Removal

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

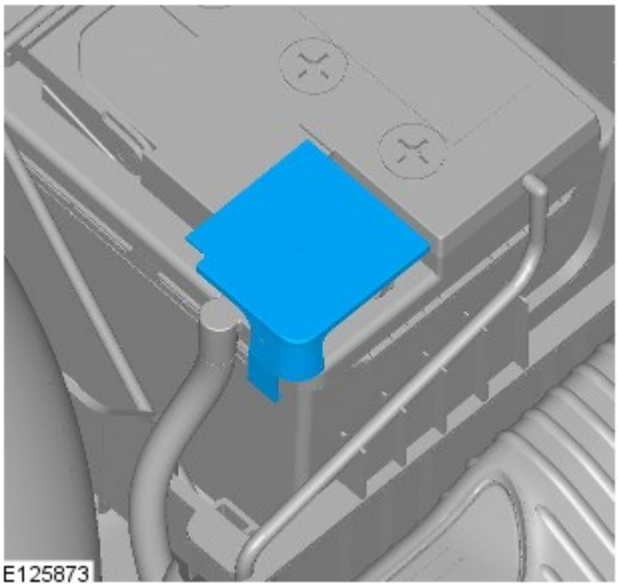
3. Raise and secure the luggage compartment floor covering.

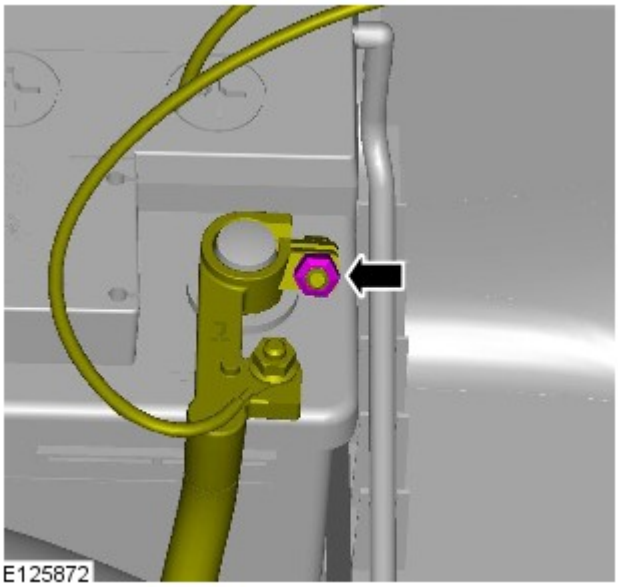


4. CAUTION: Take extra care not to damage the wiring harness.

Torque: 6 Nm

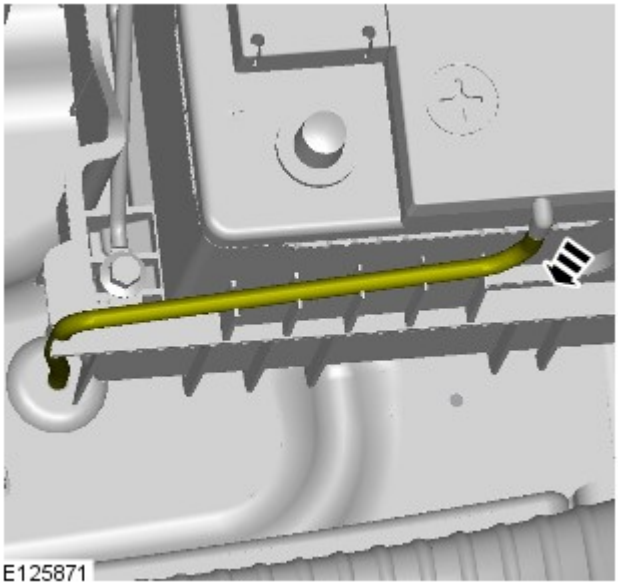
5.





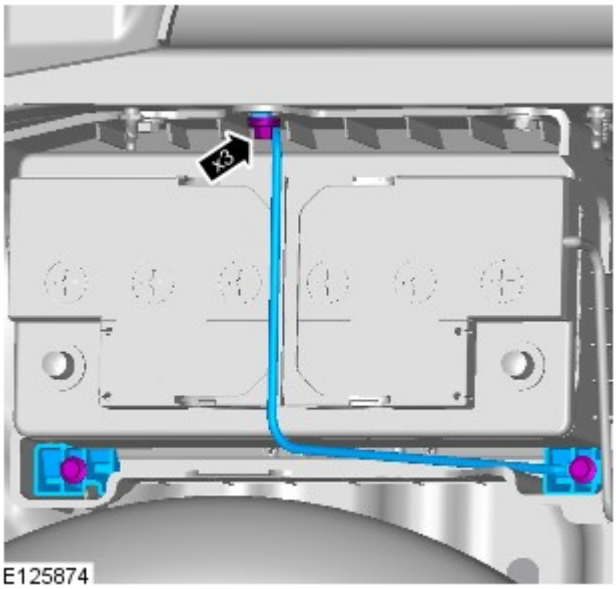
6. CAUTION: Take extra care not to damage the wiring harness.

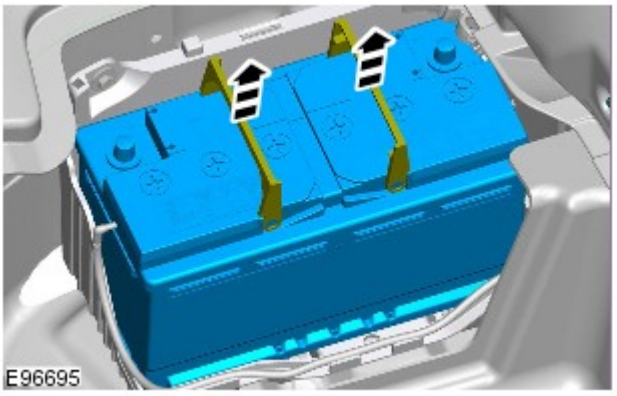
Torque: 6 Nm



7.

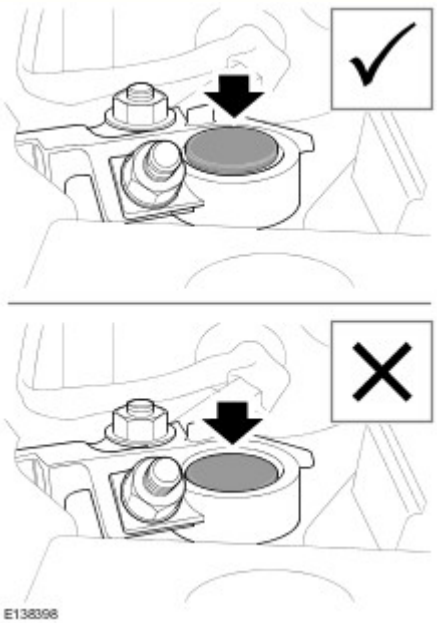
8. *Torque:* 13 Nm





9. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Installation



1. CAUTION: Make sure the battery monitoring system (BMS) electrical connector is connected to the module, before installing the BMS on to the battery terminal.

NOTE: Make sure that both the positive and negative battery terminals are correctly located.

To install, reverse the removal procedure.

2. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system .

3. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

4. Enter the audio unit preset radio frequencies.

5. Reset the clock to the correct time.

6. Start the engine and allow to idle until the engine reaches normal operating temperature.

7. Switch the engine off.

Rear End Sheet Metal Repairs - Back Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The back panel is a category A repair.

E129307

2. NOTE: The back panel is manufactured from aluminium alloy 5754-NG.

The back panel is serviced as a separate riveted and bonded panel, it includes the back panel inner.

3. The back panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation) / Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. Remove the luggage compartment lid weatherstrip.

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove both the rear mufflers.
For additional information, refer to: Rear Muffler (309-00A, Removal and Installation) / Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the right-hand and left-hand rear muffler heatshields.

12. Remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

13. Remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

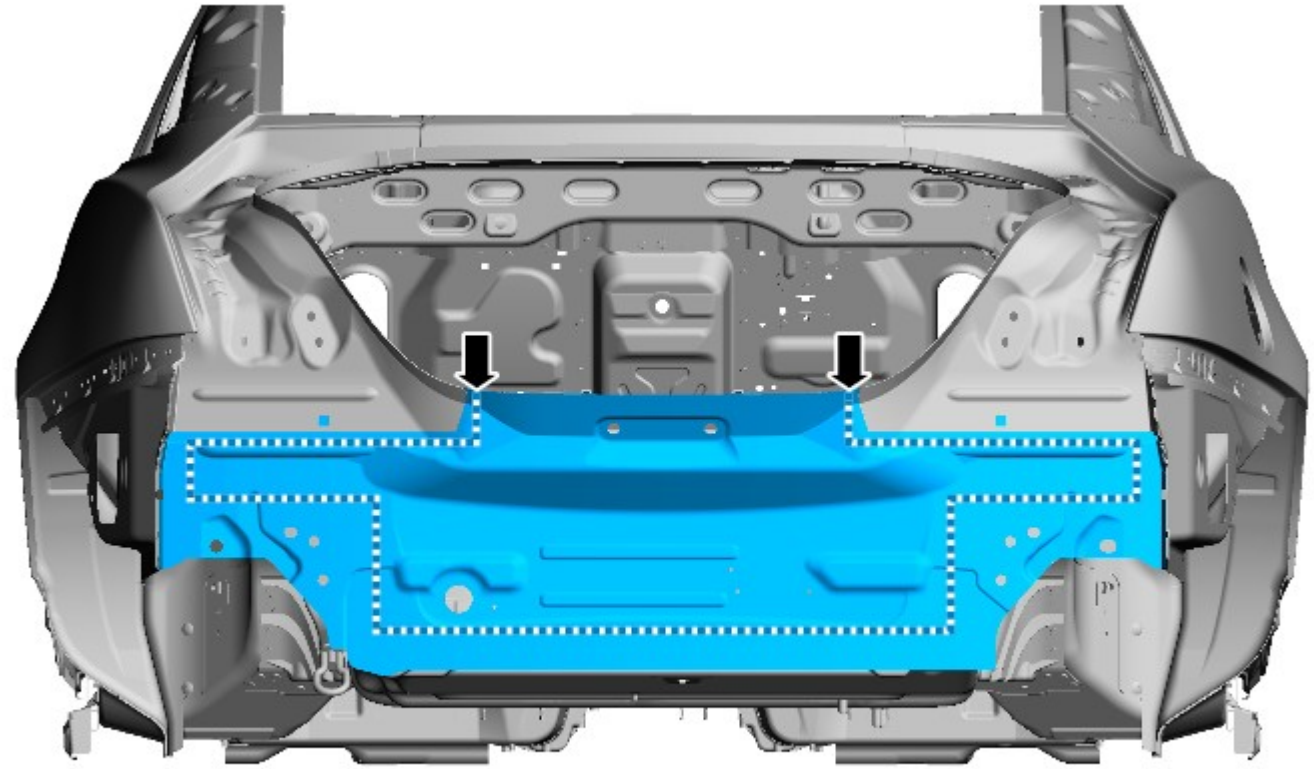
14. Release the back panel and loadspace wiring harness and position it to one side.

15. Remove the luggage compartment latch striker.

16. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

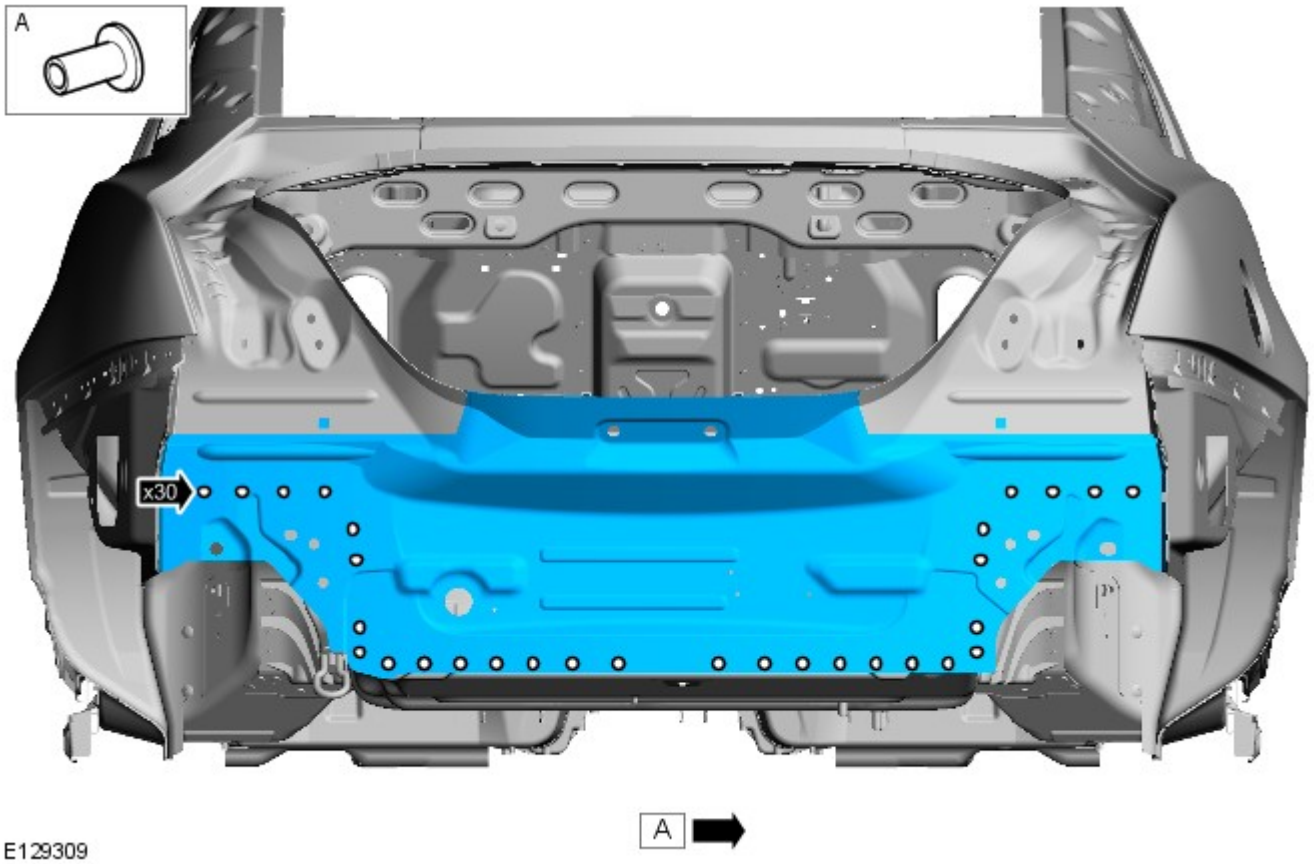
17. Remove any electrical components in the local area of repair to prevent damage.

18. Saw cut the old panel along the point shown in the illustration. This allows access to allow the use of the ESN50.



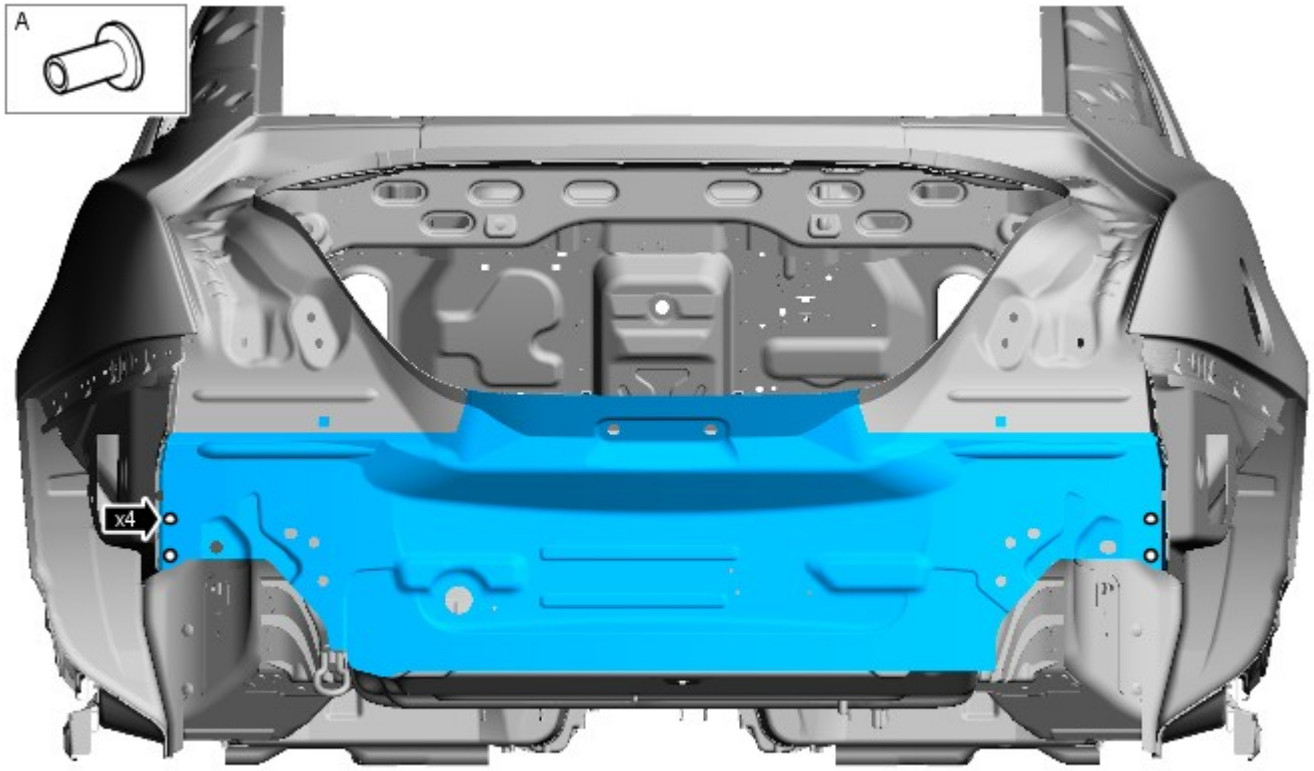
E129308

19. Using the ESN50, remove the self piercing rivets from the spare wheel well and rear side members.

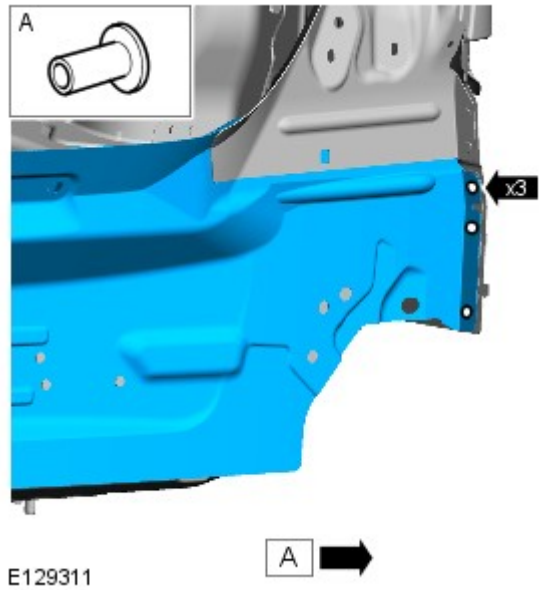


E129309

20. Using the ESN50, remove the self piercing rivets from the rear floor side extensions.



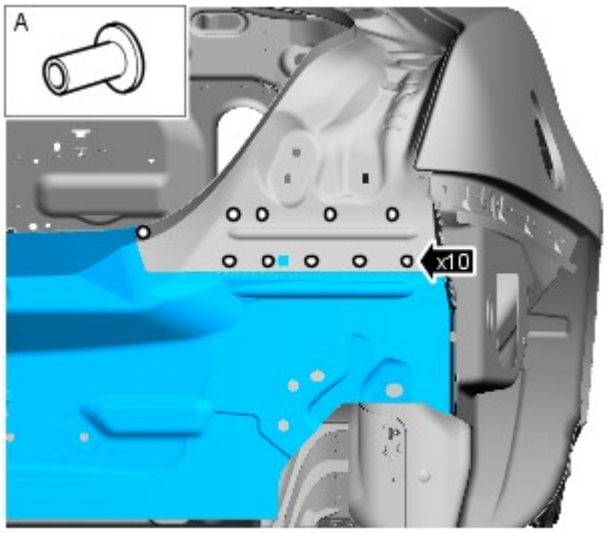
E129310



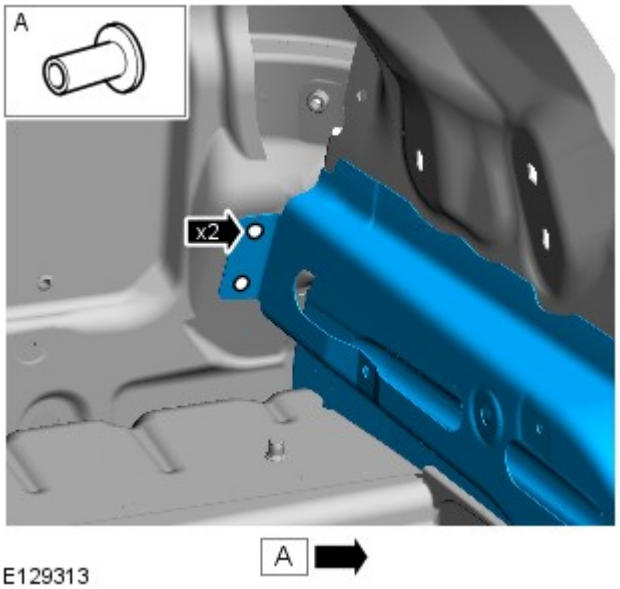
E129311

21. Using the ESN50, remove the self piercing rivets (3 each side) from the quarter panel lower extensions.

22. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets (10 each side) from the quarter panels.



E129312

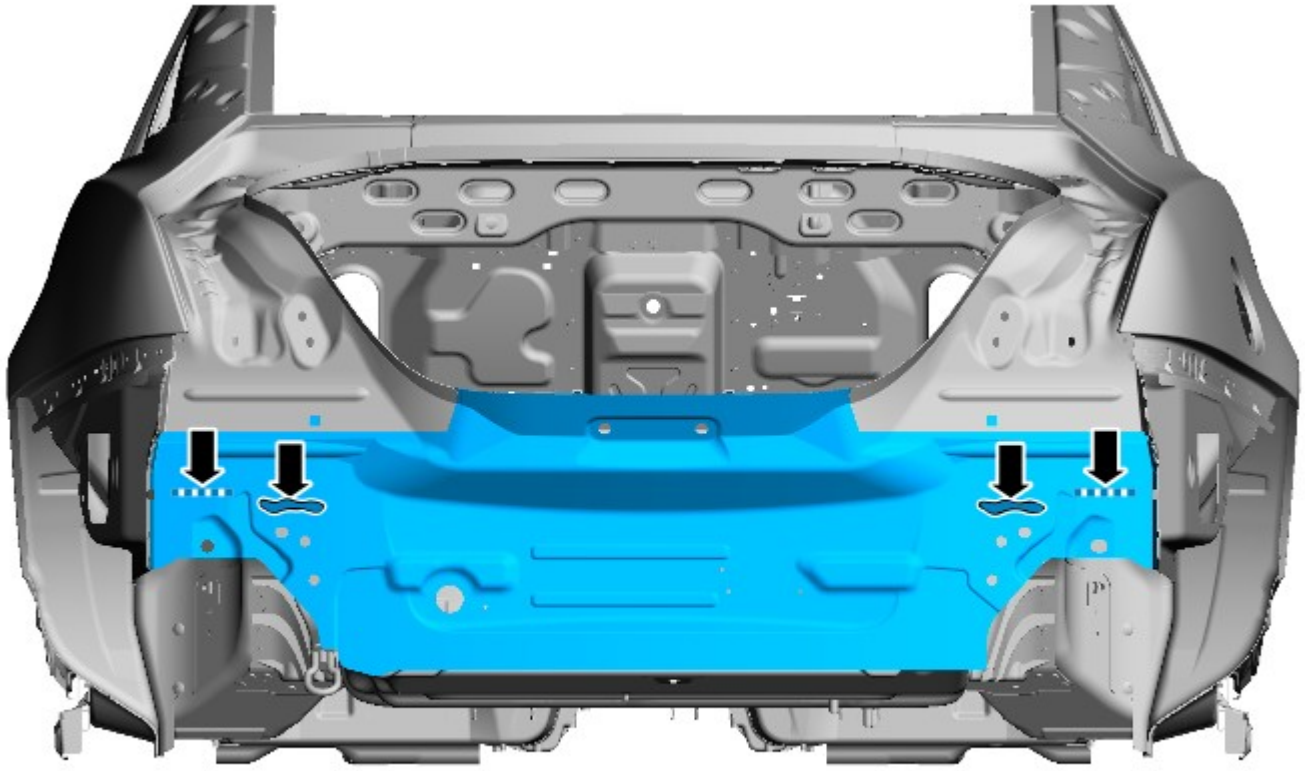


E129313

23. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets (2 each side) from the junction box and modules mounting panels.

24. Separate the joints and remove the old panel, carefully releasing the adhesive at the points illustrated.



E129314

Installation

1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, remove the adhesive residue.

3. Dress flanges where necessary.

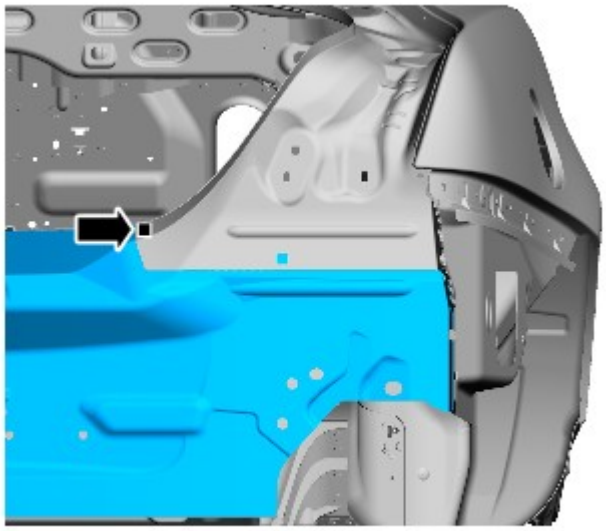
4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

5. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

6. Remove the new panel.

7. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

8. Using a 10mm drill bit, drill 2 holes in the old quarter panel ready for MIG plug welding.



E129612

9. Debur the drilled holes.

10. CAUTION: Use care not to damage the panel.

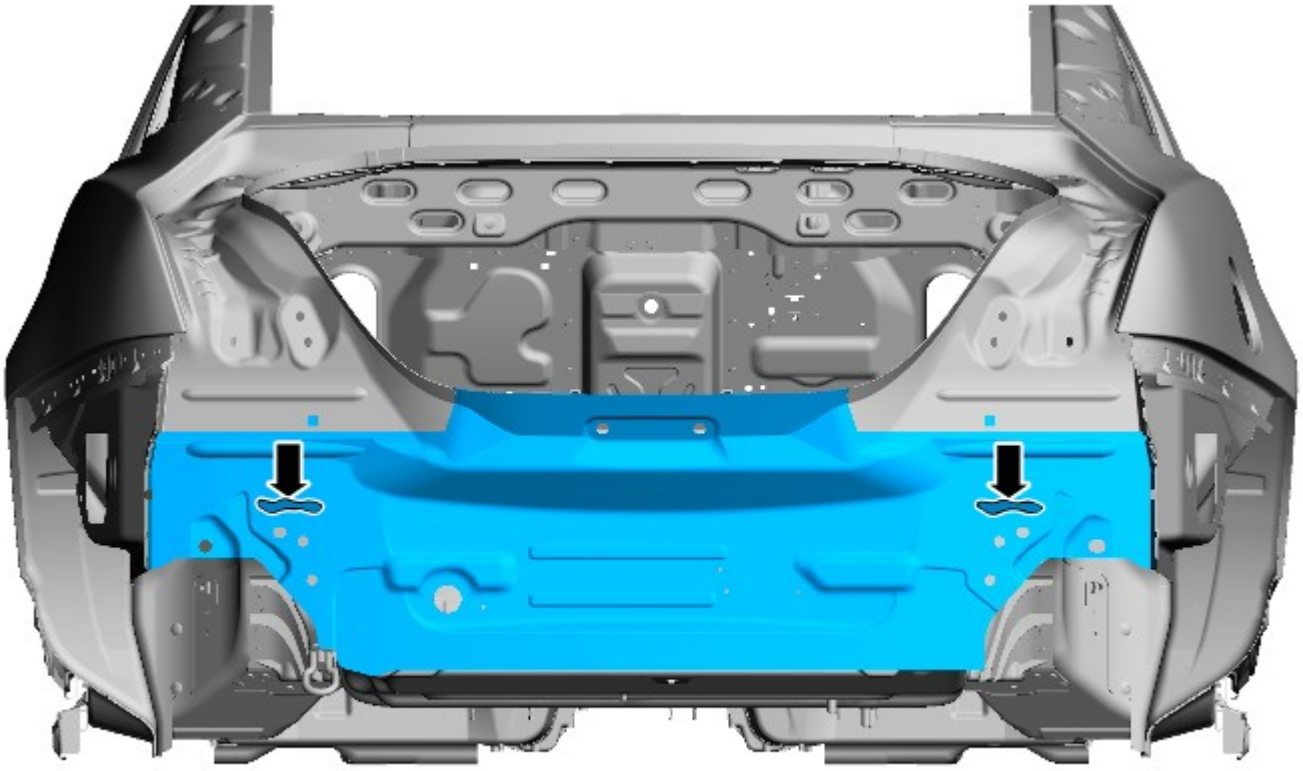
Remove seam sealer where applicable.

11. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

12. Pyrosil the joints.

13. Apply the coupling agent and allow to dry.

14. Apply the semi-rigid sealer at the points illustrated.



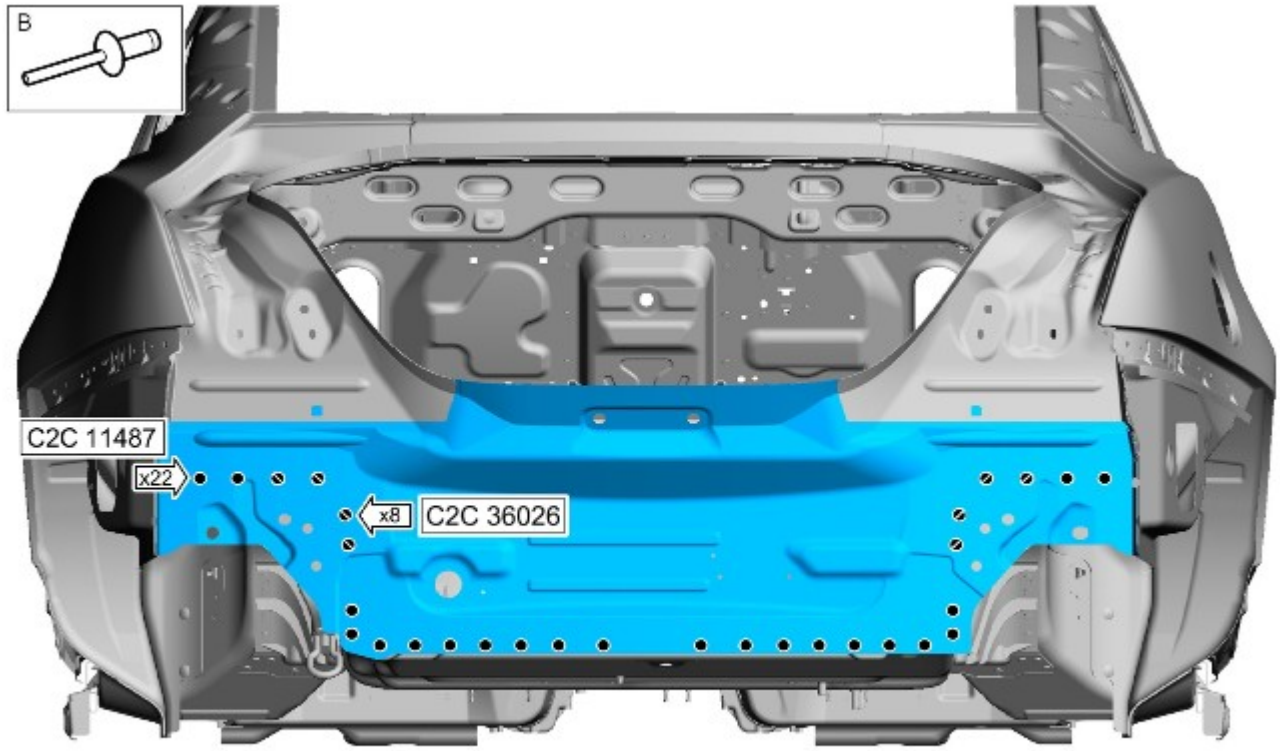
E129315

15. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

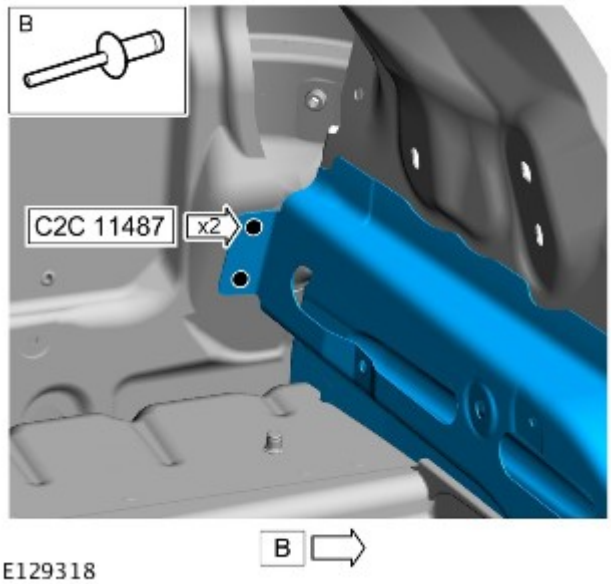
Apply a 5mm zig zag style bead of 3M 8115 adhesive to the body joints.

16. Offer up the new panel and clamp into position.

17. Using the Genesis G4, install 8 Hemloks (4 each side) into the rear side member. Install a further 22 Hemloks (11 each side) into the spare wheel well and rear floor side extension.



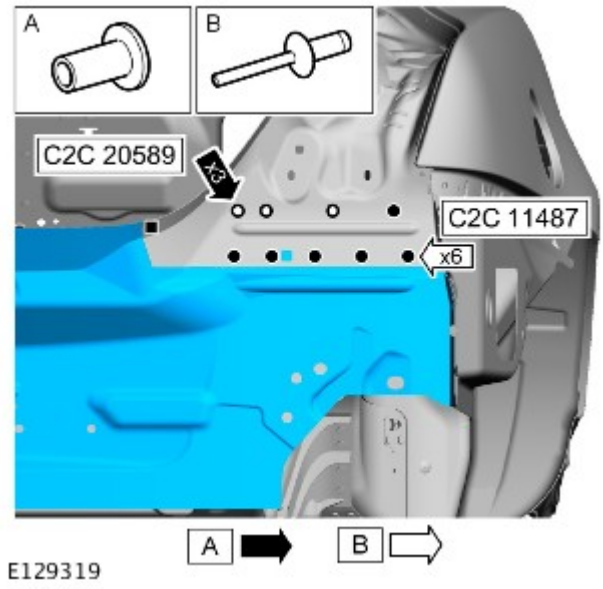
E129317



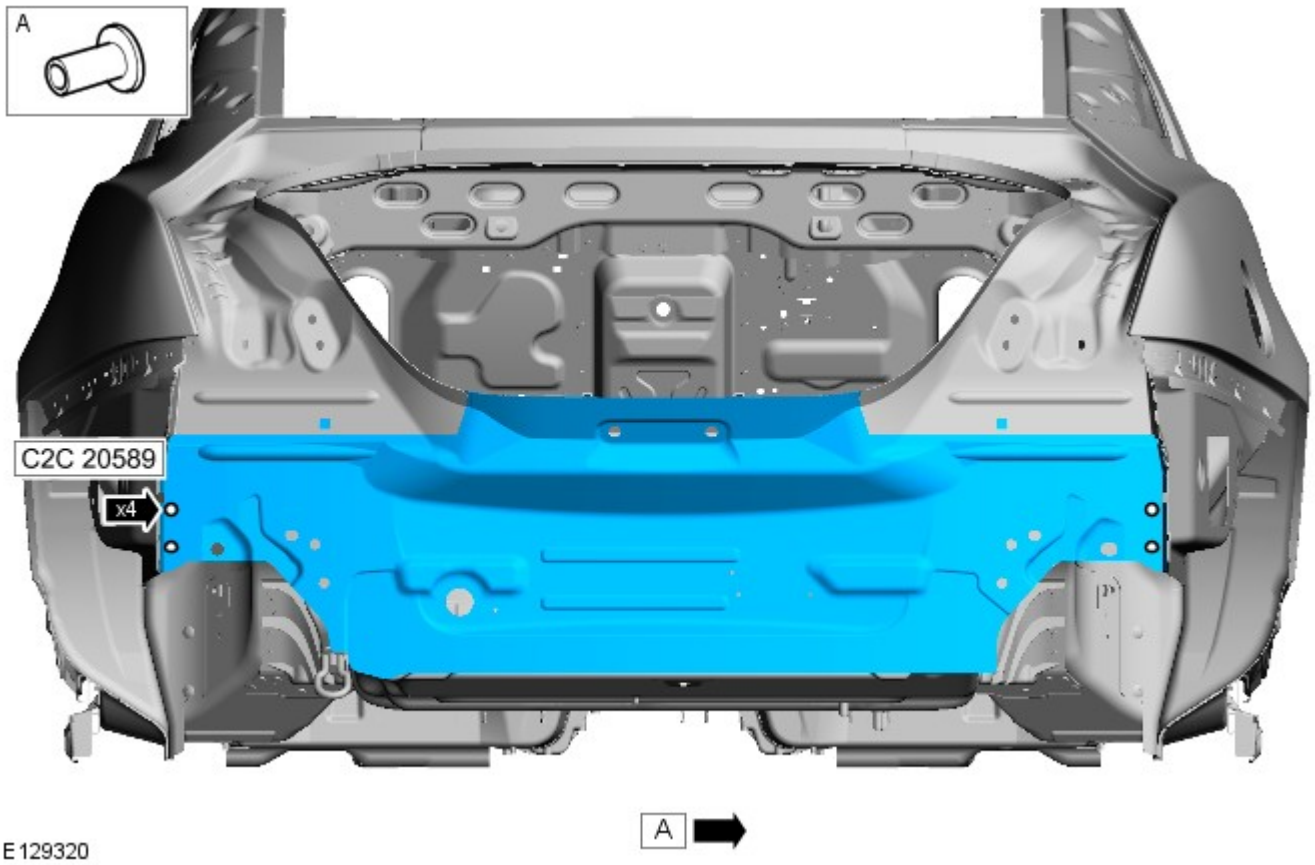
E129318

18. Using the Genesis G4, install the Hemloks (2 each side) into the junction box and modules mounting panels.

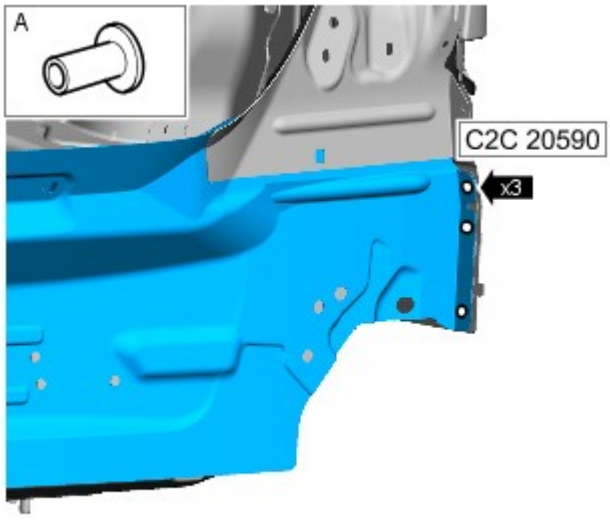
19. Using the Genesis G4, install 12 Hemloks (6 each side) into the quarter panel. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel.



20. Using the ESN50, install the self piercing rivets into the rear floor side extension.

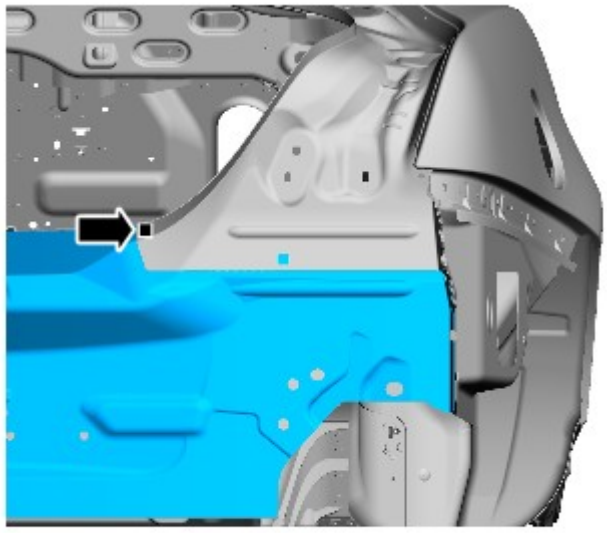


21. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel lower extension.



E129321

22. Remove any excess adhesive.



E129612

23. Install 2 MIG plug welds (1 each side) into the quarter panel.

24. The installation of associated panels and components is the reversal of removal procedure.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

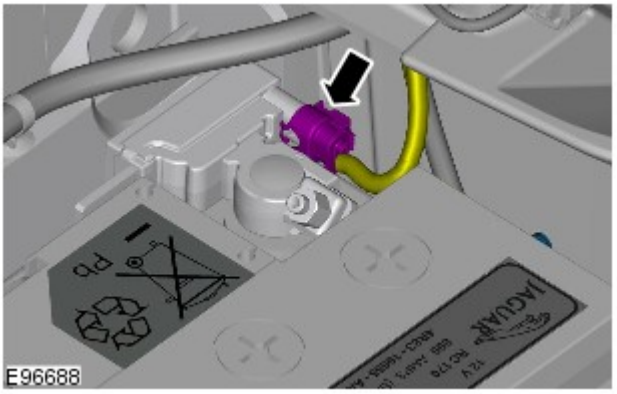
General Procedures

Disconnect

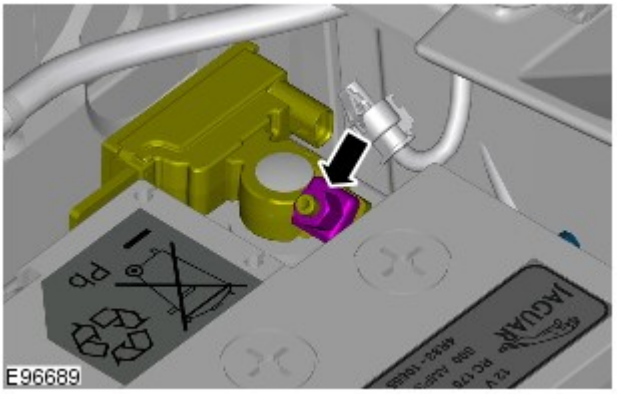
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

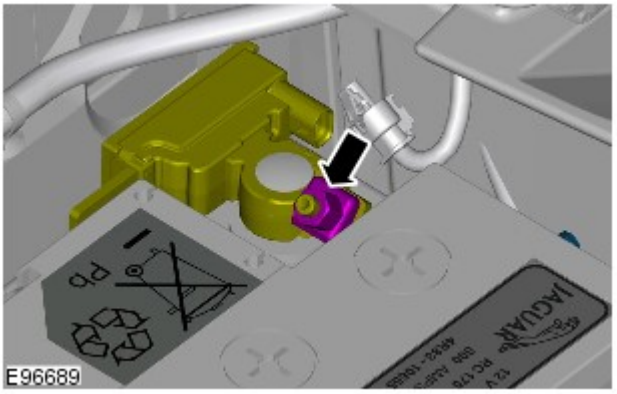


4. CAUTION: Take extra care not to damage the wiring harness.

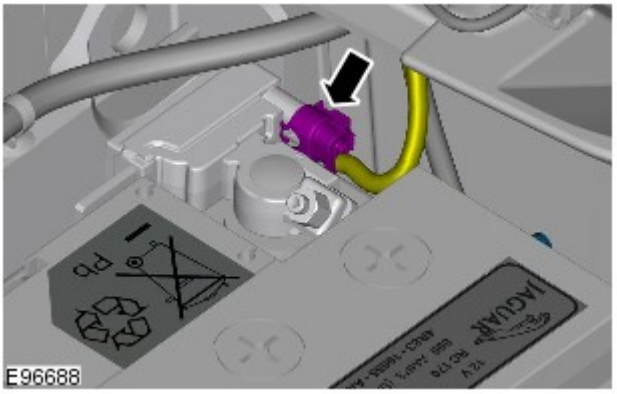


5.

Connect

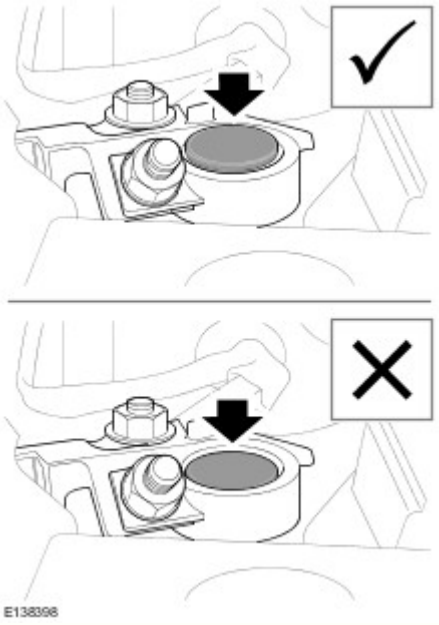


1. *Torque:* 6 Nm



2.

3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places

particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel

- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual

- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A

- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During	Yes - **caution** material sensitive to heat.	Yes - **must** be heated to maintain original alloy properties. Ideal

Repair	Range: 140 - 160°C Ideal panel temperature: **150°C**	panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

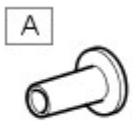
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

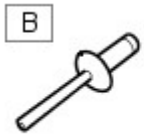
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

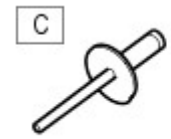
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

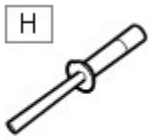
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

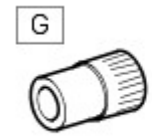
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

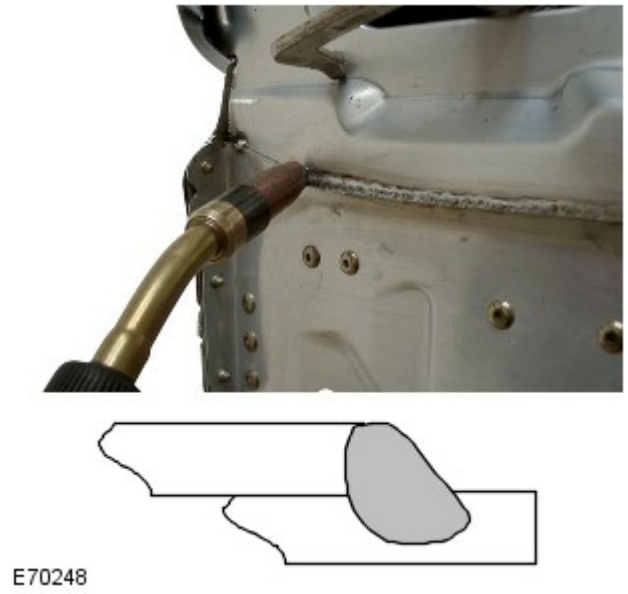
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

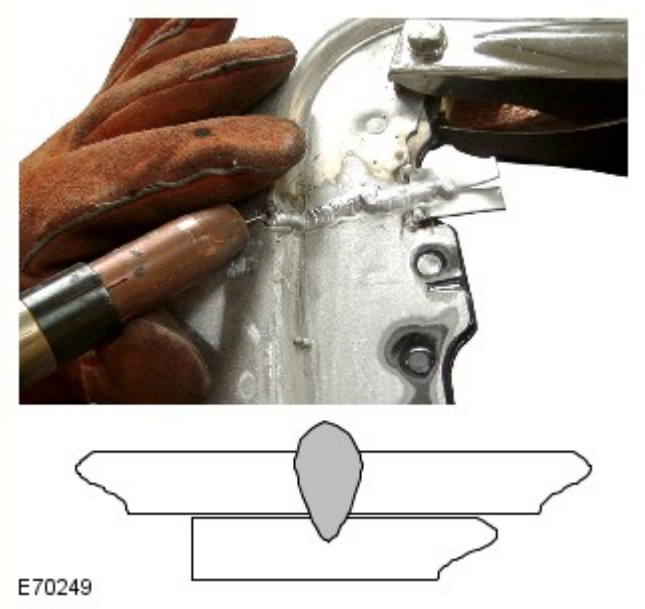
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

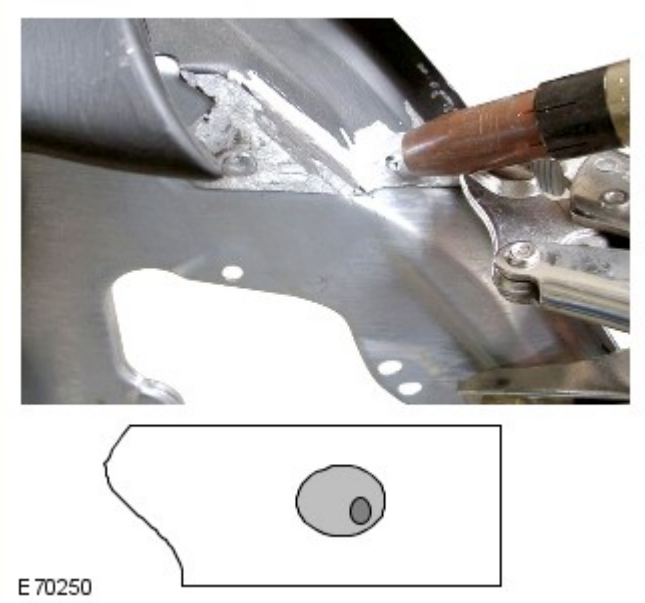
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

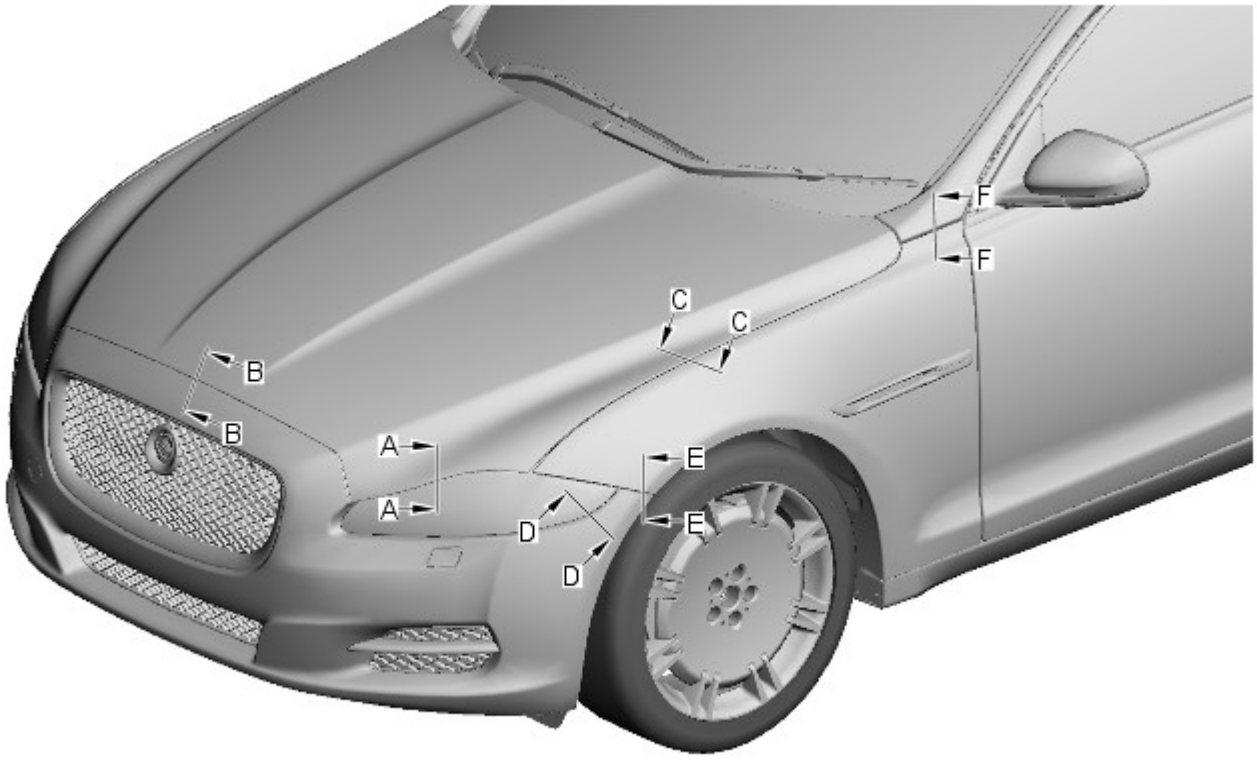
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

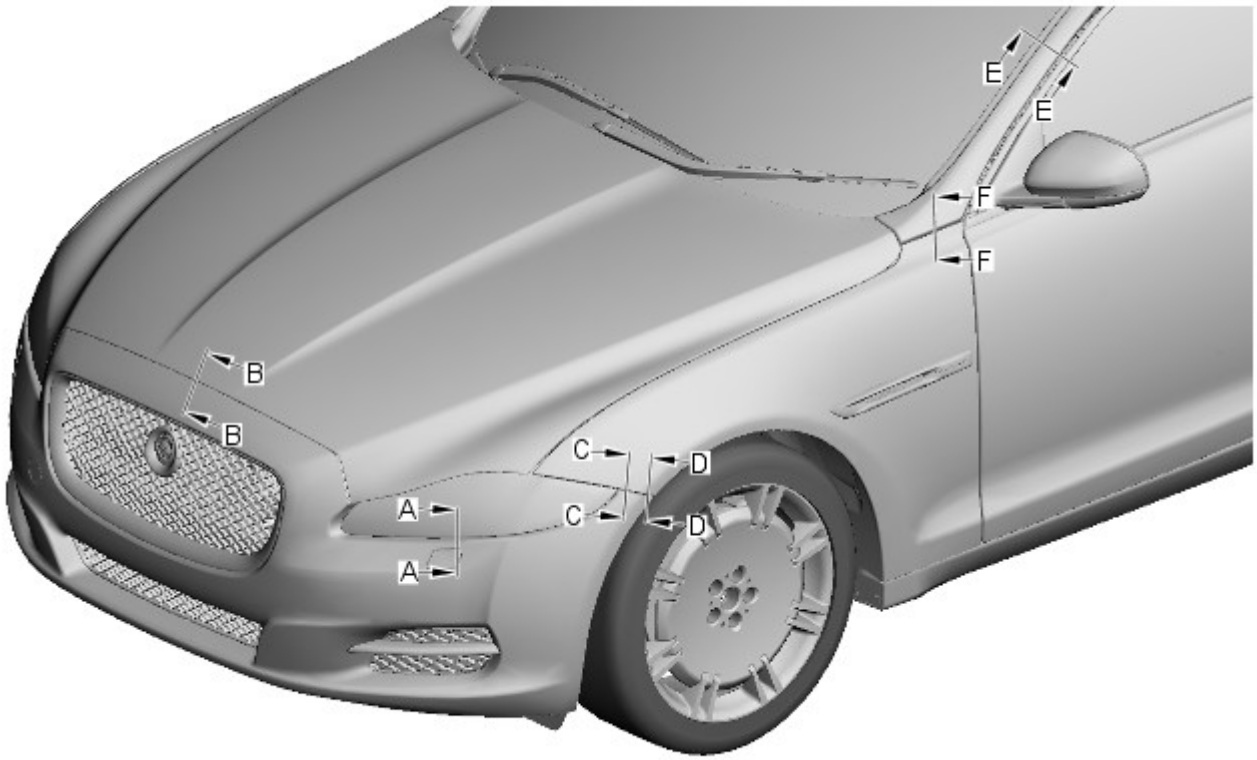
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



E133472

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.
