Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

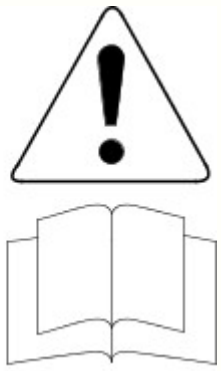
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

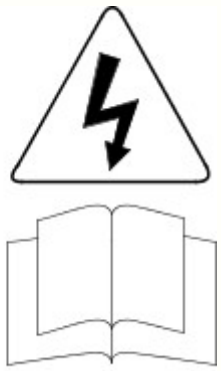
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



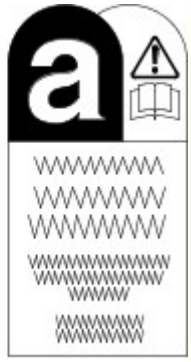
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



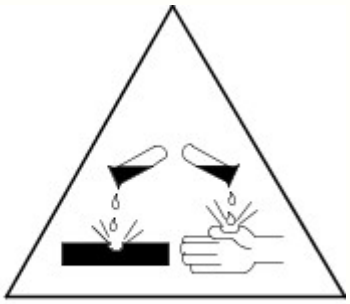
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

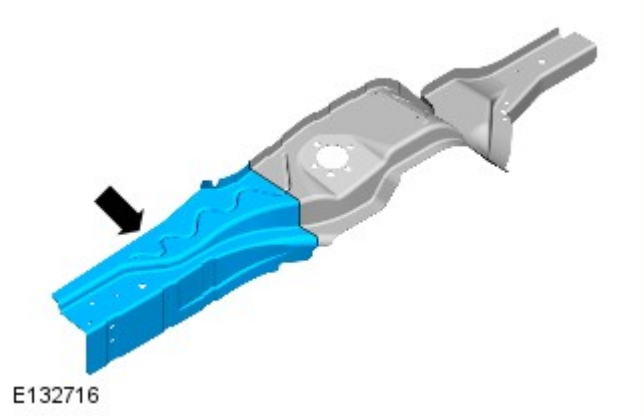
Rear End Sheet Metal Repairs - Rear Side Member Closing Panel Section

Removal and Installation

Removal

1. CAUTION: The rear side member closing panel must be sectioned at the point indicated so that the aluminium casting of the rear suspension mounting can be inspected for damage.

The rear side member closing panel section is a category A repair.



E132716

2. NOTE: The rear side member closing panel section is manufactured from aluminium alloy 5754-NG.

The rear side member closing panel section is cut from the rear side member closing panel service panel.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The rear side member closing panel section is replaced in conjunction with:

- Rear bumper cover
- Rear bumper
- Back panel
- Spare wheel well
- Rear floor side extension
- Rear side member section
- Rear side member inner reinforcement and noise, vibration and harshness (NVH) component (plastic)

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. NOTE: This procedure assumes that if the rear side member closing panel section is damaged, the rear side member section will also be damaged. Therefore the replacement procedure for the rear side member closing panel section is combined within the rear side member section procedure.

Remove the rear side member section.
For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Installation

1. The installation of associated panels and components is the reversal of removal procedure.

Published: 28-Dec-2012

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Published: 23-Apr-2015

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis

- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Country	Phone	Fax

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

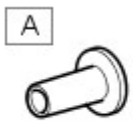
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

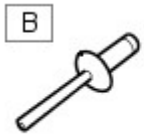
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

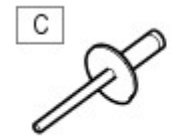
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

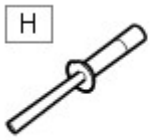
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

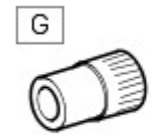
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

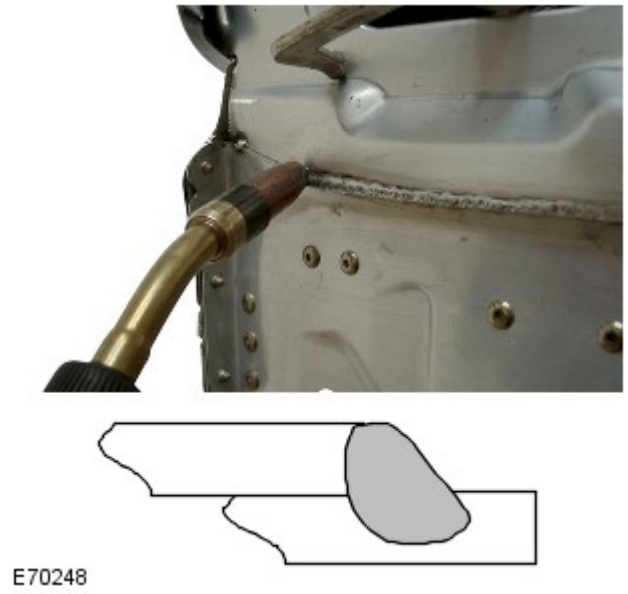
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

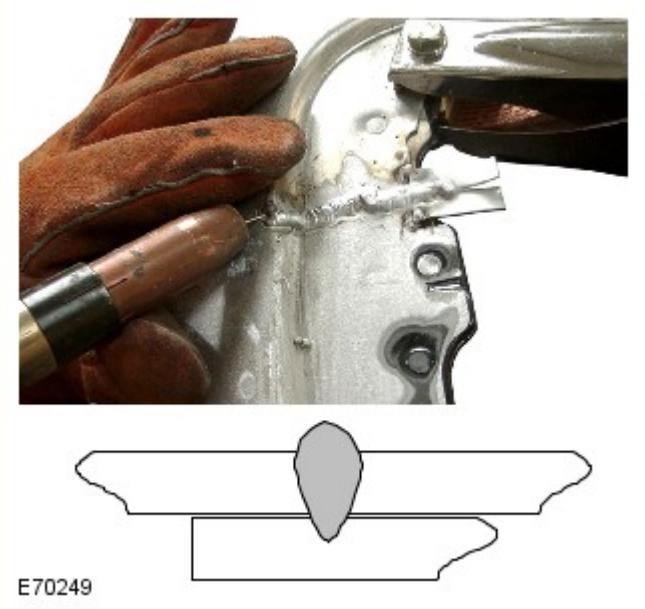
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

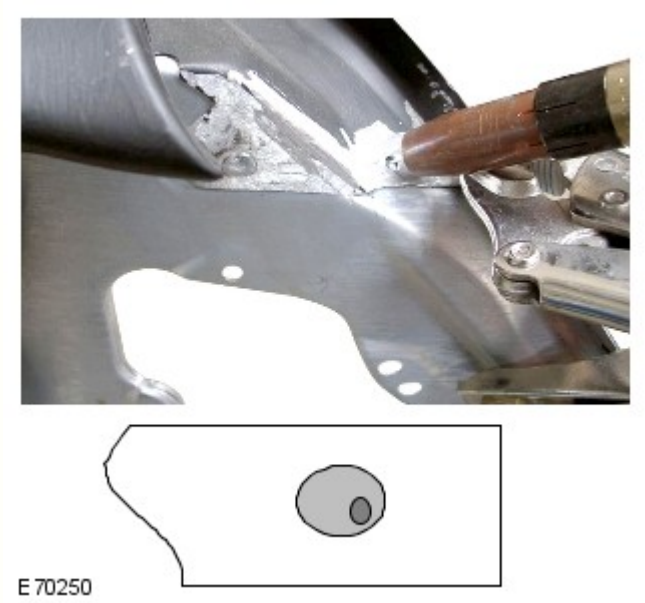
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Repairs - Vehicle Specific Information and Tolerance Checks - Body and Frame

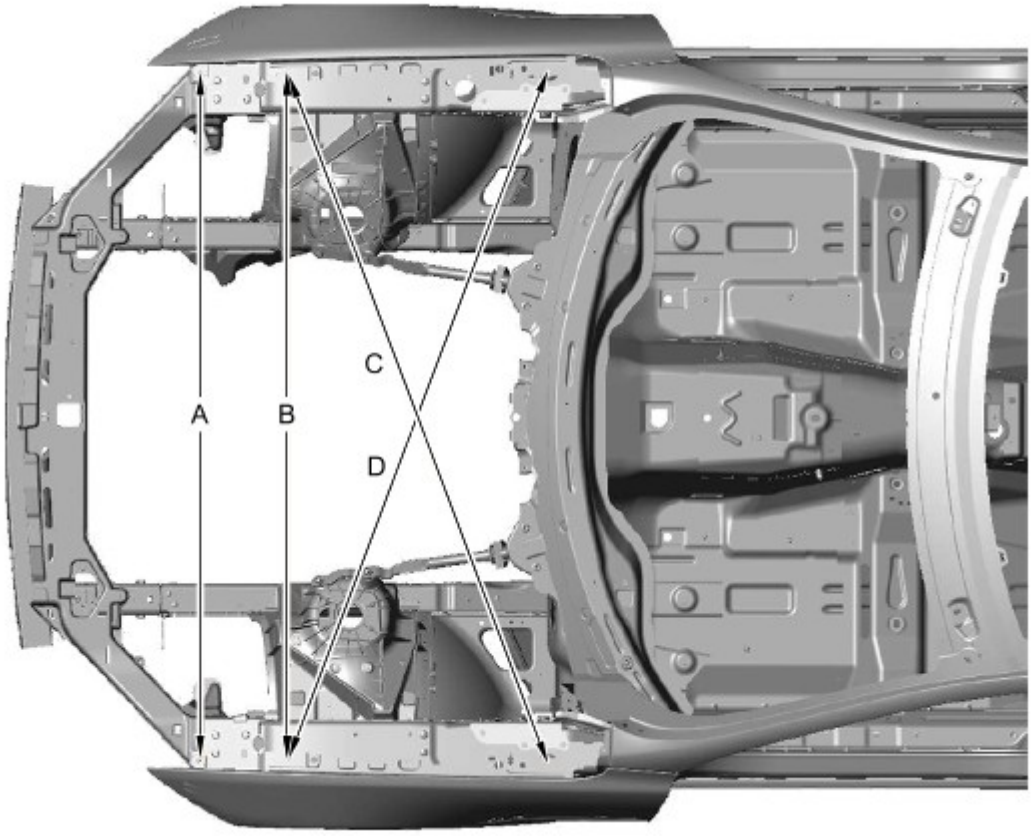
Description and Operation

Front End Body Dimensions

NOTES:

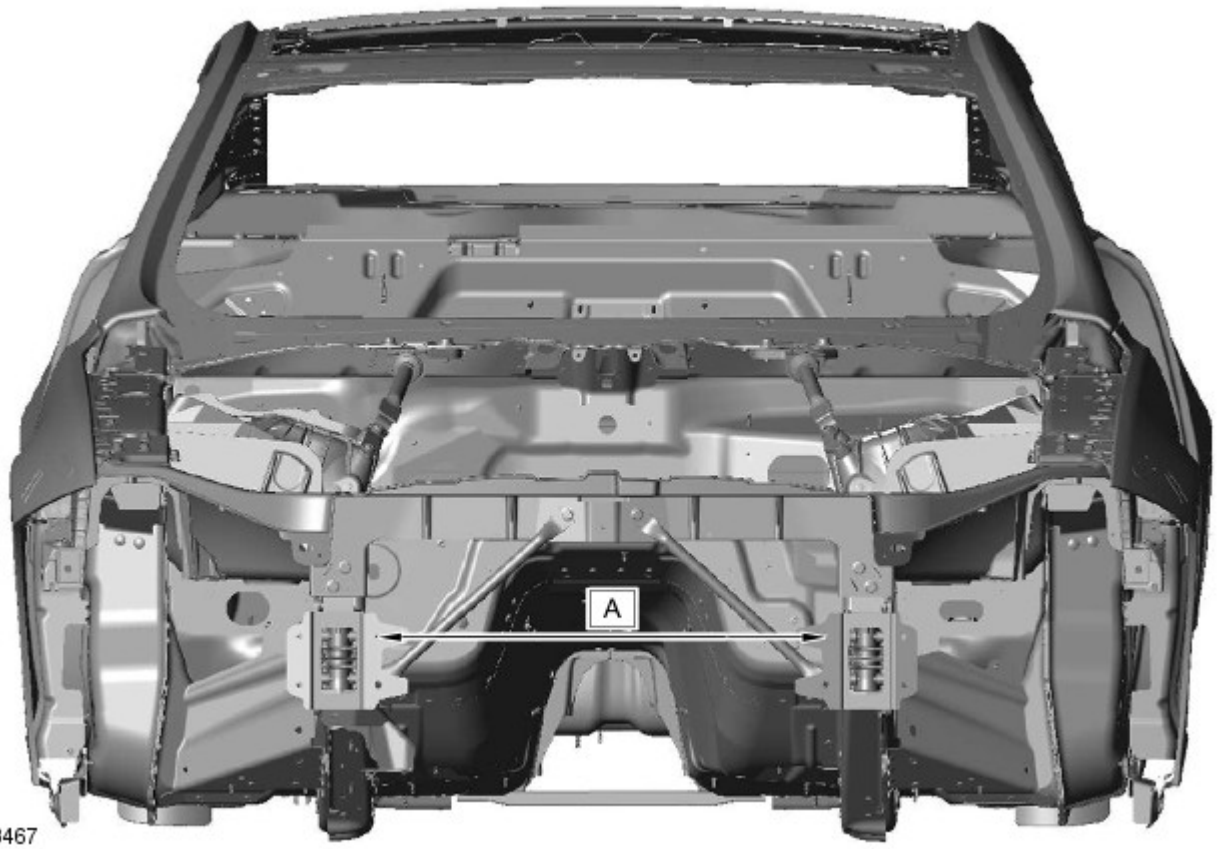
All dimensions shown are in millimetres (mm).

Dimensions shown to holes, are always taken from/to the hole centre. They are also always to the body panel surface, not to the top of bolts or components.



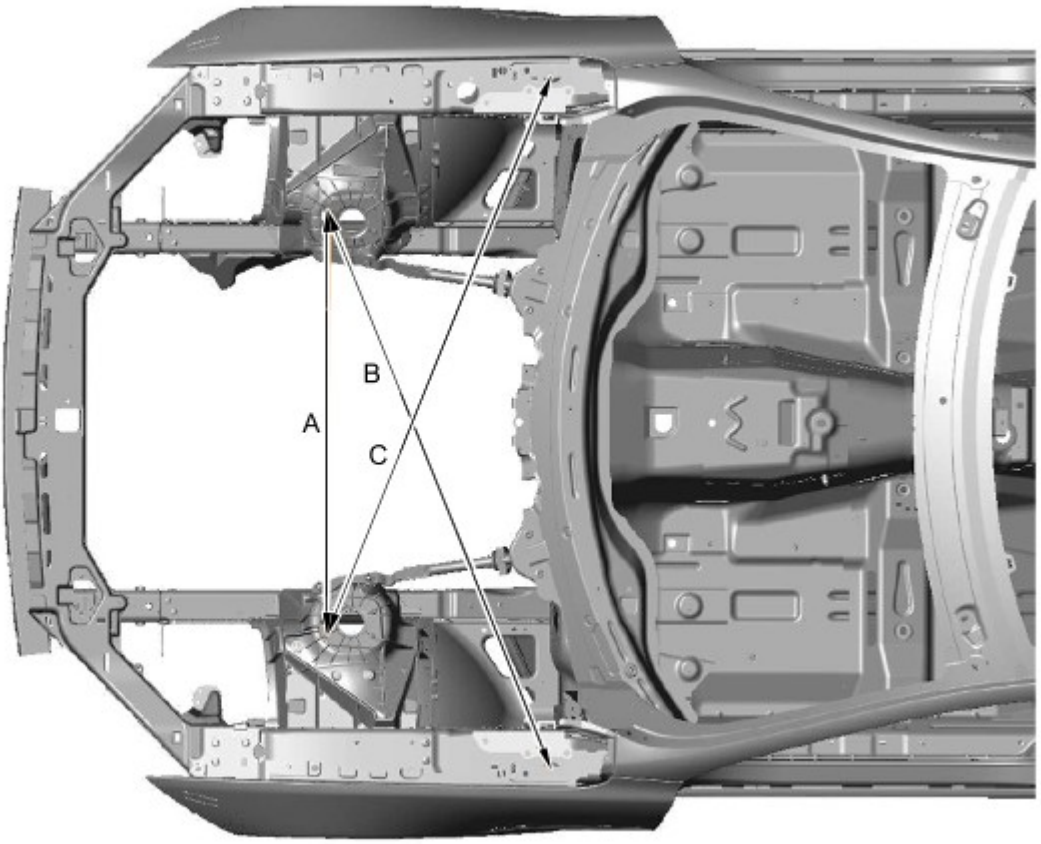
E133463

Item	From	To	Dimension
A	Front fender RH, front fixing hole	Front fender LH, front fixing hole	1580.0
B	Front fender RH, second front fixing hole	Front fender LH, second front fixing hole	1570.0
C	Front fender RH, second front fixing hole	Front fender LH, rear fixing hole	1689.4
D	Front fender LH, second front fixing hole	Front fender RH, rear fixing hole	1689.4



E133467

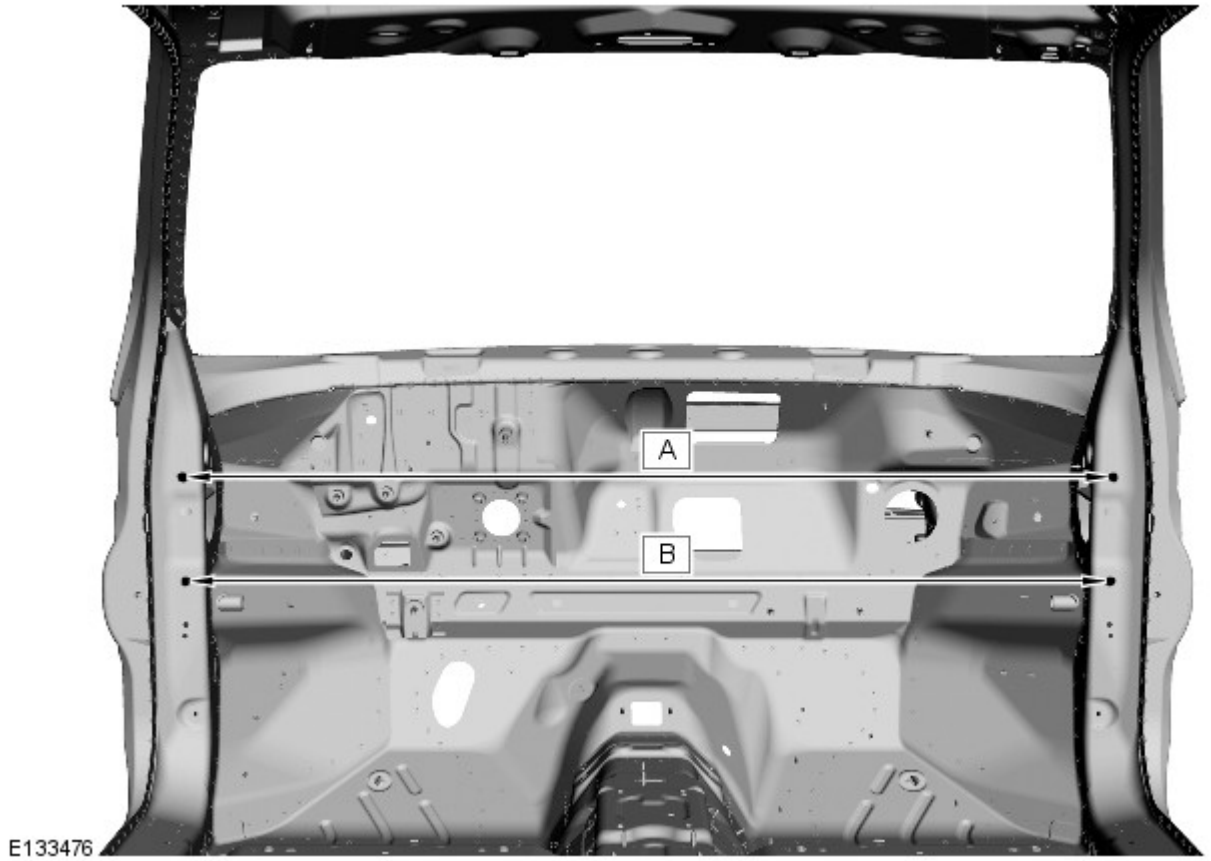
Item	From	To	Dimension
A	Side member deformation element RH, top inboard fixing hole	Side member deformation element LH, top inboard fixing hole	712.5



E133468

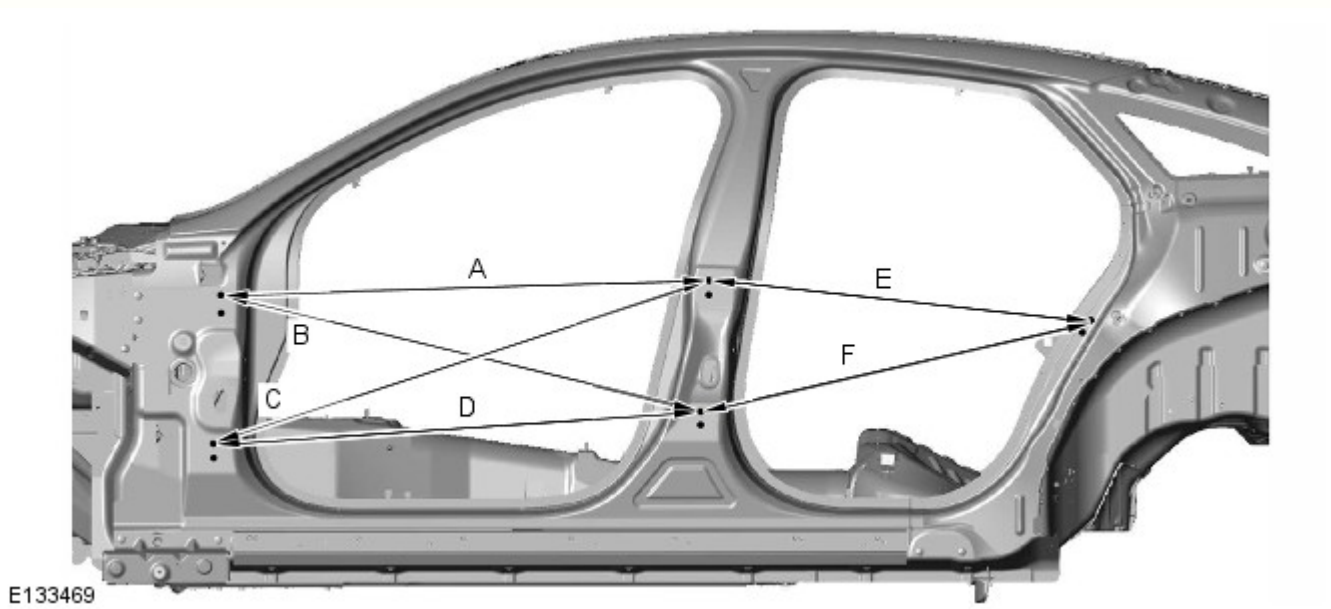
Item	From	To	Dimension
A	Suspension top mount RH, front outboard fixing	Suspension top mount LH, front outboard fixing	986.5
B	Suspension top mount RH, front outboard fixing	Front fender LH, rear fixing	1379.9

C	Suspension top mount LH, front outboard fixing	Front fender RH, rear fixing	1379.9



Item	From	To	Dimension
A	Instrument panel carrier RH top fixing hole	Instrument panel carrier LH top fixing hole	1416
B	Instrument panel carrier RH bottom fixing hole	Instrument panel carrier LH bottom fixing hole	1416

Side Panel Dimensions



Item	From	To	Dimension
A	Front door top hinge, top fixing hole	Rear door top hinge, top fixing hole	1109.1
B	Front door top hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1119.9
C	Front door bottom hinge, top fixing hole	Rear door top hinge, top fixing hole	1184.8
D	Front door bottom hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1108.9

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

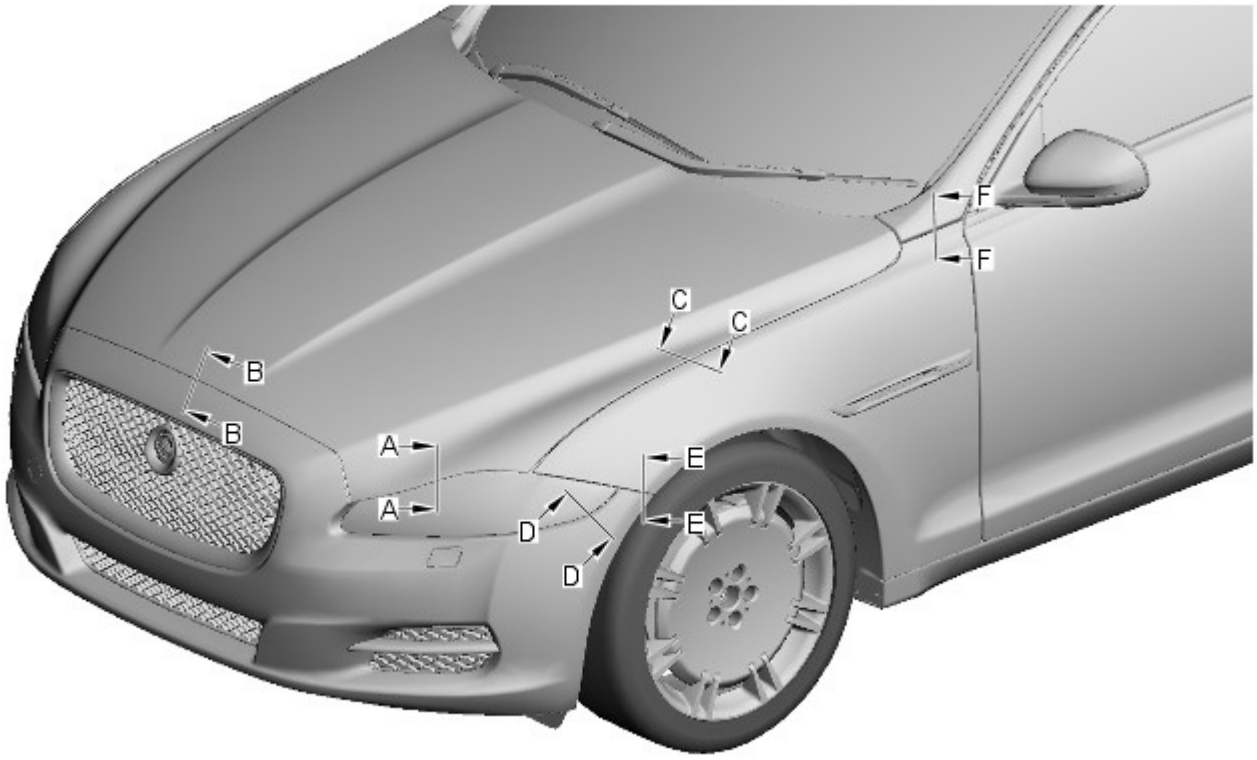
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

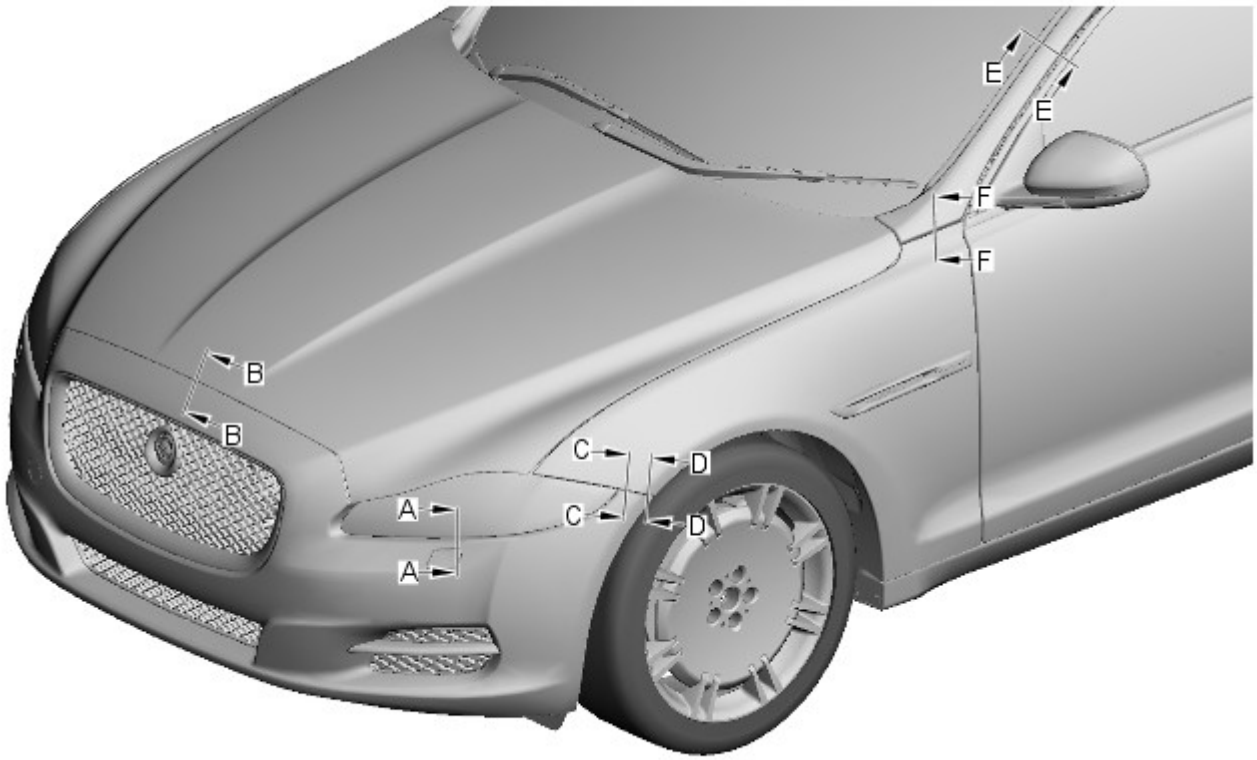
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



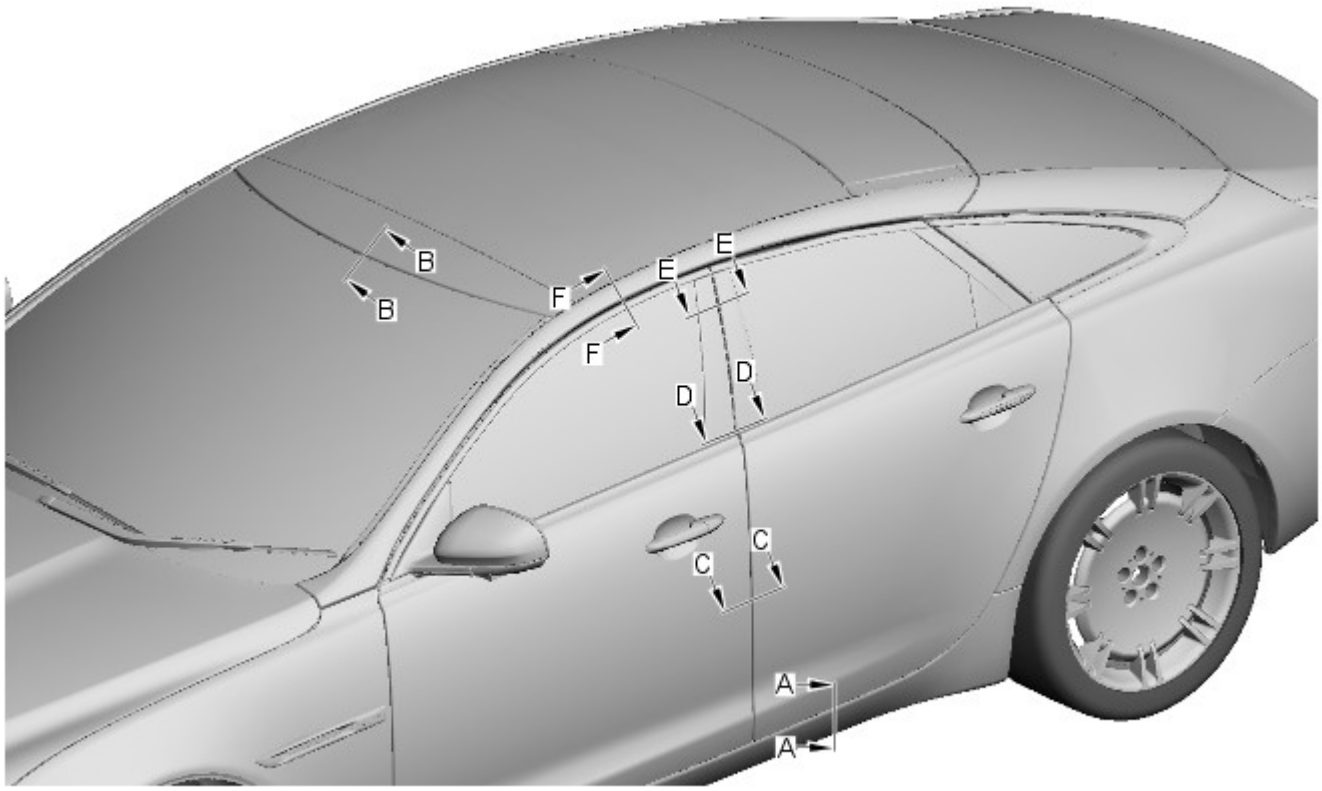
E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



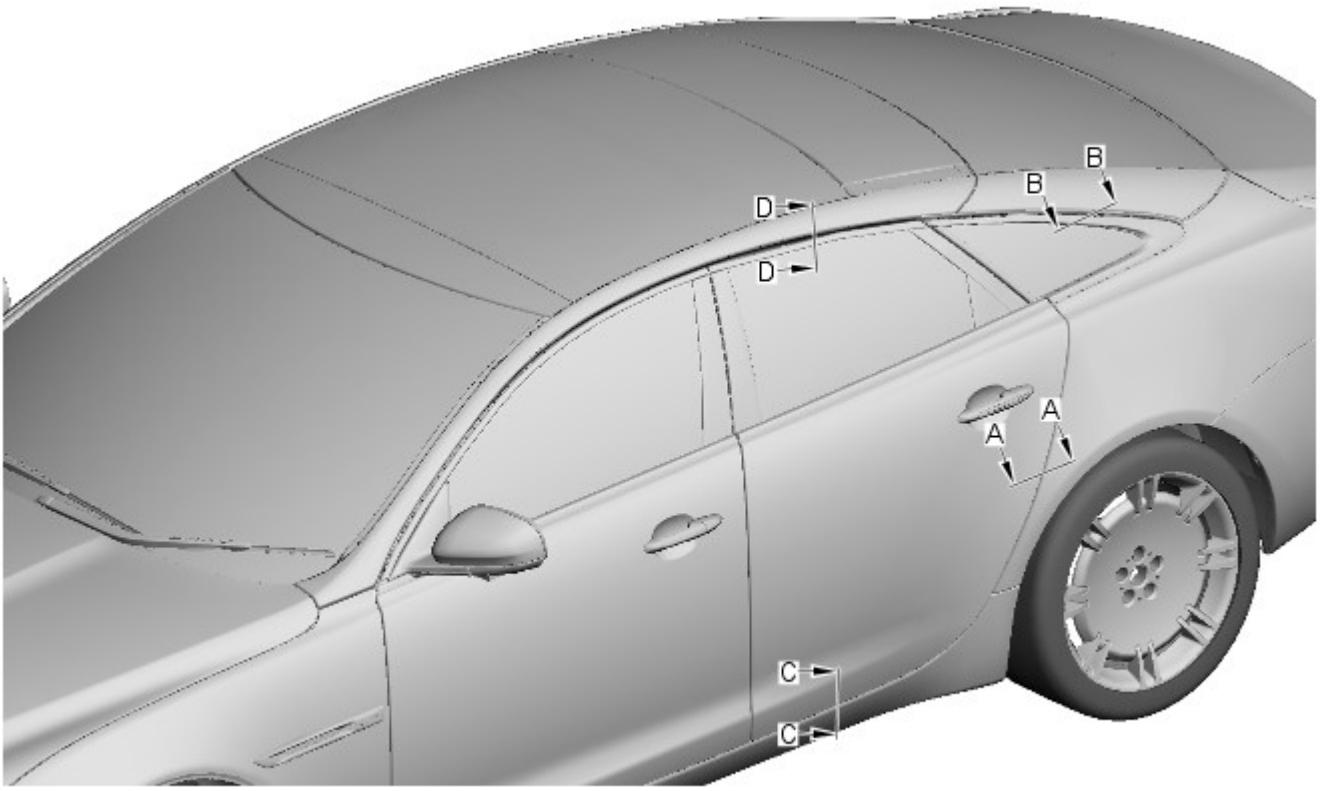
E133472

A-A	Front bumper cover to headlamp	1.0 ± 0.5
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Front bumper cover to front fender	0.0 + 1.0
D-D	Front bumper cover to front fender	0.0 + 1.0
E-E	Front door to A-pillar	4.0 ± 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



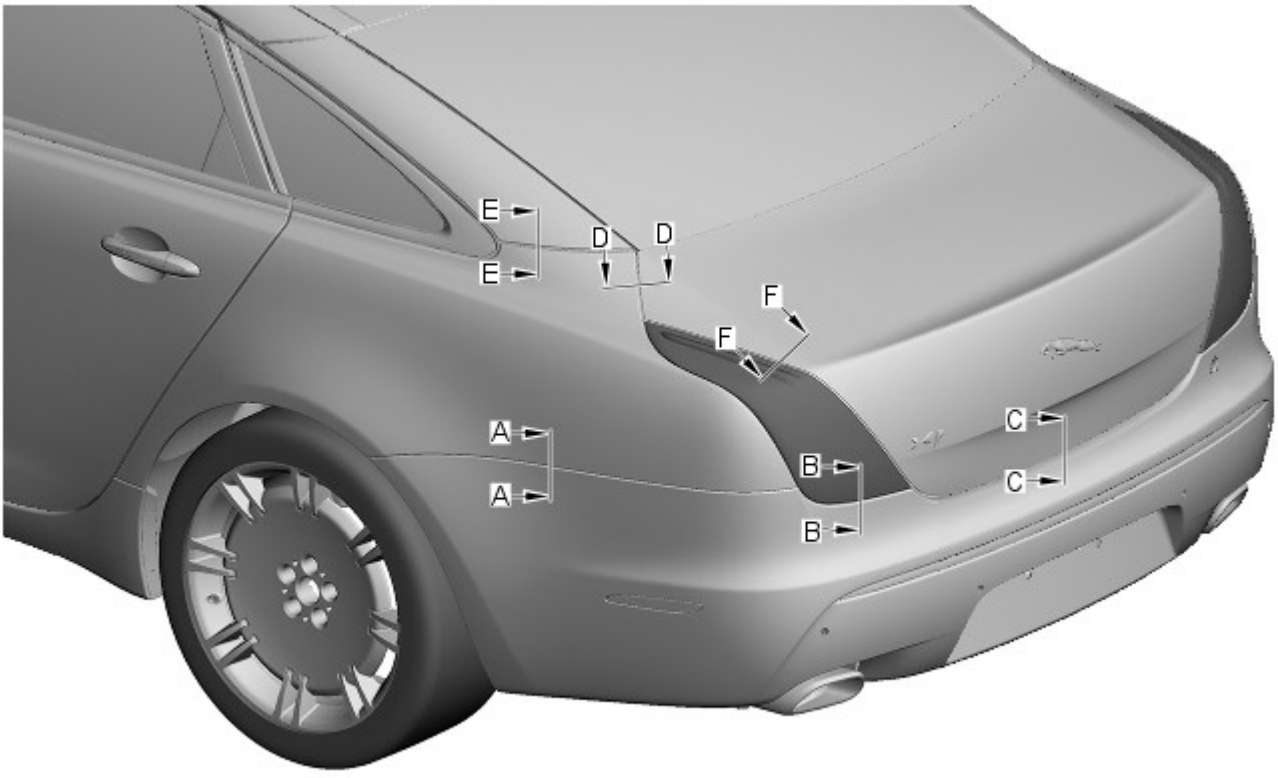
E133473

A-A	Rear door to rocker panel	5.0 ± 1.0
B-B	Windshield encapsulation to front glass roof panel encapsulation	0.0
C-C	Front door to rear door	4.0 ± 1.0
D-D	Front door to rear door	4.0 ± 1.0
E-E	Front door to rear door	4.0 ± 1.0
F-F	Front door to A-pillar / roof panel	6.5 ± 1.0



E133474

A-A	Rear door to quarter panel	4.0 ± 1.0
B-B	Rear quarter window glass encapsulation to quarter panel finisher	0.0
C-C	Rear door to rocker panel	5.0 ± 1.0
D-D	Rear door to roof panel	6.5 ± 1.0



E133475

A-A	Rear bumper cover to quarter panel	0.0 + 1.0
B-B	Rear bumper cover to rear lamp assembly	1.0 ± 0.5
C-C	Rear bumper cover to luggage compartment lid	6.0 ± 1.0
D-D	Quarter panel to luggage compartment lid	6.0 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

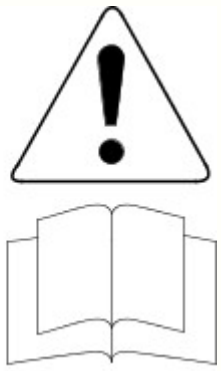
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

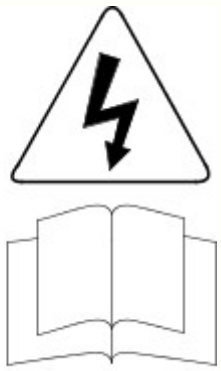
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



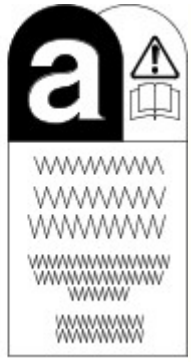
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



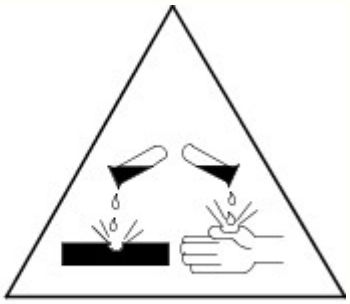
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

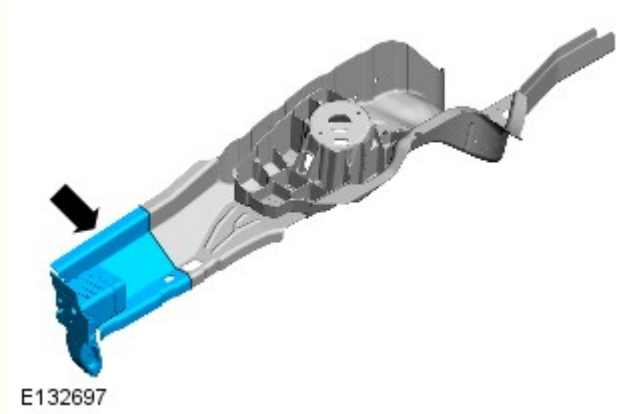
Rear End Sheet Metal Repairs - Rear Side Member Section

Removal and Installation

Removal

1. The rear side member section is a category A repair.



2. NOTE: The rear side member section is manufactured from aluminium alloy 5754-NG.

The rear side member section is cut from the rear side member service panel, it includes the rear bumper mounting.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. CAUTION: The rear side member closing panel must be sectioned at the point indicated so that the aluminium casting of the rear suspension mounting can be inspected for damage.

NOTE: This procedure assumes that the rear side member closing panel section is damaged. Therefore, the procedure combines the repair of the rear side member section and the rear side member closing panel section.

The rear side member section is replaced in conjunction with:

- Rear bumper cover
- Rear bumper
- Back panel
- Spare wheel well
- Rear floor side extension
- Rear side member closing panel section
- Rear side member inner reinforcement and noise, vibration and harshness (NVH) component (plastic)

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Remove the spare wheel well.
For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

7. Remove the rear floor side extension.
For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

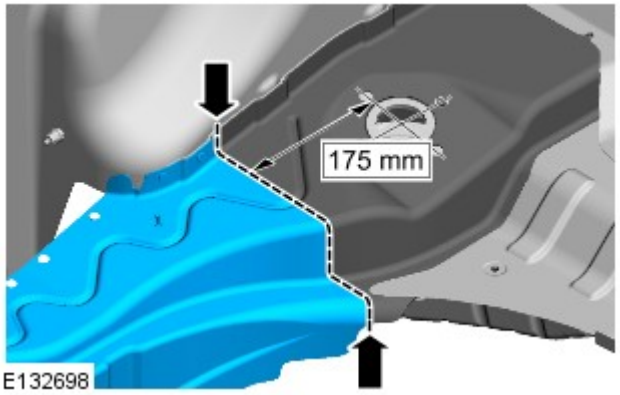
10. Remove any remaining miscellaneous components from the repair area as necessary.

11. Release rear side member wiring harness and position it to one side.

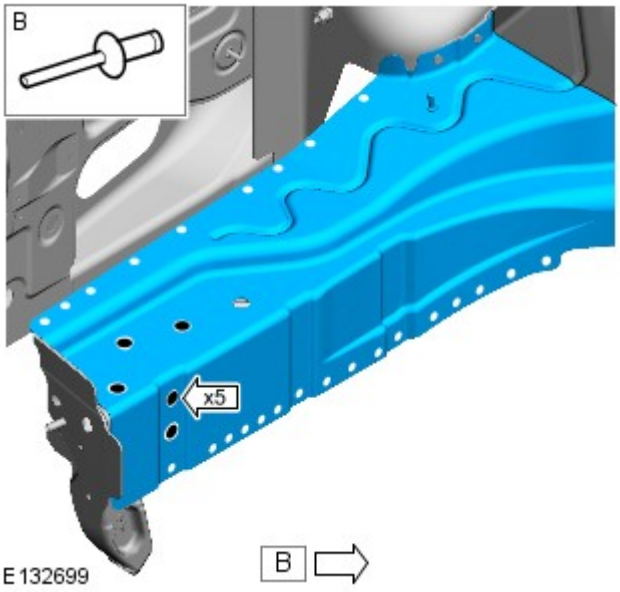
12. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old rear side member closing panel as indicated.



13. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove any remaining self piercing rivets to release the rear side member closing panel section.



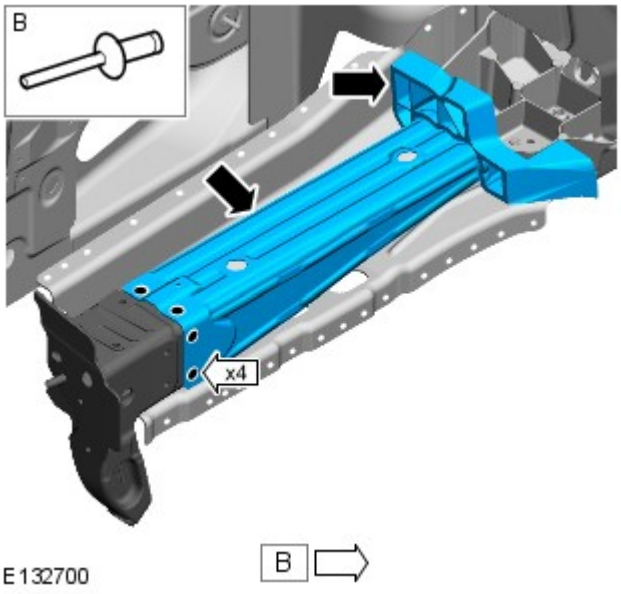
14. Using a 6.5mm Cryobit drill bit, remove any remaining Hemloks to release the rear side member closing panel section.

15. NOTE: Retain the old panel remnant as it may be used as a template and to fabricate a backing strip.

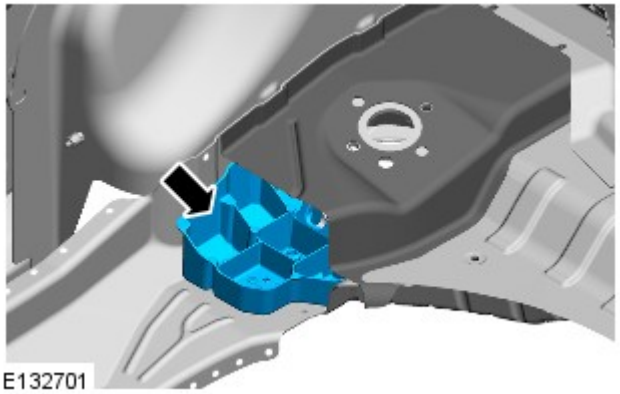
Separate the joints and carefully remove the old rear side member closing panel section.

16. NOTE: Retain the rear side member inner reinforcement and its NVH component for reuse on installation. If damaged, a new component must be installed

Using a 6.5mm Cryobit drill bit, remove the Hemloks from the rear side member inner reinforcement. Separate the joints and carefully remove the rear side member inner reinforcement, also releasing and removing the NVH component.

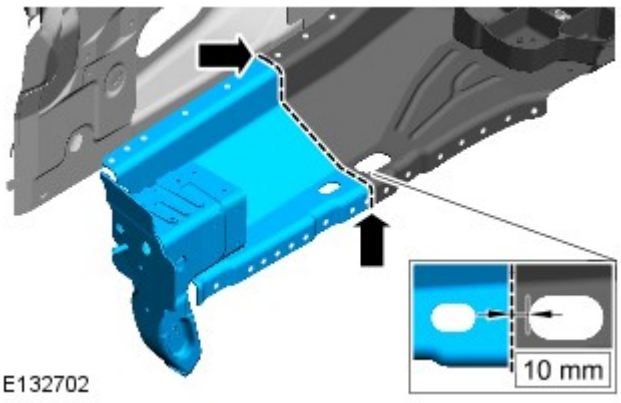


E132700



E132701

17. Remove any adhesive, clean and inspect the aluminium casting of the rear suspension mounting for damage. A non-destructive crack inspection must be carried out to identify any unseen damage. Only proceed to next step if no damage is identified.



E132702

18. NOTE: Retain the old panel remnant as it may be used as a template and to fabricate a backing strip.

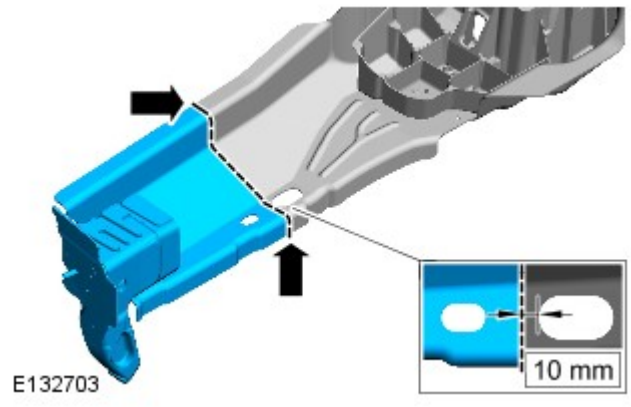
Measure, mark and cut the old rear side member as indicated.

Installation

1. Remove rivet remnants.

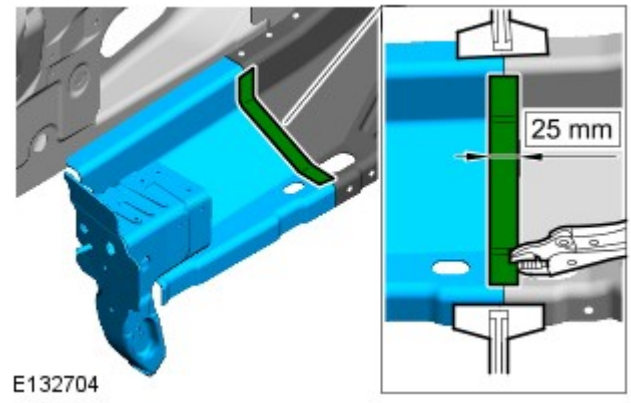
2. Dress flanges where necessary.

3. Mark out the position on the rear side member service panel, where the section MIG butt joint is to be made and cut the panel at this point as indicated.



4. Debur the new panel.

5. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



6. Fabricate a 25mm backing plate from the old/new rear side member remnant. Debur and offer up to the rear side member as indicated.

7. Cut a run on/run off tab from the unused part of the old/new rear side member remnant.

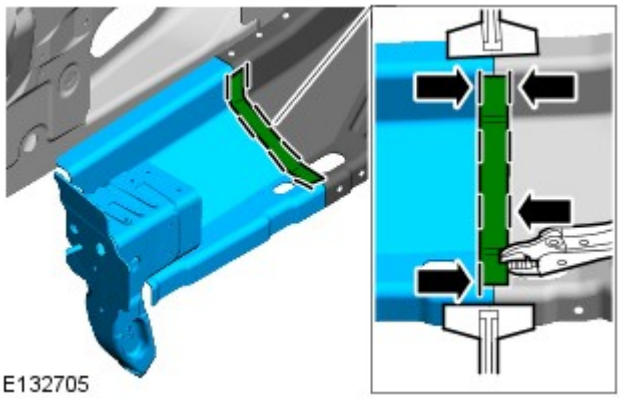
8. Remove the new rear side member section and its backing plate.

9. Using a Roloc fine bristle disc, clean and prepare the rear side member panel surfaces, the backing plate and the run on/run off tabs, including the inner panel surfaces where the backing plate is to be welded.

10. Offer up the new rear side member section with its backing plate, align and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

11. NOTE: MIG weld runs should avoid the hole in the rear side member.

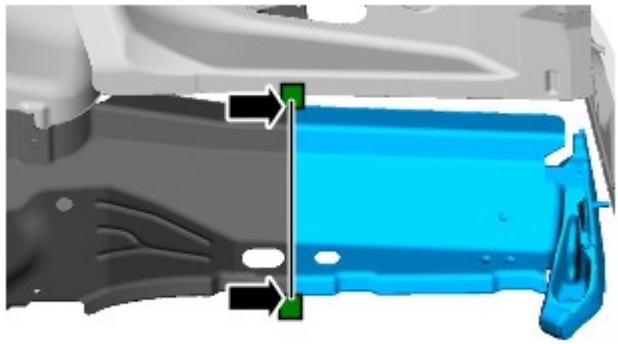
MIG weld the backing plate into the rear side member using 20mm runs as indicated.



E132705

12. Tack weld the run-on/run-off tabs to the rear side member section.

13. Clean the area of the MIG butt joint prior to welding.



E132706

14. MIG weld the rear side member section butt joint.

15. Cut off the run on/run off tabs.

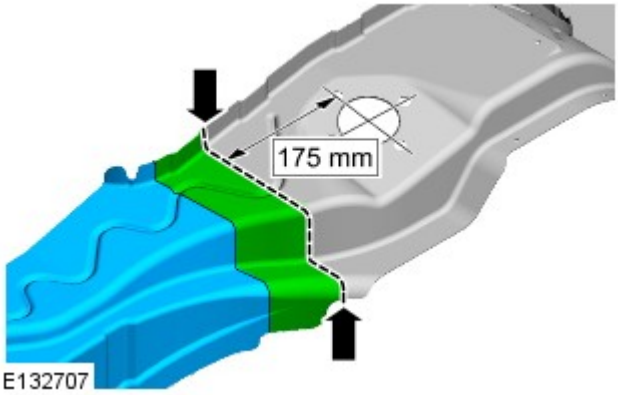
16. Dress the mating panel flanges of the rear side member section MIG butt joint to ensure correct alignment with the rear side member closing panel.

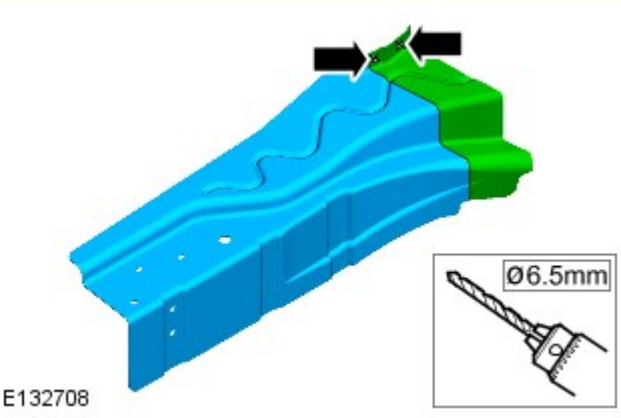
17. Carry out a non destructive crack inspection on the rear side member MIG butt joint. If correct proceed to next step, if not, rectify and recheck before proceeding.

18. Dress the rear side member MIG butt joint.

19. Cut a template from the old rear side member closing panel remnant, clean and dress the template.

20. Offer up, align and clamp the template in place on the rear side member closing panel service panel. Cut the rear side member closing panel service panel at the point indicated.





21. Using a 6.5mm Cryobit drill bit, drill through the template into the new side member closing panel section at the points indicated.

22. Remove the template.

23. Debur the new panel.

24. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

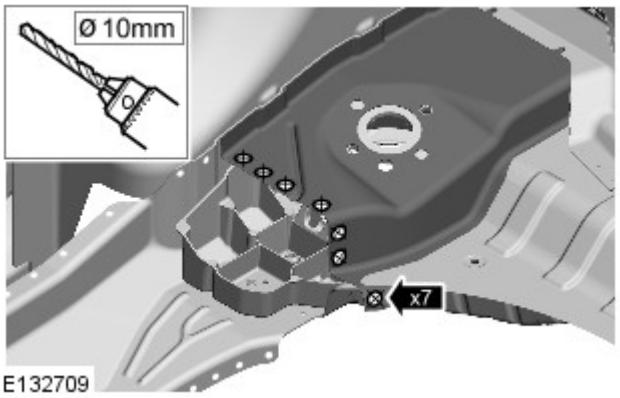
25. NOTE: The old rear side member and rear side member closing panel remnants can be used to identify where rivet locations are to be drilled.

Using a 6.5mm Cryobit drill bit, drill holes through the rear side member and rear side member closing panel where the spare wheel well and rear floor side extension Hemloks are to be installed.

26. Remove the new panel.

27. Debur the drilled holes.

28. Using a 10mm drill bit, drill holes for MIG plug welds for the installation of the backing plate as indicated.



29. Debur the drilled holes.

30. NOTE: It may be necessary to fabricate the backing plate from several pieces welded together. The backing plate should be wide enough to accommodate 10mm MIG plug welds.

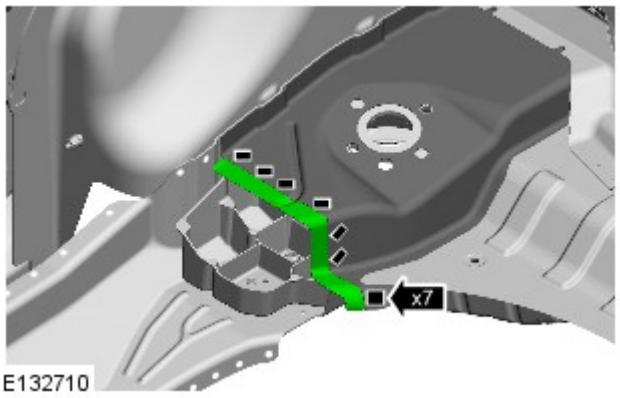
Fabricate a backing plate from the old/new rear side member closing panel remnant. Debur and offer up the backing plate to the rear side member closing panel and to the new rear side member closing panel section. If correct proceed to next step, if not, rectify and recheck before proceeding.

31. Remove the backing plate.

32. Using a Roloc fine bristle disc, clean the backing plate and the panel surfaces where the backing plate is to be welded.

33. Offer up the backing plate, align and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

34. MIG plug weld the backing plate as indicated.



35. Clean and prepare the all remaining panel joint surfaces.

36. Pyrosil the joints of the rear side member and the rear side member closing panel, new and old.

37. Apply the coupling agent and allow to dry.

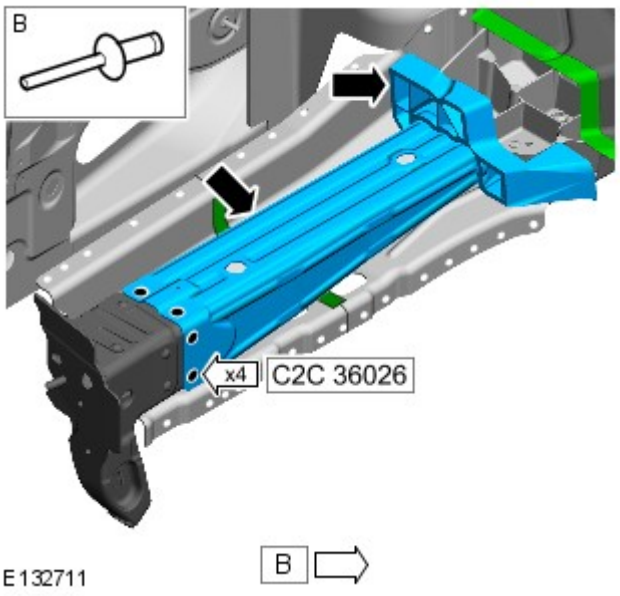
38. NOTES:

An adhesive kit is supplied with the rear side member inner reinforcement service part.

Do not apply adhesive in the areas where 3M 8115 adhesive is to be applied, or in the vicinity of the MIG welded butt joint.

Apply adhesive to the rear side member and the rear side member inner reinforcement where the NVH component is to be installed.

39. Install the NVH component to the rear side member inner reinforcement and install the rear side member inner reinforcement to the rear side member.



40. Using the Genesis G4, install the Hemloks.

41. NOTES:

An adhesive kit is supplied with the rear side member inner reinforcement service part.

Do not apply adhesive in the areas where 3M 8115 adhesive is to be applied.

Apply adhesive to the NVH component where it comes into contact with the rear side member closing panel section.

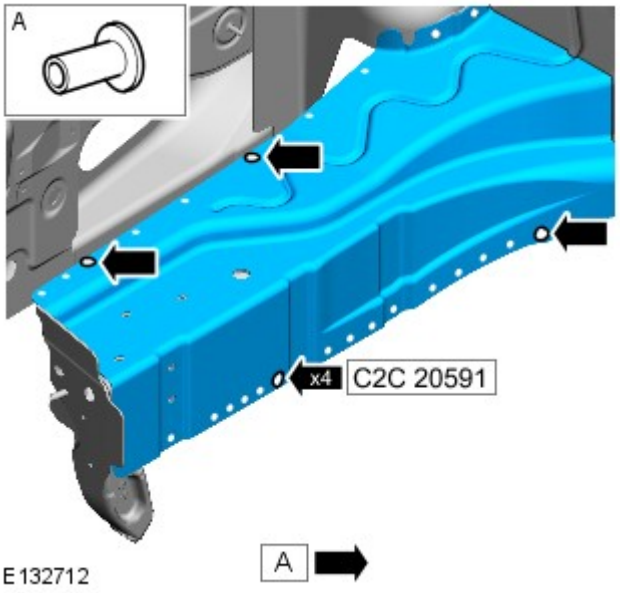
42. NOTE: Ensure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG weld.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the rear side member.

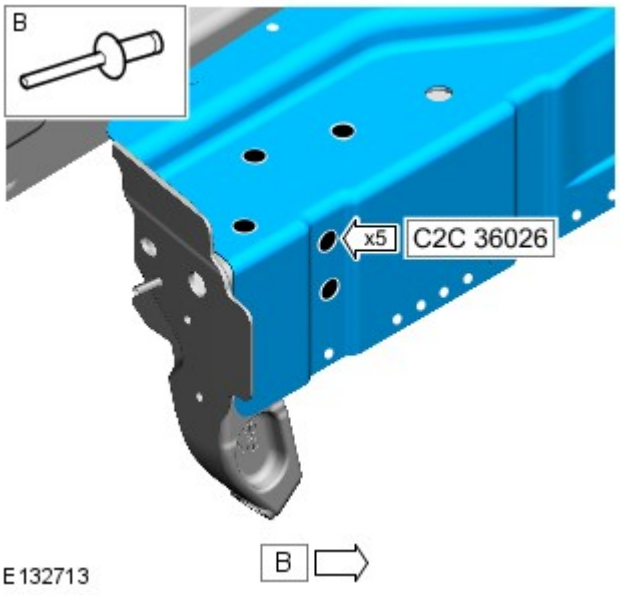
43. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of other panels. These joints must be left clamped until the adhesive has cured.

NOTE: If necessary and to aid alignment, the unattached side of the backing plate can be secured with panel pin clamps.

Offer up the new rear side member closing panel section, align and clamp into position.



44. Using the ESN50, install the self piercing rivets as indicated.



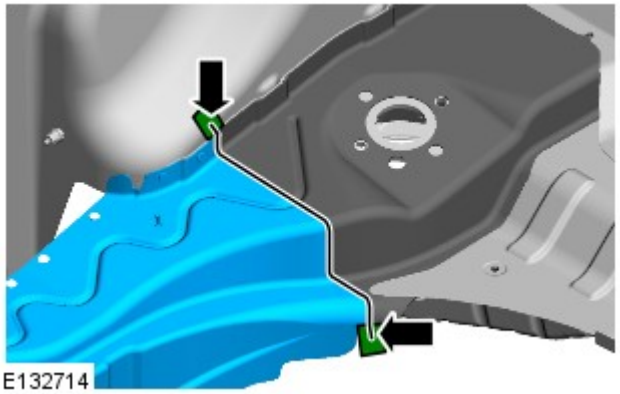
45. Using the Genesis G4, install the Hemloks.

46. Cut a run on/run off tab from the unused part of the old/new rear side member closing panel remnant.

47. Tack weld the run-on/run-off tabs to the rear side member closing panel section.

48. Clean the area of the MIG butt joint prior to welding.

49. MIG weld the rear side member closing panel section butt joint.

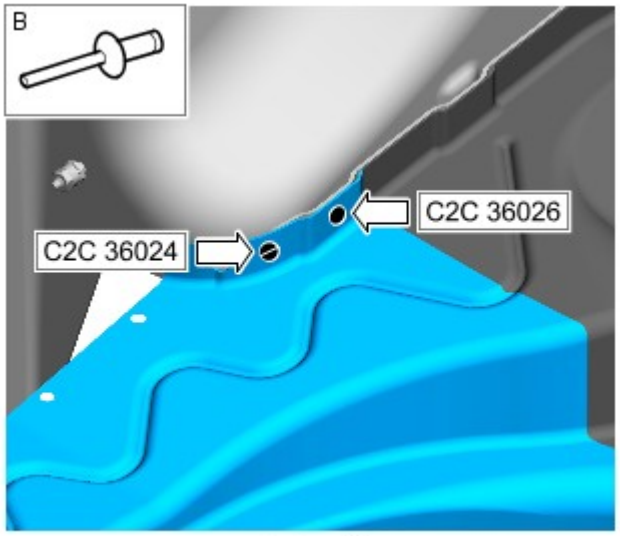


E132714

50. Cut off the run on/run off tabs.

51. Carry out a non destructive crack inspection on the rear side member closing panel section MIG butt joint. If correct proceed to next step, if not, rectify and recheck before proceeding.

52. Dress the rear side member closing panel MIG butt joint and MIG plug welds.



E132715

53. Using the Genesis G4, install the Hemloks as indicated.

54. Remove any excess adhesive.

55. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

56. The installation of associated panels and components is the reversal of removal procedure.

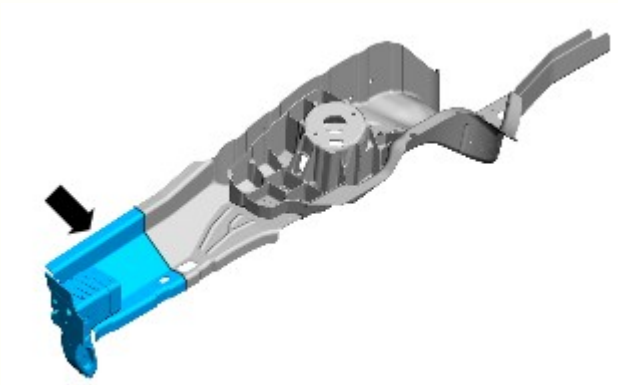
Rear End Sheet Metal Repairs - Rear Side Member Section

Removal and Installation

Removal

1. The rear side member section is a category A repair.



E132697

2. NOTE: The rear side member section is manufactured from aluminium alloy 5754-NG.

The rear side member section is cut from the rear side member service panel, it includes the rear bumper mounting.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. CAUTION: The rear side member closing panel must be sectioned at the point indicated so that the aluminium casting of the rear suspension mounting can be inspected for damage.

NOTE: This procedure assumes that the rear side member closing panel section is damaged. Therefore, the procedure combines the repair of the rear side member section and the rear side member closing panel section.

The rear side member section is replaced in conjunction with:

- Rear bumper cover
- Rear bumper
- Back panel
- Spare wheel well
- Rear floor side extension
- Rear side member closing panel section
- Rear side member inner reinforcement and noise, vibration and harshness (NVH) component (plastic)

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Remove the spare wheel well.
For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

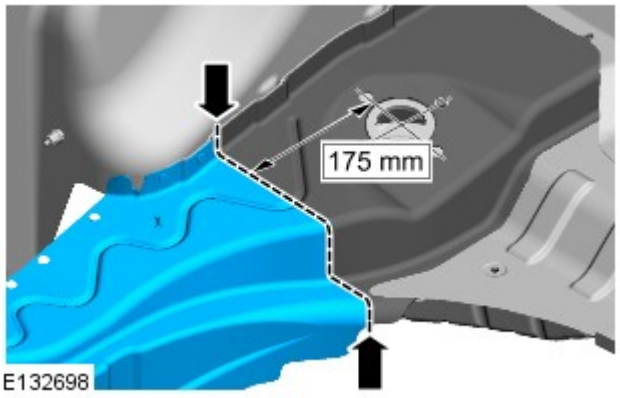
7. Remove the rear floor side extension.
For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove any remaining miscellaneous components from the repair area as necessary.

11. Release rear side member wiring harness and position it to one side.

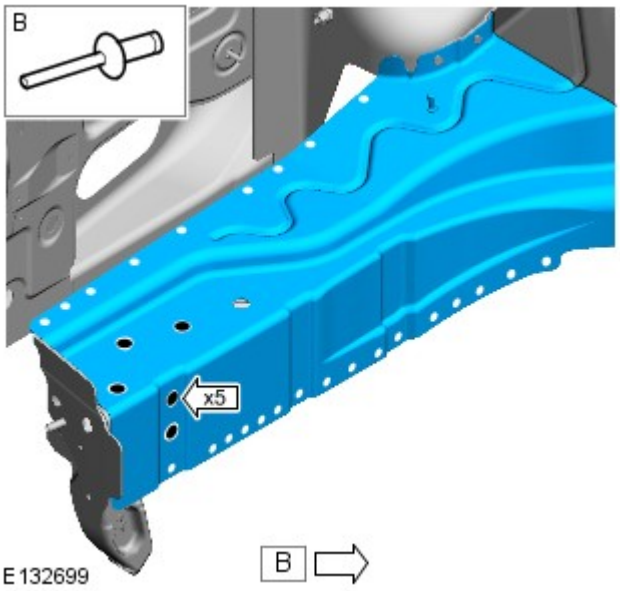


12. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old rear side member closing panel as indicated.

13. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove any remaining self piercing rivets to release the rear side member closing panel section.

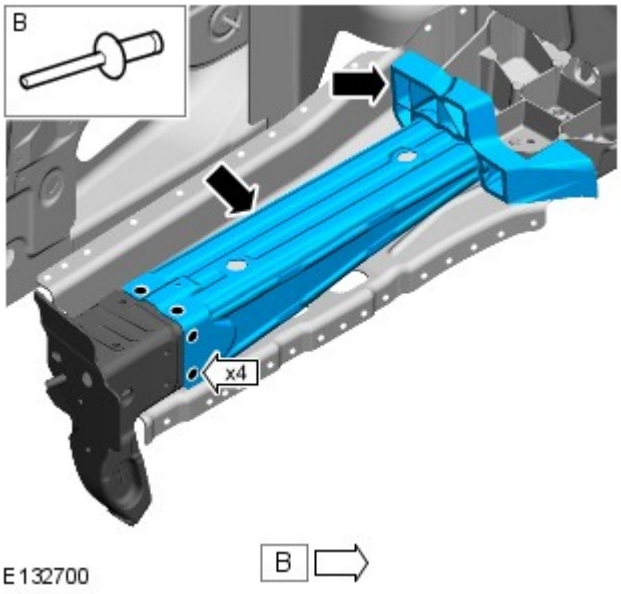


14. Using a 6.5mm Cryobit drill bit, remove any remaining Hemloks to release the rear side member closing panel section.

15. NOTE: Retain the old panel remnant as it may be used as a template and to fabricate a backing strip.

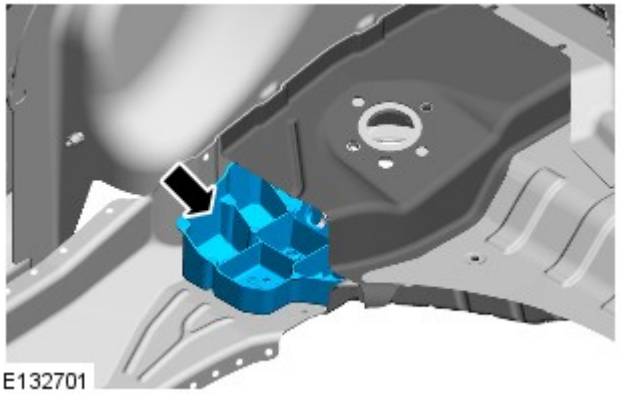
Separate the joints and carefully remove the old rear side member closing panel section.

16.

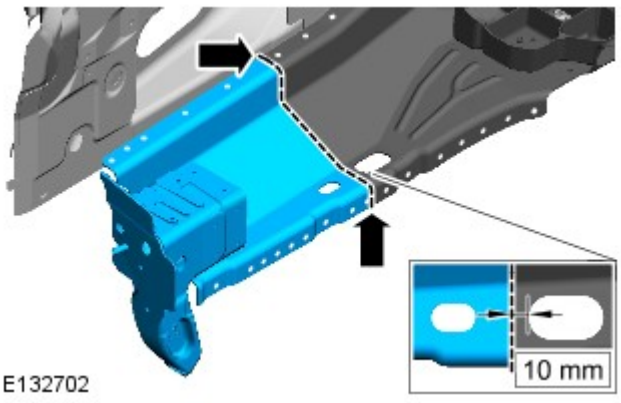


NOTE: Retain the rear side member inner reinforcement and its NVH component for reuse on installation. If damaged, a new component must be installed

Using a 6.5mm Cryobit drill bit, remove the Hemloks from the rear side member inner reinforcement. Separate the joints and carefully remove the rear side member inner reinforcement, also releasing and removing the NVH component.



17. Remove any adhesive, clean and inspect the aluminium casting of the rear suspension mounting for damage. A non-destructive crack inspection must be carried out to identify any unseen damage. Only proceed to next step if no damage is identified.



18. NOTE: Retain the old panel remnant as it may be used as a template and to fabricate a backing strip.

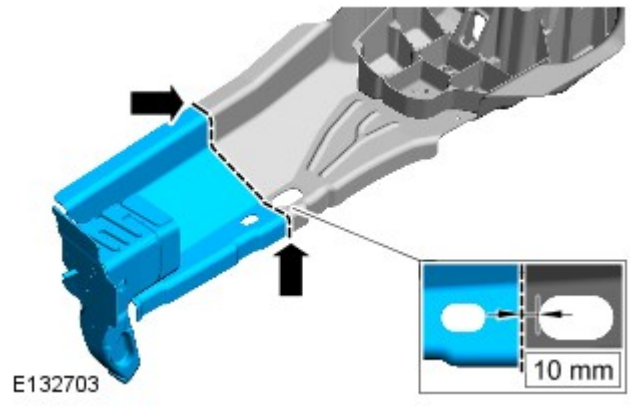
Measure, mark and cut the old rear side member as indicated.

Installation

1. Remove rivet remnants.

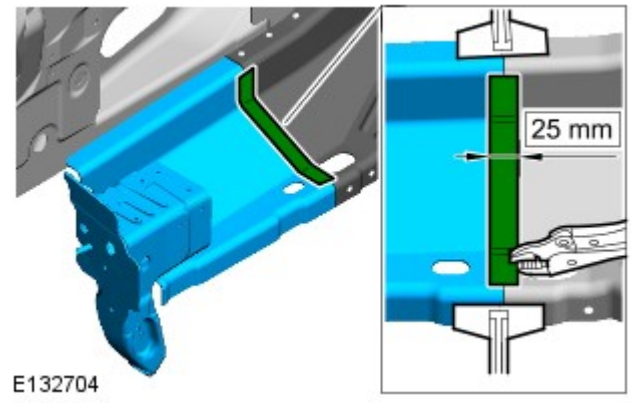
2. Dress flanges where necessary.

3. Mark out the position on the rear side member service panel, where the section MIG butt joint is to be made and cut the panel at this point as indicated.



4. Debur the new panel.

5. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



6. Fabricate a 25mm backing plate from the old/new rear side member remnant. Debur and offer up to the rear side member as indicated.

7. Cut a run on/run off tab from the unused part of the old/new rear side member remnant.

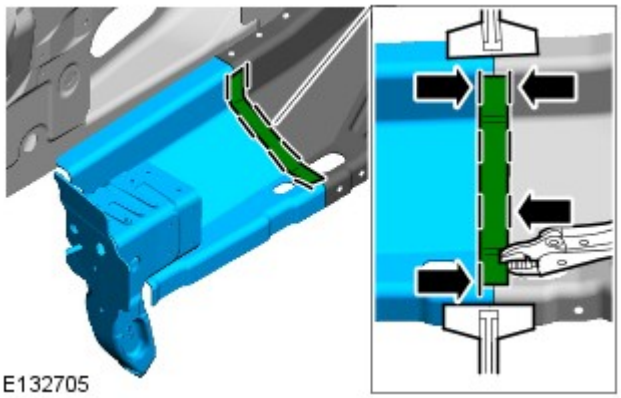
8. Remove the new rear side member section and its backing plate.

9. Using a Roloc fine bristle disc, clean and prepare the rear side member panel surfaces, the backing plate and the run on/run off tabs, including the inner panel surfaces where the backing plate is to be welded.

10. Offer up the new rear side member section with its backing plate, align and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

11. NOTE: MIG weld runs should avoid the hole in the rear side member.

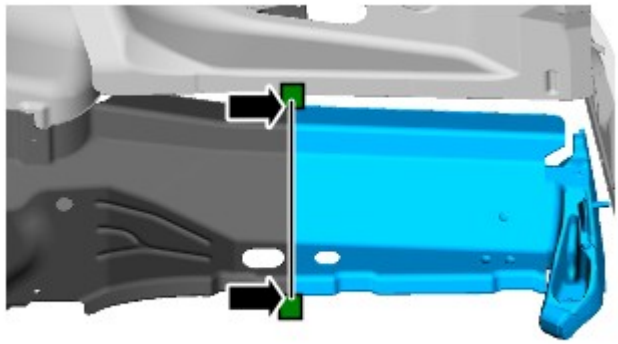
MIG weld the backing plate into the rear side member using 20mm runs as indicated.



E132705

12. Tack weld the run-on/run-off tabs to the rear side member section.

13. Clean the area of the MIG butt joint prior to welding.



E132706

14. MIG weld the rear side member section butt joint.

15. Cut off the run on/run off tabs.

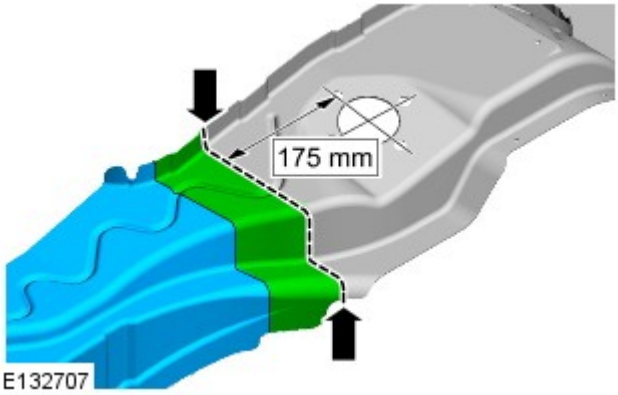
16. Dress the mating panel flanges of the rear side member section MIG butt joint to ensure correct alignment with the rear side member closing panel.

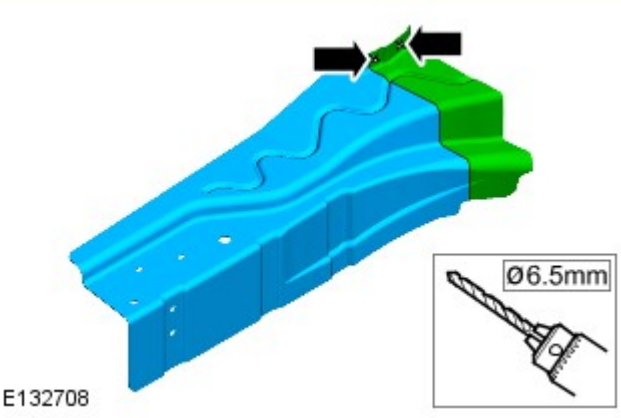
17. Carry out a non destructive crack inspection on the rear side member MIG butt joint. If correct proceed to next step, if not, rectify and recheck before proceeding.

18. Dress the rear side member MIG butt joint.

19. Cut a template from the old rear side member closing panel remnant, clean and dress the template.

20. Offer up, align and clamp the template in place on the rear side member closing panel service panel. Cut the rear side member closing panel service panel at the point indicated.





21. Using a 6.5mm Cryobit drill bit, drill through the template into the new side member closing panel section at the points indicated.

22. Remove the template.

23. Debur the new panel.

24. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

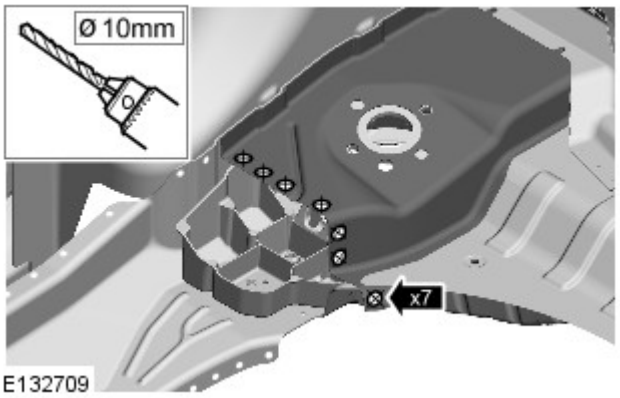
25. NOTE: The old rear side member and rear side member closing panel remnants can be used to identify where rivet locations are to be drilled.

Using a 6.5mm Cryobit drill bit, drill holes through the rear side member and rear side member closing panel where the spare wheel well and rear floor side extension Hemloks are to be installed.

26. Remove the new panel.

27. Debur the drilled holes.

28. Using a 10mm drill bit, drill holes for MIG plug welds for the installation of the backing plate as indicated.



29. Debur the drilled holes.

30. NOTE: It may be necessary to fabricate the backing plate from several pieces welded together. The backing plate should be wide enough to accommodate 10mm MIG plug welds.

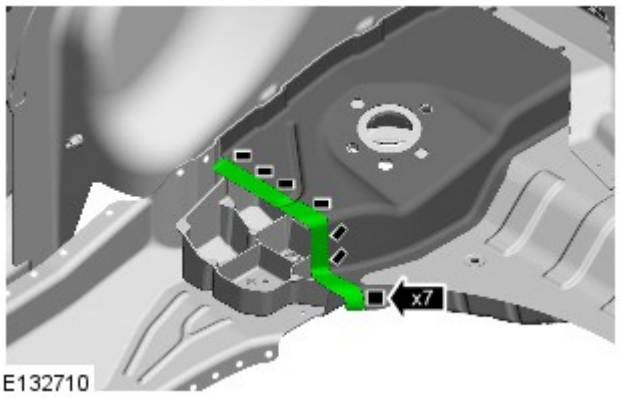
Fabricate a backing plate from the old/new rear side member closing panel remnant. Debur and offer up the backing plate to the rear side member closing panel and to the new rear side member closing panel section. If correct proceed to next step, if not, rectify and recheck before proceeding.

31. Remove the backing plate.

32. Using a Roloc fine bristle disc, clean the backing plate and the panel surfaces where the backing plate is to be welded.

33. Offer up the backing plate, align and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

34. MIG plug weld the backing plate as indicated.



35. Clean and prepare the all remaining panel joint surfaces.

36. Pyrosil the joints of the rear side member and the rear side member closing panel, new and old.

37. Apply the coupling agent and allow to dry.

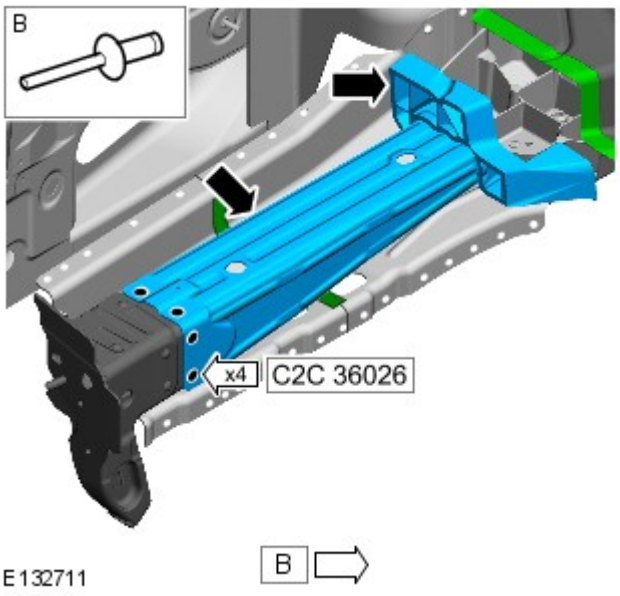
38. NOTES:

An adhesive kit is supplied with the rear side member inner reinforcement service part.

Do not apply adhesive in the areas where 3M 8115 adhesive is to be applied, or in the vicinity of the MIG welded butt joint.

Apply adhesive to the rear side member and the rear side member inner reinforcement where the NVH component is to be installed.

39. Install the NVH component to the rear side member inner reinforcement and install the rear side member inner reinforcement to the rear side member.



40. Using the Genesis G4, install the Hemloks.

41. NOTES:

An adhesive kit is supplied with the rear side member inner reinforcement service part.

Do not apply adhesive in the areas where 3M 8115 adhesive is to be applied.

Apply adhesive to the NVH component where it comes into contact with the rear side member closing panel section.

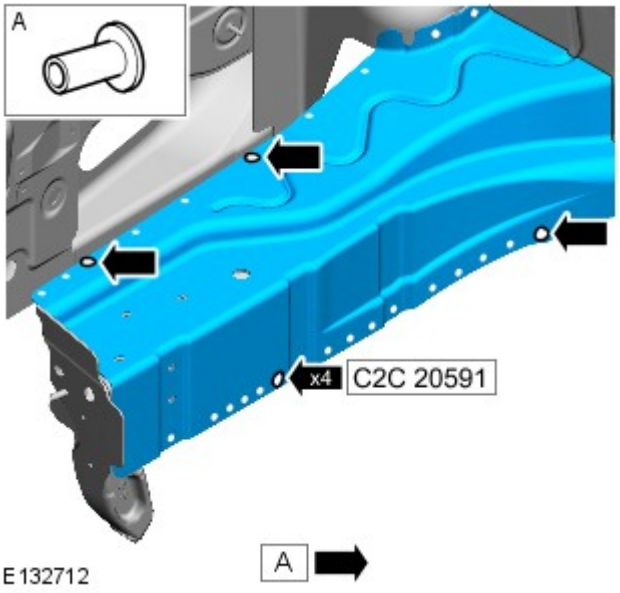
42. NOTE: Ensure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG weld.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the rear side member.

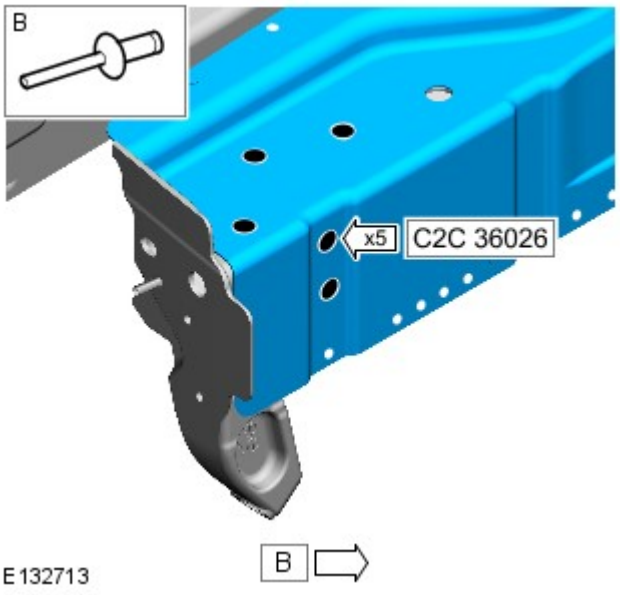
43. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of other panels. These joints must be left clamped until the adhesive has cured.

NOTE: If necessary and to aid alignment, the unattached side of the backing plate can be secured with panel pin clamps.

Offer up the new rear side member closing panel section, align and clamp into position.



44. Using the ESN50, install the self piercing rivets as indicated.



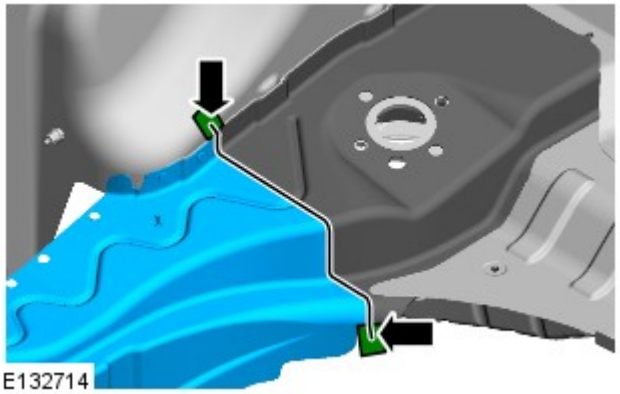
45. Using the Genesis G4, install the Hemloks.

46. Cut a run on/run off tab from the unused part of the old/new rear side member closing panel remnant.

47. Tack weld the run-on/run-off tabs to the rear side member closing panel section.

48. Clean the area of the MIG butt joint prior to welding.

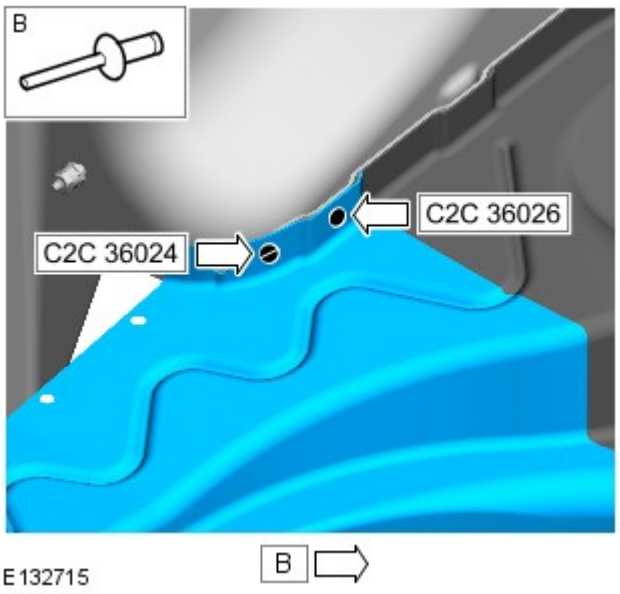
49. MIG weld the rear side member closing panel section butt joint.



50. Cut off the run on/run off tabs.

51. Carry out a non destructive crack inspection on the rear side member closing panel section MIG butt joint. If correct proceed to next step, if not, rectify and recheck before proceeding.

52. Dress the rear side member closing panel MIG butt joint and MIG plug welds.



53. Using the Genesis G4, install the Hemloks as indicated.

54. Remove any excess adhesive.

55. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

56. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

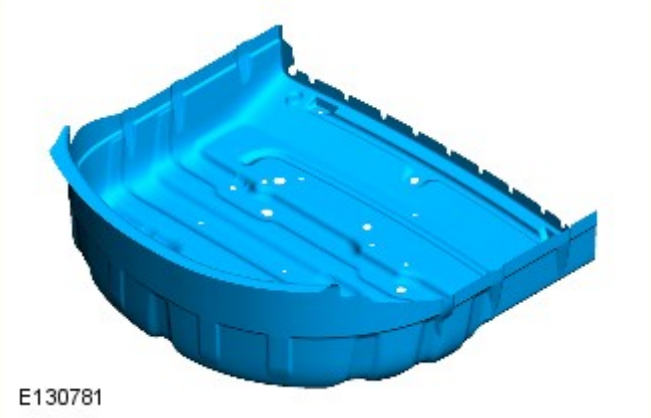
Published: 11-May-2011

Rear End Sheet Metal Repairs - Spare Wheel Well

Removal and Installation

Removal

1. The spare wheel well is a category A repair.



2. NOTE: The spare wheel well is manufactured from aluminium alloy 5754-NG.

The spare wheel well is serviced as a separate riveted and bonded panel. It is not serviced with all its rivet-studs.

3. NOTE: The rear suspension and subframe assembly can remain in place, however, some aspects of the refinishing process will need to be carried out prior to the installataion of the new panel.

The spare wheel well is replaced in conjunction with:

- Rear bumper cover
- Rear bumper
- Back panel

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the back panel.
For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Remove the fuel tank filler pipe.
For additional information, refer to: Fuel Tank Filler Pipe (310-01A, Removal and Installation).

8. Remove the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

9. Remove sealer from the area of repair as required, to reveal the panel joints.

10. Prior to removal, mark the position of the spare wheel well in relation to adjacent panels, for ease of alignment on installation.

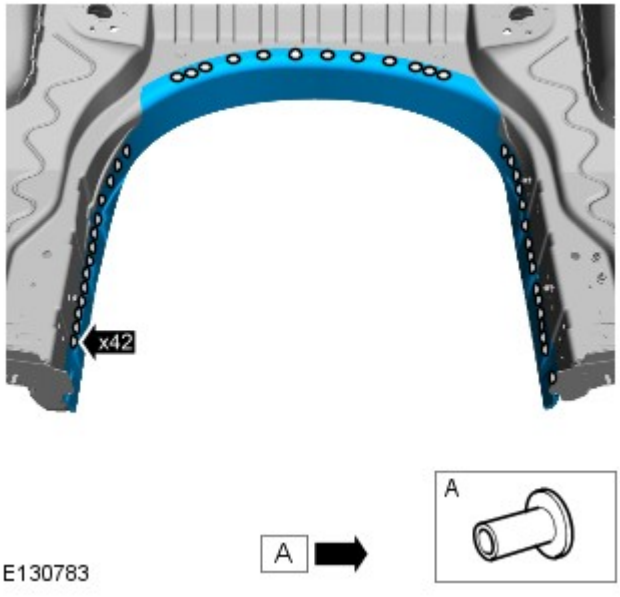
E130782

11. CAUTION: Use care not to damage adjacent panels.

Saw cut to remove the panel bulk as indicated.

12. NOTE: Remove the sealer to expose the self piercing rivets.

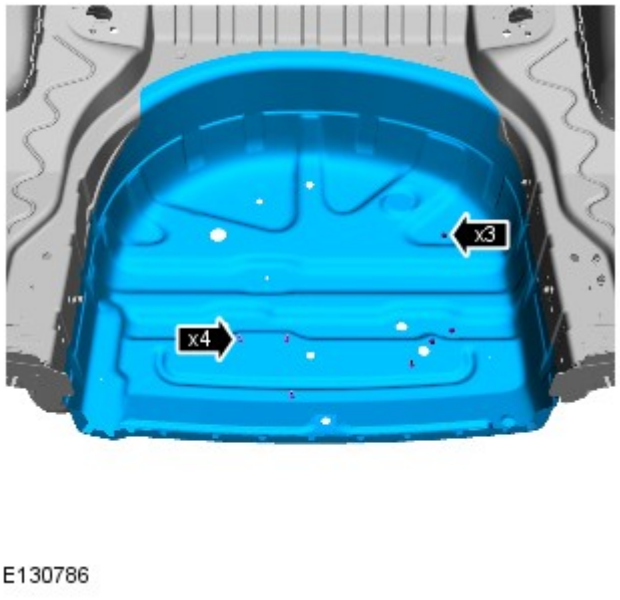
Using the ESN50, remove the self piercing rivets.



13. NOTE: Retain the remnant as it will be used as a template.

Separate the joints and remove the old panel remnant.

Installation



1. Using the old panel for reference, install the rivet-studs into the new panel as indicated.

2. Remove rivet remnants.

3. Dress flanges where necessary.

4. Trim, clean and prepare the old panel remnant to be used as a template.

5. Clamp the template to the new panel and using a 6.5mm Cryobit drill bit. Drill holes through the template into the new panel, ready for Hemloks to be installed.

E130784

6. Remove the template from the new panel.

7. Debur the drilled holes in the new panel.

8. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, removing any sealer and adhesive residue.

9. NOTE: Use the marks made prior to removal to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

10. Using a 6.5mm Cryobit drill bit. Drill holes through the old panels into the new panel, at the points where Hemloks are to be installed.

11. Remove the new panel.

12. Debur the drilled holes.

13. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

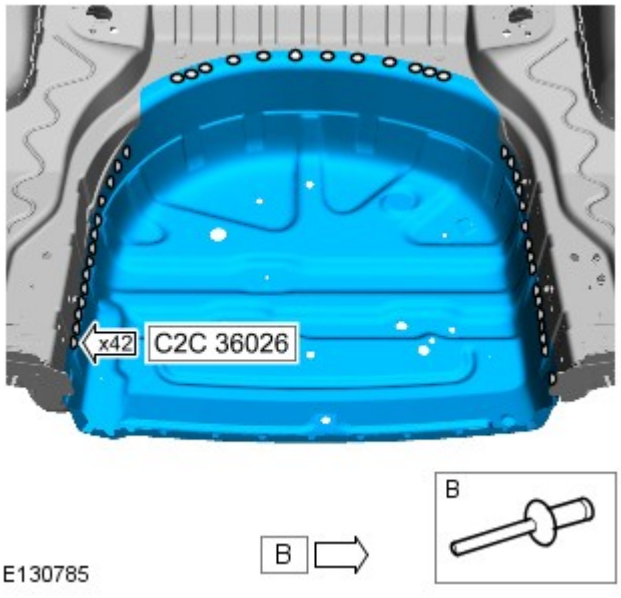
14. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

15. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

16. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

17. Offer up the new panel, align and clamp into position.



18. Using the Genesis G4, install the Hemloks.

19. Remove any excess adhesive.

20. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

21. The installation of associated panels and components is the reversal of removal procedure.

Battery, Mounting and Cables - Battery Disconnect and Connect

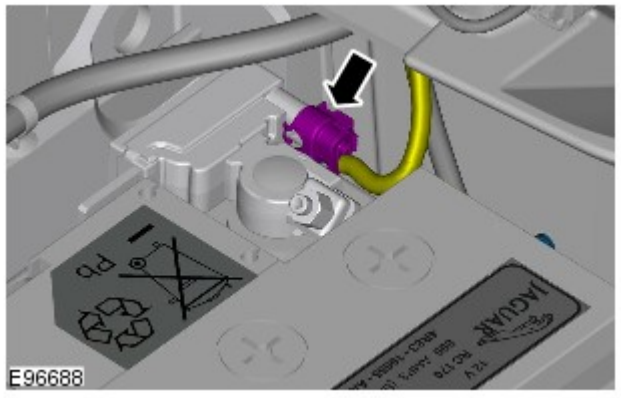
General Procedures

Disconnect

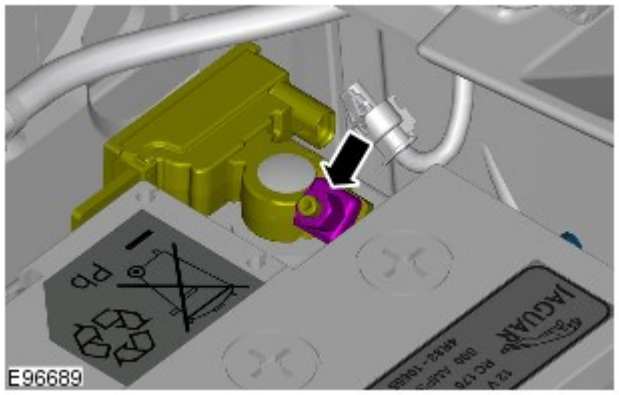
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

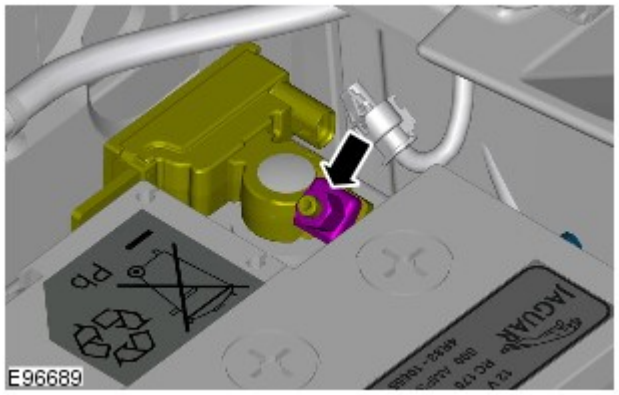


4. CAUTION: Take extra care not to damage the wiring harness.

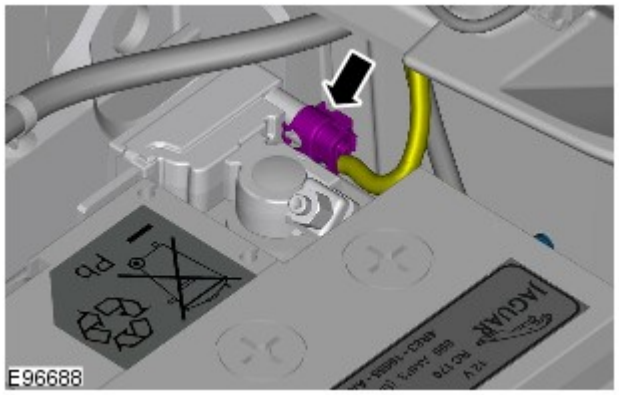


5.

Connect

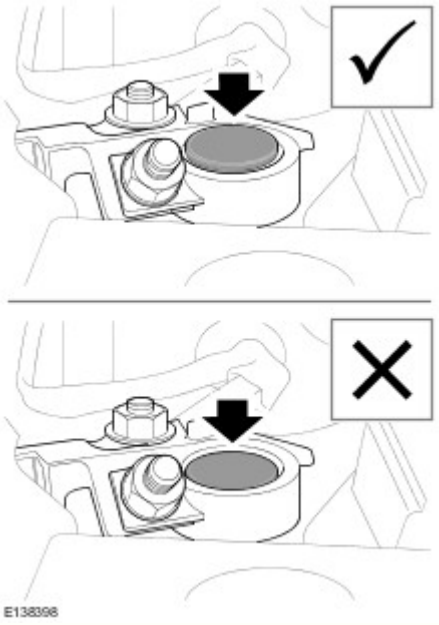


1. *Torque:* 6 Nm



2.

3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.



4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Rear End Sheet Metal Repairs - Rear Floor Side Extension

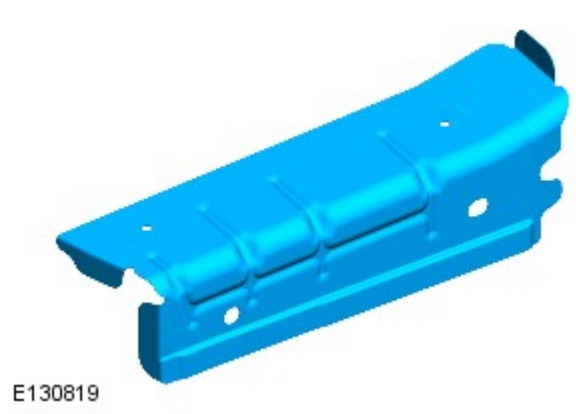
Removal and Installation

Removal

1. NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

The rear floor side extension is a category A repair.

2. NOTE: The rear floor side extension is manufactured from aluminium alloy 5754-NG.



The rear floor side extension is serviced as a separate rivetted and bonded panel.

3. The rear floor side extension is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Back panel

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove the back panel.
For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

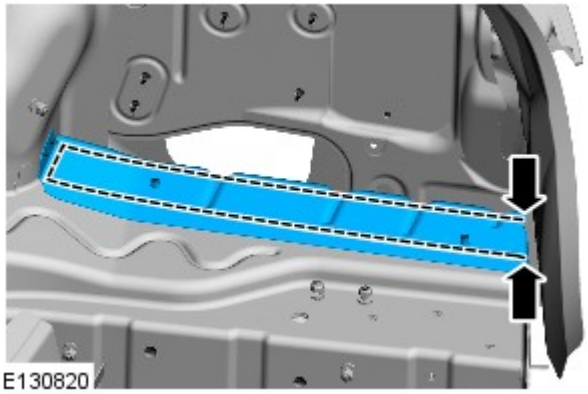
7. If the right-hand rear floor side extension is to be replaced, remove the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

8. Remove sealer from the area of repair as required, to reveal the panel joints.

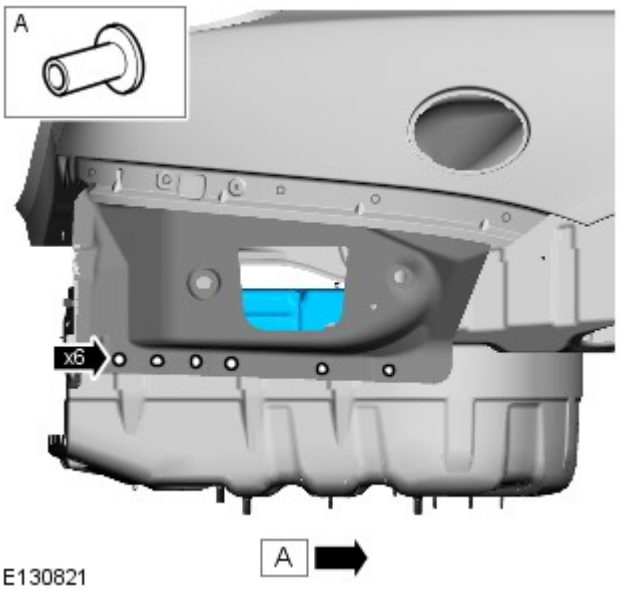
9. Prior to removal, mark the position of the rear floor side extension in relation to adjacent panels, for ease of alignment on installation.

10. CAUTION: Use care not to damage adjacent panels.

Saw cut to remove the panel bulk as indicated.

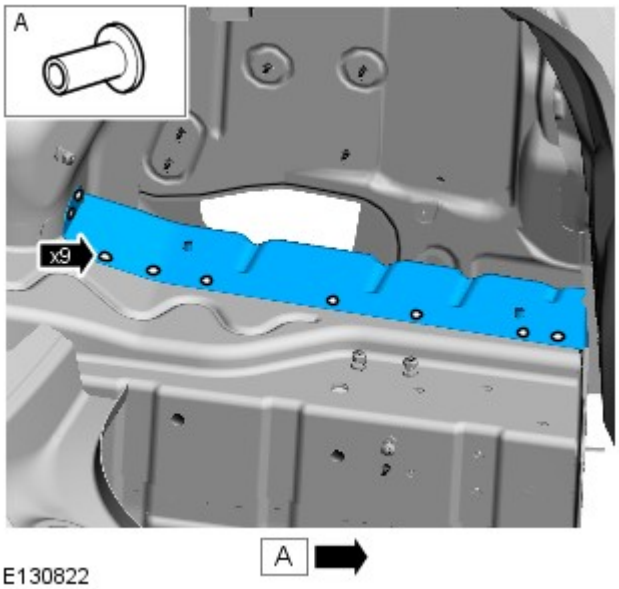


E130820



E130821

11. Using the ESN50, remove the self piercing rivets.

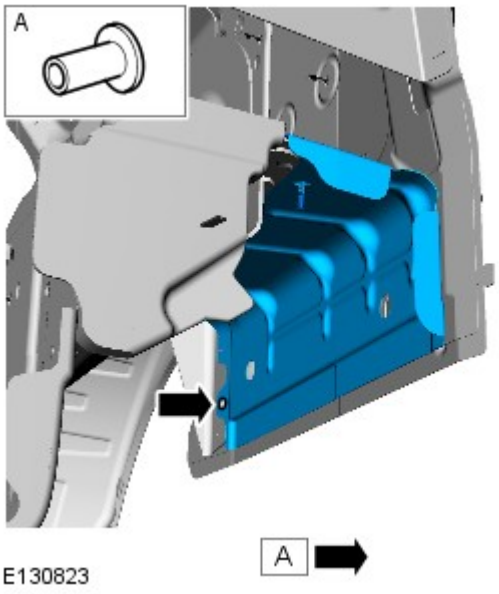


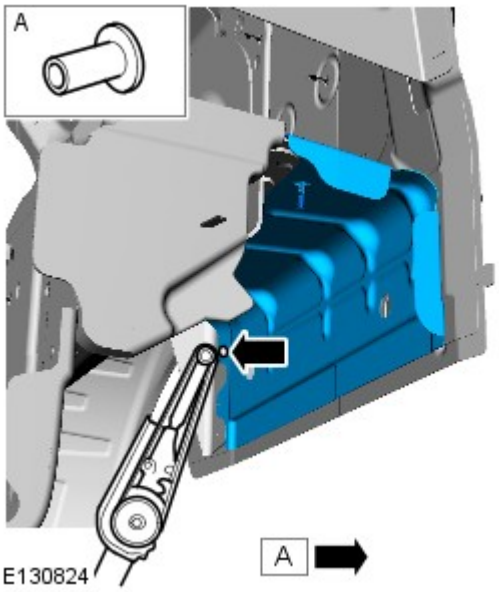
E130822

12. Using the ESN50, remove the self piercing rivets.

13. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivet from the wheelhouse.





14. NOTE: This fixing is not replaced on installation, due to restricted access.

Using a belt sander, remove the self piercing rivet from the wheelhouse.

15. Separate the joints and remove the old panel remnant.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. NOTE: Use the marks made prior to removal to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

4. NOTE: The joint to the quarter panel lower extension uses self piercing rivets.

Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed.

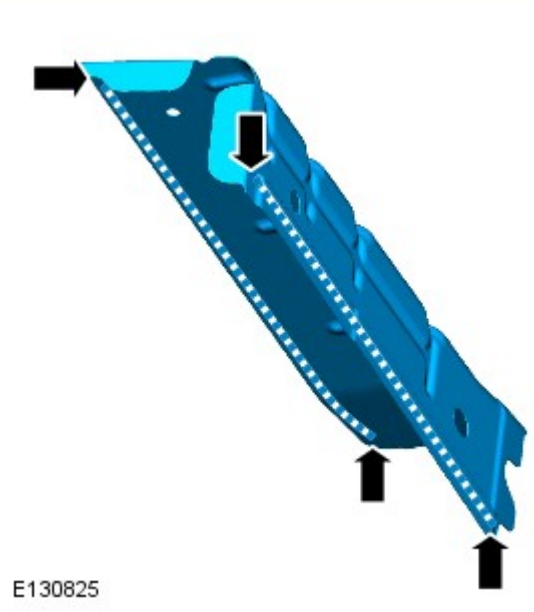
5. Remove the new panel.

6. Debur the drilled holes.

7. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

8. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

9. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

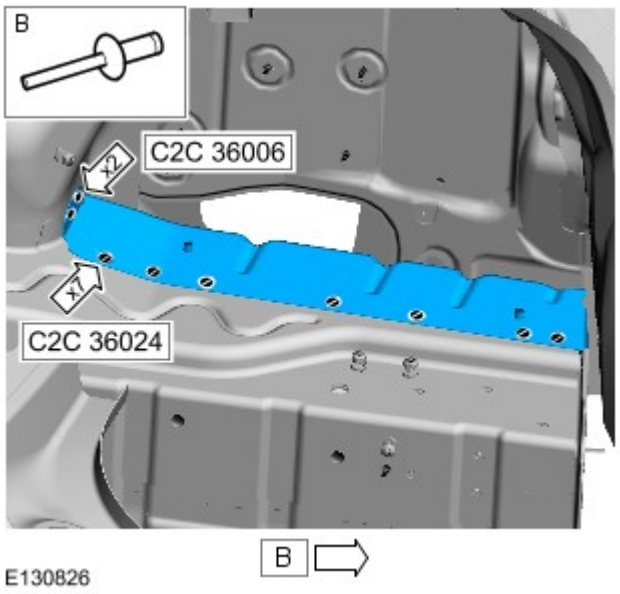


E130825

10. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

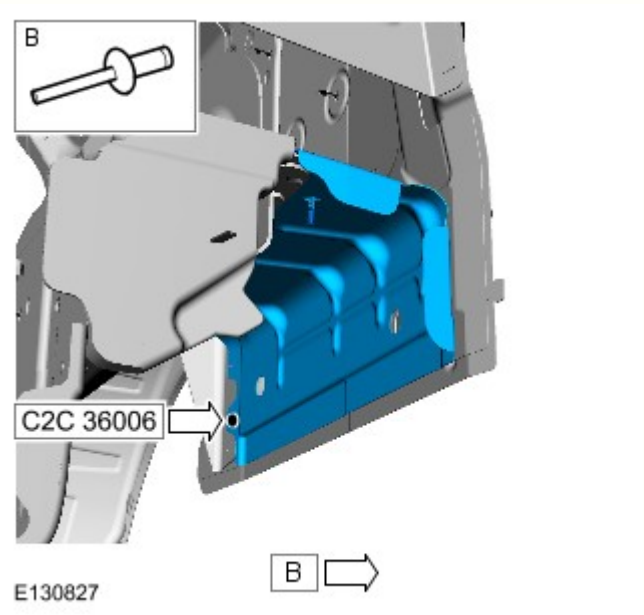
Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

11. Offer up the new panel, align and clamp into position.

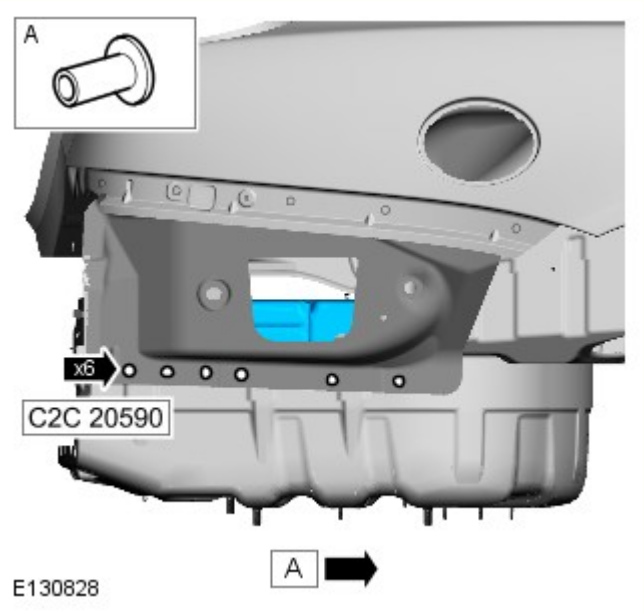


E130826

12. Using the Genesis G4, install the Hemloks.



13. Using the Genesis G4, install the Hemloks.



14. Using the ESN50, install the self piercing rivets into the quarter panel lower extension.

15. Remove any excess adhesive.

16. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

17. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion

- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Country	Phone	Fax

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only.

		Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

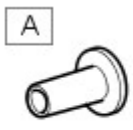
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

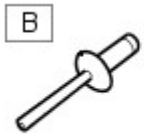
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

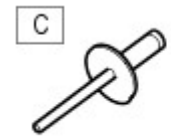
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

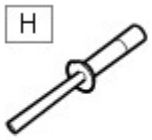
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

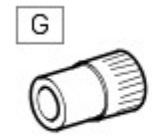
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

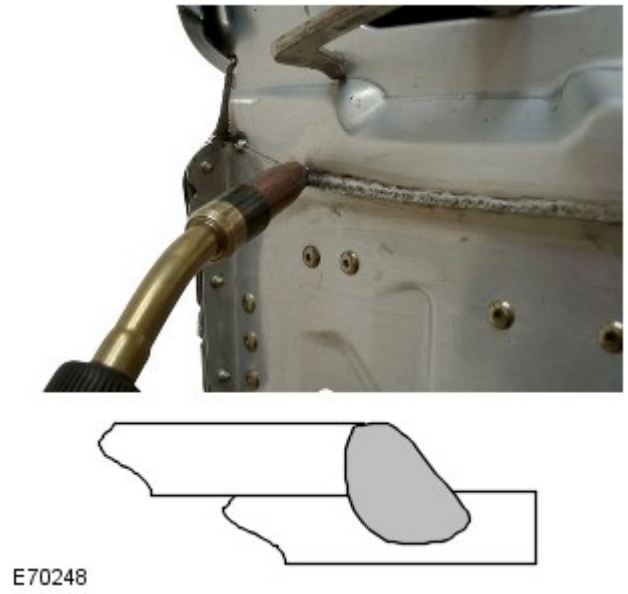
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

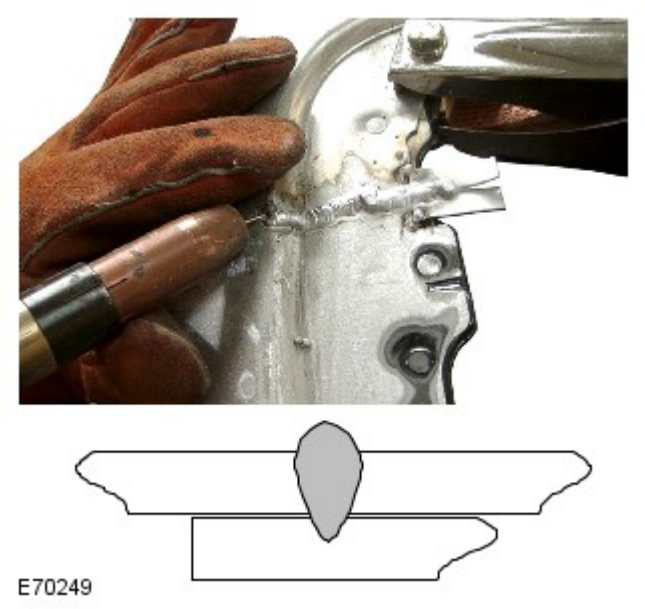
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

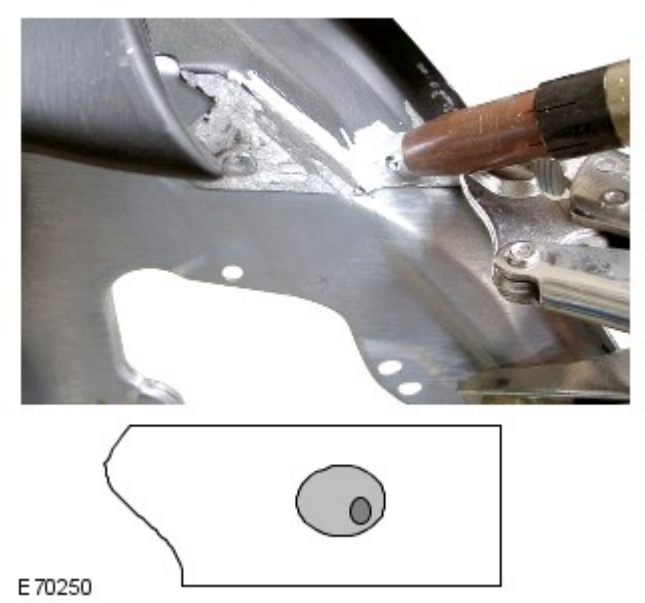
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

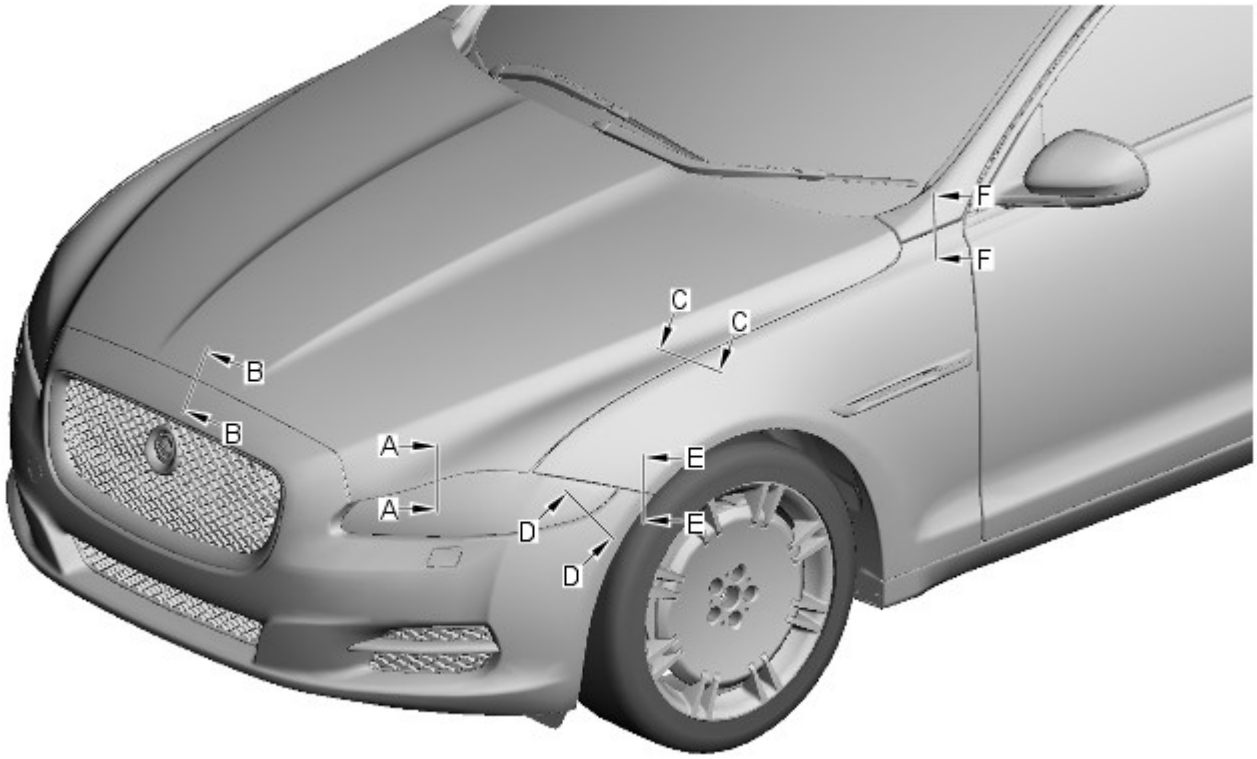
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules
- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat

- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

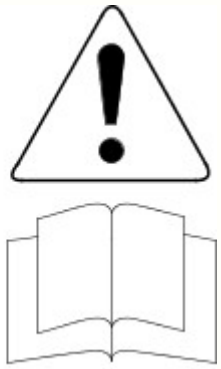
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

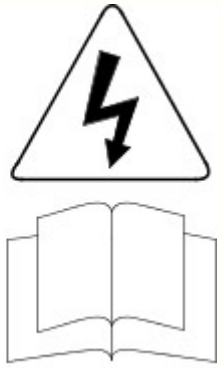
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



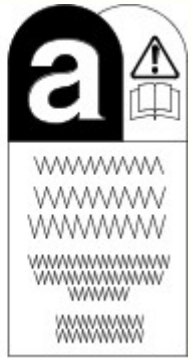
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.

VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing

damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Rear End Sheet Metal Repairs - Rear Wheelhouse Outer

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The inner quarter panel rear section is a category A repair.

2. NOTES:

The rear wheelhouse outer is manufactured from aluminium alloy 5754-NG.

The illustration shows the left-hand service panel, the right-hand is similar but with the fuel filler aperture.

The rear wheelhouse outer is serviced as a separate rivetted and bonded panel.

3. The rear wheelhouse outer is replaced in conjunction with:
   - Rear bumper
   - Rear bumper cover
   - Quarter panel
   - Luggage compartment Lid
   - Luggage compartment lid hinge
   - Rear window glass
   - Headliner
   - Inner quarter panel rear section
   - Rear door

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Disconnect the generator electrical connectors.

7. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

8. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

9. Remove the quarter panel.
For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

10. Remove the luggage compartment lid.
For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

11. Remove the luggage compartment lid hinge.
For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

12. Remove the rear window glass.
For additional information, refer to: Rear Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

13. Remove the headliner.
For additional information, refer to: Headliner (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the inner quarter panel rear section.
For additional information, refer to: Inner Quarter Panel Rear Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

15. Remove the rear door.
For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

16. If the right-hand rear wheelhouse outer is to be replaced, remove the DLM (Differential Locking Module).

17. If the right-hand rear wheelhouse outer is to be replaced, remove the ADM (Adaptive Damping Module).
For additional information, refer to: Adaptive Damping Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

18. If the right-hand rear wheelhouse outer is to be replaced, remove the air suspension control module.
For additional information, refer to: Air Suspension Control Module (204-05 Vehicle Dynamic Suspension, Removal and Installation).

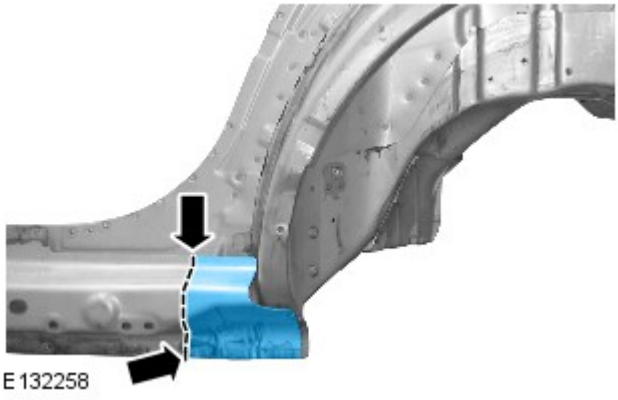
19. Remove any remaining miscellaneous components from the repair area as necessary.

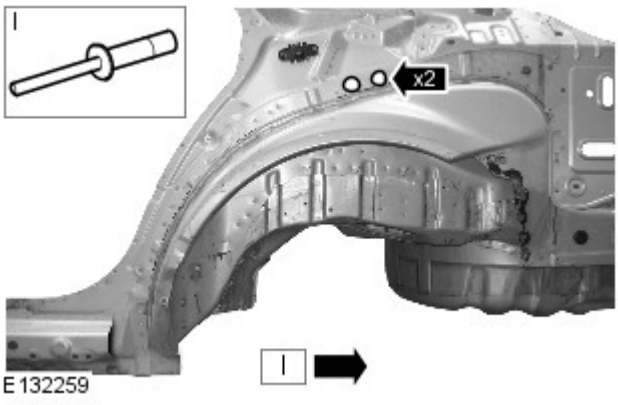
20. Release and lay aside the rear wheelhouse outer wiring harness.

21. Prior to removal, mark the position of the rear wheelhouse outer in relation to adjacent panels, for ease of alignment on installation.

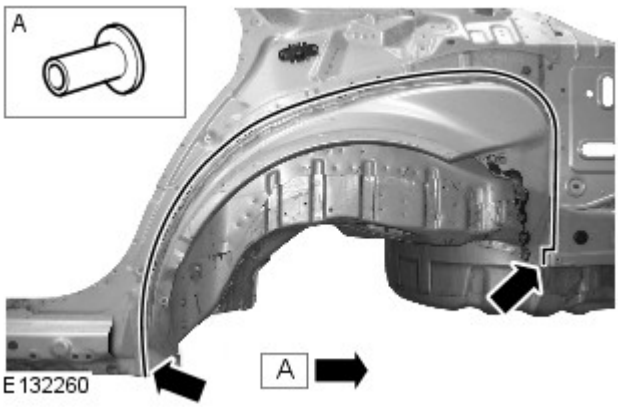
22. NOTE: Retain the rocker panel inner reinforcement section for installation.

Saw cut and remove a minimal section from the rocker panel inner reinforcement to allow access to the self piercing rivets as indicated.





23. Remove the monobolts.



24. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.

25. Carefully separate the joints and remove the old panel.

Installation

CAUTION: Installation of rivets should always be referenced against the stack size of the panel/s, access and the pitch between the original removed rivets locations, to make sure the correct type and size of rivet is installed.

NOTE: Hemloks should be installed in the hole created by the removed self piercing rivets.

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, removing any sealer and adhesive residue.

4. NOTE: Use the marks made prior to removal to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

5. Using a 6.5mm Cryobit drill bit, drill through the old panel holes into the new panel, at the points where Hemloks are to be installed.

6. Remove the new panel.

7. Deburr the drilled holes.

8. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

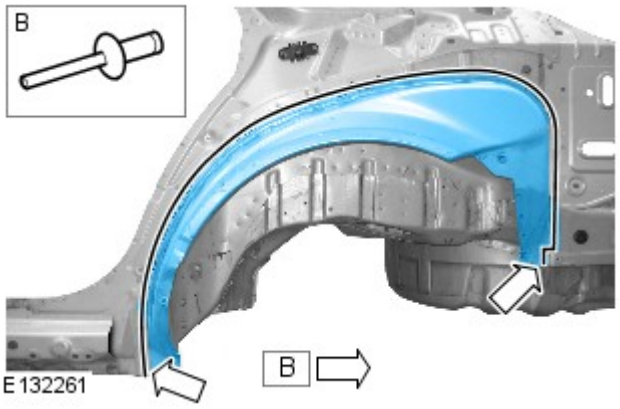
9. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

10. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

11. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the new panel and to the corresponding body joints.

12. Offer up the new panel, align and clamp into position.

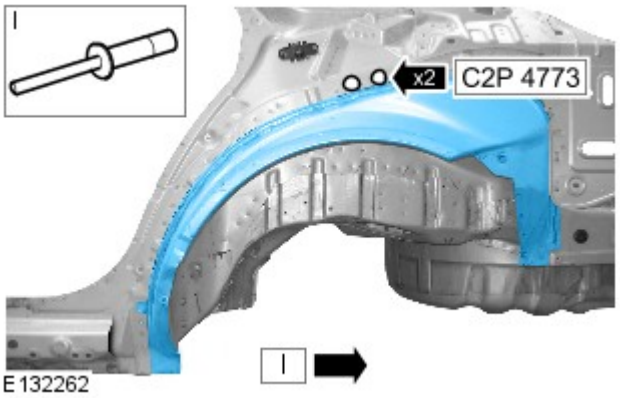


13. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

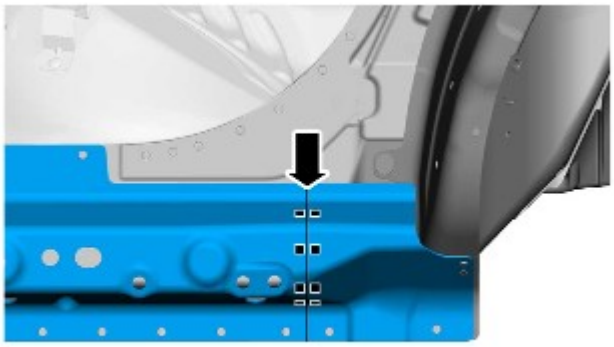
14. Using the Genesis G4, install the Monobolts.



E132262

15. Remove any excess adhesive.

16. Offer up the rocker panel inner reinforcement section and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



E197983

17. Drill holes in the rocker panel reinforcement where the backing plate is to be installed as indicated.

18. NOTE: Hemloks for the rocker panel inner reinforcement section will be installed with the installation of outer panels.

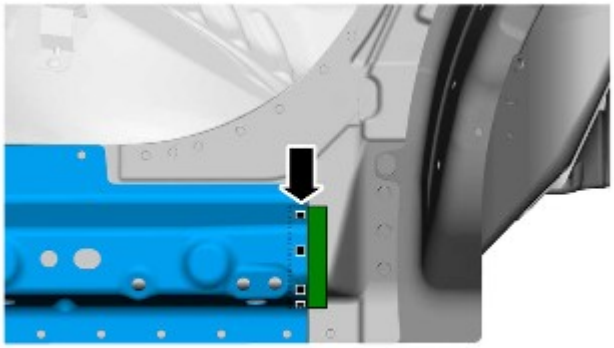
Using a 6.5mm Cryobit drill bit, drill holes through the old rocker panel inner reinforcement section, at the points where Hemloks are to be installed.

19. Remove the rocker panel inner reinforcement section.

20. Deburr the drilled holes.

21. Dress, clean and prepare the panel joint surfaces of the rocker panel inner reinforcement section.

22. Install and MIG plug weld the backing plate as indicated.



E197984

23. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

24. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

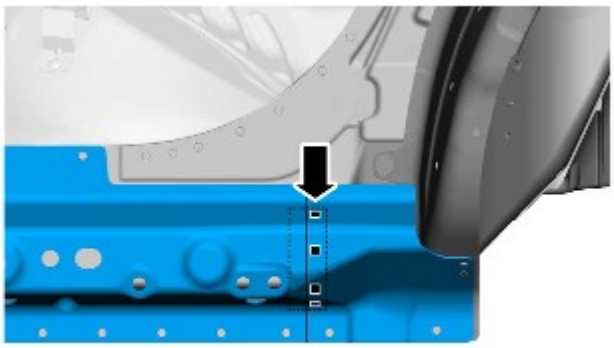
25. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

26. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG weld.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the rocker panel inner reinforcement section.

27. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

Offer up the new panel, align and clamp into position.



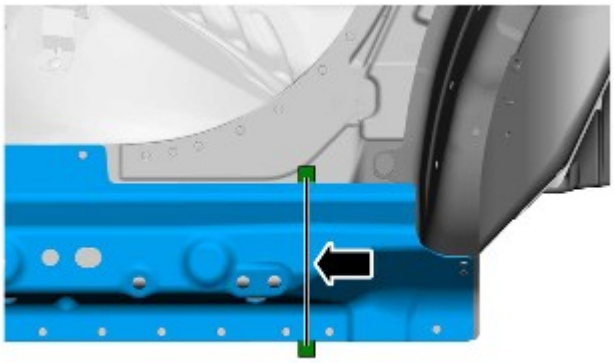
E197985

28. MIG plug weld the backing plate as indicated.

29. NOTE: The run-on/run-off tabs should be fabricated from similar material.

Tack weld the run-on/run-off tabs to all MIG butt joints.

30. MIG weld the MIG butt joint.



E197986

31. Remove the run-on/run-off tabs.

32. Carry out a non destructive crack inspection on the MIG butt joint. If correct proceed to next step, if not, rectify and recheck before proceeding.

33. Dress the welded joint.

34. Remove any excess adhesive.

35. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

36. The installation of associated panels and components is the reversal of removal procedure.

Rear End Sheet Metal Repairs - Inner Quarter Panel Rear Section

Removal and Installation

Removal

NOTES:

The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

The procedure shown is for the right-hand inner quarter panel rear section, the procedure for the left-hand is similar.

1. The inner quarter panel rear section is a category A repair.

2. The inner quarter panel rear section is serviced as a separate welded, bonded and riveted panel.

E132009

3. The inner quarter panel rear section is replaced in conjunction with:
- Rear bumper cover
- Rear bumper
- Rear Door
- Quarter panel
- Luggage compartment lid
- Luggage compartment lid hinge
- Rear window glass
- Headliner

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the vehicle battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Disconnect the generator electrical connectors.

7. Remove the quarter panel.
For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

8. Remove the rear door.
For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

9. Remove the headliner.
For additional information, refer to: Headliner (501-05 Interior Trim and Ornamentation, Removal and Installation).

10. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20B Supplemental Restraint System, Removal and Installation).

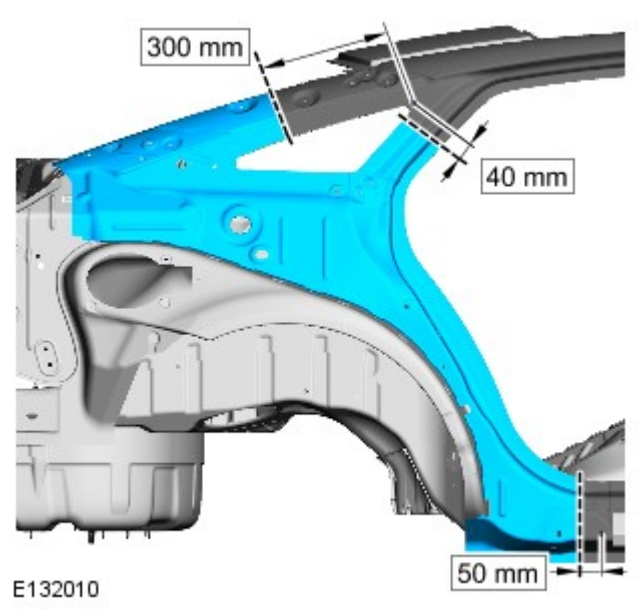
11. If the right-hand rear quarter panel is to be repaired, drain the fuel tank.
For additional information, refer to: Fuel Tank Draining - 3.0L V6 - TdV6 (310-00, General Procedures) / Fuel Tank Draining - V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol (310-00 Fuel System - General Information, General Procedures).

12. If the right-hand rear quarter panel is to be repaired, remove the fuel filler pipe.
For additional information, refer to: Fuel Tank Filler Pipe (310-01A, Removal and Installation).

13. Remove any remaining miscellaneous components from the repair area as necessary.

14. Release the inner quarter panel wiring harness and position to one side.

15. Prior to removal, mark the position of the inner quarter panel rear section in relation to adjacent panels for ease of alignment on installation.

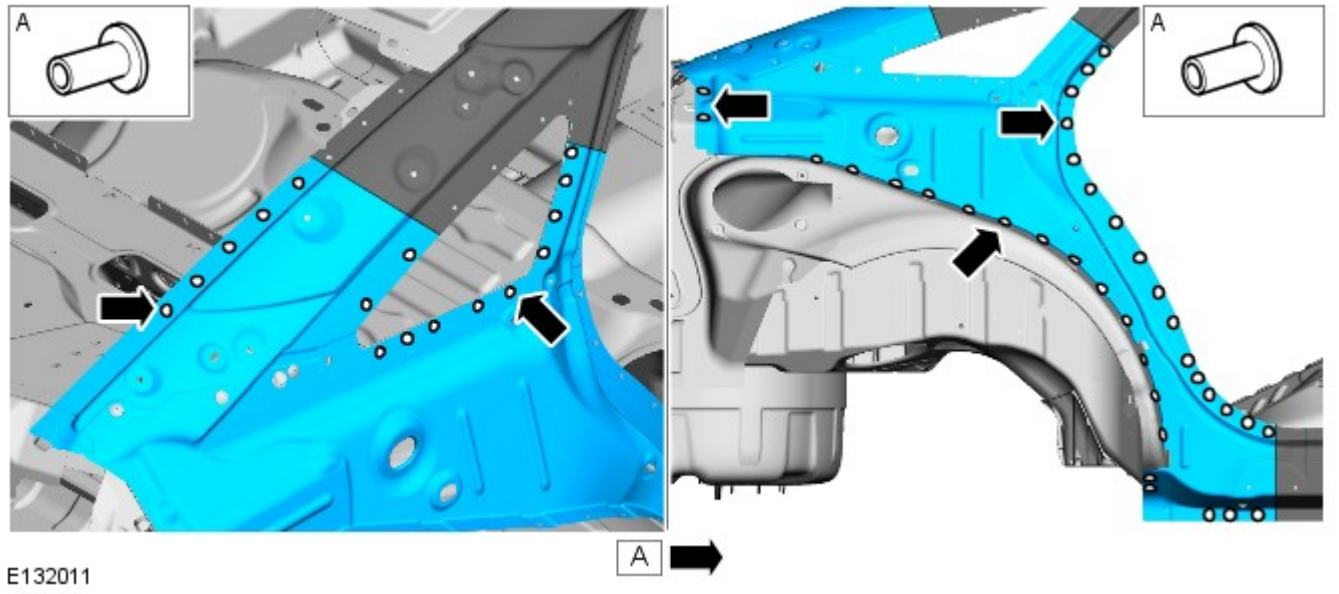


16. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old panel as indicated.

17. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove any remaining self piercing rivets to release the inner quarter panel rear section.



18. NOTES:

Retain the old panel remnant as it will be used in installation.

Remove and retain the noise vibration and harshness (NVH) components if they are to be reused.

Separate the joints and remove the old panel, also releasing the NVH components.

Installation

CAUTION: Installation of rivets should always be referenced against the stack size of the panels, access and the pitch between the original removed rivets locations, to make sure the correct type and size of rivet is installed.

NOTE: Installation of self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivets.

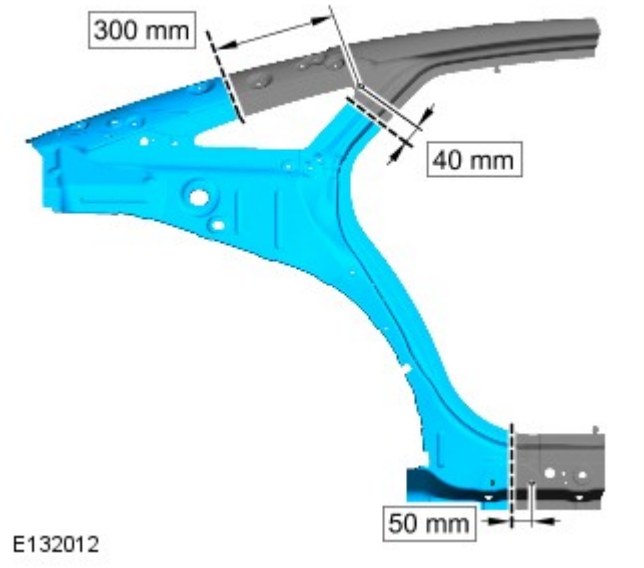
1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, removing any sealer and adhesive residue.

3. Dress flanges where necessary.

4. NOTE: Retain the remnants of the new panel as these may be used for backing strips on installation.

Using the old panel for reference, measure, mark and cut the new inner quarter panel rear section at the points where the MIG butt joints are to be made as indicated.



5. Debur the new panel.

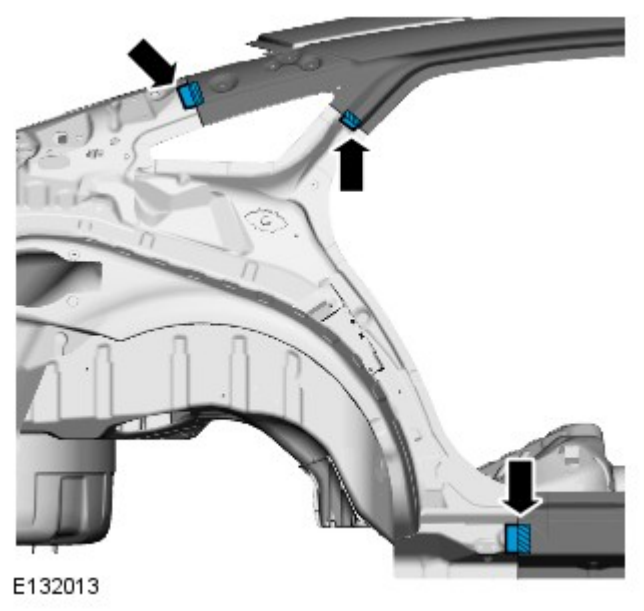
6. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

7. Using a 6.5mm Cryobit drill bit, drill holes at the points where Hemloks are to be installed.

8. Remove the new panel.

9. Debur the drilled holes.

10. Measure and cut backing plates and run on/run off tabs, from the old and new panel remnants.



11. NOTE: The backing plates should be an interference fit.

Offer up the backing plates to the vehicle. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

12. Remove the backing plates.

13. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

14. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

15. NOTE: The backing plates are installed with an interference fit.

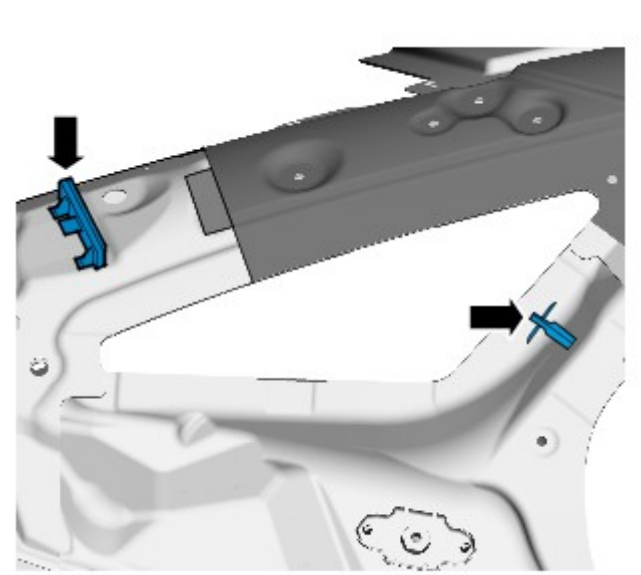
Install and align the backing plates to the vehicle.

16. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

17. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

18. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the new panel where the lower NVH component is to be installed. Install the NVH component to the new panel.



E132014

19. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component as indicated.

20. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the new panel.

21. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

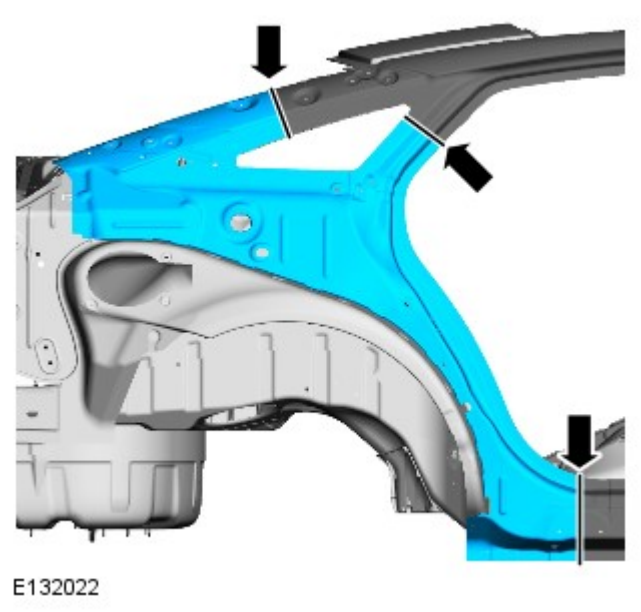
Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

22.

CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

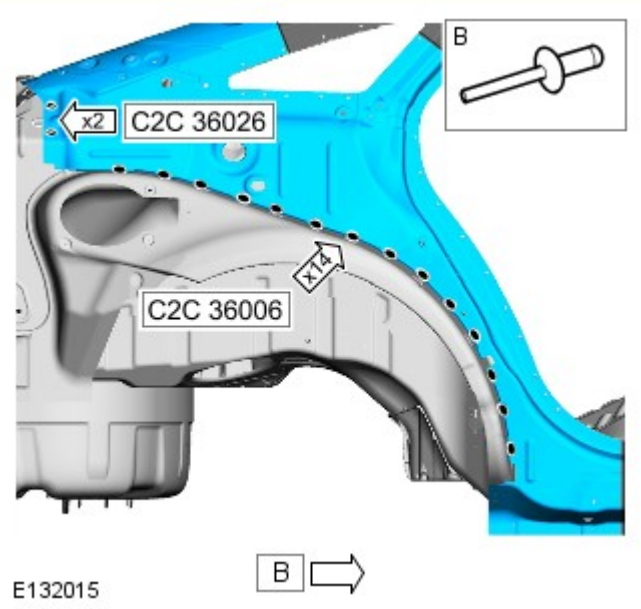
Offer up the new panel, align and clamp into position.

23. Tack weld the run-on/run-off tabs to all MIG butt joints.



E132022

24. MIG weld the MIG butt joints.



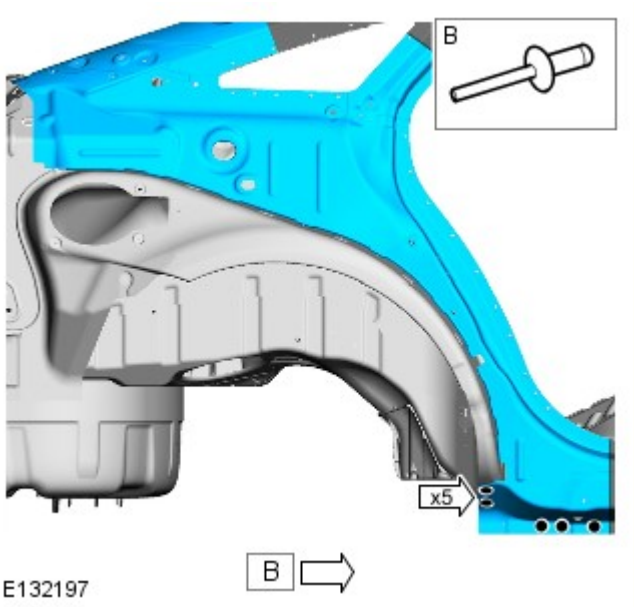
E132015

25. Using the Genesis G4, install the Hemloks.

26. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252

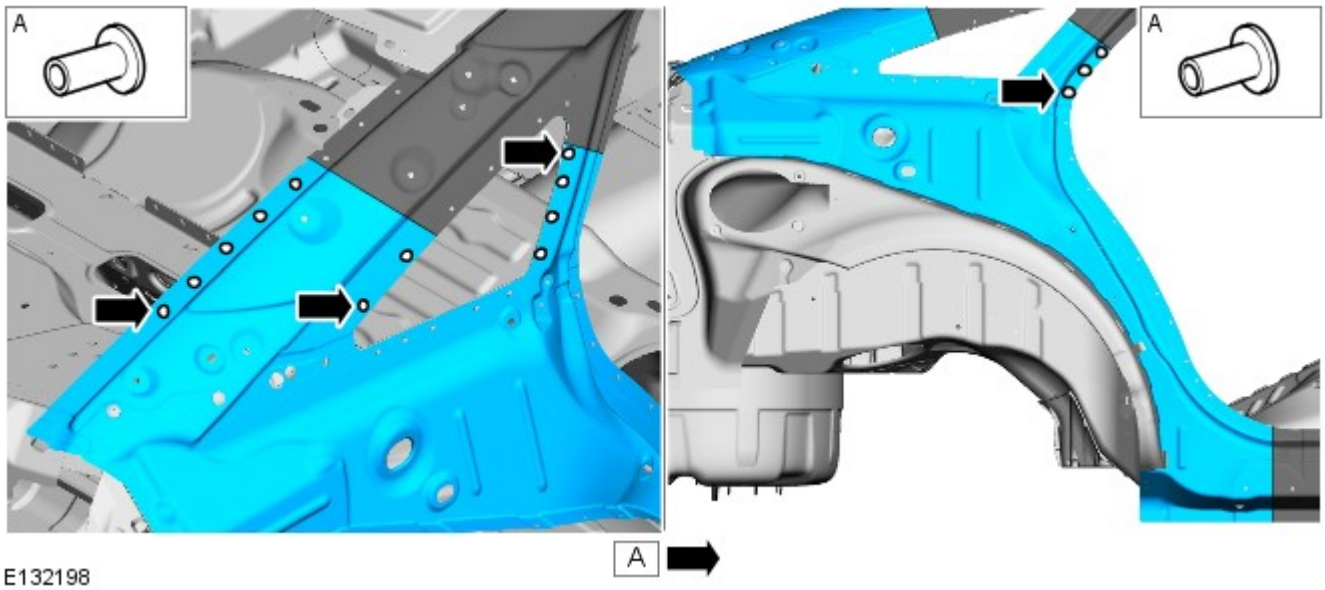


6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

27. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595



28. Remove any excess adhesive.

29. Remove the run-on/run-off tabs.

30. Dress the welded joints.

31. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

32. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

33. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Vehicle Specific Information and Tolerance Checks - Body and Frame

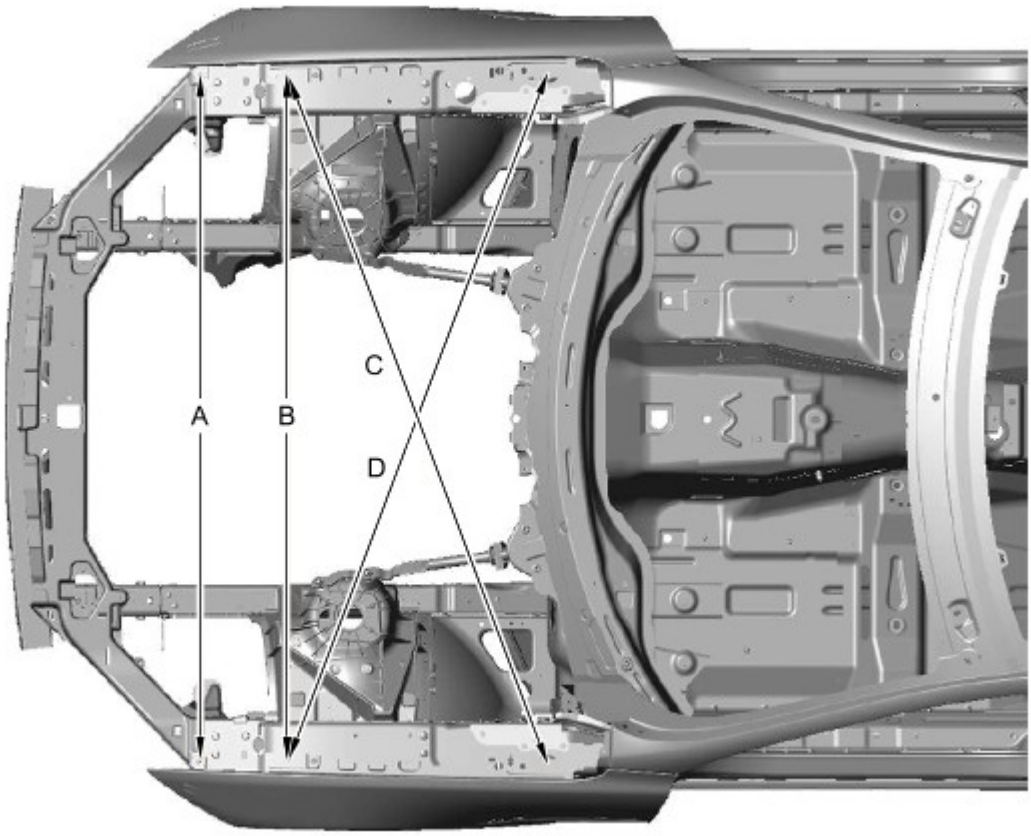
Description and Operation

Front End Body Dimensions

NOTES:

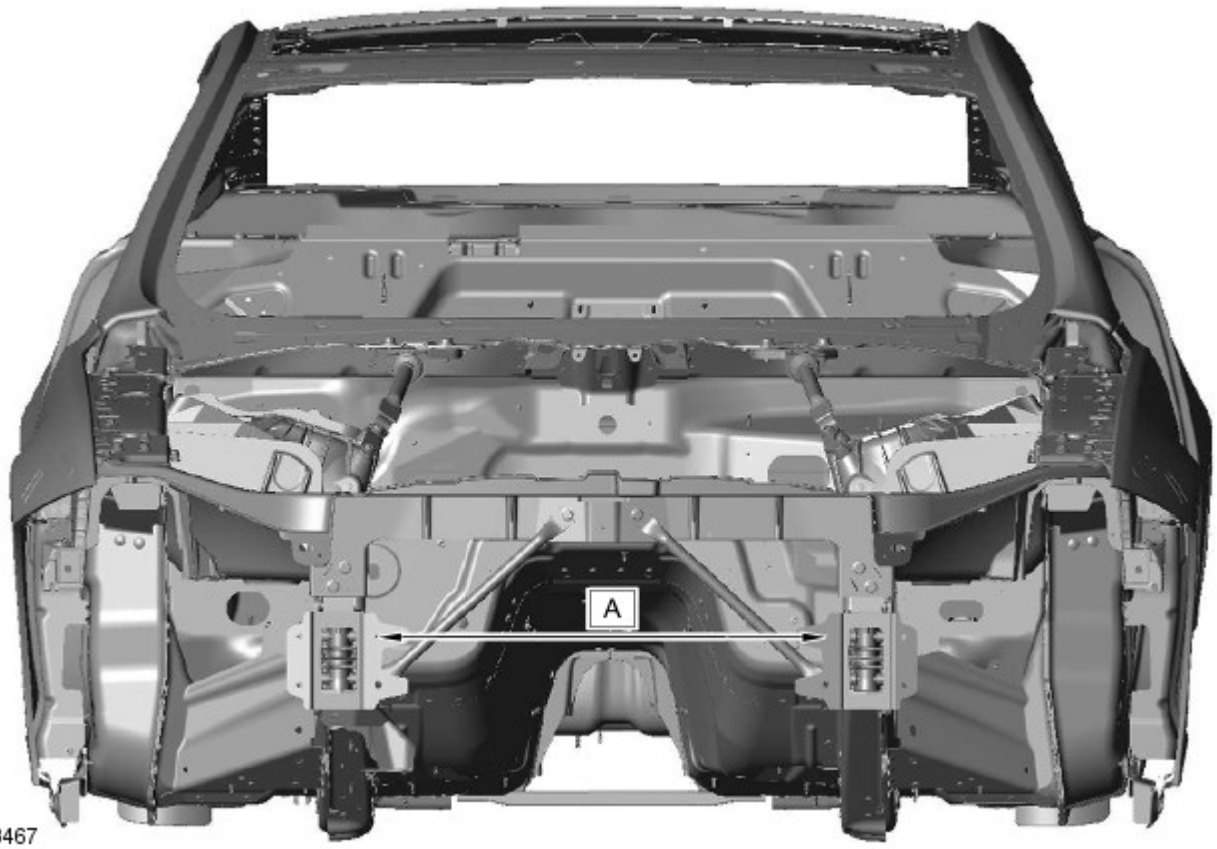
All dimensions shown are in millimetres (mm).

Dimensions shown to holes, are always taken from/to the hole centre. They are also always to the body panel surface, not to the top of bolts or components.



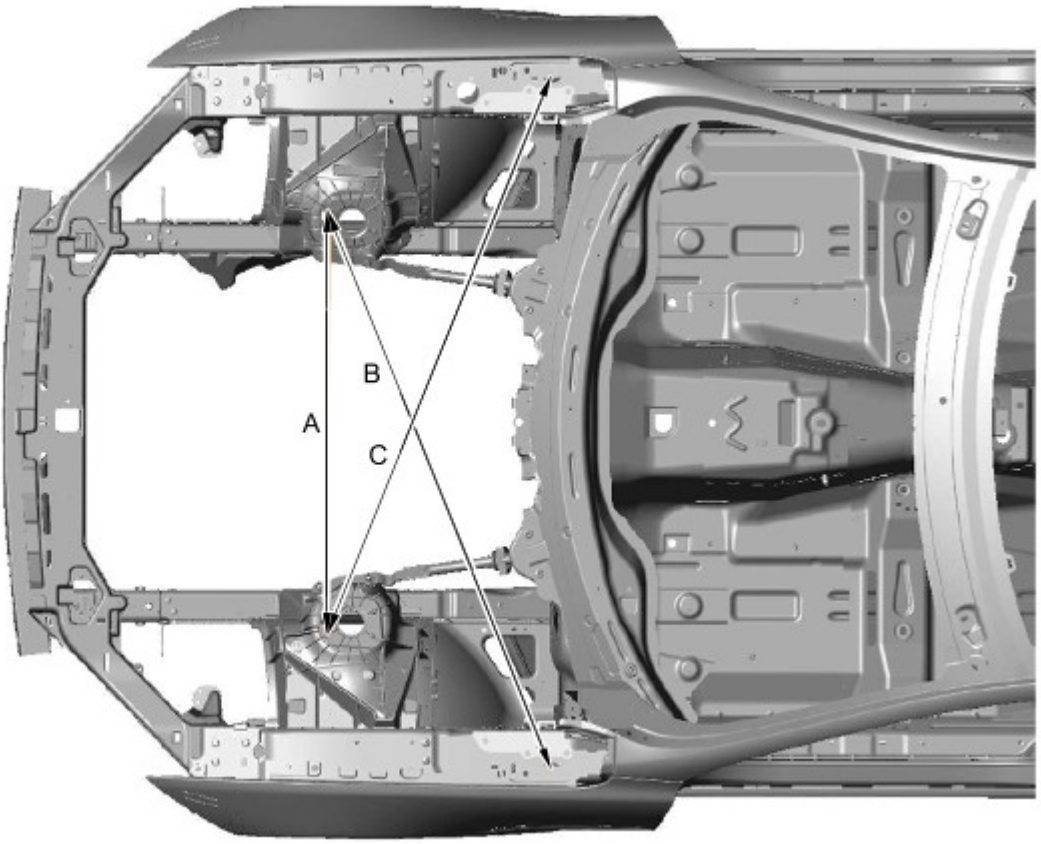
E133463

Item	From	To	Dimension
A	Front fender RH, front fixing hole	Front fender LH, front fixing hole	1580.0
B	Front fender RH, second front fixing hole	Front fender LH, second front fixing hole	1570.0
C	Front fender RH, second front fixing hole	Front fender LH, rear fixing hole	1689.4
D	Front fender LH, second front fixing hole	Front fender RH, rear fixing hole	1689.4



E133467

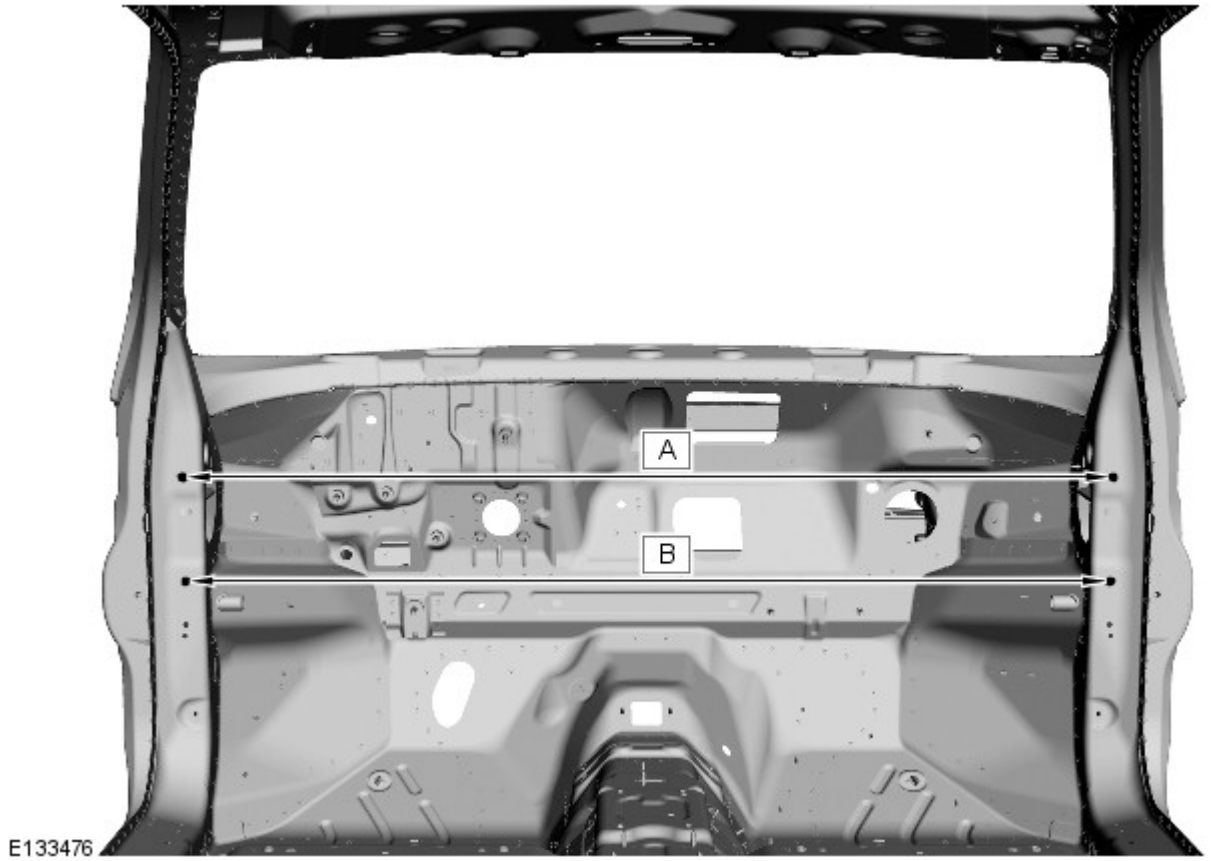
Item	From	To	Dimension
A	Side member deformation element RH, top inboard fixing hole	Side member deformation element LH, top inboard fixing hole	712.5



E133468

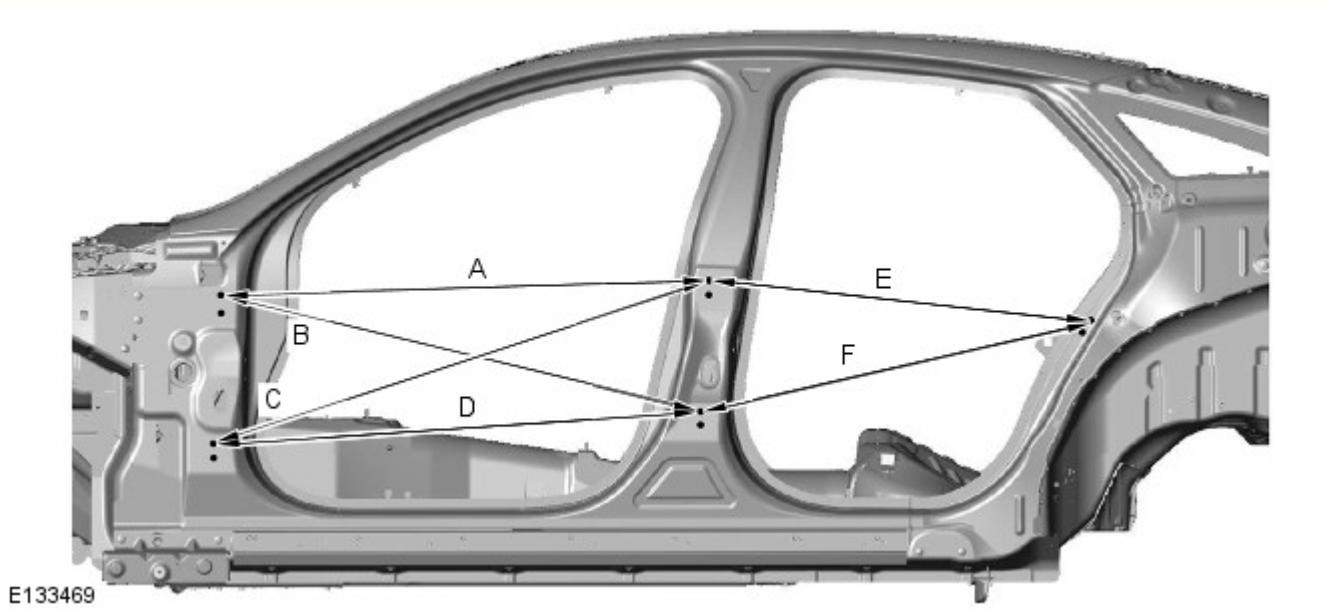
Item	From	To	Dimension
A	Suspension top mount RH, front outboard fixing	Suspension top mount LH, front outboard fixing	986.5
B	Suspension top mount RH, front outboard fixing	Front fender LH, rear fixing	1379.9

C	Suspension top mount LH, front outboard fixing	Front fender RH, rear fixing	1379.9



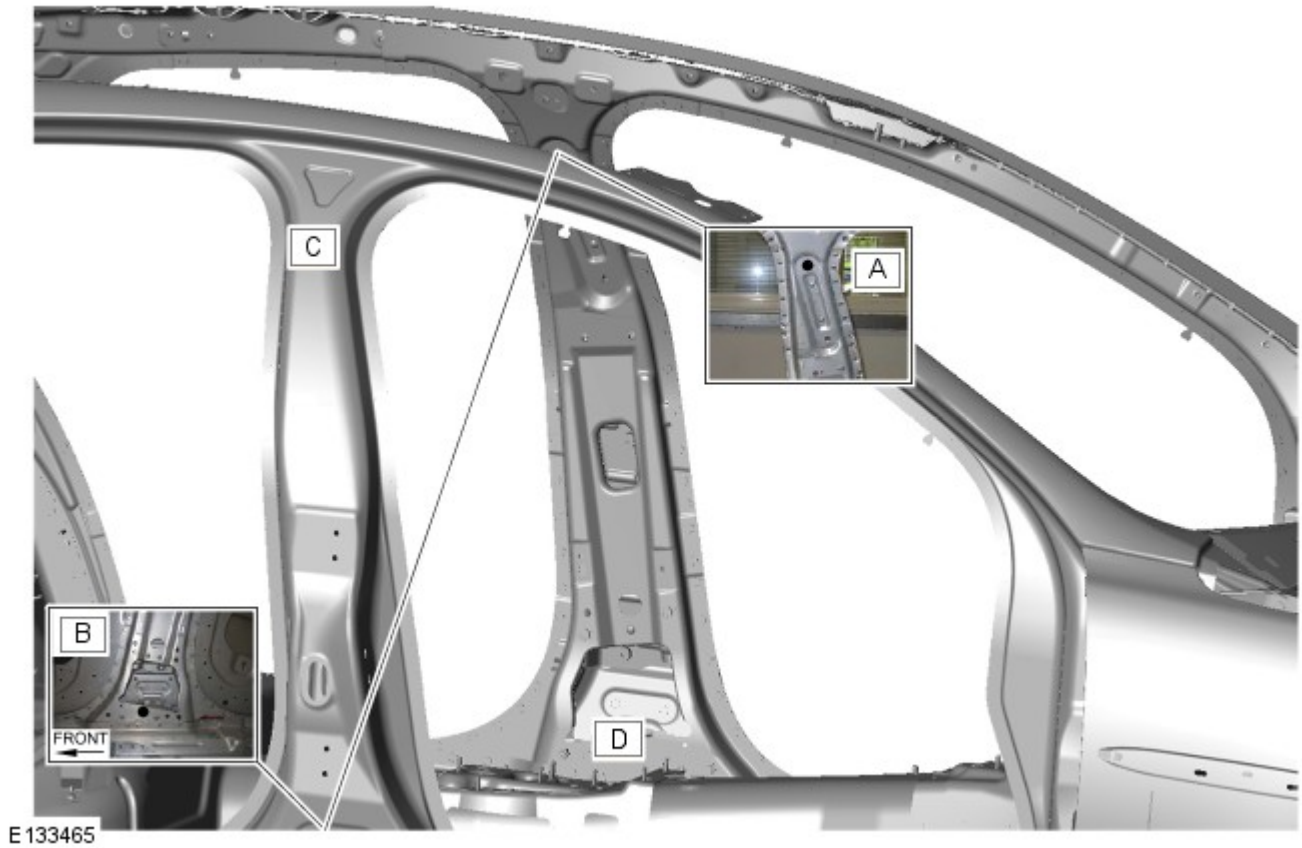
Item	From	To	Dimension
A	Instrument panel carrier RH top fixing hole	Instrument panel carrier LH top fixing hole	1416
B	Instrument panel carrier RH bottom fixing hole	Instrument panel carrier LH bottom fixing hole	1416

Side Panel Dimensions



Item	From	To	Dimension
A	Front door top hinge, top fixing hole	Rear door top hinge, top fixing hole	1109.1
B	Front door top hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1119.9
C	Front door bottom hinge, top fixing hole	Rear door top hinge, top fixing hole	1184.8
D	Front door bottom hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1108.9
E (short wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	885.6
E (long wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	1009.5
F (short wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	914.0

F (long wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	1036.8



E133465

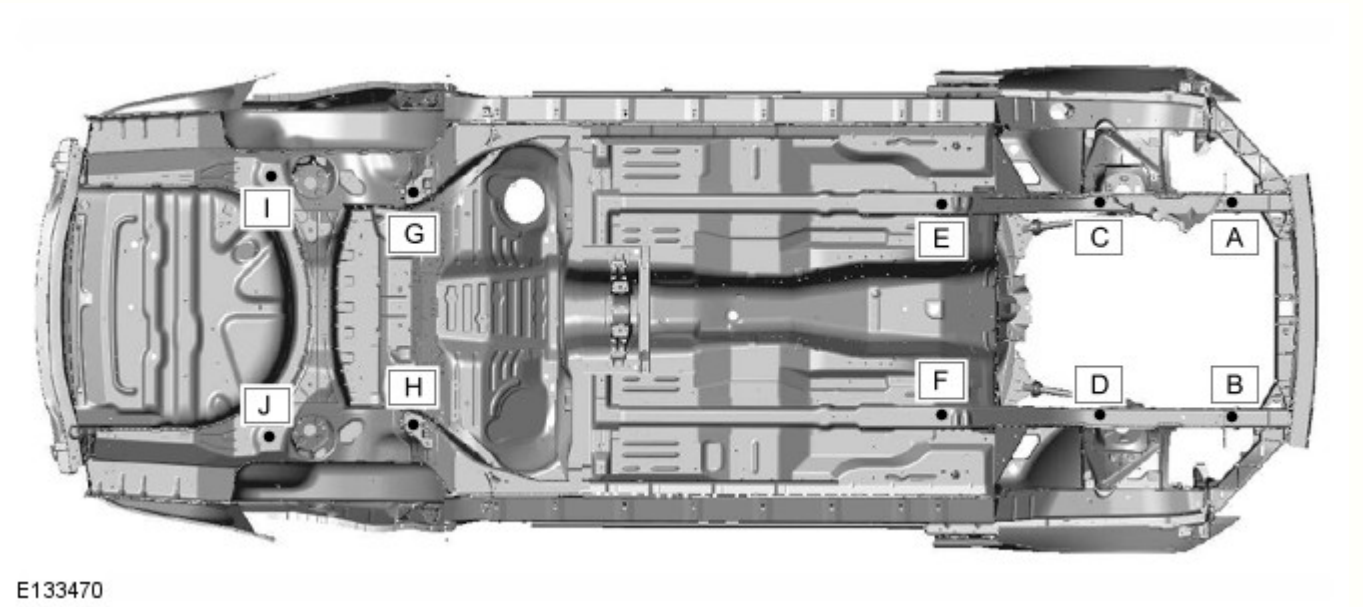
Item	From	To	Dimension
A-B	Front seat belt adjuster LH, top fixing hole	Front seat belt retractor RH, mounting hole	1606.2
C-D	Front seat belt adjuster RH, top fixing hole	Front seat belt retractor LH, mounting hole	1606.2

Rear End Body Dimensions

E133464

Item	From	To	Dimension
A	Rear bumper RH lower fixing hole	Rear bumper LH lower fixing hole	995.92

Under Body Dimensions



Item	From	To	Dimension
A-B	Front subframe, RH front fixing hole	Front subframe, LH front fixing hole	839.0
C-D	Front subframe, RH rear fixing hole	Front subframe, LH rear fixing hole	833.0
E-F	Front side member RH, tooling hole	Front side member LH, tooling hole	820.0
A-D	Front subframe, RH front fixing hole	Front subframe, LH rear fixing hole	982.5

B-G (long wheel base)	Front subframe, LH front fixing hole	Rear subframe, RH front fixing hole	3419.9

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

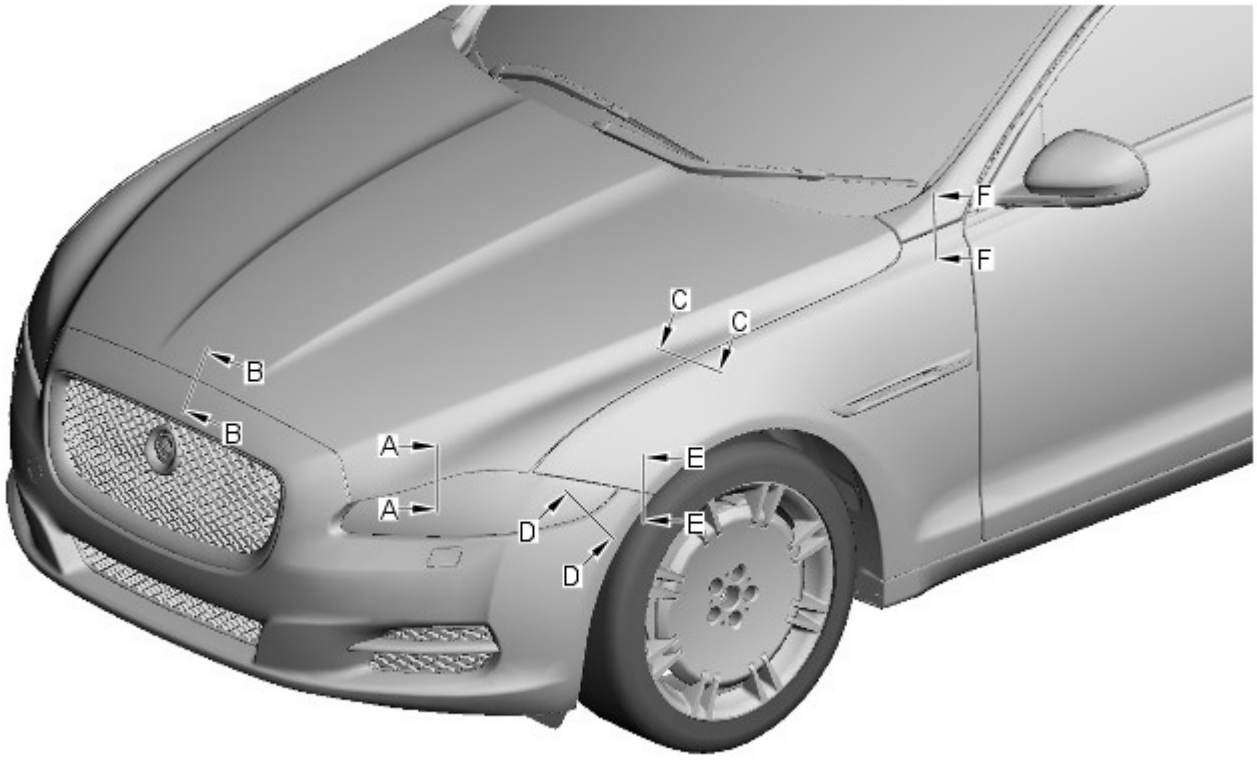
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

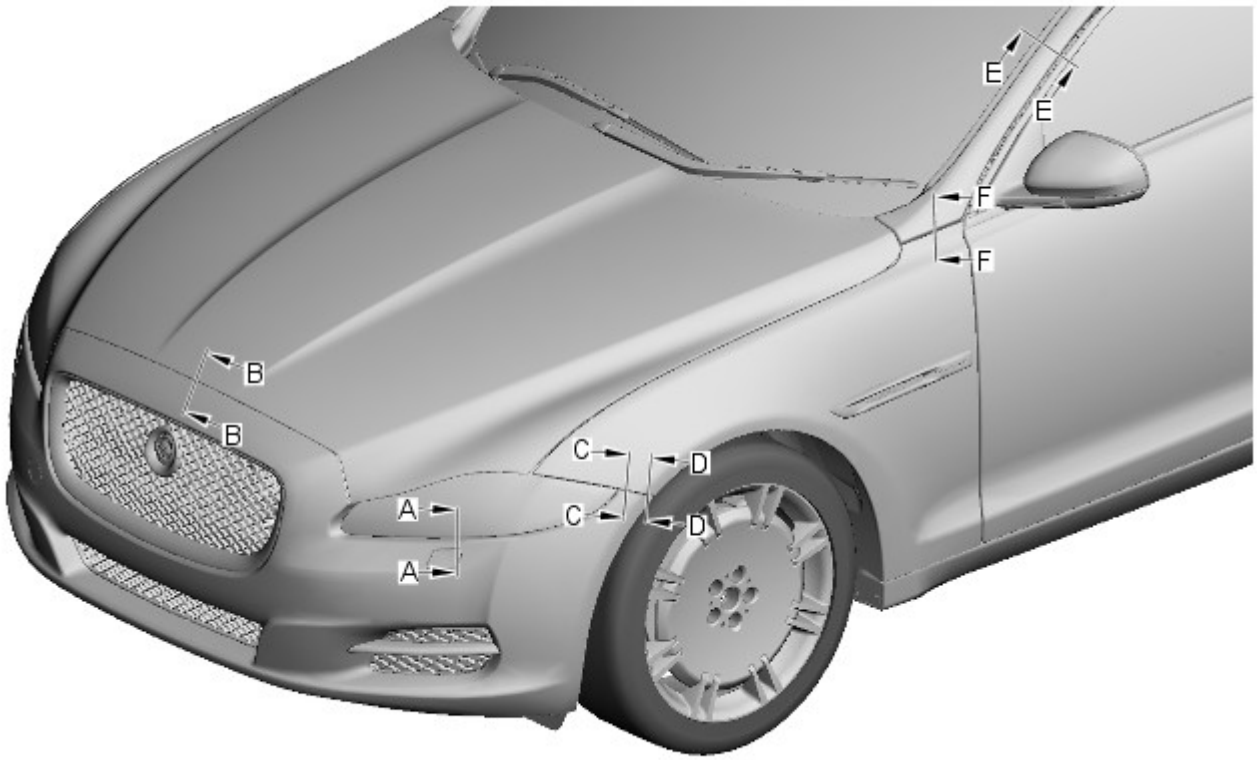
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



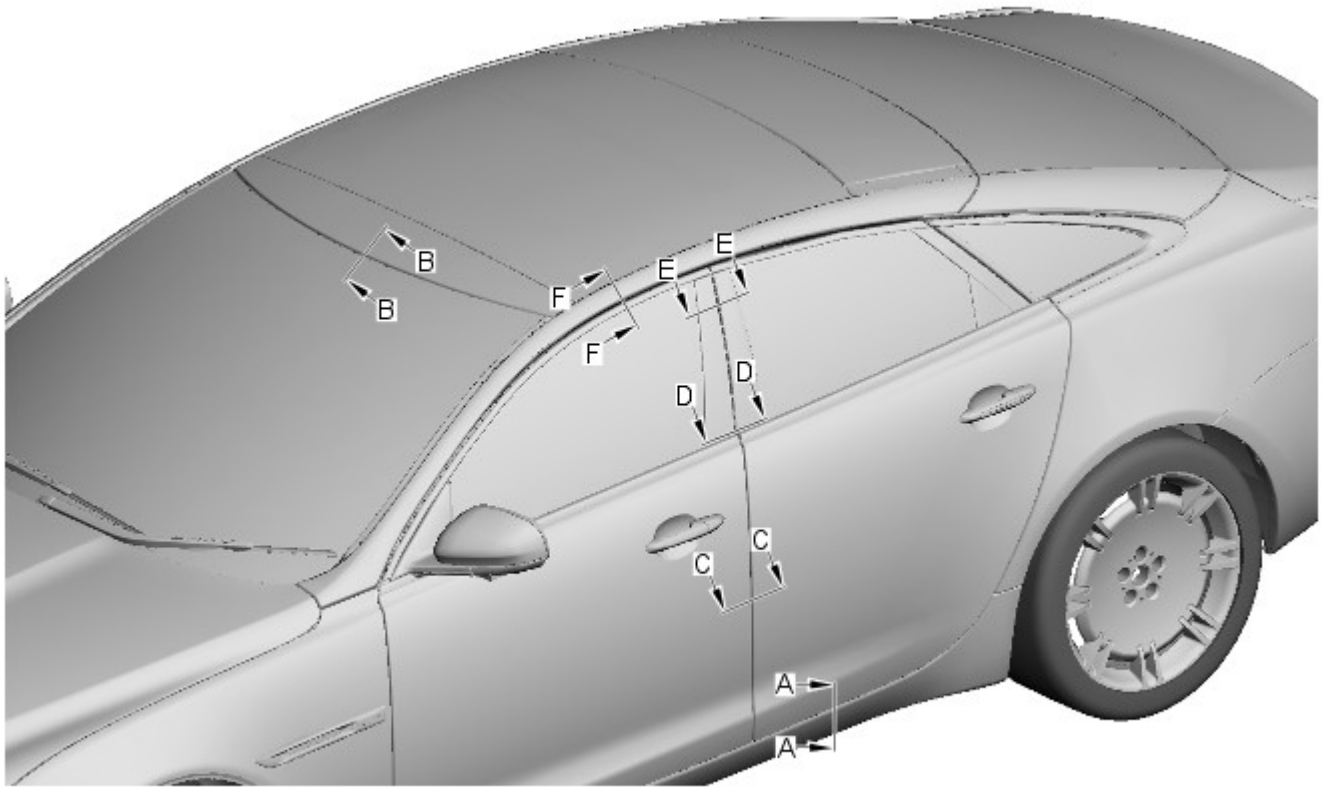
E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



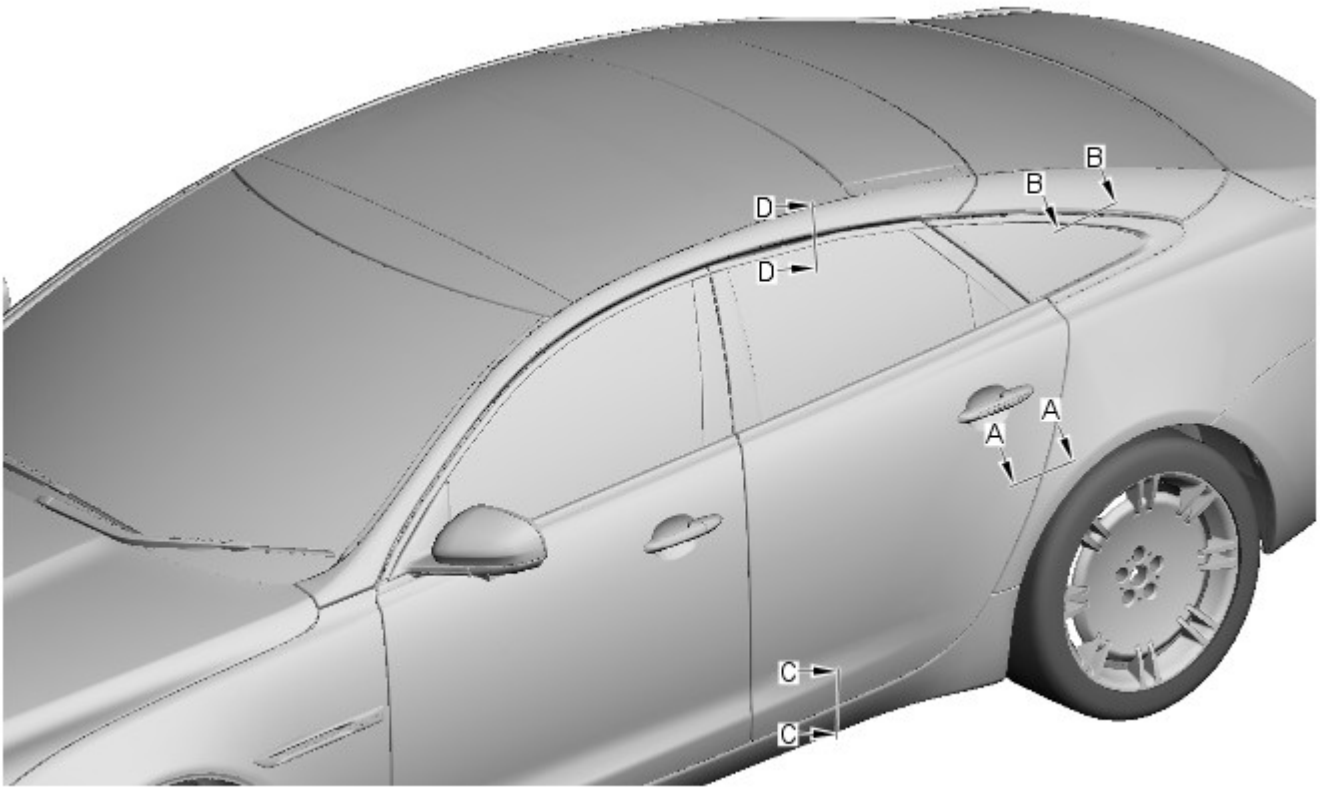
E133472

A-A	Front bumper cover to headlamp	1.0 ± 0.5
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Front bumper cover to front fender	0.0 + 1.0
D-D	Front bumper cover to front fender	0.0 + 1.0
E-E	Front door to A-pillar	4.0 ± 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



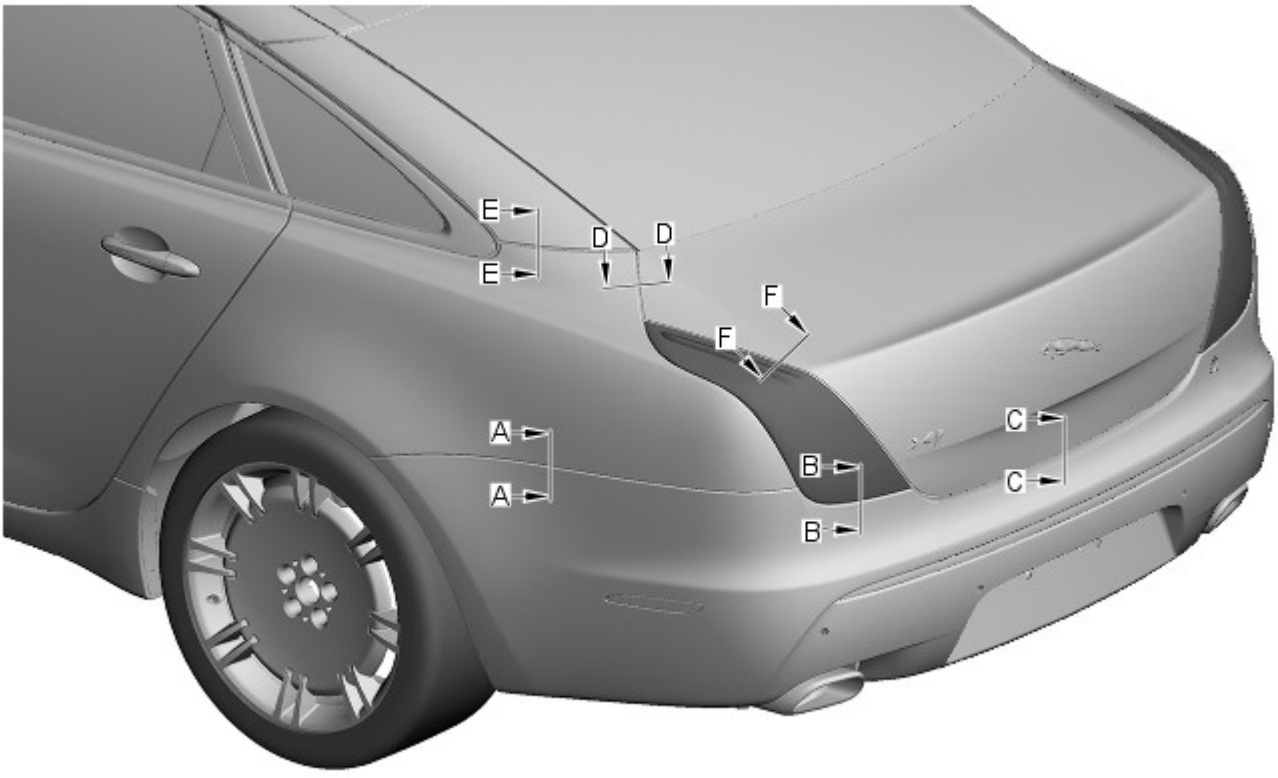
E133473

A-A	Rear door to rocker panel	5.0 ± 1.0
B-B	Windshield encapsulation to front glass roof panel encapsulation	0.0
C-C	Front door to rear door	4.0 ± 1.0
D-D	Front door to rear door	4.0 ± 1.0
E-E	Front door to rear door	4.0 ± 1.0
F-F	Front door to A-pillar / roof panel	6.5 ± 1.0



E133474

A-A	Rear door to quarter panel	4.0 ± 1.0
B-B	Rear quarter window glass encapsulation to quarter panel finisher	0.0
C-C	Rear door to rocker panel	5.0 ± 1.0
D-D	Rear door to roof panel	6.5 ± 1.0



E133475

A-A	Rear bumper cover to quarter panel	0.0 + 1.0
B-B	Rear bumper cover to rear lamp assembly	1.0 ± 0.5
C-C	Rear bumper cover to luggage compartment lid	6.0 ± 1.0
D-D	Quarter panel to luggage compartment lid	6.0 ± 1.0
E-E	Quarter panel to quarter panel finisher	0.0 + 1.0
F-F	Luggage compartment lid to rear lamp assembly	3.5 ± 1.0

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Body Closures - Luggage Compartment Lid

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

E127601

1. CAUTION: Make sure to protect the paintwork.

NOTES:

The luggage compartment lid is manufactured from aluminium.

The luggage compartment lid is serviced as a separate bolt-on panel, less its hinges.

2. For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation).

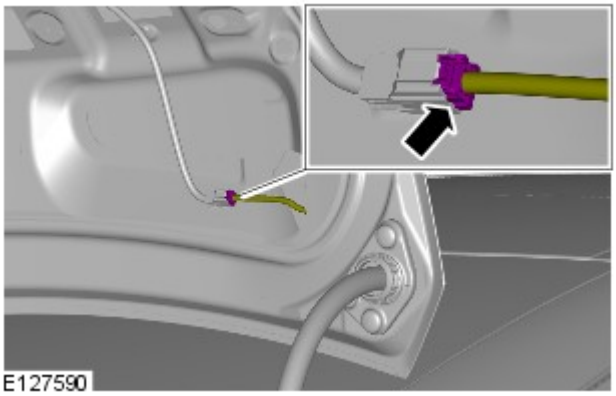
3. For additional information, refer to: Body Repairs (501-25A Body Repairs - General Information, Description and Operation).

4. For additional information, refer to: Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation).

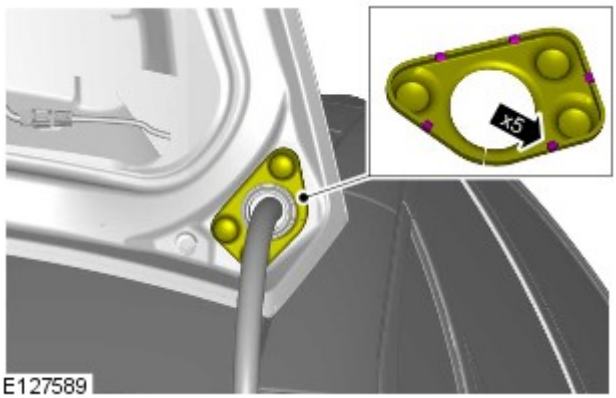
5. For additional information, refer to: Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. For additional information, refer to: Luggage Compartment Lid Latch Actuator (501-14 Handles, Locks, Latches and Entry Systems, Removal and Installation).



8.

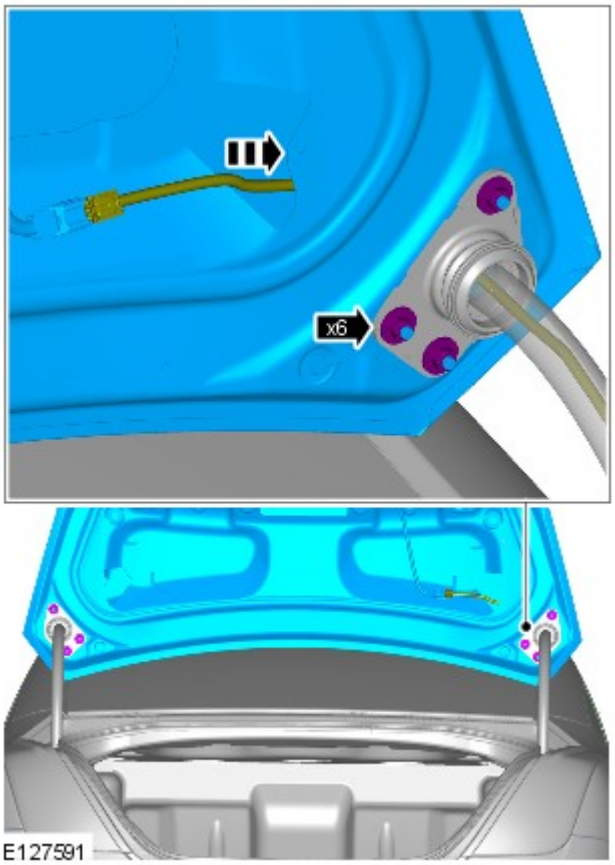


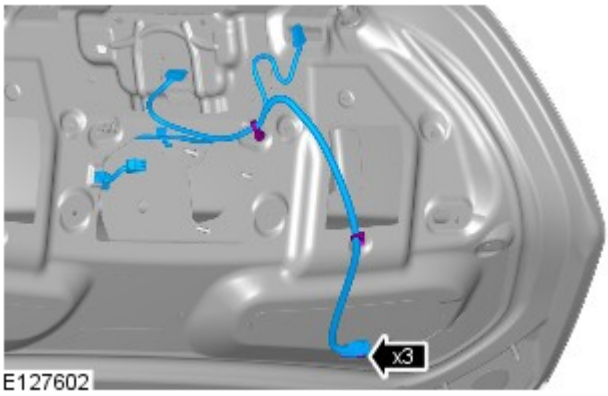
9. NOTE: The step must be carried out on both sides.

10. WARNING: This step requires the aid of another technician.

CAUTION: Take extra care not to damage the wiring harnesses.

TORQUE: 23 Nm





11. CAUTION: Protect the surrounding paintwork to avoid damage.

NOTE: Do not disassemble further if the component is removed for access only.

Installation

1. To install, reverse the removal procedure.

Published: 02-Sep-2015

Body Closures - Luggage Compartment Lid Hinge

Removal and Installation

Removal

1. The luggage compartment lid hinge is a category B repair.

2. NOTE: The luggage compartment lid hinge is manufactured from steel.

The luggage compartment lid hinge is serviced as a separate bolt-on panel.

E129123

3. The luggage compartment lid hinge is replaced in conjunction with:
   - Luggage compartment lid

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

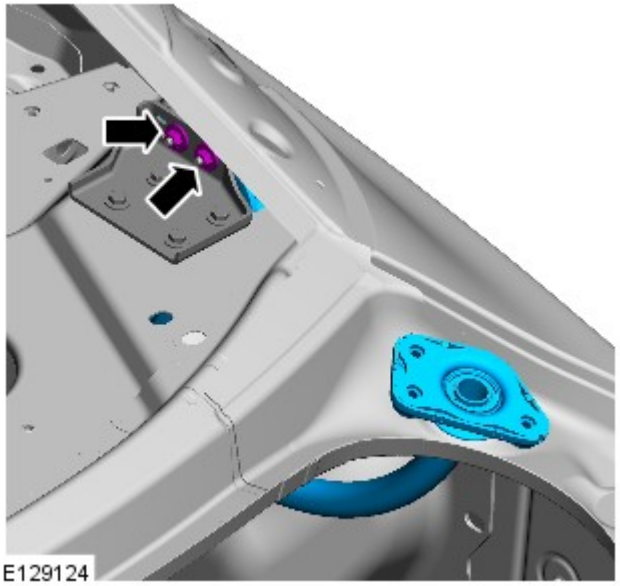
6. Remove the luggage compartment lid.
For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

7. Remove the parcel shelf.
For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

8. Remove the back panel inner trim.

9. Remove the loadspace trim panel.
For additional information, refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation) / Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).

10. Remove the retaining nuts to the luggage compartment lid hinge mounting.



Installation

1. NOTE: Make sure the gasket is installed between the luggage compartment lid and the luggage compartment lid hinge.

Offer up the luggage compartment lid hinge. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

2. Tighten the luggage compartment lid hinge retaining nuts.

CAUTION: Apply a suitable sealent to the luggage compartment hinge mounting plate to prevent water ingress.

NOTE: Bolts are pre-coated to inhibit galvanic corrosion and can be reused only if the coating is not damaged.

- Tighten to 17 Nm.

3. The installation of associated panels and components is the reversal of removal procedure.

Published: 11-May-2011

Bumpers - Rear Bumper

Removal and Installation

Removal

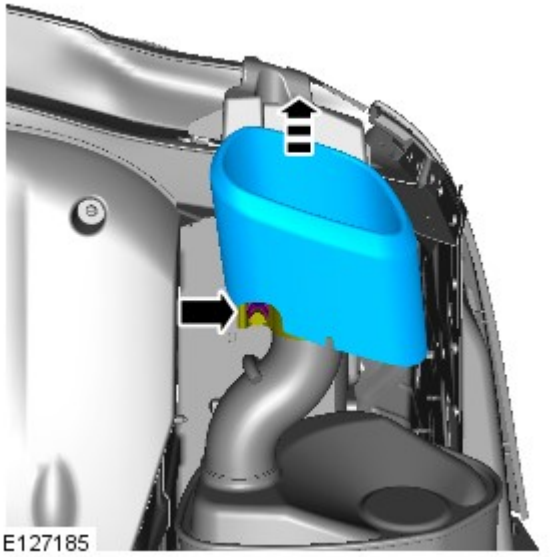
NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

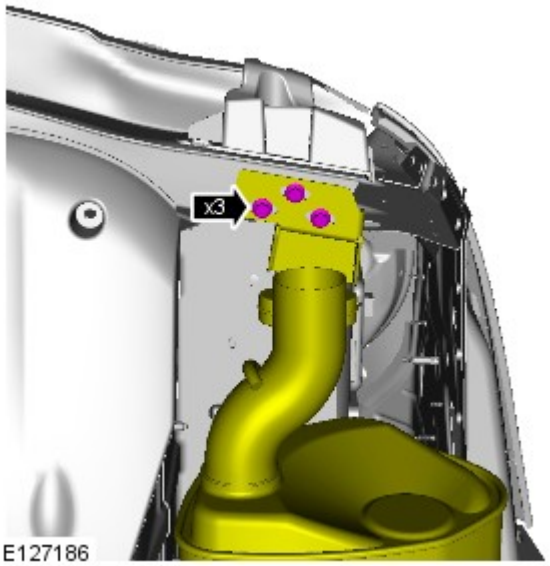


4. NOTES:

RH illustration shown, LH is similar.

The procedure must be carried out on both sides.

Torque: 25 Nm



5. CAUTION: Make sure that the exhaust system is supported with suitable retaining straps.

NOTES:

RH illustration shown, LH is similar.

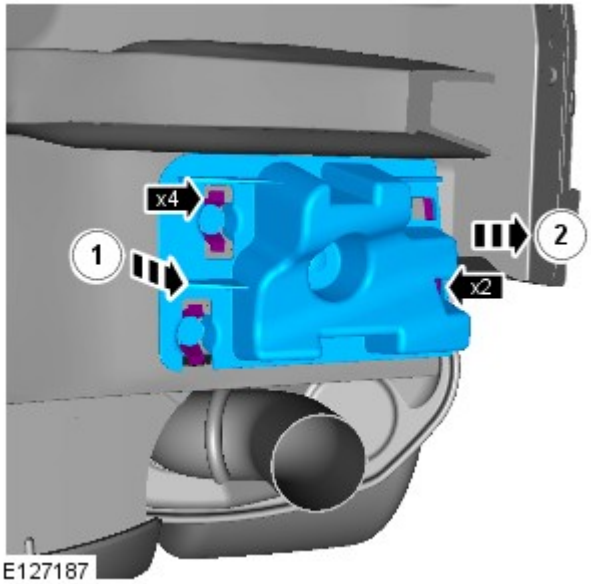
The procedure must be carried out on both sides.

Torque: 25 Nm

6. NOTES:

RH illustration shown, LH is similar.

The procedure must be carried out on both sides.



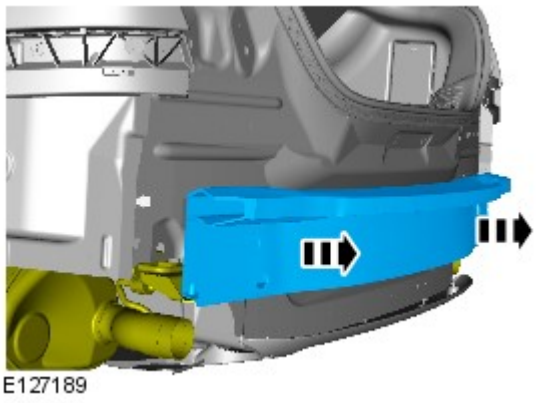
7. NOTES:

RH illustration shown, LH is similar.

The procedure must be carried out on both sides.

Support as necessary.

Torque: 30 Nm



8.

Installation

1. To install, reverse the removal procedure.

Published: 04-Sep-2013

Glass, Frames and Mechanisms - Rear Window Glass
Removal and Installation

Removal

CAUTIONS:

Always protect paintwork and glass when removing exterior components.

Always protect the interior components when removing body glass.

Lay the glass on felt covered supports. Do not stand on edge as this can cause chips which subsequently develop into cracks.

NOTES:

The following equipment is required: l Cutting wire and handles l Kent knife l Glazing knife l Windshield replacement kit l Sealant applicator gun l Suction cups l A felt covered table or stand to support glass

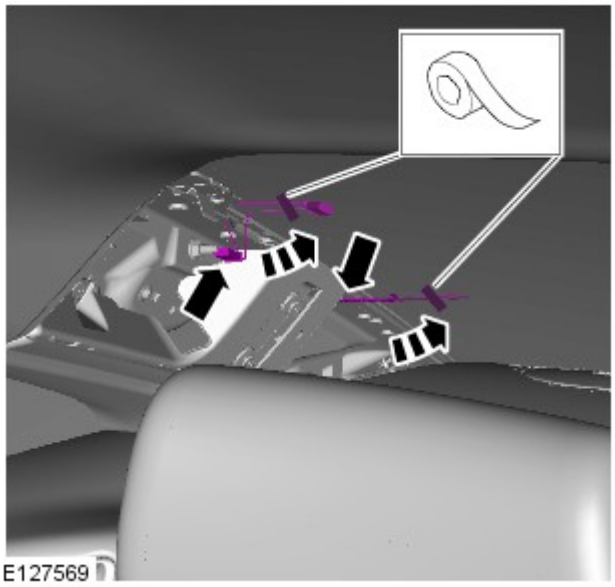
Removal steps in this procedure may contain installation details.

1. NOTE: The procedure must be carried out on both sides.

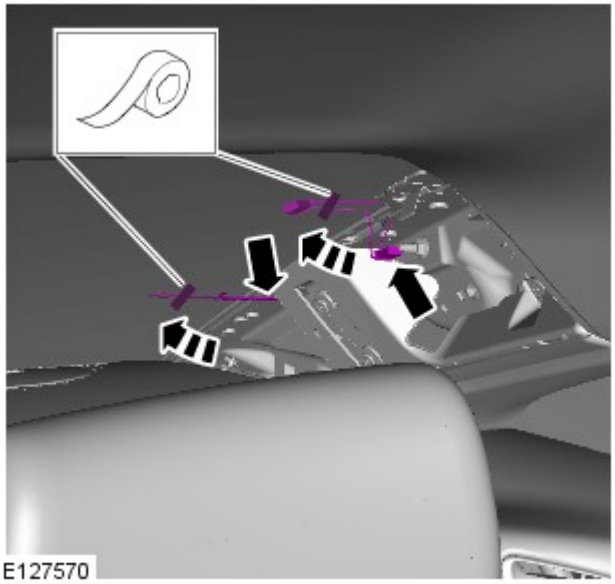
   Refer to: C-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.
   - Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

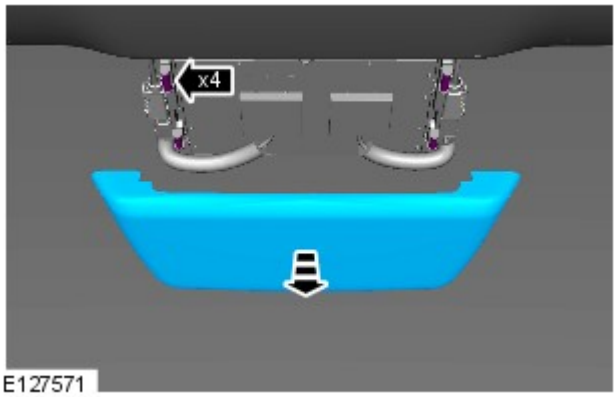
3.



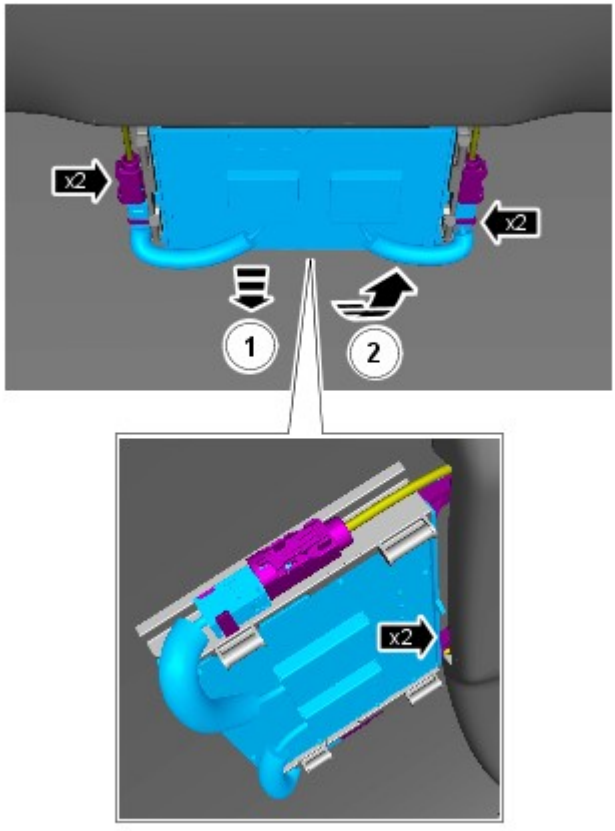
4.

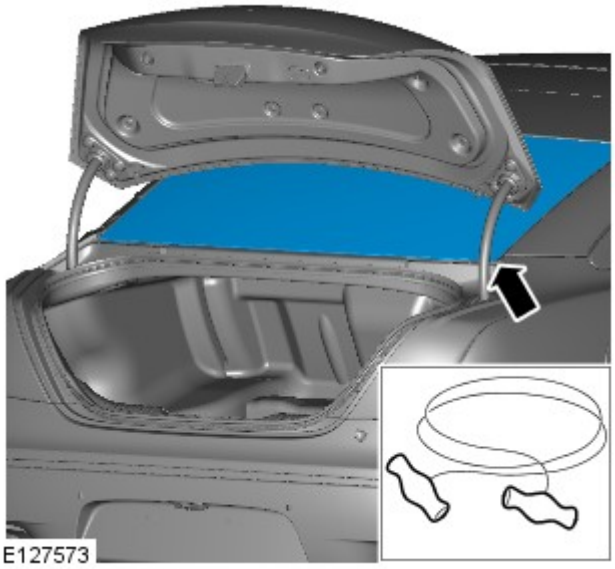


5.



6.

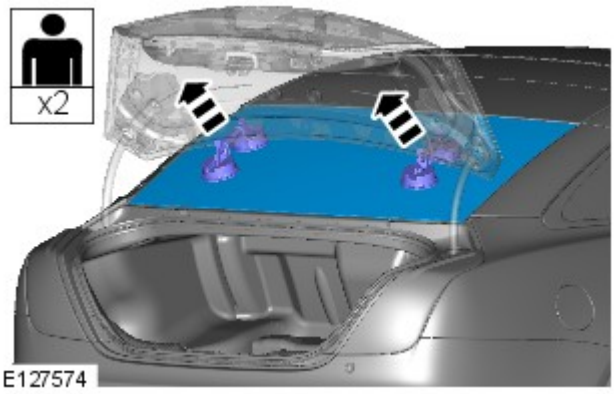




7. CAUTIONS:

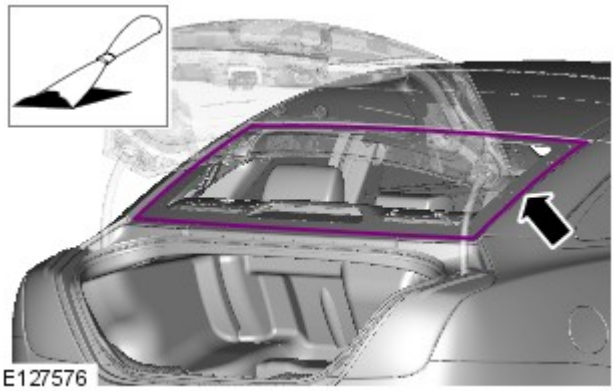
Protect the surrounding components.

Protect the surrounding paintwork to avoid damage.



8. WARNING: This step requires the aid of another technician.

Installation



1. CAUTIONS:

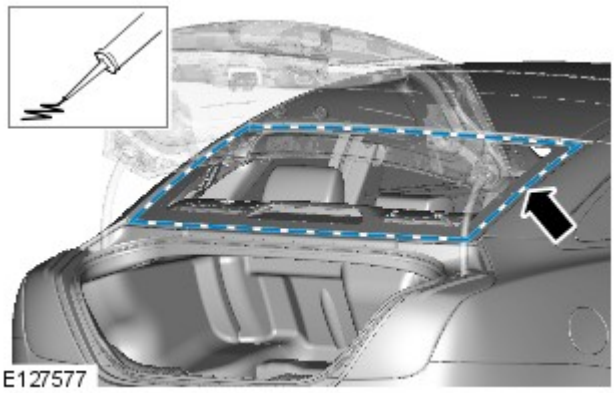
Make sure that the mating faces are clean and free of foreign material.

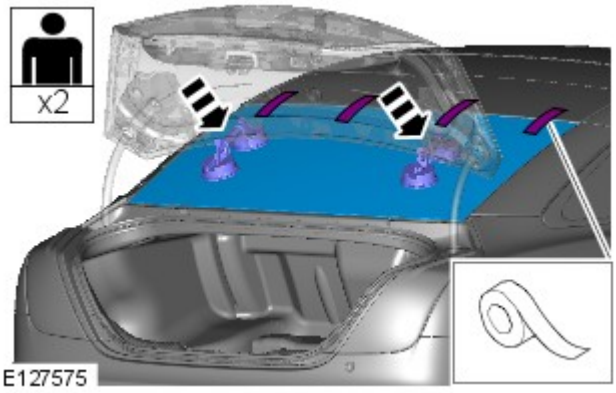
Correct preparation of body apertures “post painting” to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.

2. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.





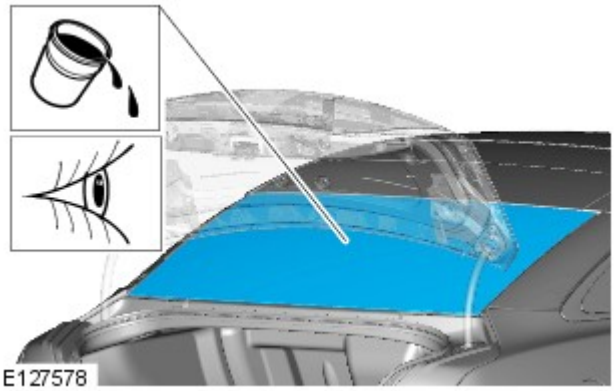
3. WARNING: This step requires the aid of another technician.

CAUTIONS:

Make sure that the component is correctly located on the locating dowels.

Make sure that equal pressure is applied to the full length of the component.

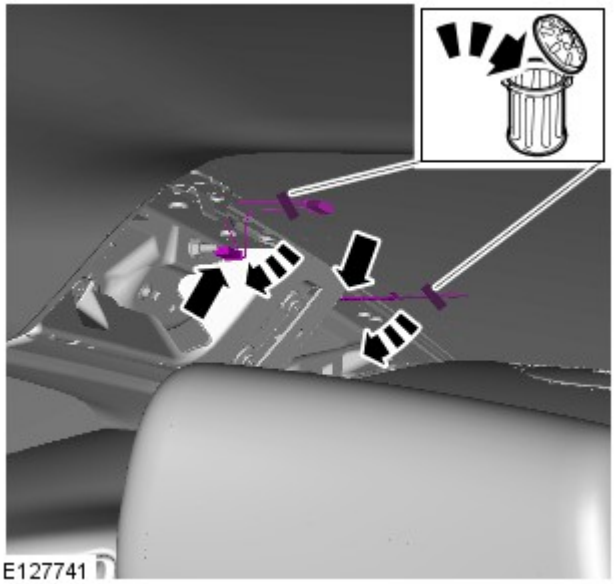
- With assistance, install and align the windshield glass.
- If the ambient temperature falls below 10 degrees C, apply warm air (25 degrees C) continuously for 15 minutes.



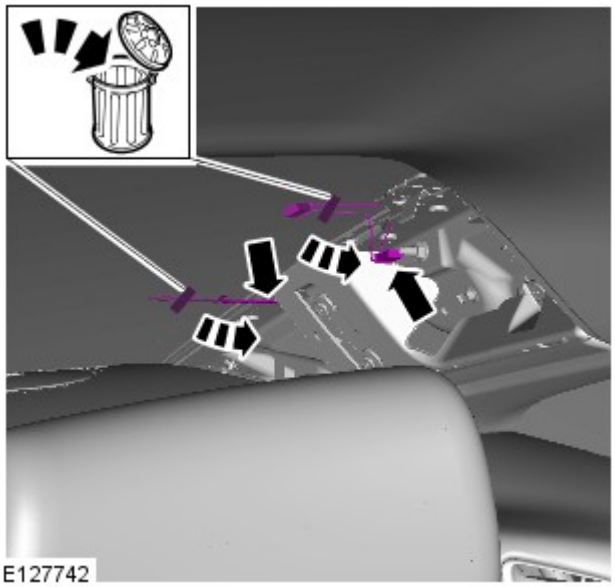
4. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.

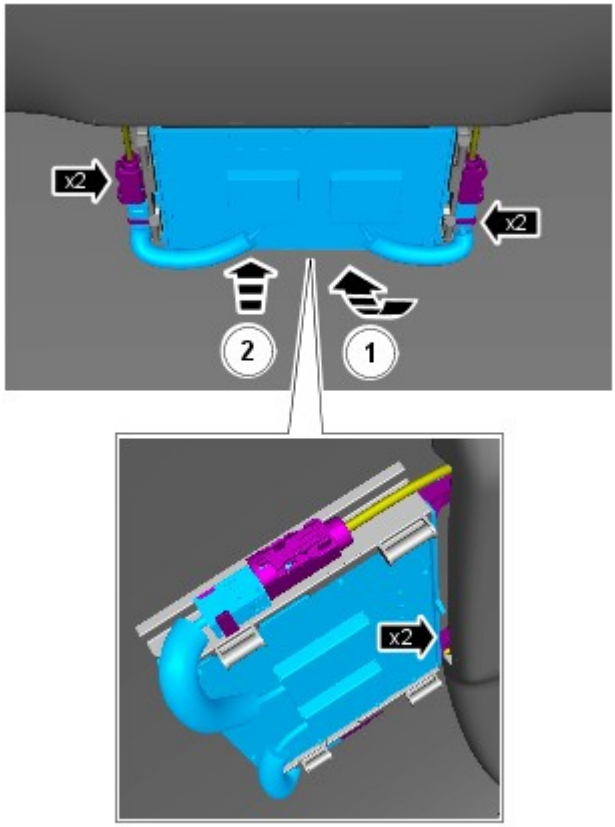
5.



6.

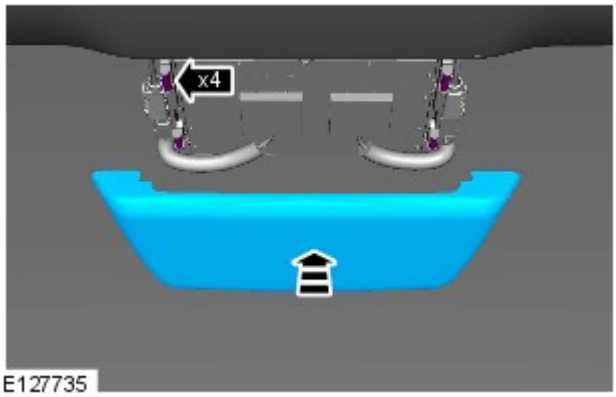


7.



E127736

8.



E127735

9. NOTE: The procedure must be carried out on both sides.

Refer to: C-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

Battery, Mounting and Cables - Battery Disconnect and Connect

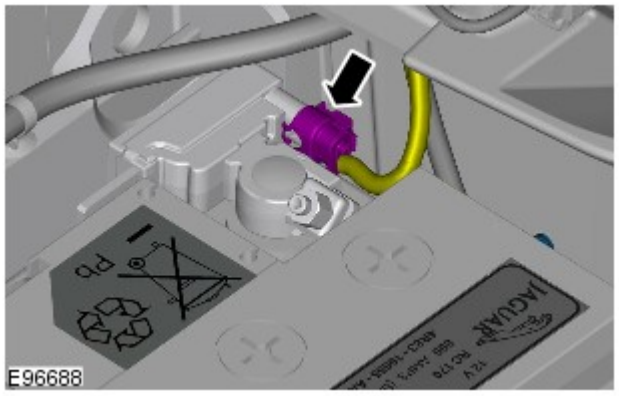
General Procedures

Disconnect

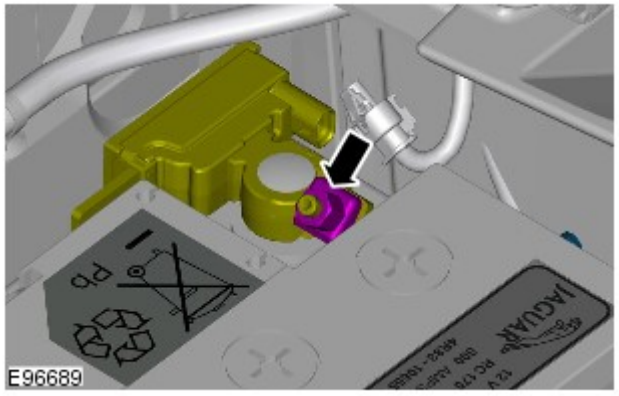
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

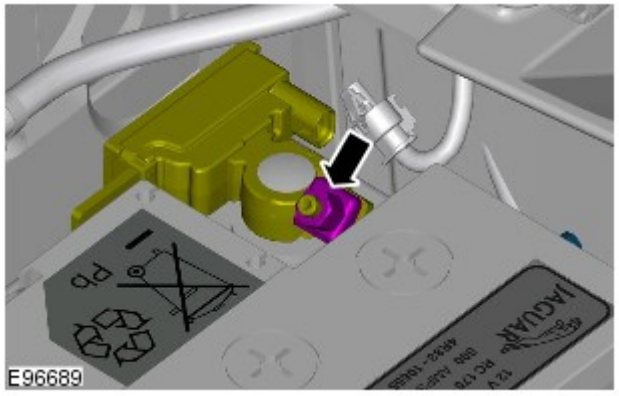


4. CAUTION: Take extra care not to damage the wiring harness.

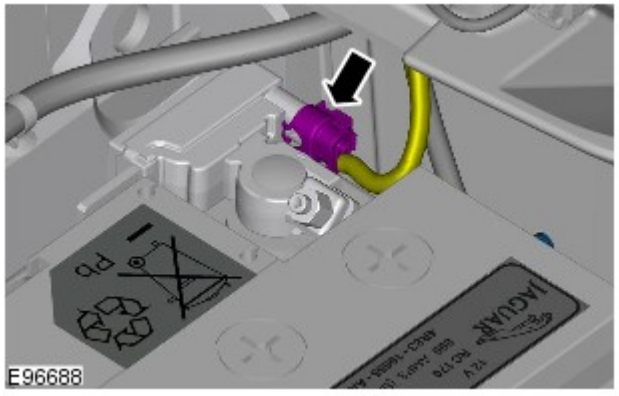


5.

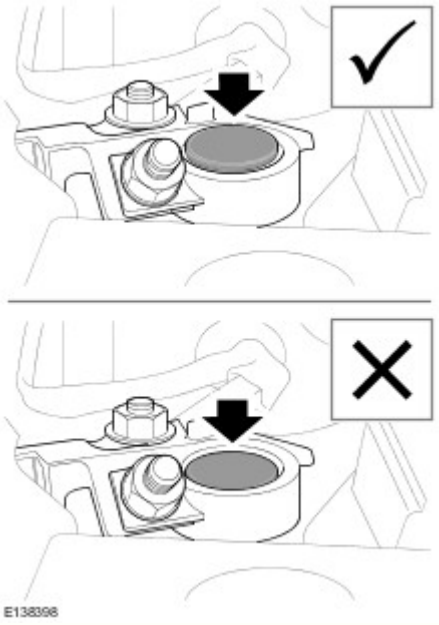
Connect



1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Published: 11-May-2011

Vehicle Dynamic Suspension - Air Suspension Control Module

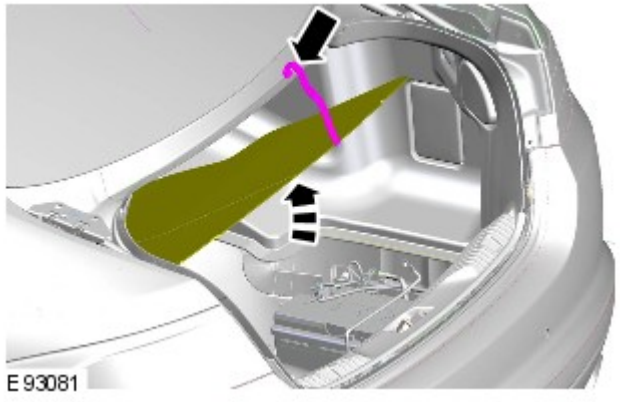
Removal and Installation

Removal

CAUTION: Calibration of the air suspension system must be carried out after the following components have been replaced: air suspension control module, suspension height sensor, suspension components and body panels incorporating suspension fixing points.

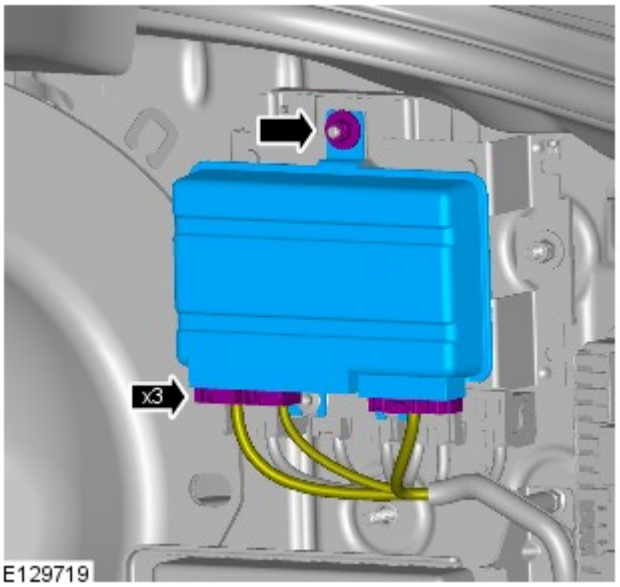
NOTE: Removal steps in this procedure may contain installation details.

1. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.



2. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).



4. *Torque:* 7 Nm

Installation

1. To install, reverse the removal procedure.

2. Refer to: Ride Height Adjustments (204-05 Vehicle Dynamic Suspension, General Procedures).

Published: 23-Apr-2015

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion

- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only.

		Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

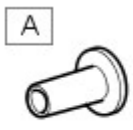
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

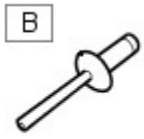
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

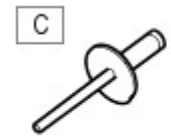
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

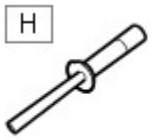
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

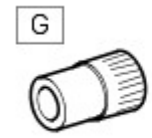
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

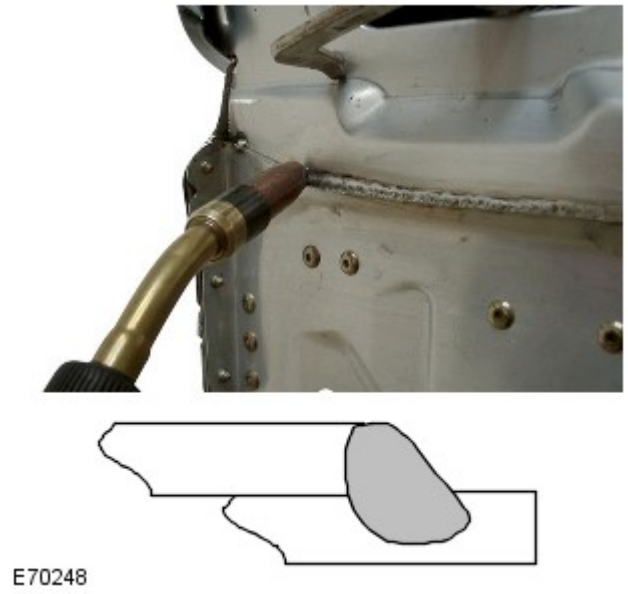
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

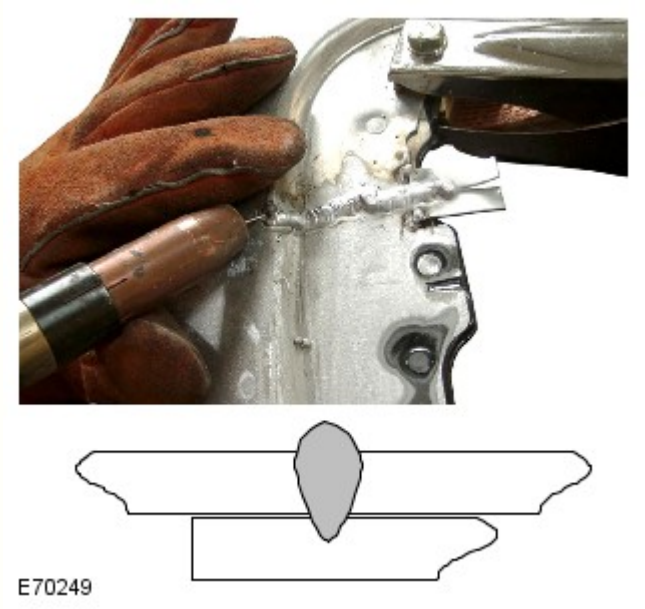
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

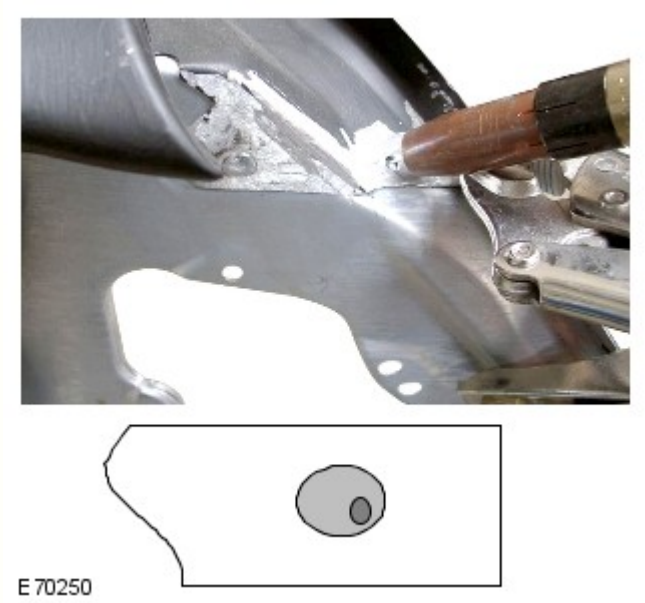
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Bumpers - Rear Bumper Cover

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

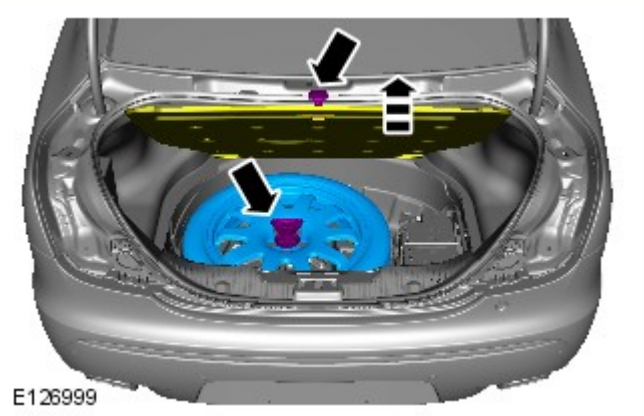
2. WARNING: Make sure to support the vehicle with axle stands.

   Raise and support the vehicle.

3. NOTE: The procedure must be carried out on both sides.

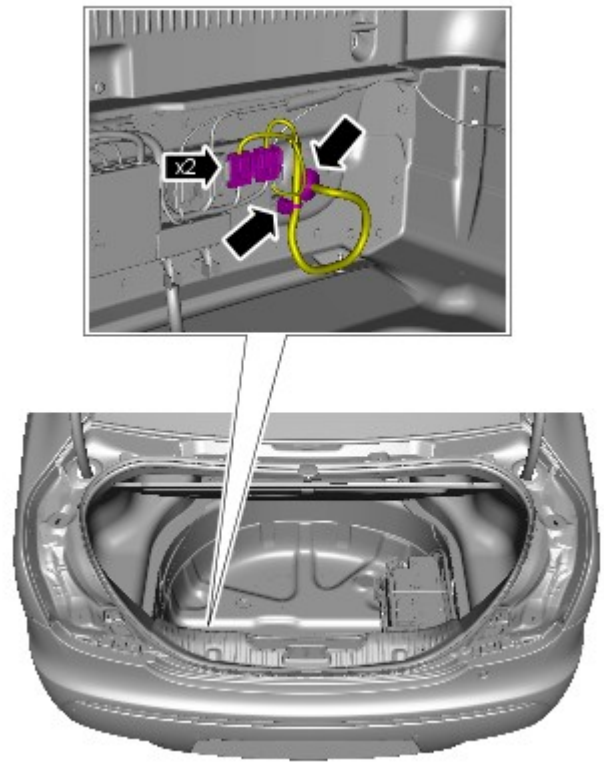
   Refer to: Rear Lamp Assembly (417-01 Exterior Lighting, Removal and Installation).

4.

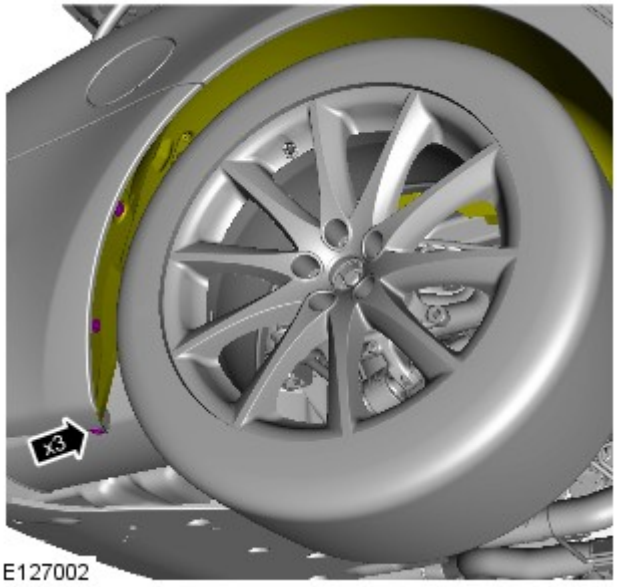


5.

6. CAUTION: Take extra care not to damage the wiring harnesses.



E127001



E127002

7. CAUTION: Protect the surrounding trim to avoid damage.

NOTES:

RH illustration shown, LH is similar.

The procedure must be carried out on both sides.

Torque: 1.5 Nm

8. CAUTION: Protect the surrounding trim to avoid damage.

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules
- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in^2) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

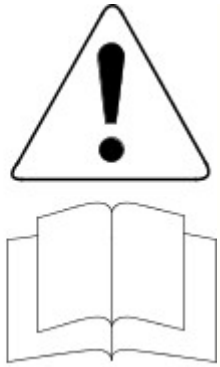
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

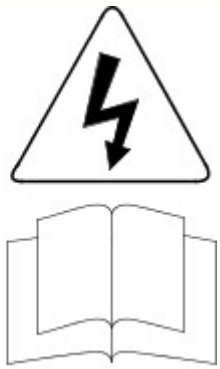
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



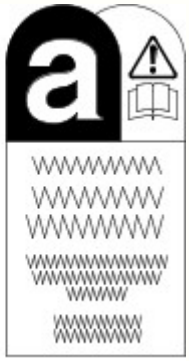
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



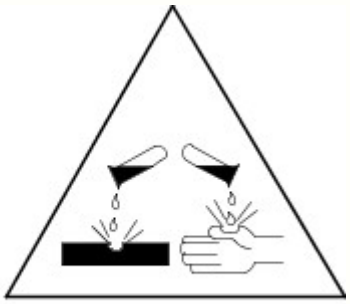
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing

damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Rear End Sheet Metal Repairs - Quarter Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being installed in isolation or is being installed in combination with panels other than those listed.

1. The quarter panel is a category A repair.

2. NOTE: The quarter panel is manufactured from aluminium alloy 6111-T4.

The quarter panel is serviced as a separate riveted and bonded panel, it includes the quarter panel lower extension.

3. The quarter panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Luggage compartment lid
   - Luggage compartment lid hinge
   - Rear window glass

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove the rear window glass.
For additional information, refer to: Rear Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

7.

Remove the luggage compartment lid hinge.
For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove the rear muffler.
For additional information, refer to: Rear Muffler (309-00 Exhaust System - 3.0L V6 - TdV6, Removal and Installation) / Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the rear muffler heatshields.

12. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation) / Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation).

13. Remove the luggage compartment lid weatherstrip.

14. Remove the parcel shelf.
For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

15. Remove the B-Pillar lower trim panel.
For additional information, refer to: B-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

16. Remove the C-Pillar side impact sensor.
For additional information, refer to: C-Pillar Side Impact Sensor (501-20B Supplemental Restraint System, Removal and Installation).

17. Remove the rear quarter window glass.
For additional information, refer to: Rear Quarter Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

18. Remove the rear safety belt retractor.
For additional information, refer to: Rear Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

19. Remove the rear door striker.

20. Remove the rocker panel outer moulding.

21. Remove the quarter panel splash shield.

22. Remove the forced air extraction grille.

23. Remove the rear bumper cover side retainer.

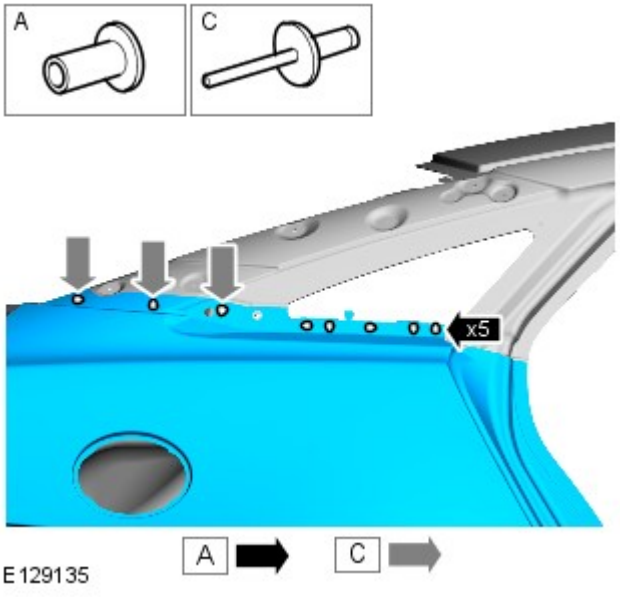
24. If the right-hand quarter panel is to be repaired, remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

25. If the right-hand quarter panel is to be repaired remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

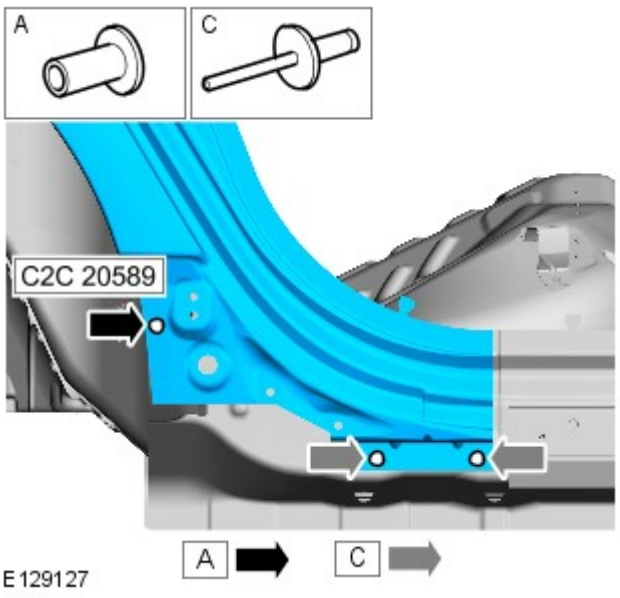
26. If the right-hand quarter panel is to be repaired remove the fuel filler door assembly.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

27. Remove any electrical components in the local area of repair to prevent damage.

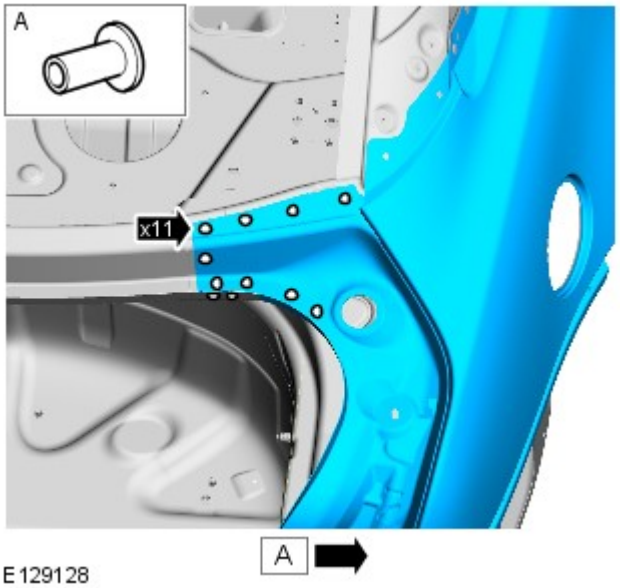
28. Release the back panel and loadspace wiring harness and position it to one side.



29. Remove the Monobolts from the quarter panel inner. Using the ESN50 remove the self piercing rivets from the quarter panel inner.

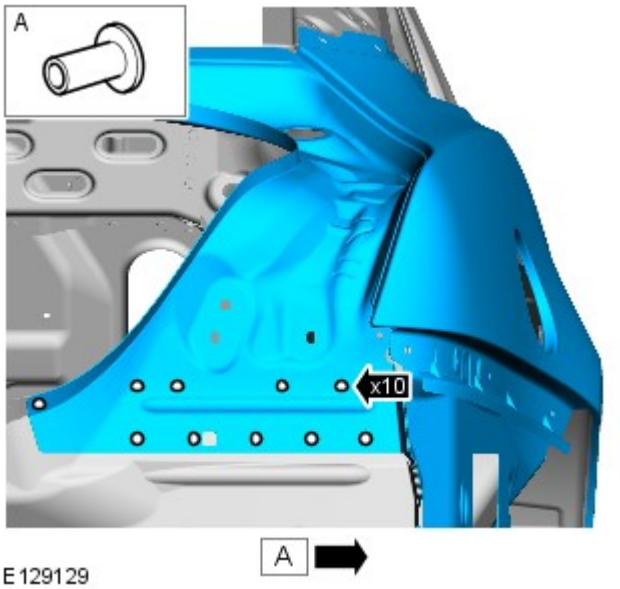


30. Remove the Monobolts from the rocker panel. Using the ESN50 remove the self piercing rivet from the rear wheelhouse outer.



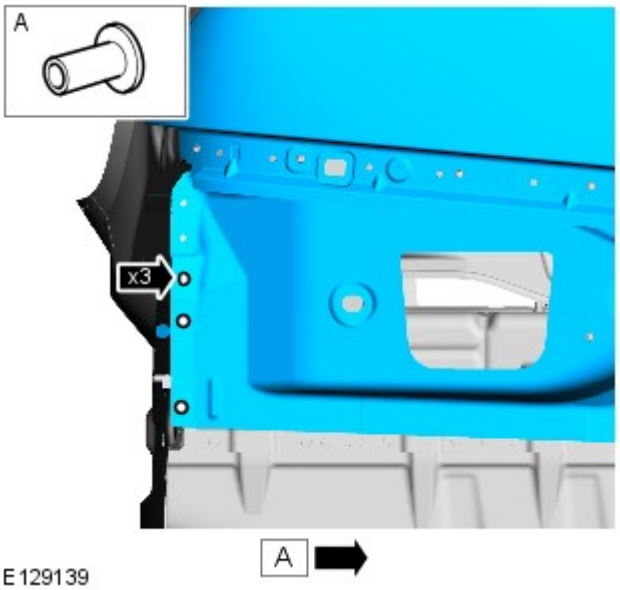
E129128

31. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the rear parcel shelf panel.



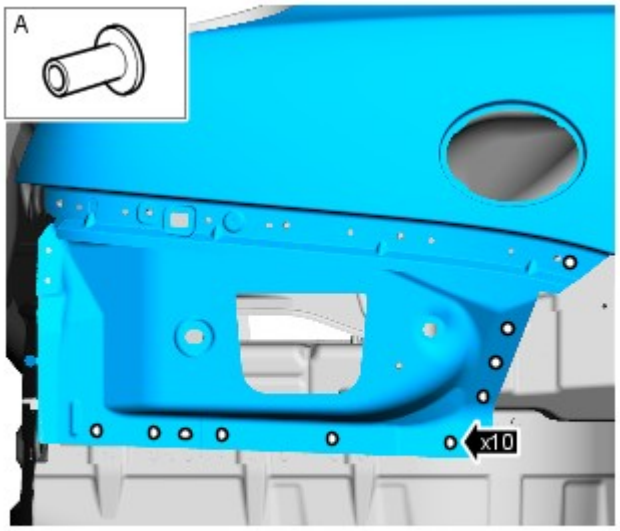
E129129

32. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the back panel.



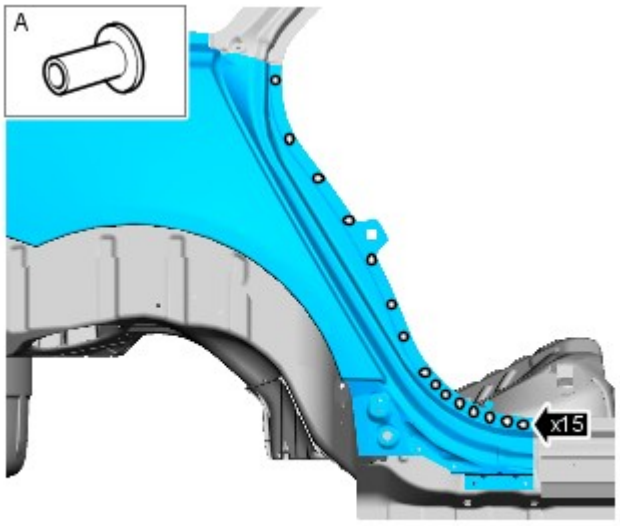
E129139

33. Using the ESN50, remove the self piercing rivets from the back panel.



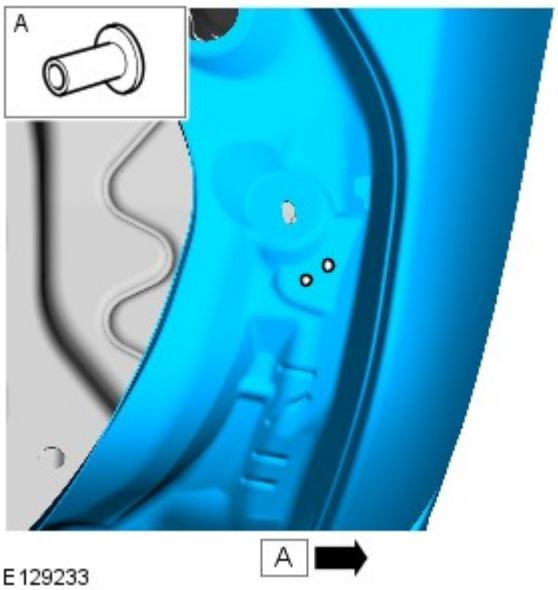
E129131

34. Using the ESN50, the self piercing rivets from the rear floor side extension and rear wheelhouse outer.



E129132

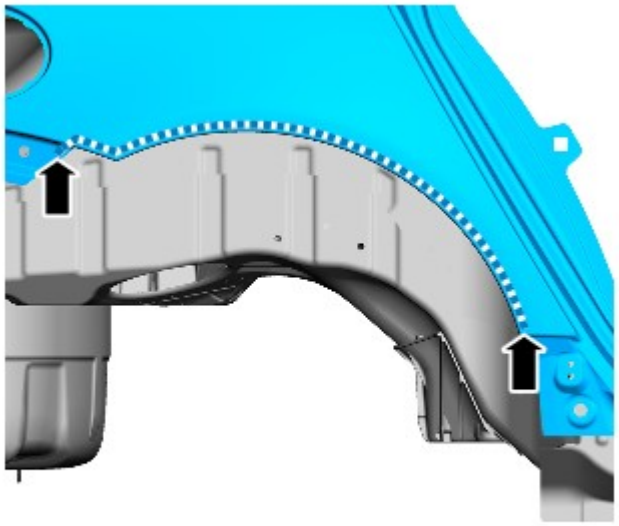
35. Using the ESN50, remove the self piercing rivets from the rear door aperture.



E129233

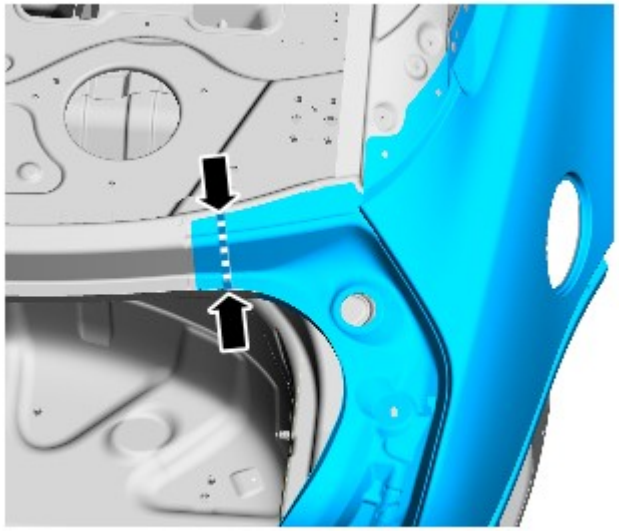
36. Using the ESN50, remove the self piercing rivets from the junction box and control module mounting panel.

37. Carefully separate and release the adhesive from the wheelarch outer.



E129134

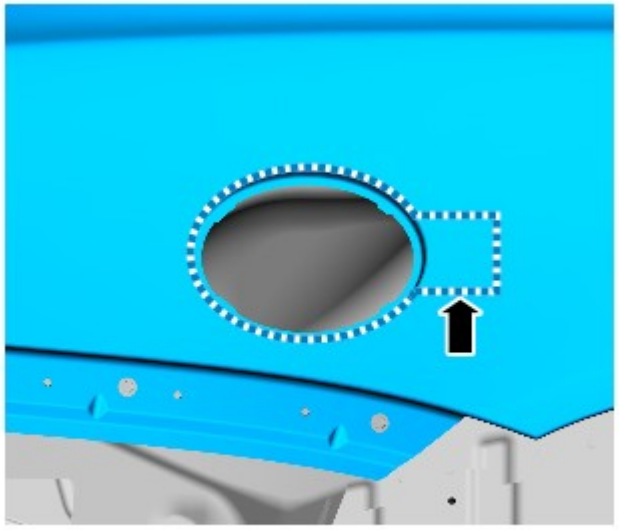
38. Carefully separate and release the adhesive from the rear parcel shelf panel.



E129717

39. Carefully separate and release the adhesive from the quarter panel inner.

E129743



E129133

40. If the right hand quarter panel is to be repaired, carefully separate and release the adhesive from the fuel filler door aperture.

41. Separate the joints and remove the old panel, also releasing the noise, vibration and harshness, (NVH), components.

Installation

1. If necessary, install the NVH components.

2. Remove rivet remnants.

3. Using a Roloc fine bristle disc, remove the adhesive residue.

4. Dress flanges where necessary.

5. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

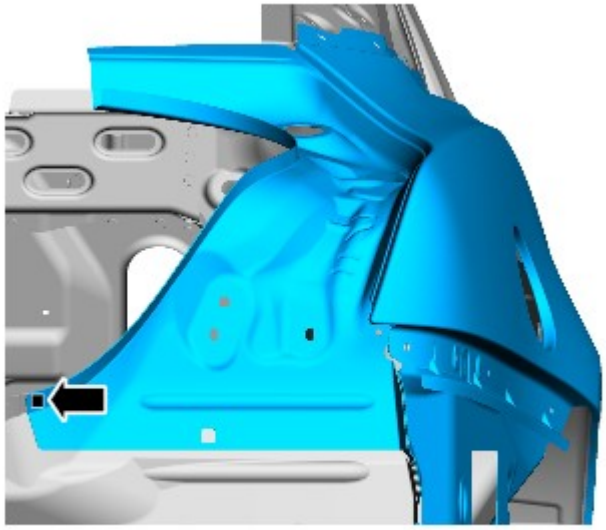
6. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

7. Remove the transit lug from the new panel.

8. Remove the new panel.

9. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

10. Drill 1 10mm hole in the new quarter panel ready for MAG plug welding.



E129716

11. Deburr the drilled holes.

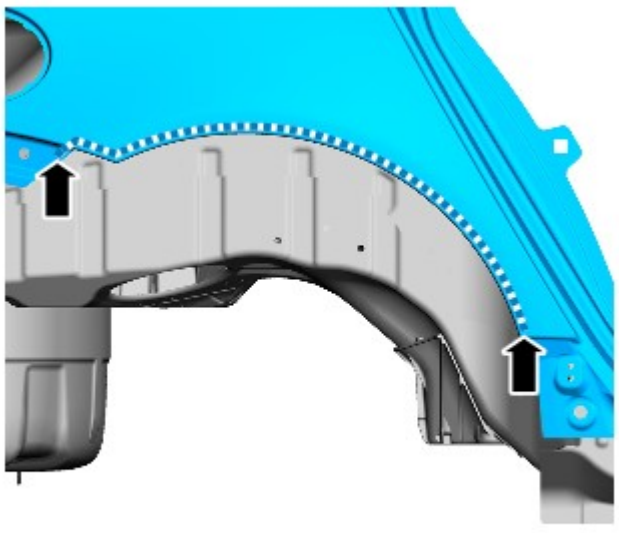
12. CAUTION: Use care not to damage the panel.

Remove seam sealer where applicable.

13. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

14. Pyrosil the joints.

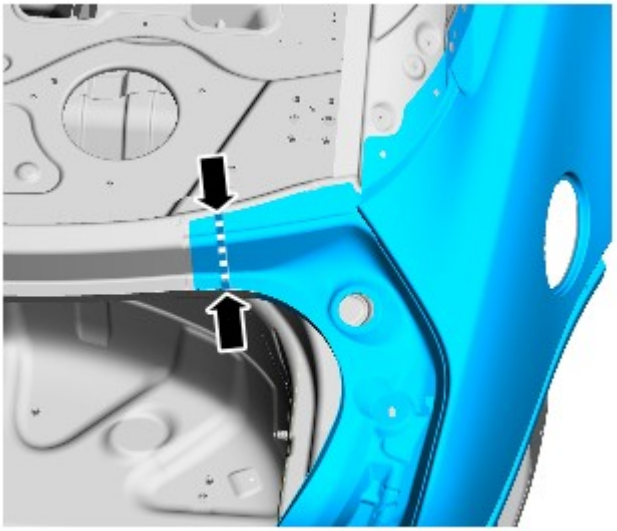
15. Apply the coupling agent and allow to dry.



E129134

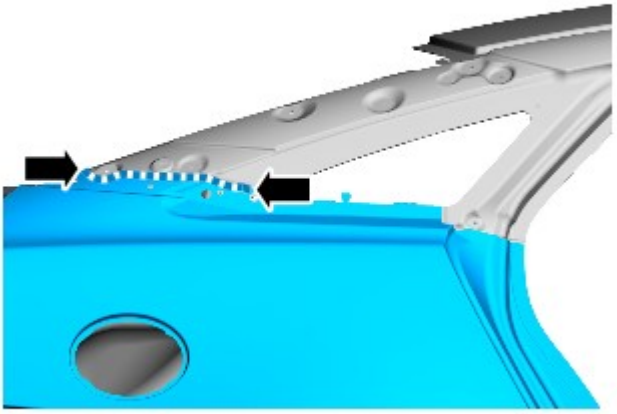
16. Apply semi-rigid sealer to the body at the wheelarch outer.

17. Apply semi-rigid sealer to the body at the rear parcel shelf panel.



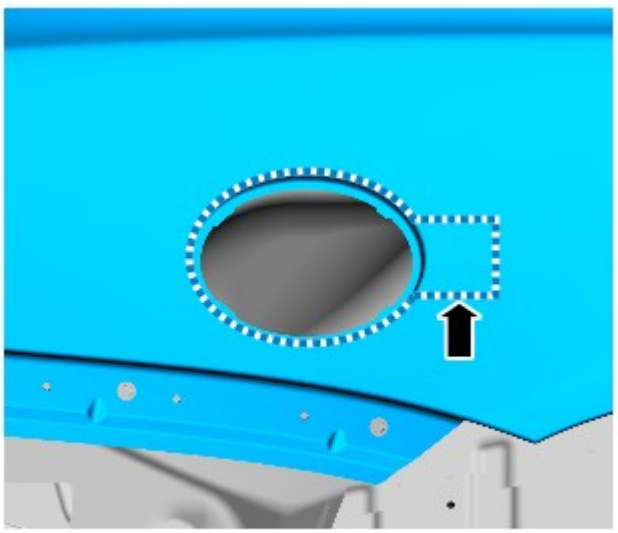
E129717

18. Apply semi-rigid sealer to the body at the quarter panel inner.



E129743

19. If the right hand quarter panel is to be repaired, apply semi-rigid sealer to the body at the fuel filler door aperture.



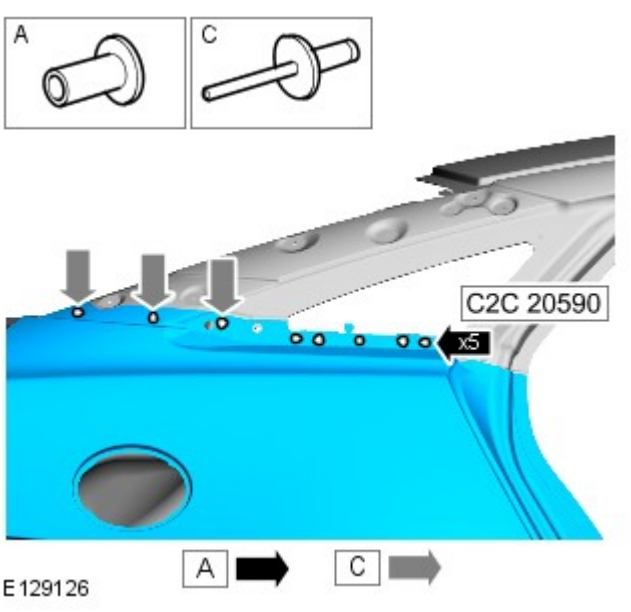
E129133

20. Apply semi-rigid sealer to the NVH components.

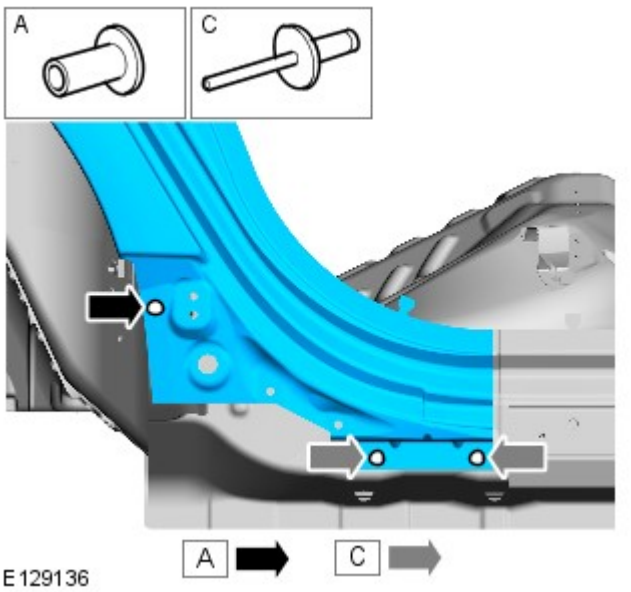
21. NOTE: make sure a continuous bead of adhesive surrounds the fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

22. Offer up the new panel and clamp into position.

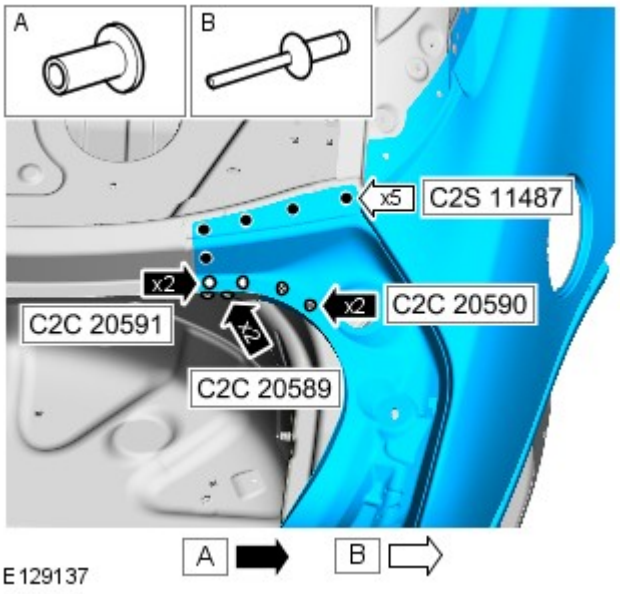


23. Using the Genesis G4, install the Monobolts into the quarter panel inner. Using the ESN50, install the self piercing rivets into the quarter panel inner.

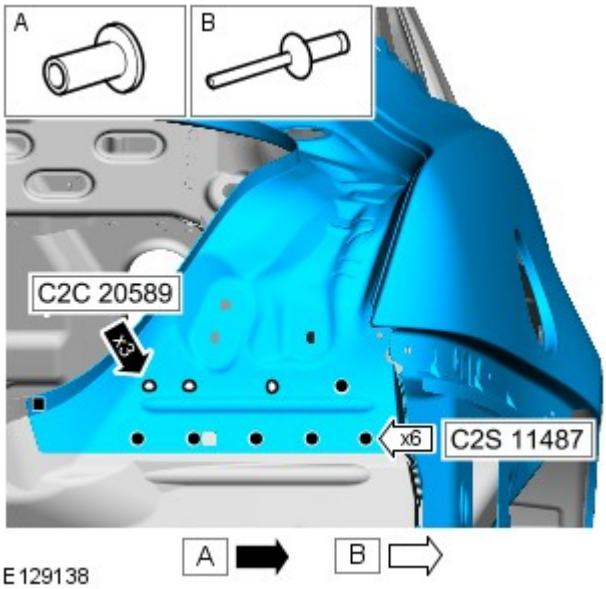


24. Using the Genesis G4, install the Monobolts into the rocker panel. Using the ESN50, install the self piercing rivet into the rear wheelhouse outer.

25. Using the Genesis G4, install the Hemloks into the rear parcel shelf panel. Using the ESN50, install the self piercing rivets into the rear parcel shelf panel.

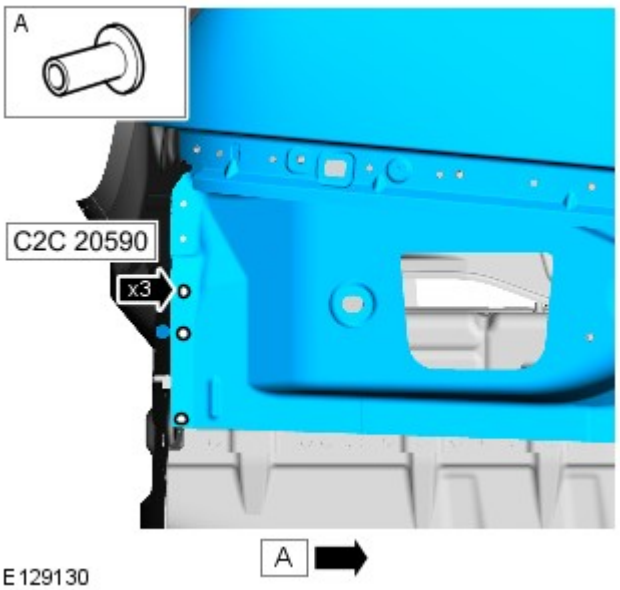


E129137



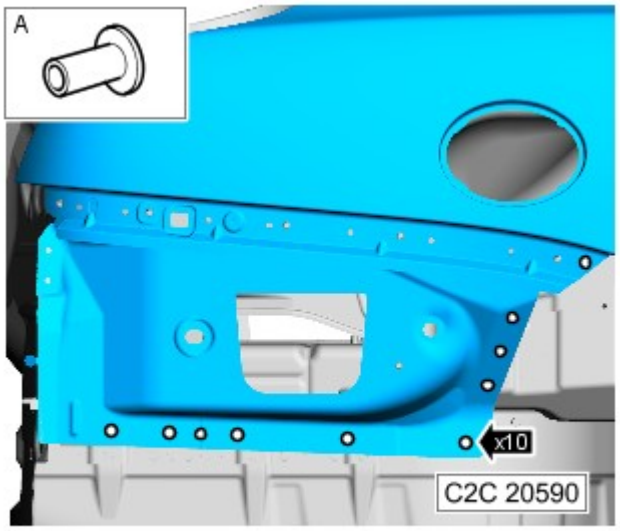
E129138

26. Using the Genesis G4, install the Hemloks into the back panel. Using the ESN50, install the self piercing rivets into the back panel.



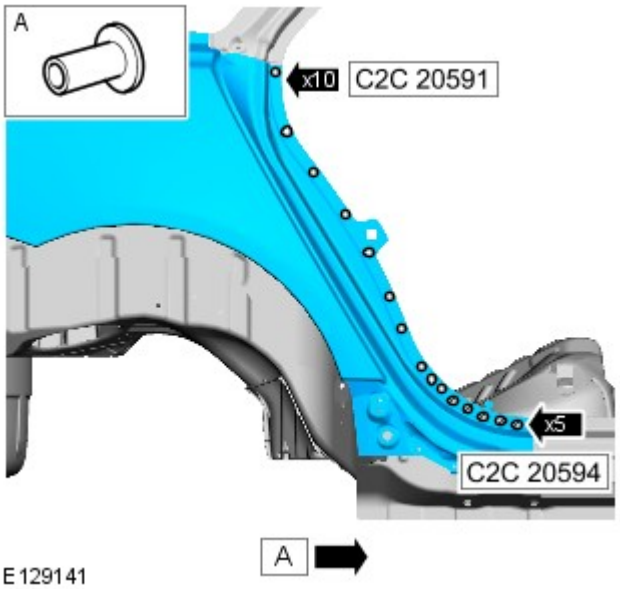
E129130

27. Using the ESN50, install the self piercing rivets into the back panel.



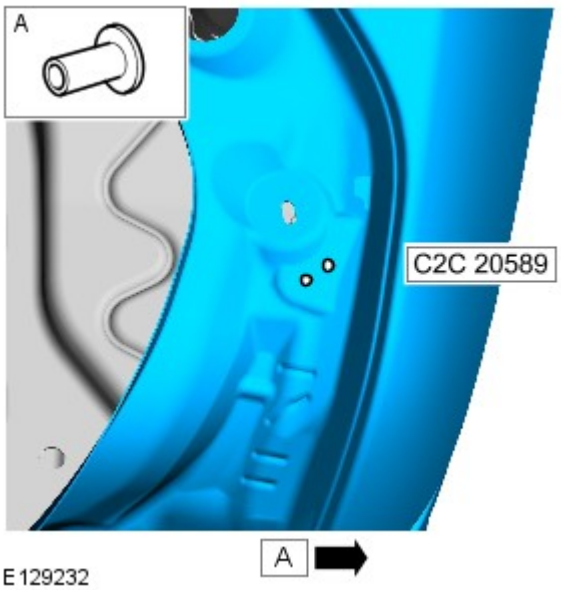
E129140

28. Using the ESN50, install the self piercing rivets into the rear floor side extension and rear wheelhouse outer.



E129141

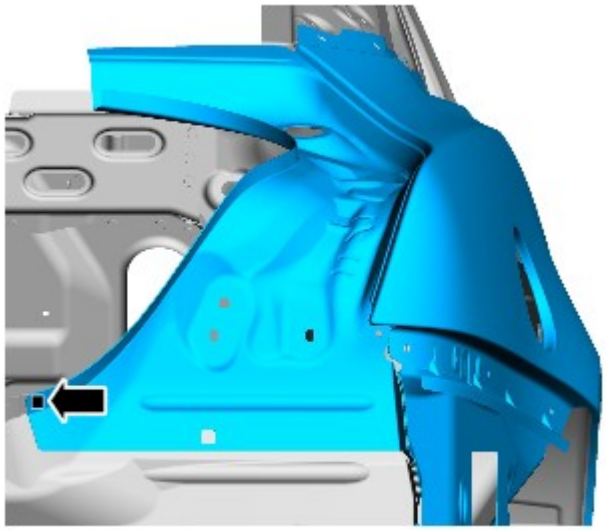
29. Using the ESN50, install the self piercing rivets into the rear door aperture.



E129232

30. Using the ESN50, install the self piercing rivets into the junction box and control module mounting panel.

31. Remove any excess adhesive.



E129716

32. Install the MIG plug weld into the back panel.

E129533

33. Install the NVH material as indicated.

34. The installation of associated panels and components is the reversal of removal procedure.

Published: 11-May-2011

Rear End Sheet Metal Repairs - Spare Wheel Well

Removal and Installation

Removal

1. The spare wheel well is a category A repair.

E130781

2. NOTE: The spare wheel well is manufactured from aluminium alloy 5754-NG.

The spare wheel well is serviced as a separate riveted and bonded panel. It is not serviced with all its rivet-studs.

3. NOTE: The rear suspension and subframe assembly can remain in place, however, some aspects of the refinishing process will need to be carried out prior to the installataion of the new panel.

The spare wheel well is replaced in conjunction with:

- Rear bumper cover
- Rear bumper
- Back panel

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the back panel.
For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Remove the fuel tank filler pipe.
For additional information, refer to: Fuel Tank Filler Pipe (310-01A, Removal and Installation).

8. Remove the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

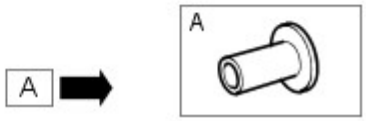
9. Remove sealer from the area of repair as required, to reveal the panel joints.

10. Prior to removal, mark the position of the spare wheel well in relation to adjacent panels, for ease of alignment on installation.

E130782

11. CAUTION: Use care not to damage adjacent panels.

Saw cut to remove the panel bulk as indicated.



E130783

12. NOTE: Remove the sealer to expose the self piercing rivets.

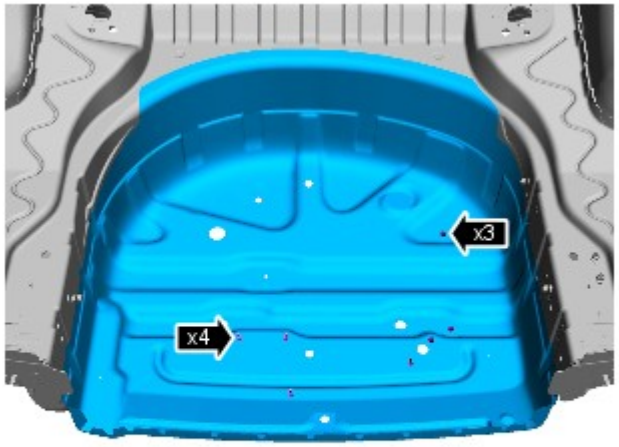
Using the ESN50, remove the self piercing rivets.

13. NOTE: Retain the remnant as it will be used as a template.

Separate the joints and remove the old panel remnant.

Installation

1. Using the old panel for reference, install the rivet-studs into the new panel as indicated.



E130786

2. Remove rivet remnants.

3. Dress flanges where necessary.

4. Trim, clean and prepare the old panel remnant to be used as a template.

E130784

5. Clamp the template to the new panel and using a 6.5mm Cryobit drill bit. Drill holes through the template into the new panel, ready for Hemloks to be installed.

6. Remove the template from the new panel.

7. Debur the drilled holes in the new panel.

8. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, removing any sealer and adhesive residue.

9. NOTE: Use the marks made prior to removal to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

10. Using a 6.5mm Cryobit drill bit. Drill holes through the old panels into the new panel, at the points where Hemloks are to be installed.

11. Remove the new panel.

12. Debur the drilled holes.

13. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

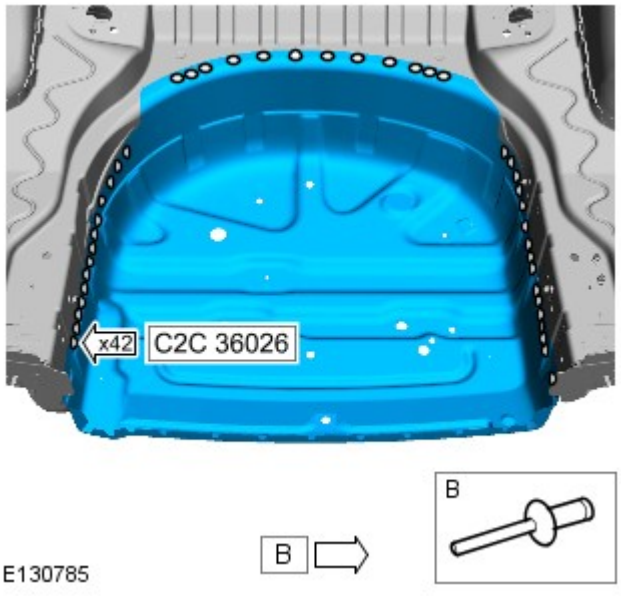
14. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

15. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

16. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

17. Offer up the new panel, align and clamp into position.



18. Using the Genesis G4, install the Hemloks.

19. Remove any excess adhesive.

20. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

21. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Battery, Mounting and Cables - Battery

Removal and Installation

Removal

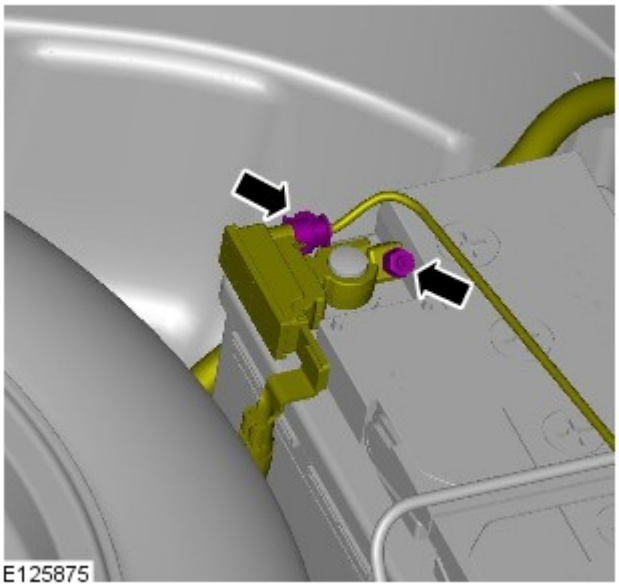
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

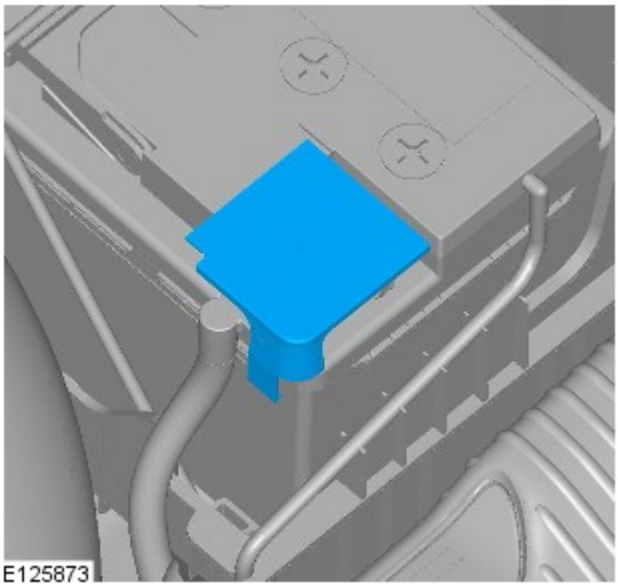
3. Raise and secure the luggage compartment floor covering.

4. CAUTION: Take extra care not to damage the wiring harness.

   Torque: 6 Nm

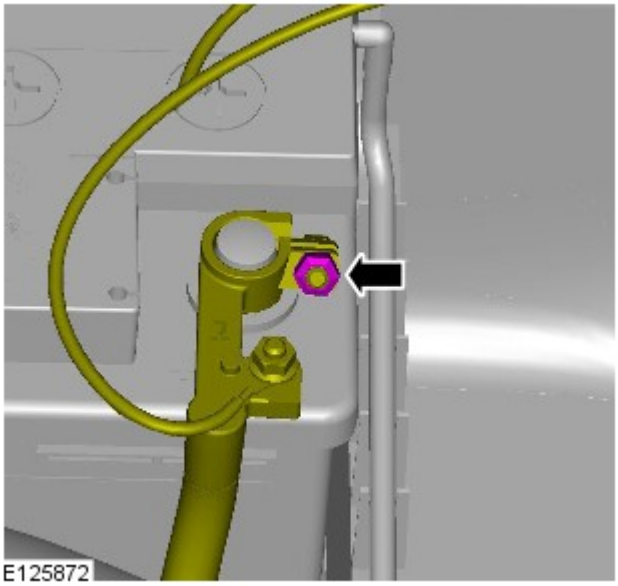


5.

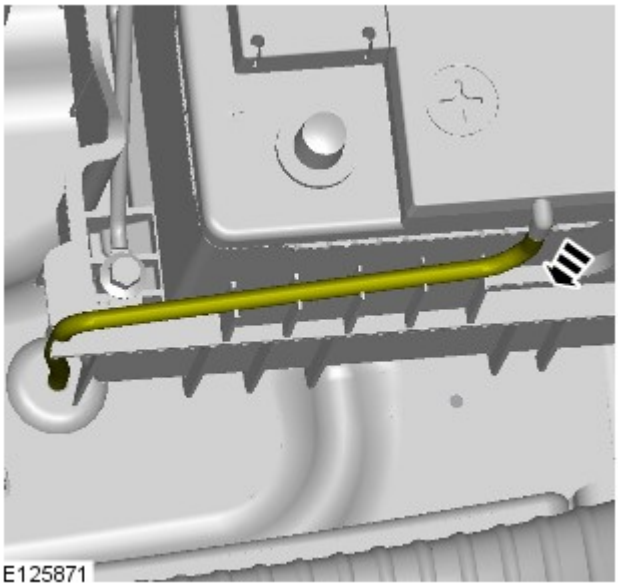


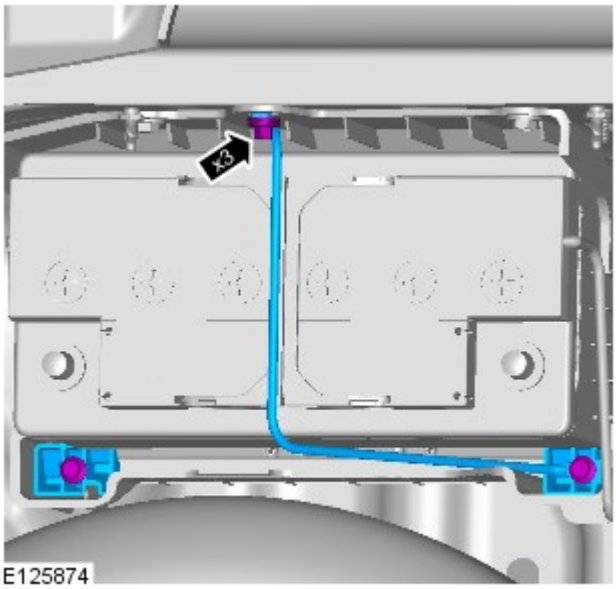
6. CAUTION: Take extra care not to damage the wiring harness.

Torque: 6 Nm

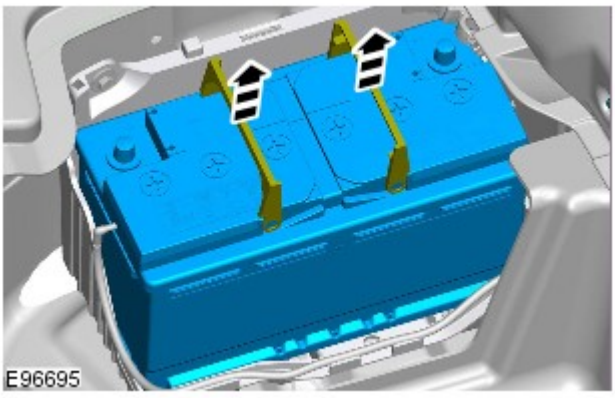


7.





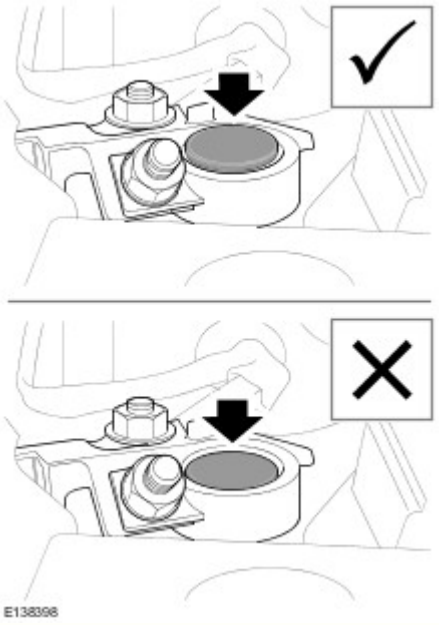
8. *Torque:* 13 Nm



9. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Installation

1. CAUTION: Make sure the battery monitoring system (BMS) electrical connector is connected to the module, before installing the BMS on to the battery terminal.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

To install, reverse the removal procedure.

2. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system .

3. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

4. Enter the audio unit preset radio frequencies.

5. Reset the clock to the correct time.

6. Start the engine and allow to idle until the engine reaches normal operating temperature.

7. Switch the engine off.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

General Procedures

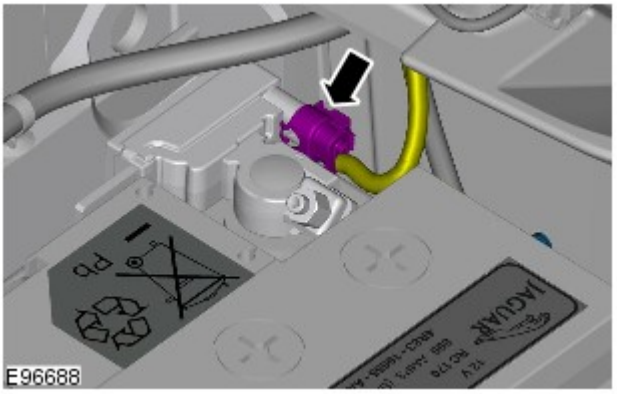
Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

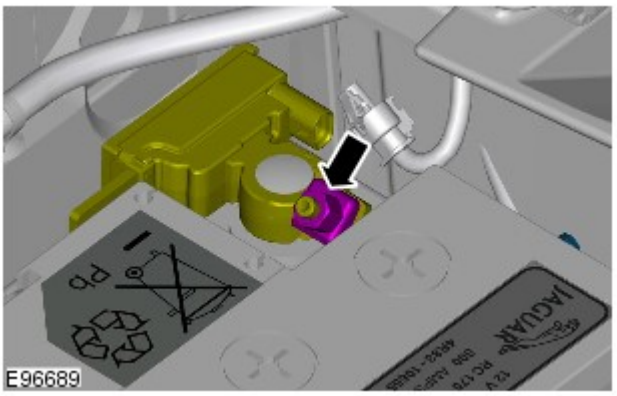
2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

4. CAUTION: Take extra care not to damage the wiring harness.

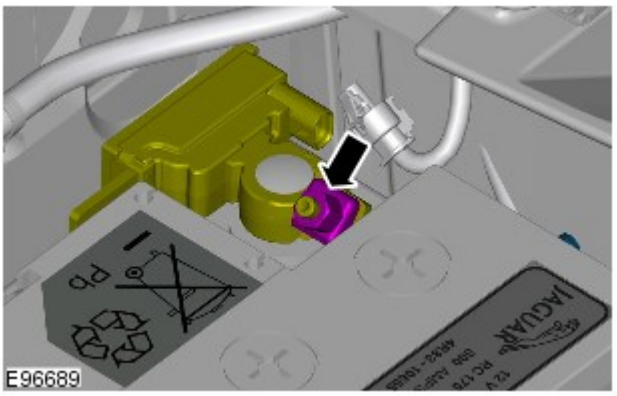


5.

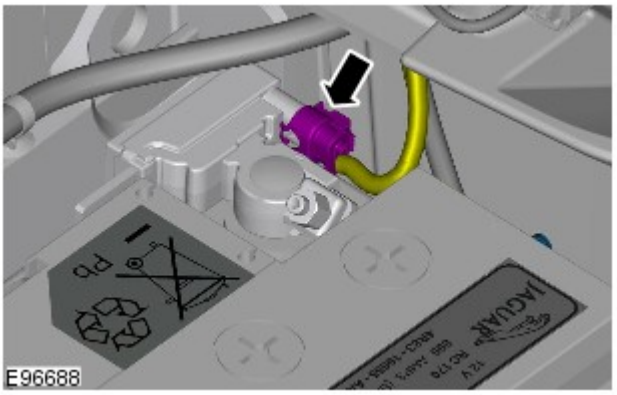


Connect

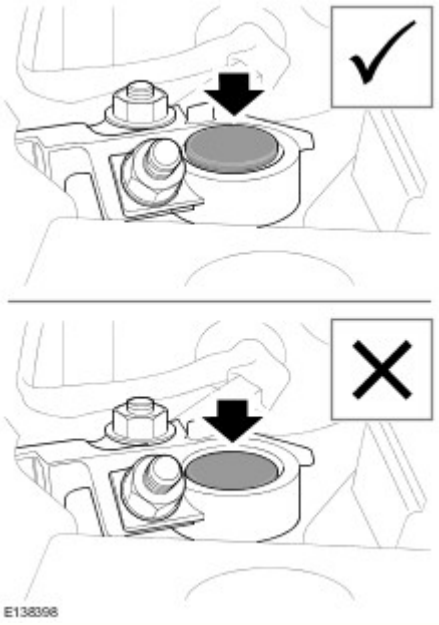
1. *Torque:* 6 Nm



2.



3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Rear End Sheet Metal Repairs - Back Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The back panel is a category A repair.

2. NOTE: The back panel is manufactured from aluminium alloy 5754-NG.

The back panel is serviced as a separate riveted and bonded panel, it includes the back panel inner.

E129307

3. The back panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation) /
Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. Remove the luggage compartment lid weatherstrip.

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove both the rear mufflers.
For additional information, refer to: Rear Muffler (309-00A, Removal and Installation) /
Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the right-hand and left-hand rear muffler heatshields.

12. Remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

13.

Remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

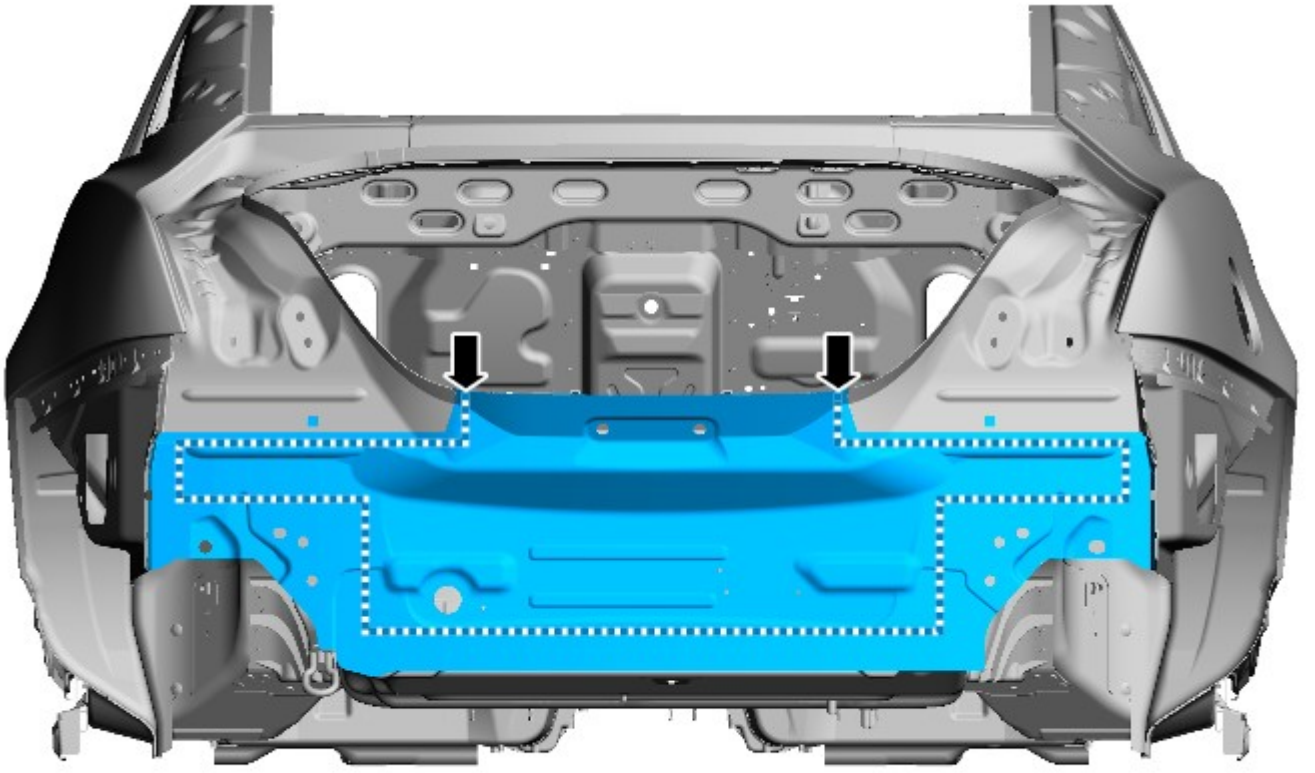
14. Release the back panel and loadspace wiring harness and position it to one side.

15. Remove the luggage compartment latch striker.

16. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

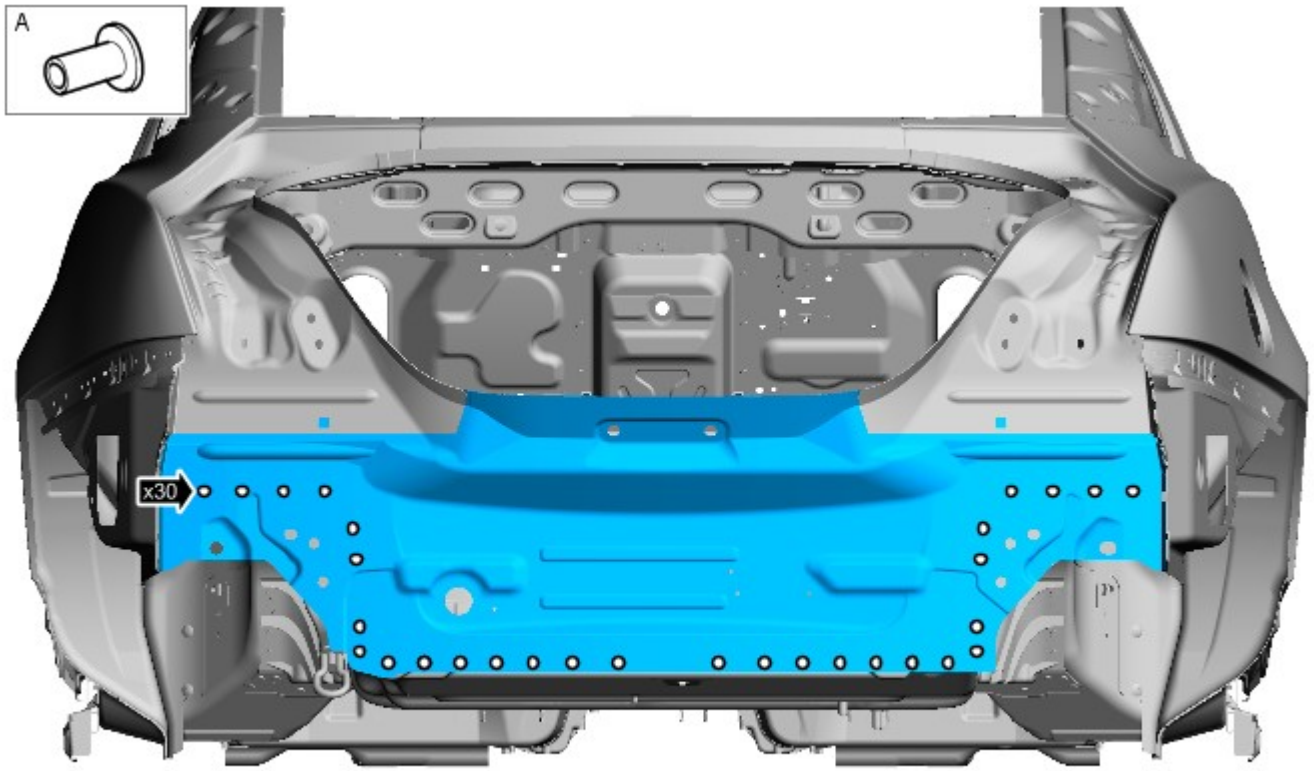
17. Remove any electrical components in the local area of repair to prevent damage.

18. Saw cut the old panel along the point shown in the illustration. This allows access to allow the use of the ESN50.



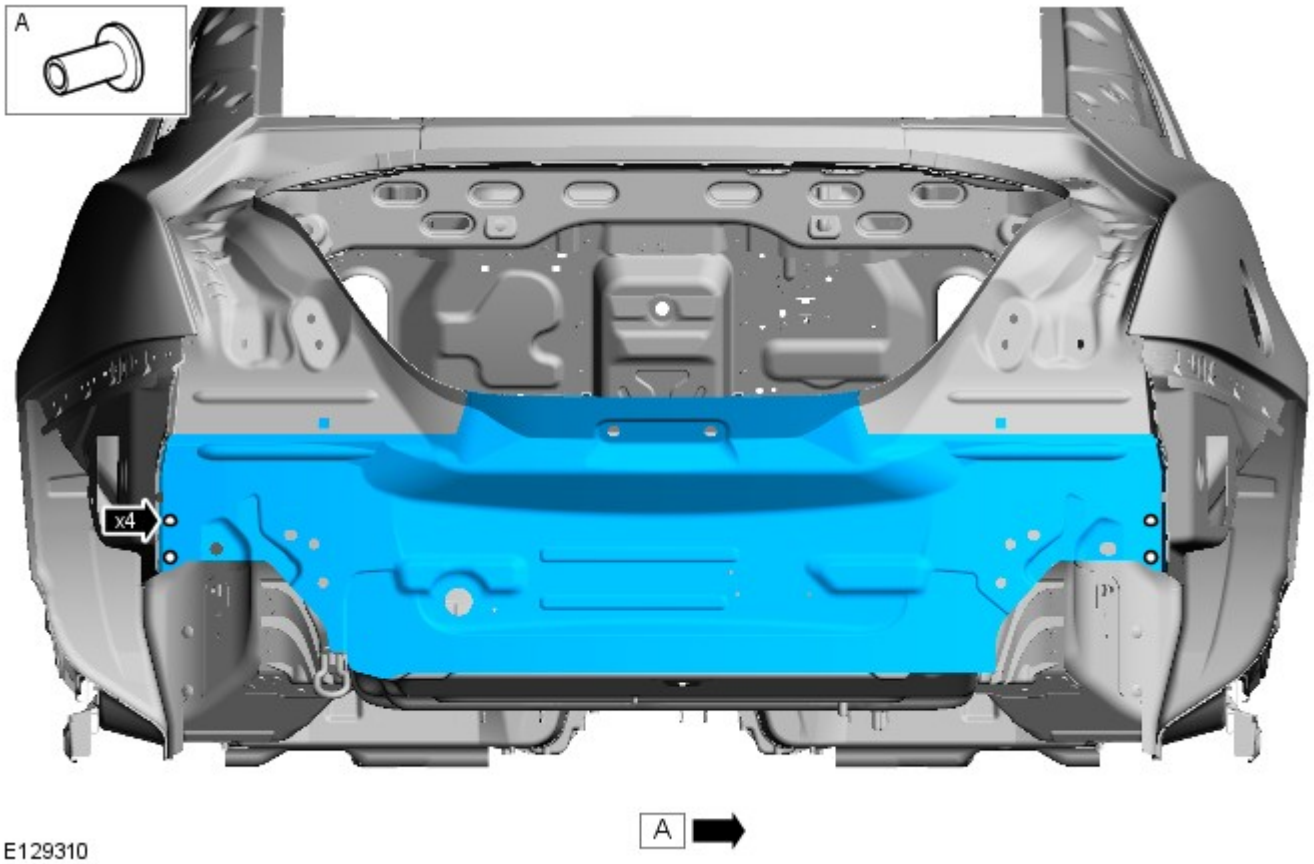
E129308

19. Using the ESN50, remove the self piercing rivets from the spare wheel well and rear side members.



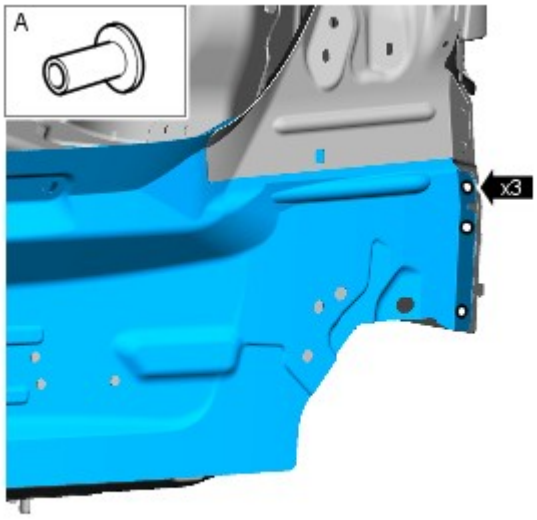
E129309

20. Using the ESN50, remove the self piercing rivets from the rear floor side extensions.

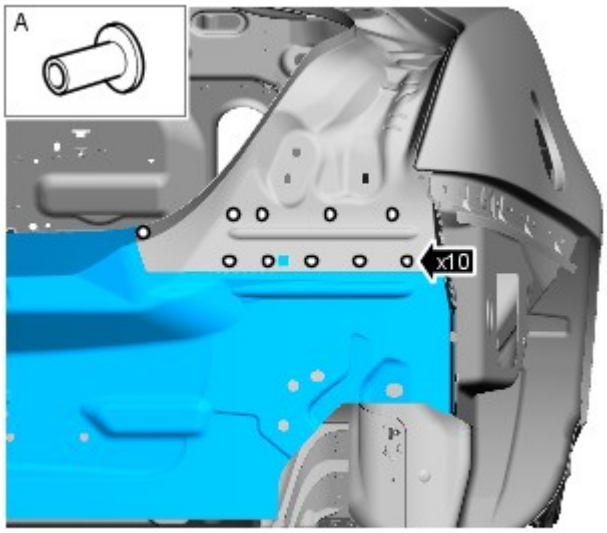


E129310

21. Using the ESN50, remove the self piercing rivets (3 each side) from the quarter panel lower extensions.

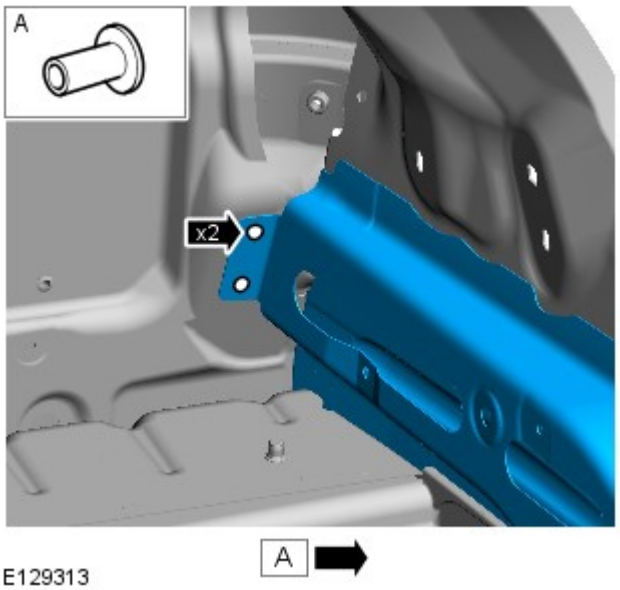


E129311



E129312

22. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets (10 each side) from the quarter panels.

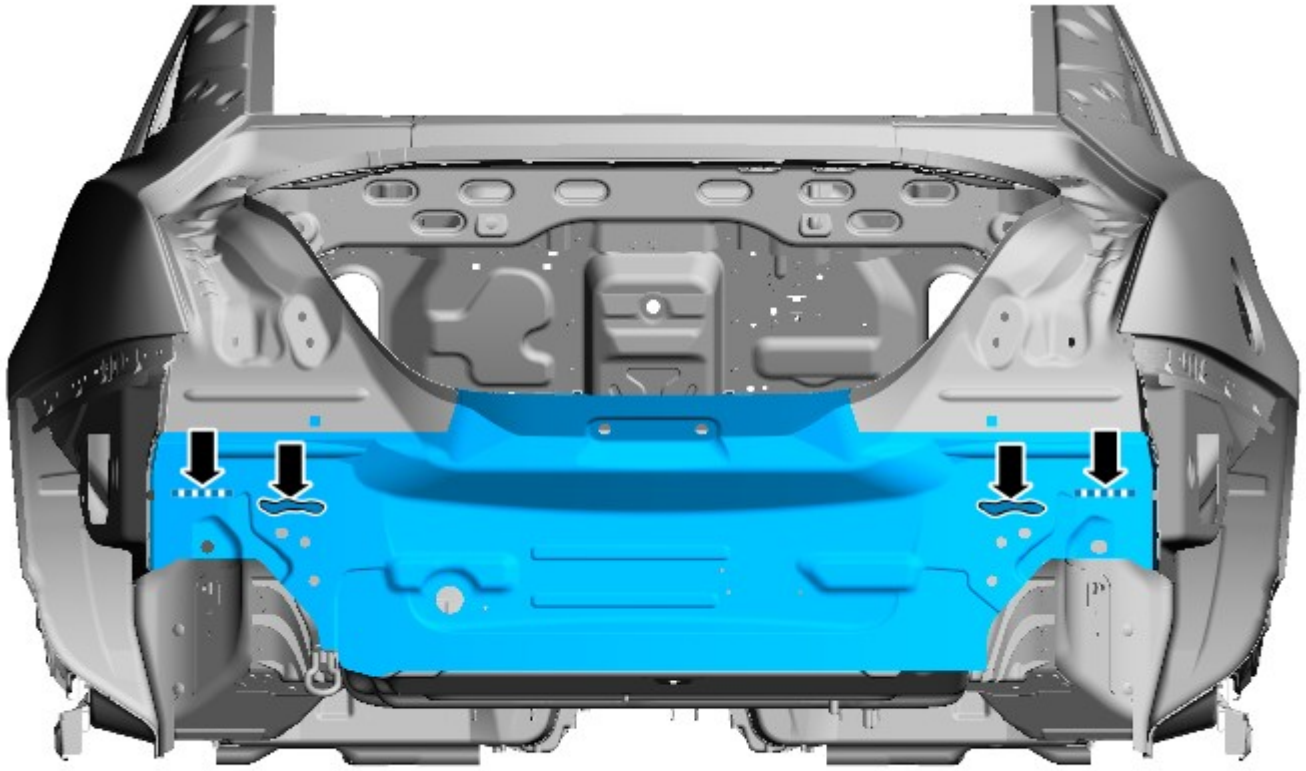


E129313

23. CAUTION: Use care not to drill through into inner panels.

Using a 6.5mm Cryobit drill bit, remove the self piercing rivets (2 each side) from the junction box and modules mounting panels.

24. Separate the joints and remove the old panel, carefully releasing the adhesive at the points illustrated.



E129314

Installation

1. Remove rivet remnants.

2. Using a Roloc fine bristle disc, remove the adhesive residue.

3. Dress flanges where necessary.

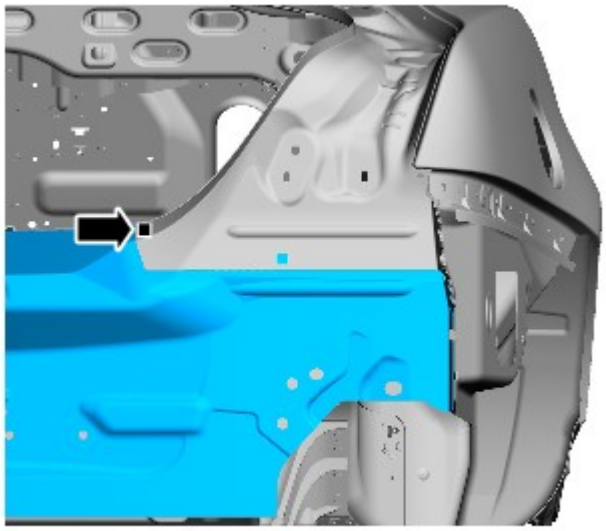
4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

5. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

6. Remove the new panel.

7. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.

8. Using a 10mm drill bit, drill 2 holes in the old quarter panel ready for MIG plug welding.



E129612

9. Debur the drilled holes.

10. CAUTION: Use care not to damage the panel.

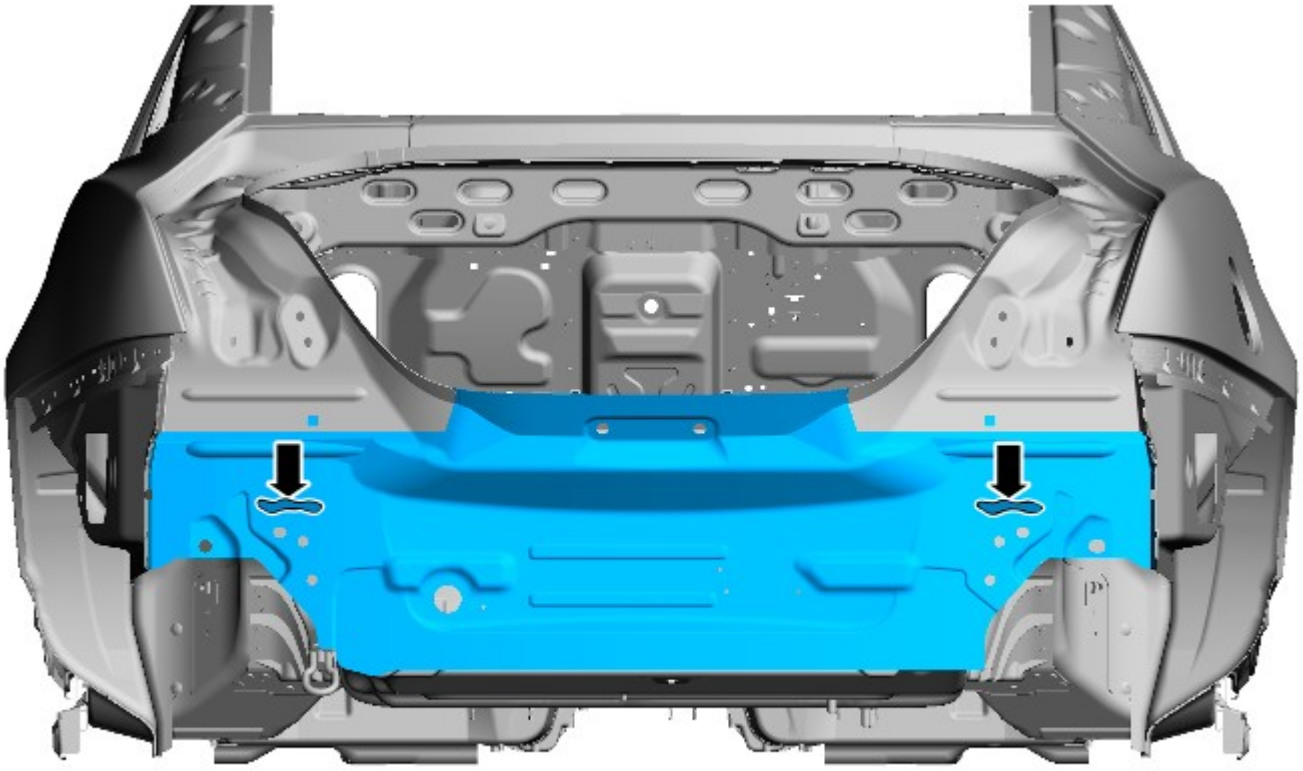
Remove seam sealer where applicable.

11. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

12. Pyrosil the joints.

13. Apply the coupling agent and allow to dry.

14. Apply the semi-rigid sealer at the points illustrated.



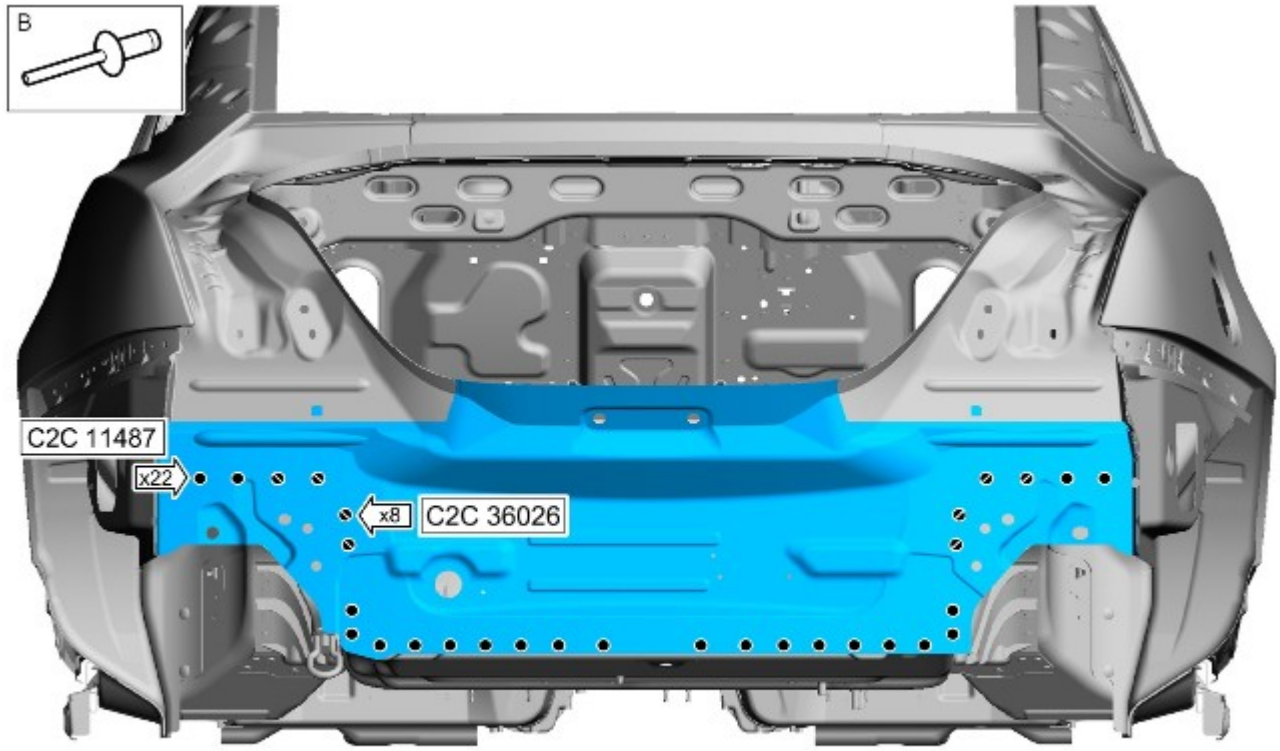
E129315

15. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

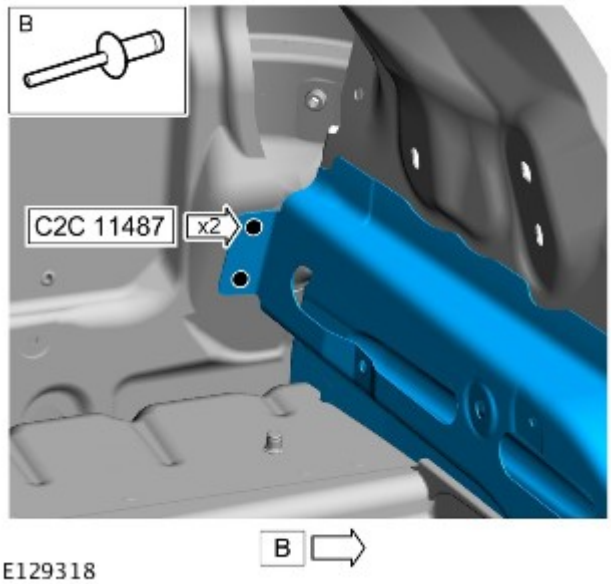
Apply a 5mm zig zag style bead of 3M 8115 adhesive to the body joints.

16. Offer up the new panel and clamp into position.

17. Using the Genesis G4, install 8 Hemloks (4 each side) into the rear side member. Install a further 22 Hemloks (11 each side) into the spare wheel well and rear floor side extension.



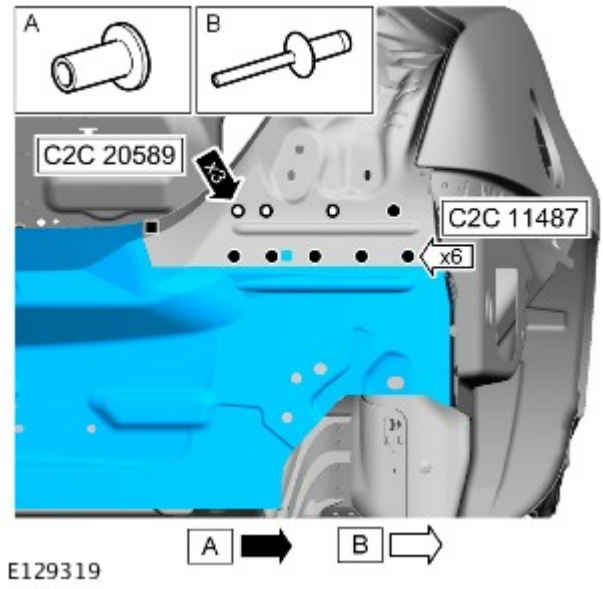
E129317



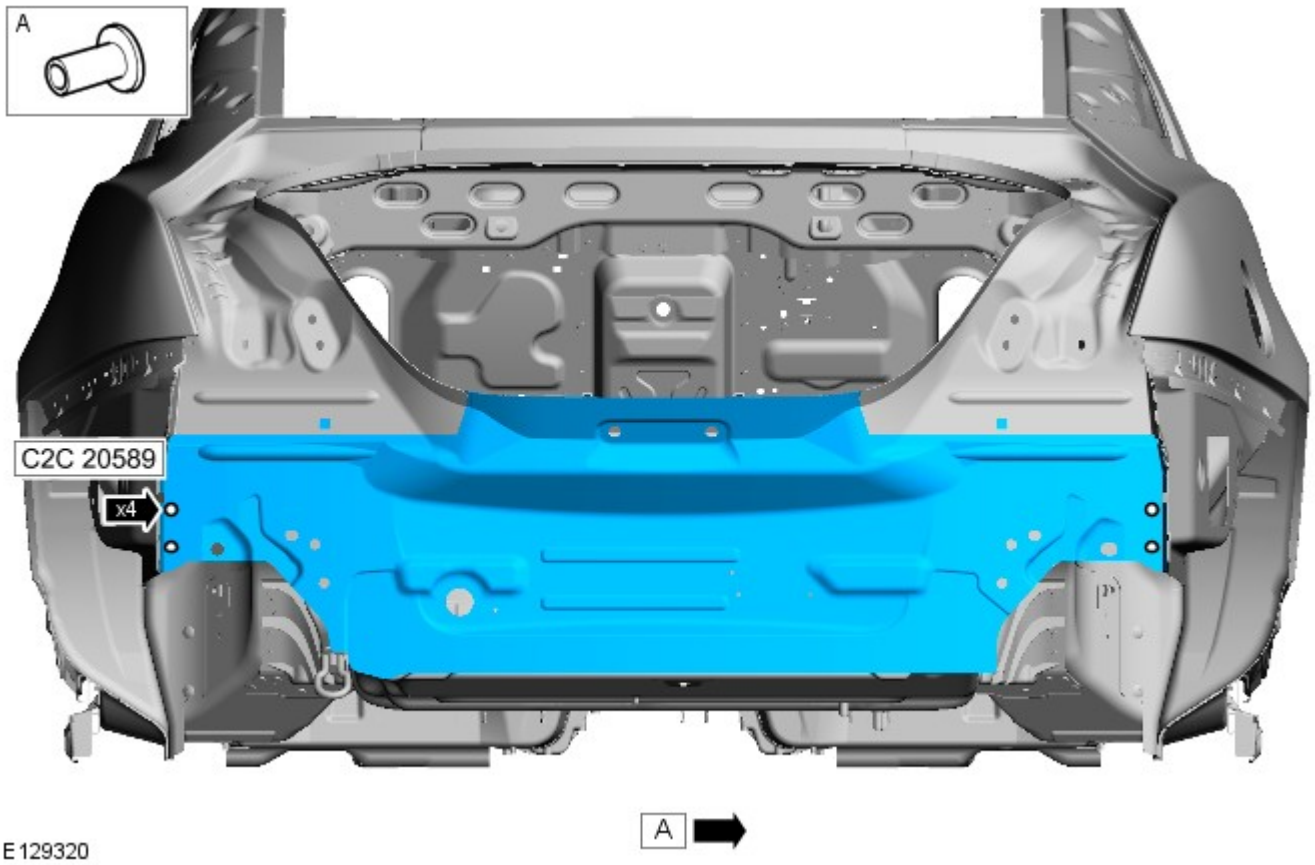
E129318

18. Using the Genesis G4, install the Hemloks (2 each side) into the junction box and modules mounting panels.

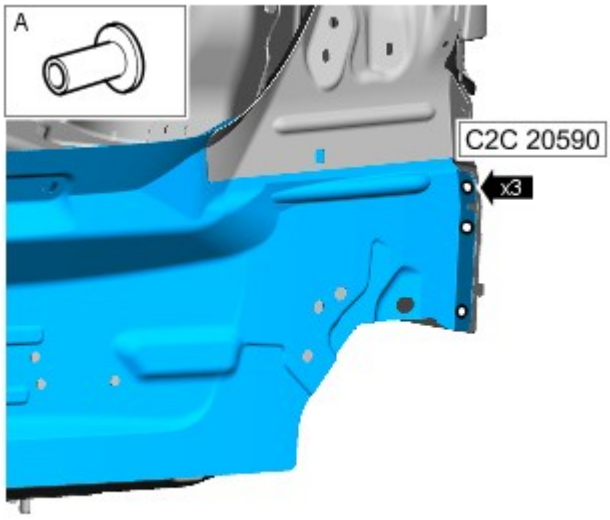
19. Using the Genesis G4, install 12 Hemloks (6 each side) into the quarter panel. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel.



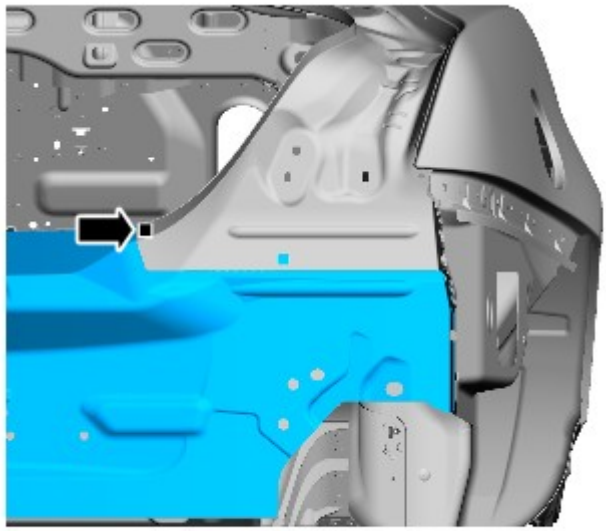
20. Using the ESN50, install the self piercing rivets into the rear floor side extension.



21. Using the ESN50, install the self piercing rivets (3 each side) into the quarter panel lower extension.



22. Remove any excess adhesive.



23. Install 2 MIG plug welds (1 each side) into the quarter panel.

24. The installation of associated panels and components is the reversal of removal procedure.

Published: 23-Apr-2015

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places

particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel

- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual

- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A

- Category B

All approved equipment is available on a Worldwide basis from:

Country	Phone	Fax

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During	Yes - **caution** material sensitive to heat.	Yes - **must** be heated to maintain original alloy properties. Ideal

Repair	Range: 140 - 160°C Ideal panel temperature: **150°C**	panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

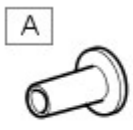
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

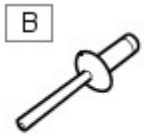
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

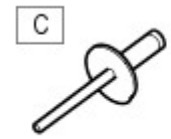
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

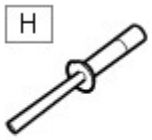
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

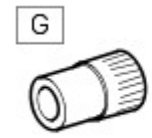
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

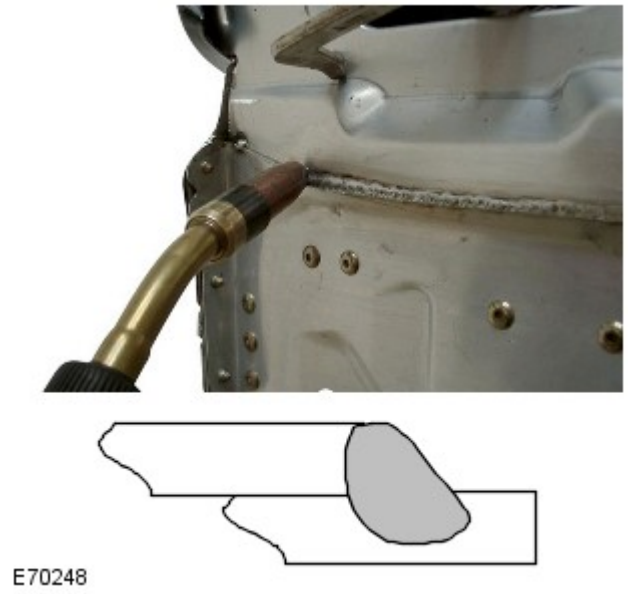
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

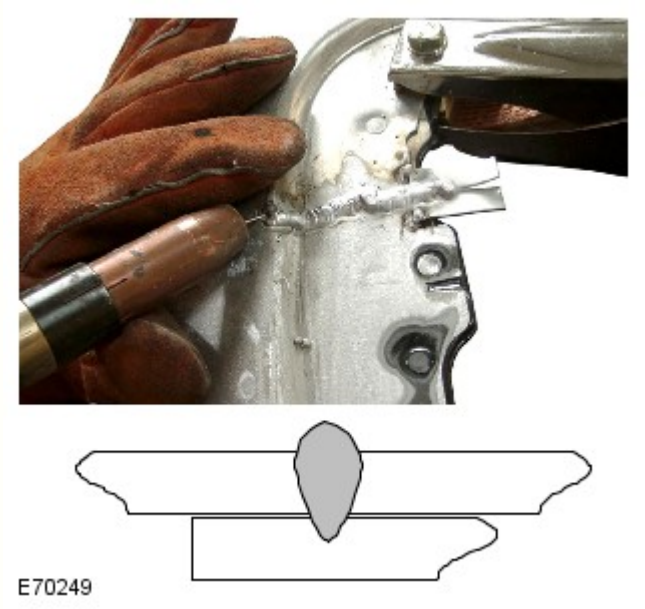
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

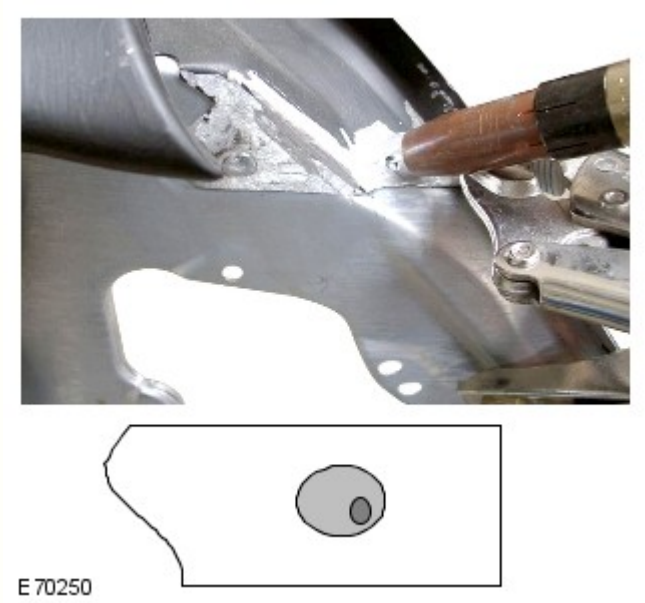
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

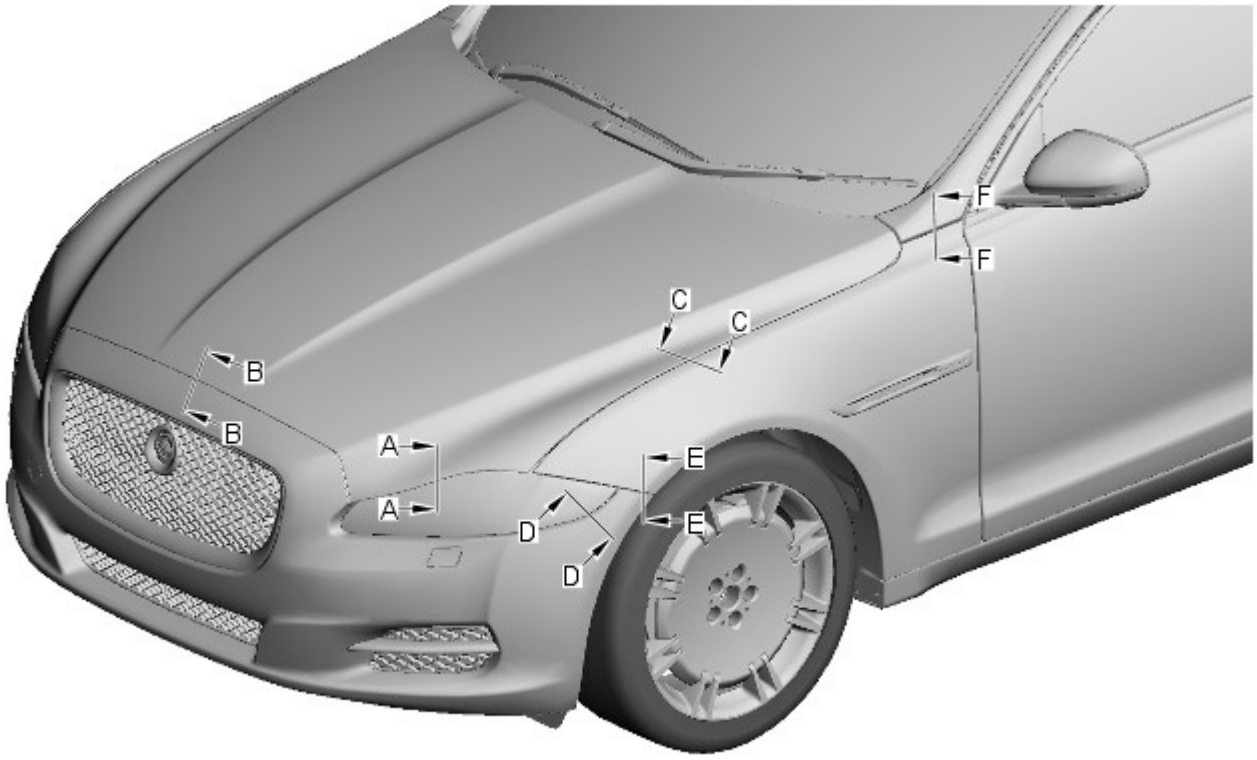
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

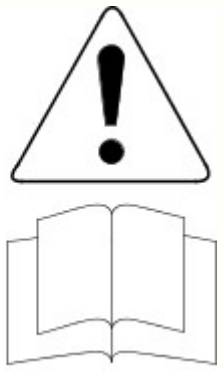
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

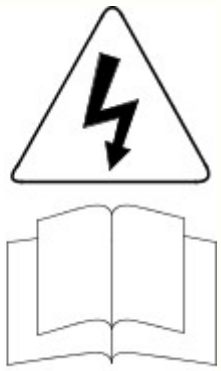
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



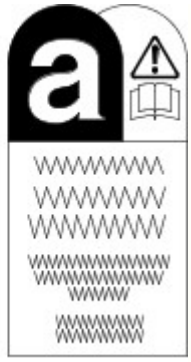
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



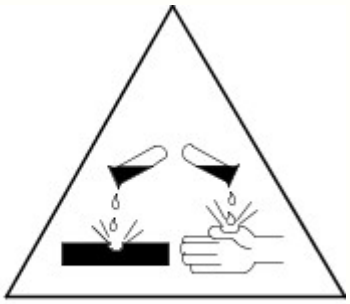
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Rear End Sheet Metal Repairs - Under Floor Reinforcement Panel

Removal and Installation

Removal

NOTE: The underfloor reinforcement panel is installed in conjunction with:

- Exhaust system
- Driveshaft
- Front seats
- Rear seats
- Floor console

1. The under floor reinforcement panel is serviced as indicated.

2. Before commencing this procedure make sure that you are aware of all Health and Safety requirements.

Refer to: Health and Safety Precautions (100-00 General Information, Description and Operation).

3. For further information on the methods, tools and fixings used in this procedure refer to the body repairs - general information section.

NOTES:

Where breakstem fasteners (BSF) removal is instructed remove fastener shaft with a 4mm punch and remove the head with a 6.5mm drill bit. Make sure all the drilled holes are free from debris.

Where self piercing rivets (SPR) removal is instructed use either the approved SPR tool or 5.3mm drill bit.

Any joints sealed as part of vehicle manufacture must be sealed as part of the repair.

4. Refer to: Exhaust System (309-00A, Removal and Installation).

Refer to: Exhaust System (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).
Refer to: Exhaust System (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).
Refer to: Exhaust System (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

5. Refer to: Driveshaft - TDV6 3.0L Diesel RWD (205-01, Removal and Installation).
Refer to: Driveshaft - 3.0L NA V6 - AJ27/V8 5.0L Petrol/V8 S/C 5.0L Petrol (205-01 Driveshaft, Removal and Installation).

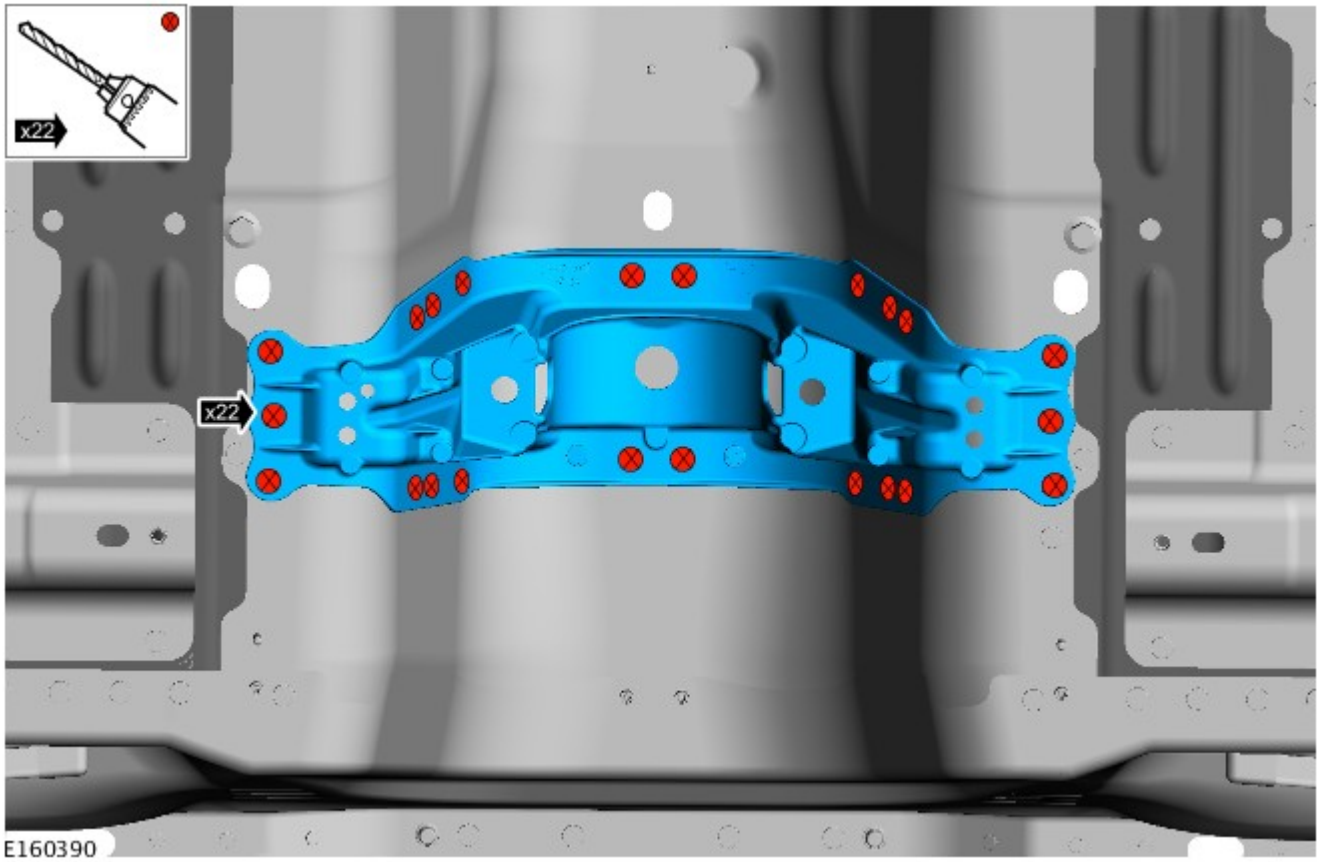
6. Refer to: Front Seat (501-10 Seating, Removal and Installation).

7. Refer to: Rear Seat Cushion - Vehicles Without: Split Rear Seat Backrest (501-10 Seating, Removal and Installation).

8. Refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).

9. Release the floor covering and lay to one side.

10. Remove the SPR's as indicated.



11. Separate the joints and remove the underfloor reinforcement panel.

Installation

CAUTION: Where structural adhesive is to be applied between surfaces it is essential compression is applied to the joints during the curing period.

NOTES:

BSF installation involves using the Jaguar approved BSF installation tool and requires a hole diameter of 6.5mm.

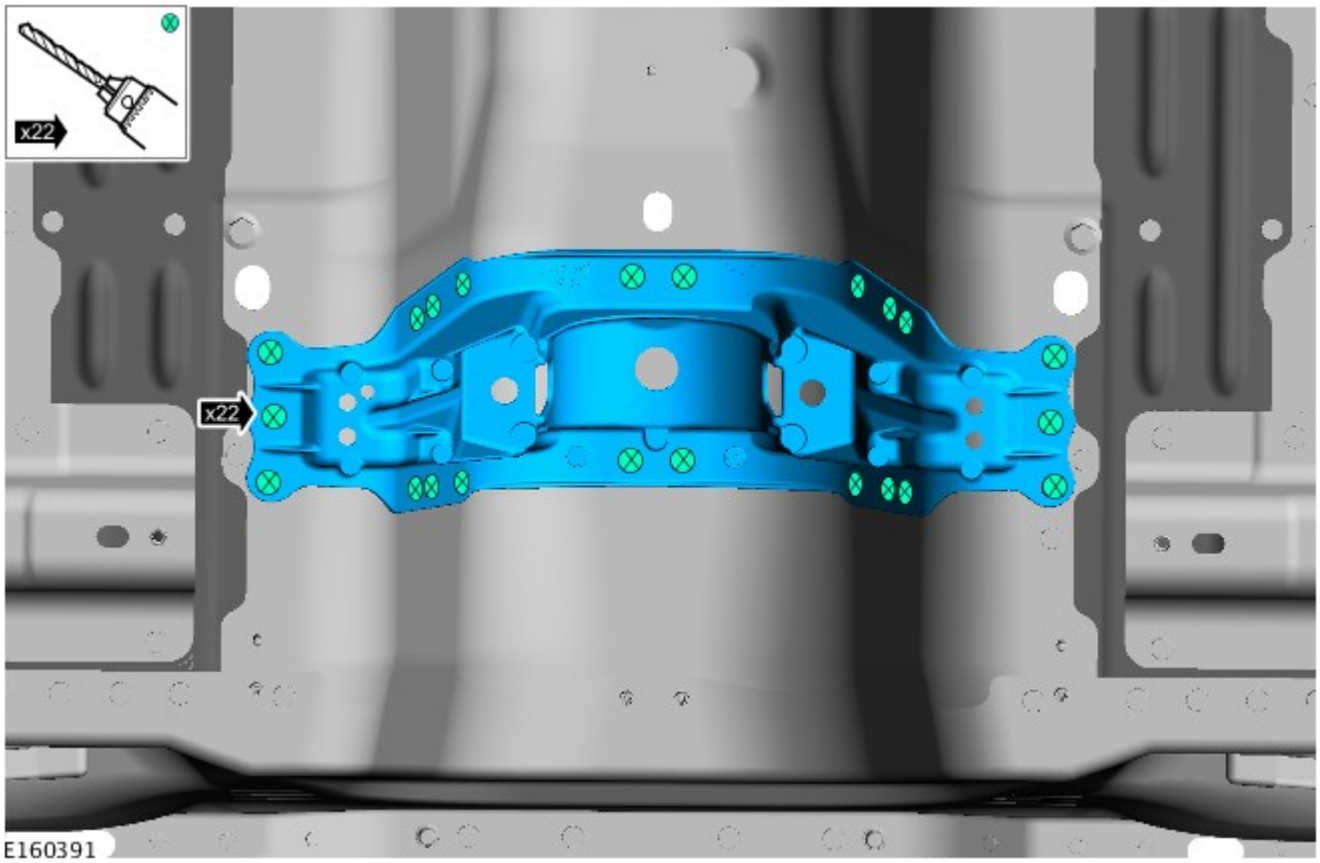
SPR installation requires using the Jaguar approved SPR tool.

1. Remove the rivet remnants.

2. Dress the flanges where necessary.

3. Offer up the new under floor reinforcement panel, clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

4. Drill holes where the BSF's are to be installed as indicated.



5. Separate panels.

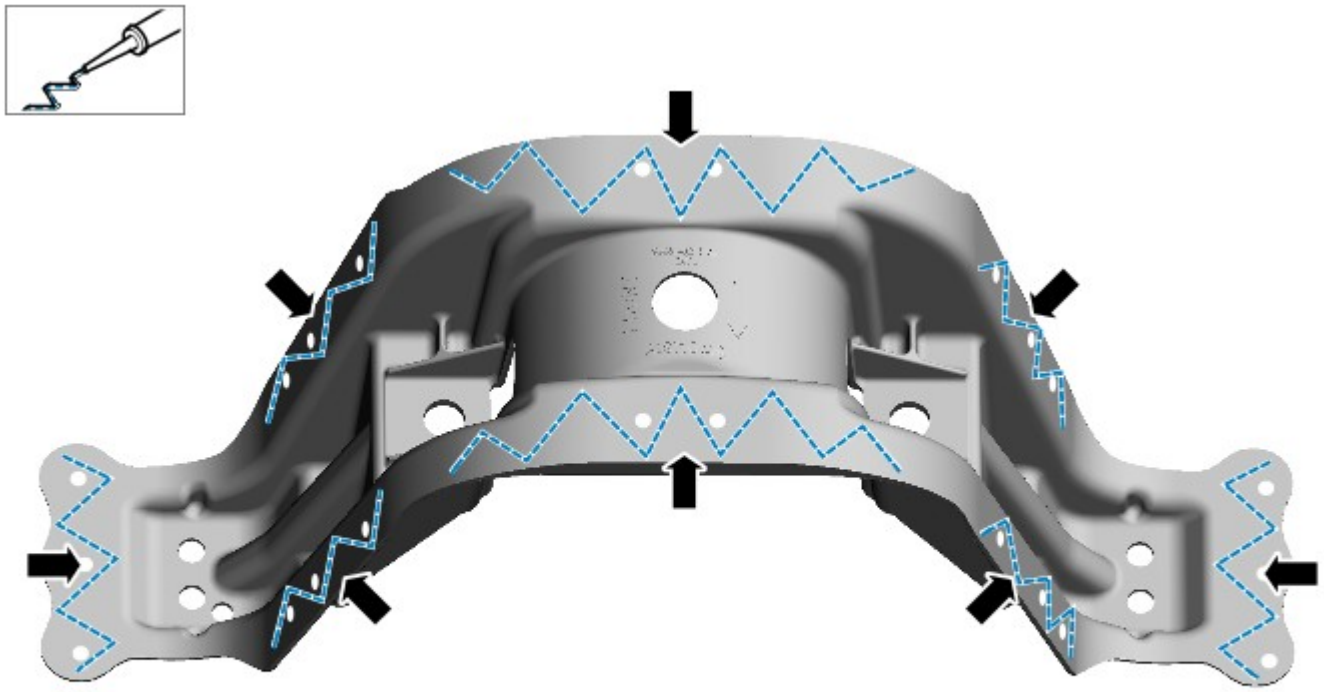
6. Remove all drill remnants.

7. Using a fine bristle disc clean and prepare the panel surfaces.

8. Apply the coupling agent where the Jaguar recommended bonding material is to be applied and allow to dry.

9. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

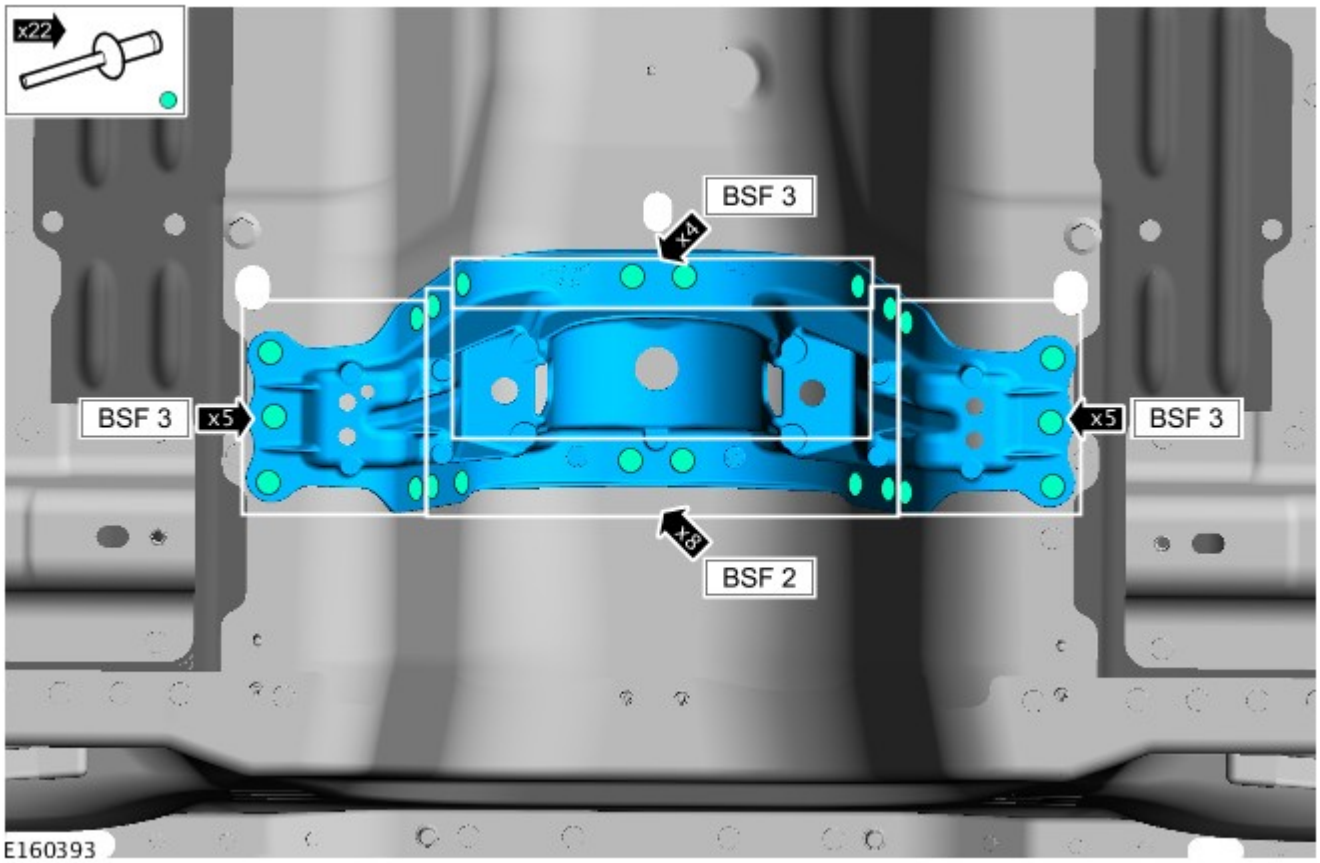
Apply a 5mm bead of Jaguar recommended bonding material to the under floor reinforcement as indicated.



E160392

10. Offer up the new under floor reinforcement panel, align and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

11. Install the BSF's as indicated.



12. Remove any excess adhesive.

13. Make sure that any open or exposed panel joints are correctly sealed.

14. Make sure corrosion protection is applied to all areas affected by repair.

15. The installation of associated panels and components is the reversal of the removal procedure.

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

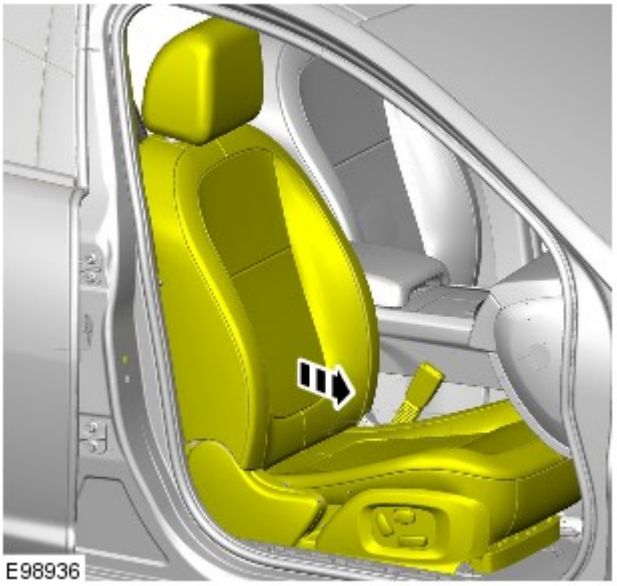
To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

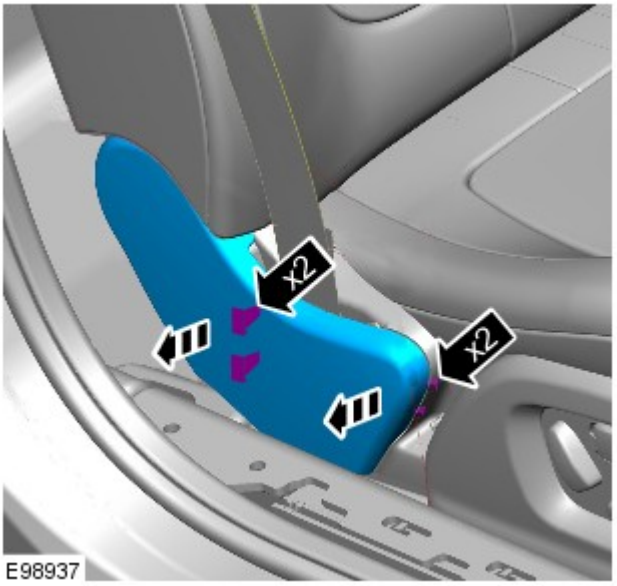
Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

1. Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

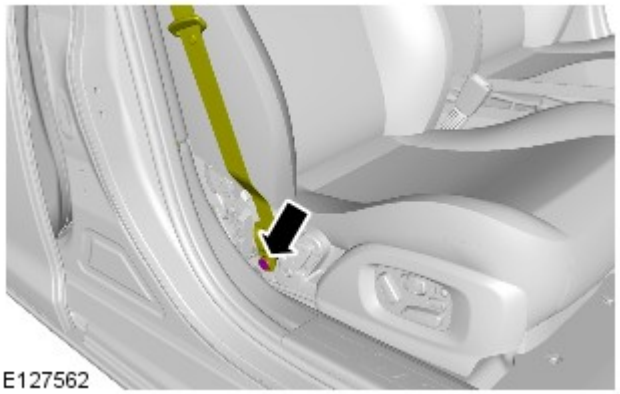
2.



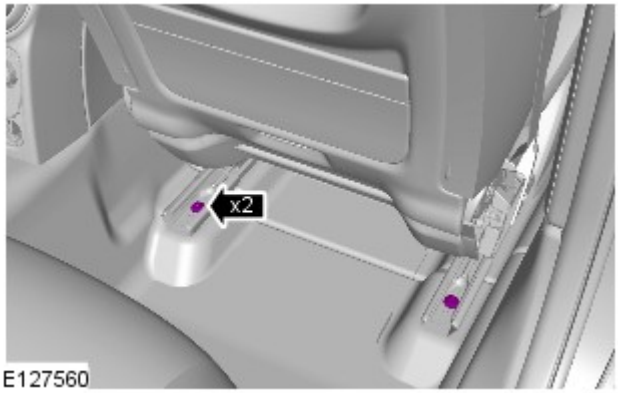
3.



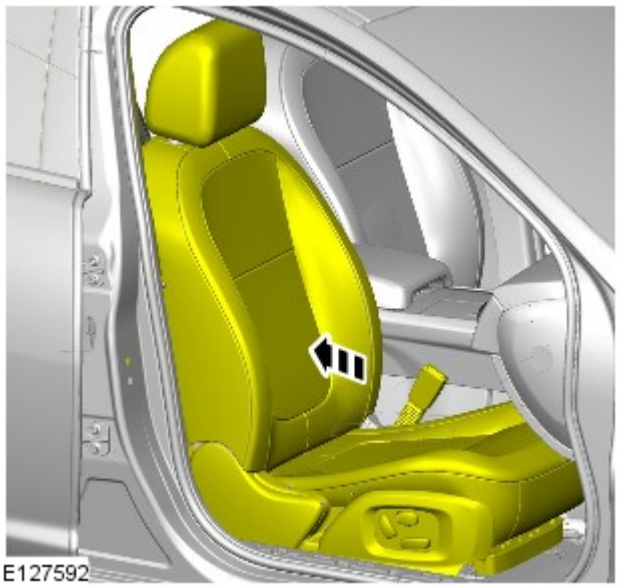
4. *Torque:* 40 Nm



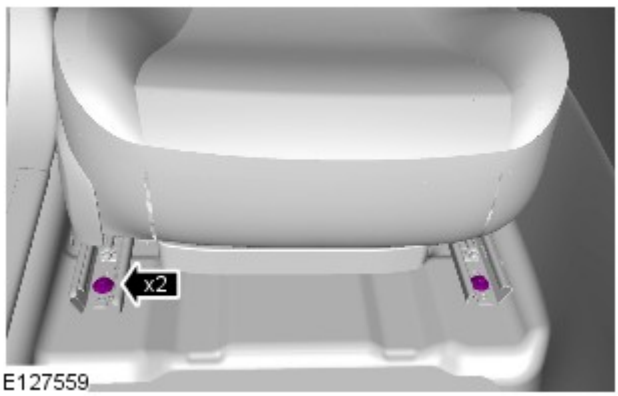
5. *Torque:* 47 Nm



6.



7. *Torque:* 47 Nm



8. Reposition the front seat to the central position.

Protect the surrounding paintwork to avoid damage.

Protect the surrounding trim to avoid damage.

NOTE: This step requires the aid of another technician.

Installation

1. To install, reverse the removal procedure.

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules
- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)

- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

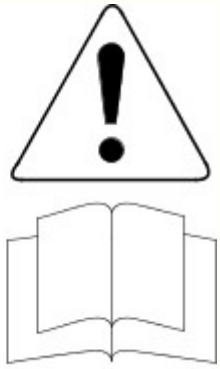
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

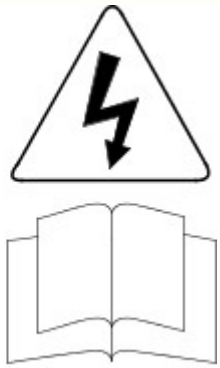
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



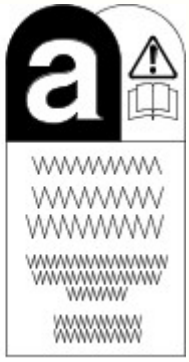
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



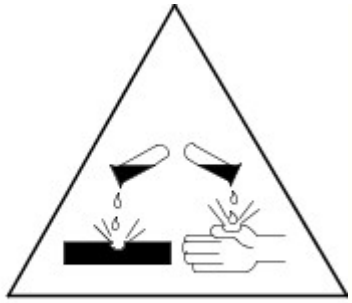
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated

- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Driveshaft - Driveshaft 3.0L NA V6 - AJ27/V8 5.0L Petrol/V8 S/C 5.0L Petrol

Removal and Installation

Special Tool(s)

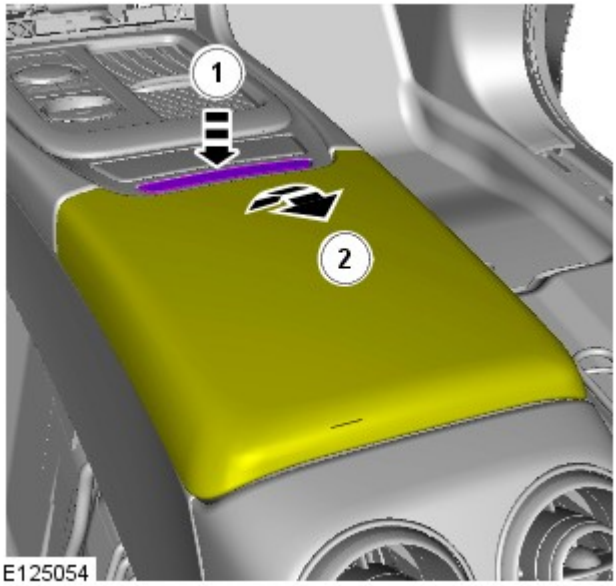
 E117586	205-932 Remover, Driveshaft

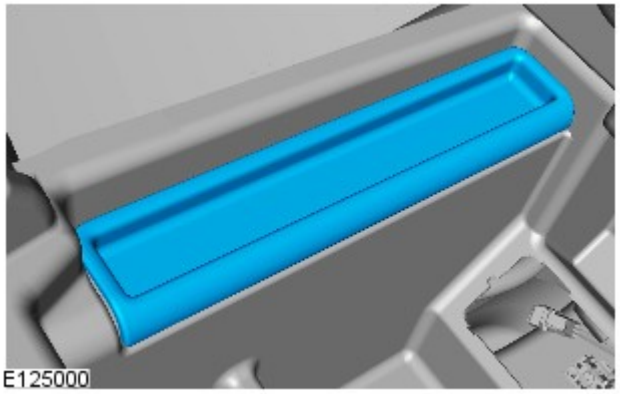
Removal

WARNING: Apply the parking brake, chock the wheels and ensure that all personnel are clear of the vehicle before carrying out the following procedure.

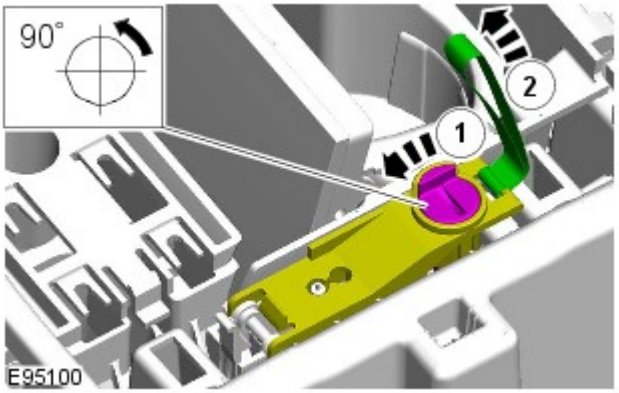
NOTE: Select NEUTRAL before disconnecting the battery, to allow the driveshaft to be turned.

1.



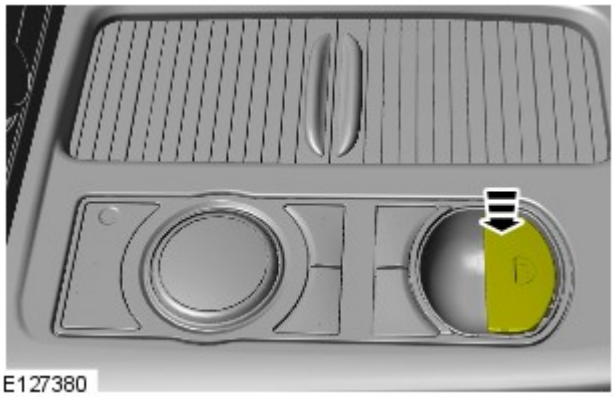


2.



3. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

4. NOTE: The ignition must be switched on.

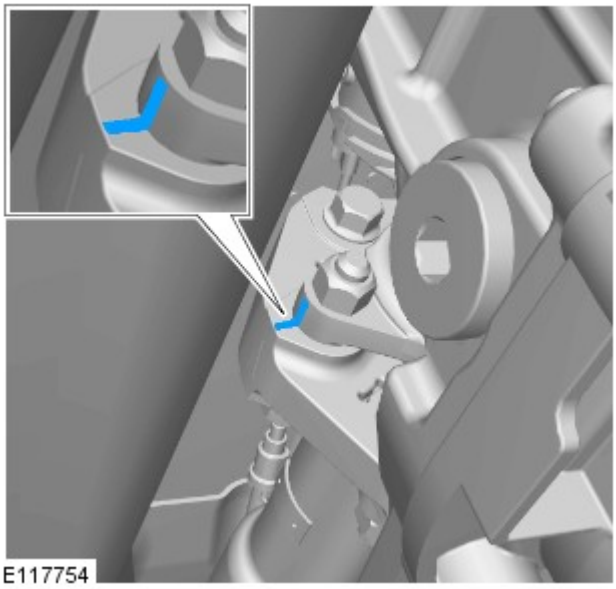


5. Refer to: Battery Disconnect and Connect (414-01, General Procedures).

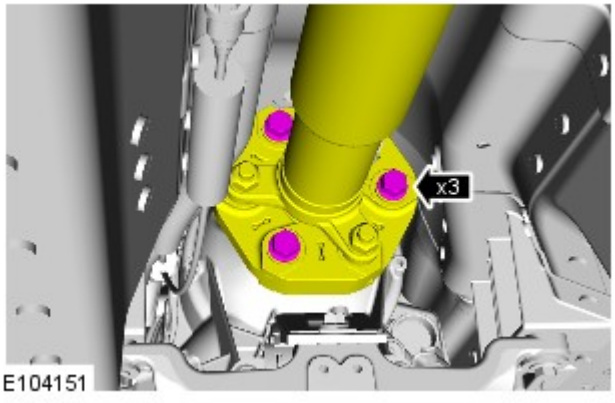
6. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

7. Refer to: Exhaust System (309-00, Removal and Installation).

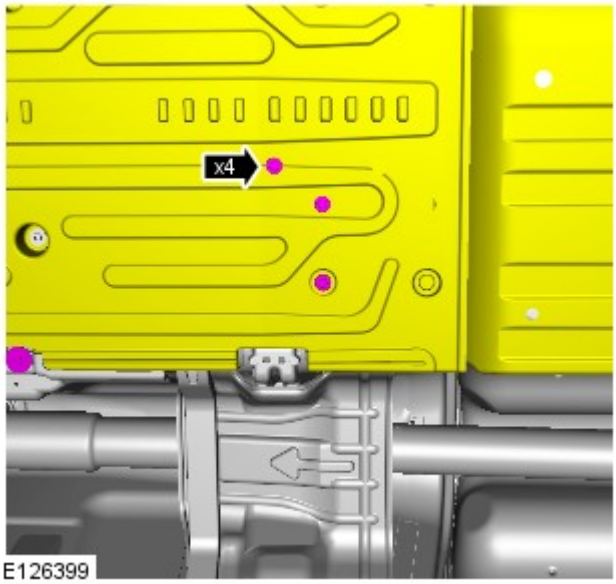


8. NOTE: Mark the position of the driveshaft on the transmission flange.

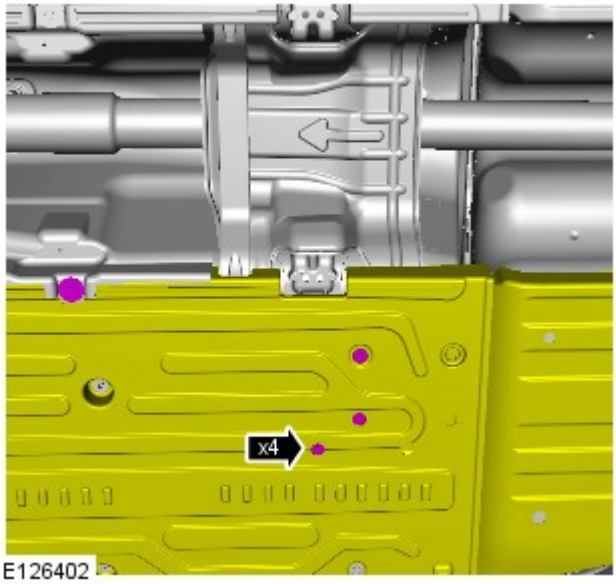


9. CAUTION: Under no circumstances must the flexible coupling (or it's fixings) be loosened or removed from the driveshaft.

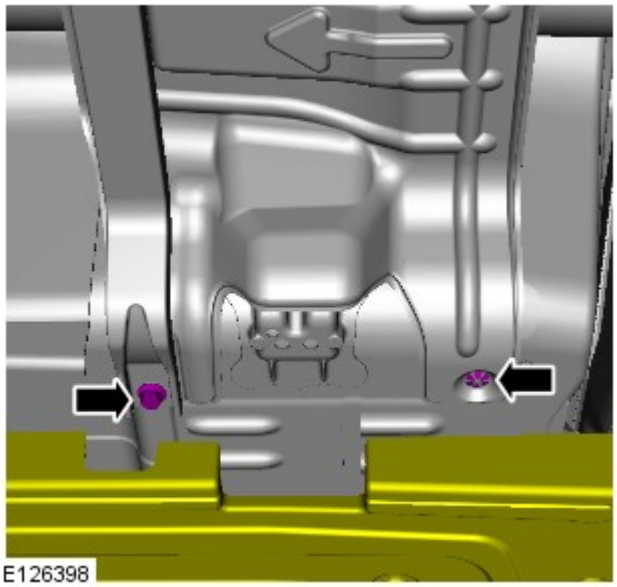
10.



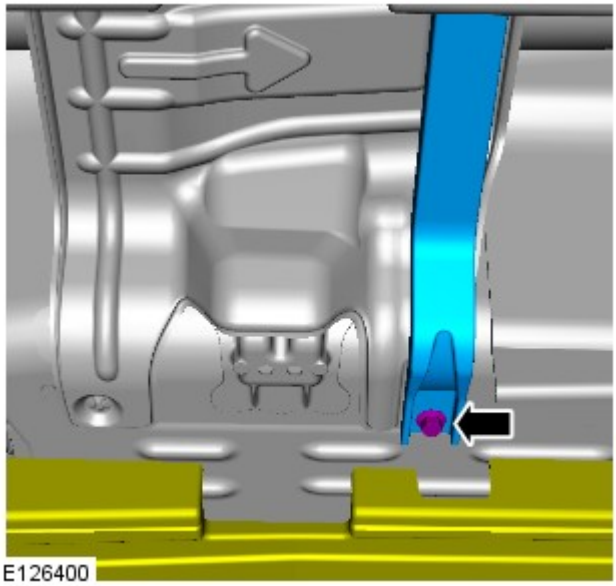
11.



12.

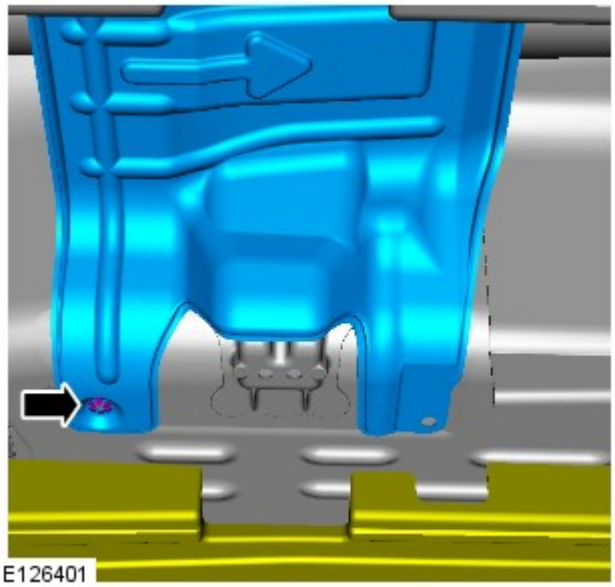


13.



E126400

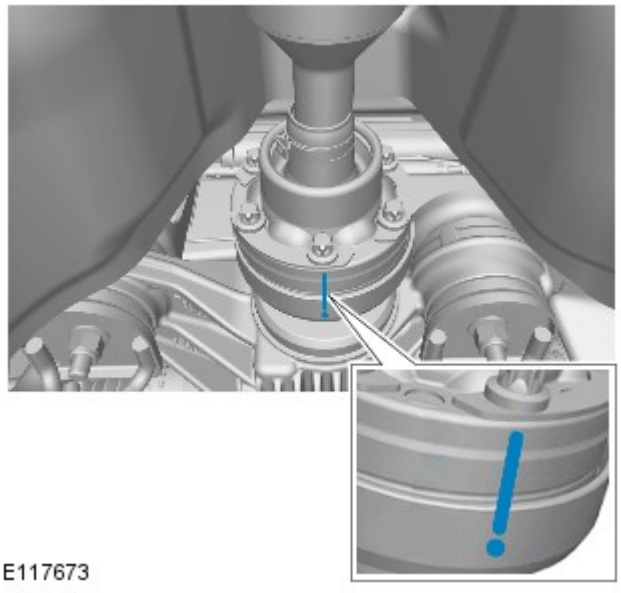
14.



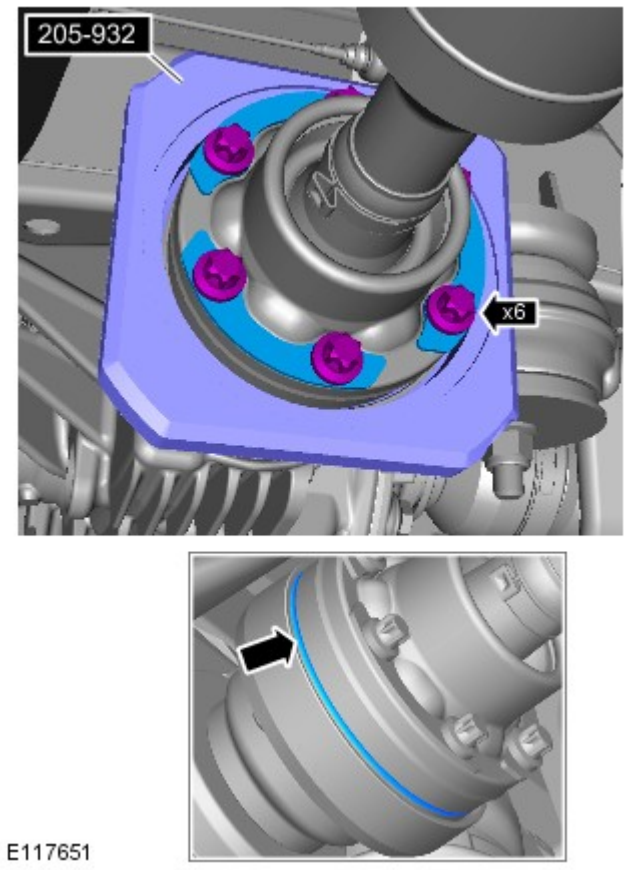
E126401

15. CAUTION: Do not use the 5mm hole on the differential case flange for the alignment mark.

NOTE: Using the 3mm hole on the differential case flange, paint an alignment mark (as indicated) to aid correct installation of the driveshaft to the differential case.



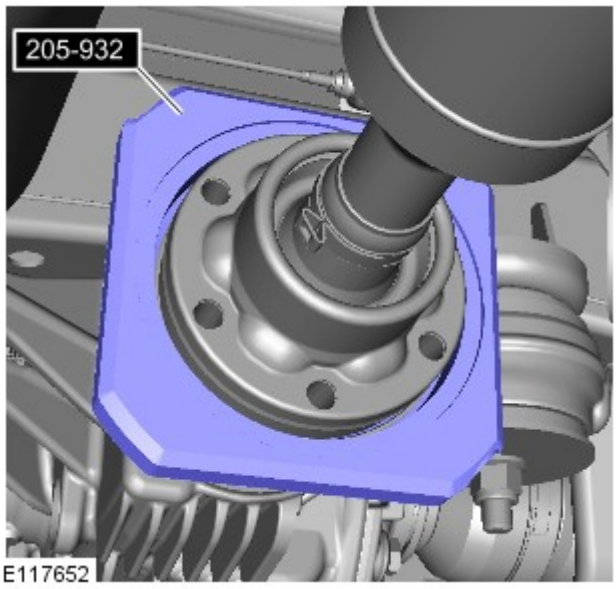
E117673



16. CAUTION: To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

NOTE: Make sure that the special tool is correctly installed to the recess on the driveshaft.

Special Tool(s): 205-932

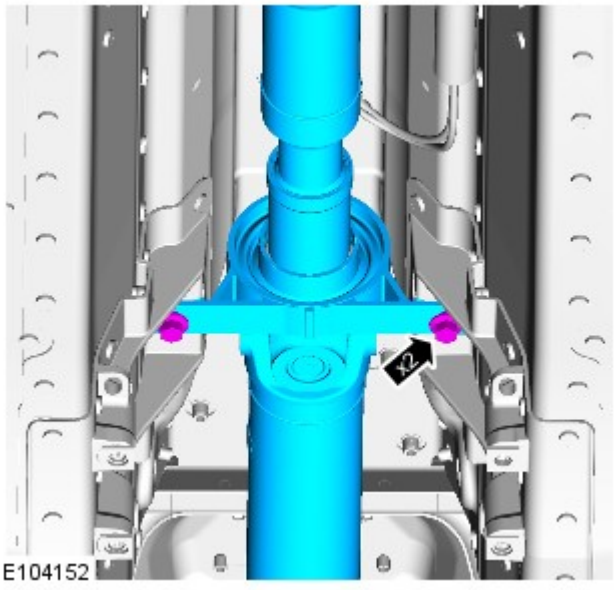


17. CAUTION: To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

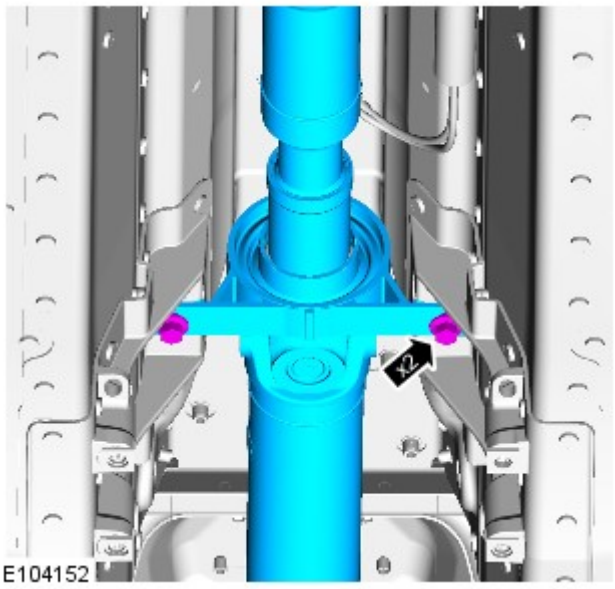
NOTE: Using a suitable hammer and drift, make sure that you only hit the corner edges of the special tool to remove the driveshaft.

Special Tool(s): 205-932

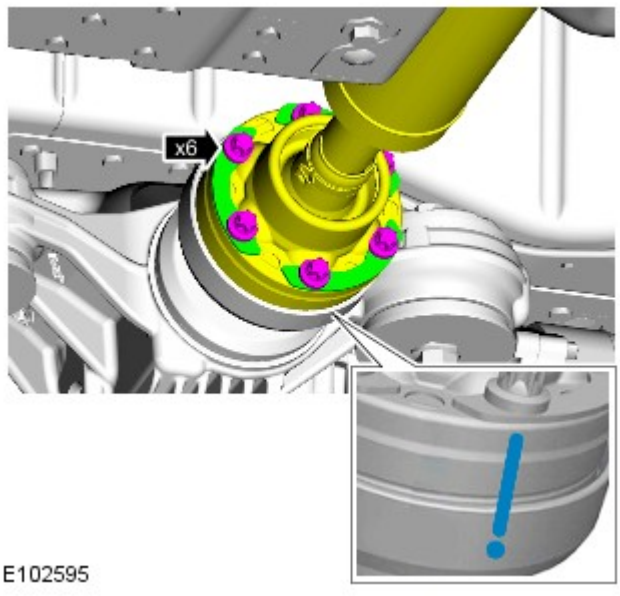
18.



Installation

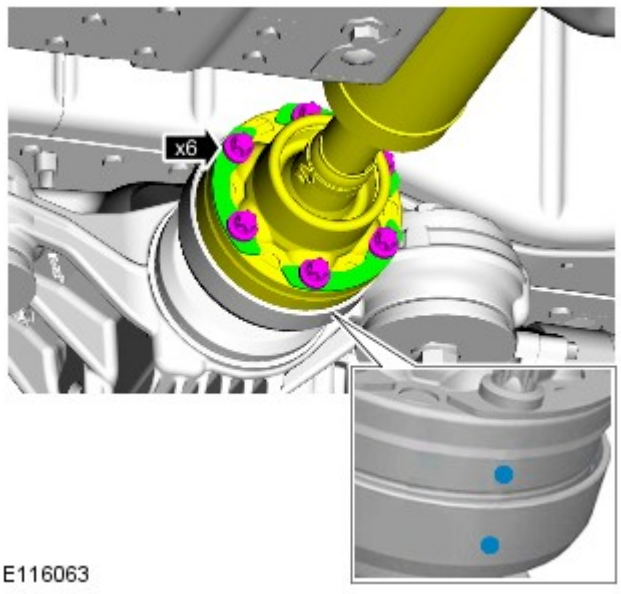


1. CAUTION: Only tighten the bolts finger-tight at this stage.



2. NOTE: Make sure that the alignment mark on the driveshaft is correctly aligned to the alignment mark on the differential case.

Torque: 75 Nm

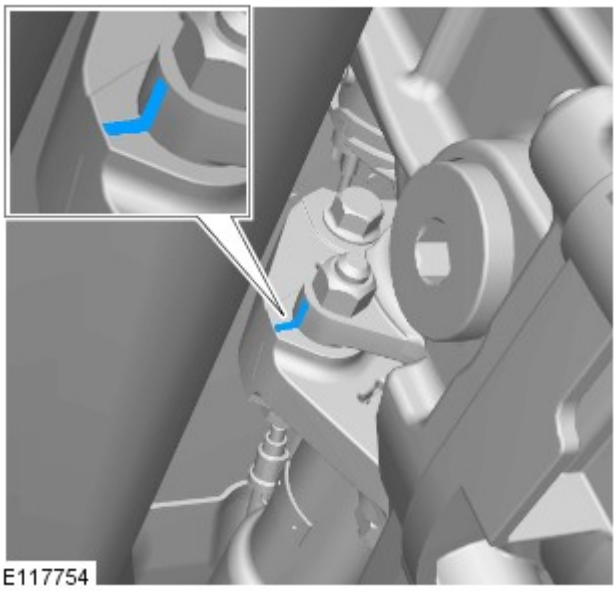


3. NOTES:

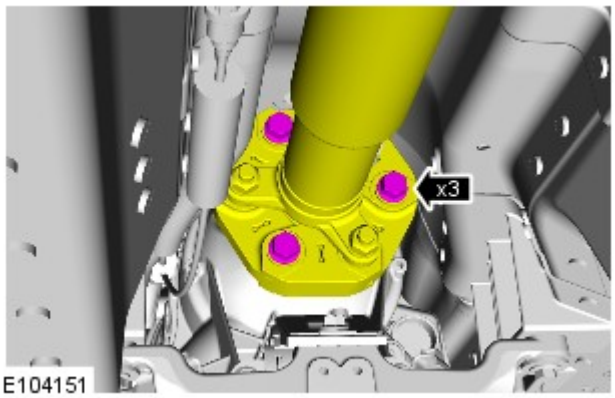
This step only applies if a new driveshaft is being installed.

Using the 3mm hole on the differential case flange and paint alignment mark on the driveshaft (as indicated). Make sure that the alignment marks are correctly aligned.

Torque: 75 Nm



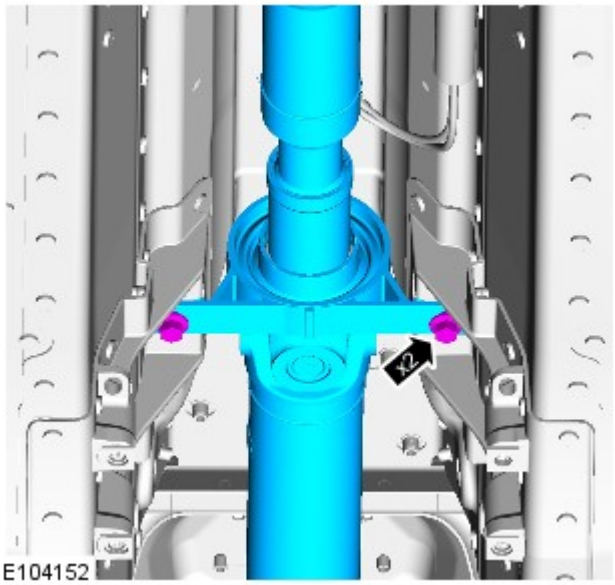
4. NOTE: Make sure that you re-align the driveshaft to the transmission flange using the alignment mark.



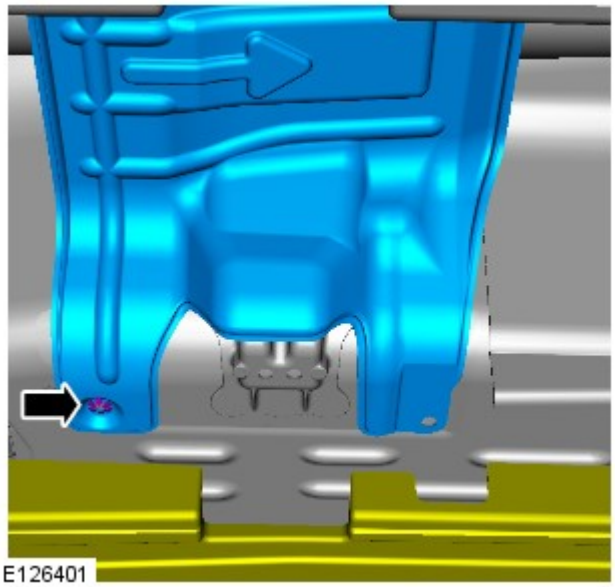
5. CAUTION: Under no circumstances must the flexible coupling (or it's fixings) be loosened or removed from the driveshaft.

Torque: 127 Nm

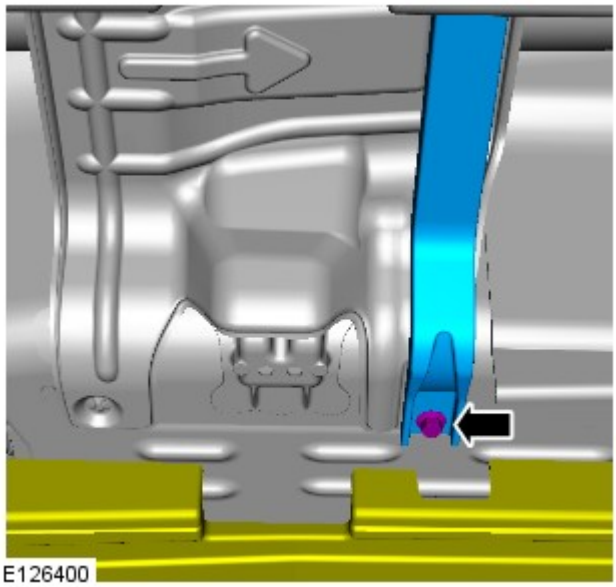
6. *Torque:* 48 Nm

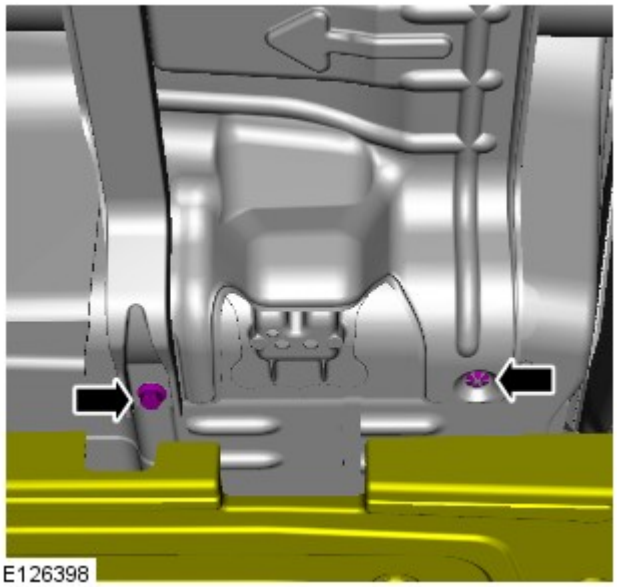


7.



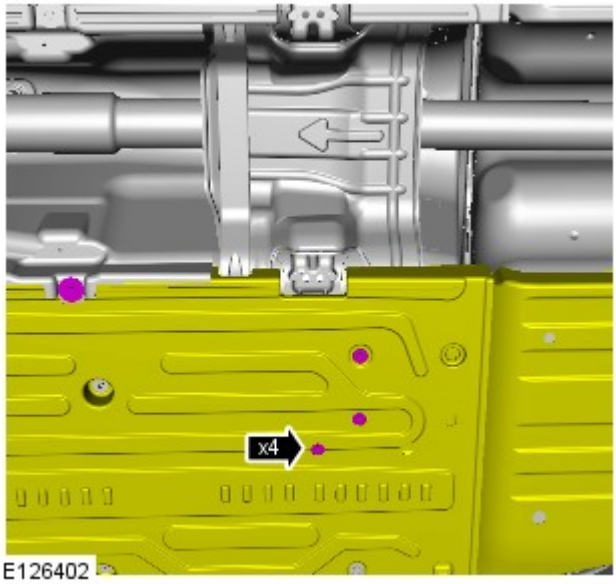
8. *Torque:* 15 Nm





E126398

9. *Torque:* 15 Nm



E126402

10. *Torque:* 7 Nm

Diagnosis and Testing

Principle of Operation

For a detailed description of the rear view mirrors system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (501-09 Rear View Mirrors)

Rear View Mirrors (Description and Operation),
Rear View Mirrors (Description and Operation),
Rear View Mirrors (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

1. Verify the customer concern.

2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
• Door mirror switch condition and installation • Door mirror condition and installation	• Battery condition and state of charge • Fuses • Harnesses and connectors • Washer jet and mirror heater relay • Memory control module(s) • Door mirror switch(s) • Door mirror motor(s) • Ignition switch • Battery Junction Box (BJB) • Central Junction Box (CJB) • Automatic Temperature Control (ATCM) module • Local Interconnect Network (LIN) circuit

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
Mirrors do not defrost/washer jets freeze	• Fuse fault • Washer jet and mirror heater relay fault • Circuit fault: high resistance • Circuit fault: short circuit to ground • Automatic temperature control module fault	Check the fuses. Check the operation of the washer jet and mirror heater relay. Check the washer jet and mirror heater circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
Mirrors inoperative in one or more directions	• Mechanical fault • Switch fault • Motor fault • Circuit fault: high resistance	Operate the mirror switch and listen for the motor(s). If the motor(s) can be heard, check the mechanical condition of the mirror and linkages. Rectify as necessary. Check for DTCs indicating a switch, motor or circuit fault.

	• Circuit fault: short circuit to ground	
Memorized mirror position is not resumed	• Battery voltage below 10.5 volts • Position not stored • Switch operated during "one-touch" memory recall • EEPROM fault	Before condemning a memory component, check the function from the switch and refer to the symptoms above. Make sure the battery voltage is adequate. Make sure that the desired position is correctly stored. Make sure that the memory store/recall procedure is being followed. Refer to the relevant section of the workshop manual.
'Lazy entry' function inoperative	• Remote transmitter fault (battery, transmitter programming, etc) • See list for "position is not resumed"	Check that the remote transmitter operates the central locking, etc. If it does, the fault is not with the transmitter. Refer to "position is not resumed".

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Driver Door Module/Passenger Door Module (DDM/PDM) (100-00 General Information, Description and Operation).

Published: 20-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Driver Door Module/Passenger Door Module (DDM/PDM)

Description and Operation

Driver/Passenger Door Module (DDM/PDM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Driver/Passenger Door Module (DDM/PDM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.
For additional information, refer to: Driver Door Module (DDM) (419-10 Multifunction Electronic Modules, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B108F-23	Cabin Lock/Unlock Switch - Signal stuck low	• Switch pressed longer than 20 seconds • Circuit fault	• Check for mechanical faults/sticking on the left and right door trim switches. Check circuits for short to ground or other circuits. Replace switch or repair wiring as required

C1B14-15	Sensor Supply #1 - Circuit short to battery or open	• Short to power or open circuit	• Refer to the electrical circuit diagrams and test window sensor supply circuit for short to power or open circuit
U0010-00	Medium Speed CAN Communication Bus - No sub type information	• Medium speed CAN communication Bus	• Carry out network integrity test using manufacturer approved diagnostic system. Refer to electrical circuit diagrams and test Medium speed CAN network for open, short circuit and high resistance
U0140-00	Lost Communication With CJB - No sub type information	• Logged when subscribed CAN message missing from Central Junction Box	• Refer to the electrical circuit diagrams and test power and ground supplies to Central Junction Box. Check CAN network between Driver Door Module and Central Junction Box. Carry out network integrity test using manufacturer approved diagnostic system
U0208-00	Lost Communication With Driver Seat Module (DSM) - No sub type information	• Missing message	• Refer to the electrical circuit diagrams and test power and ground supplies to Driver Seat Module. Check CAN network between Driver Door Module and Driver Seat Module. Carry out network integrity test using manufacturer approved diagnostic system
U0300-00	Internal Control Module Software Incompatibility - No sub type information	• Car configuration file mismatch with vehicle specification	NOTE: After updating the car configuration file, set the ignition to on and wait 30 seconds before clearing the DTCs • Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary
U0300-4A	Internal Control Module Software Incompatibility - Incorrect component installed	• DTC is set if an incorrect front or rear door module/software is connected	• Check correct door modules are installed on the vehicle. Reprogram the modules using the manufacturers approved diagnostic system
U2002-24	Switch - Signal stuck high	• Signal stuck high	• Clear DTC and re-test. If DTC remains, install a new passenger side window switch
U2010-11	Switch Illumination - Circuit short to ground	• Circuit short to ground	• Carry out CAN network tests using the manufacturer approved diagnostic system
U2010-12	Switch Illumination - Circuit short to battery	• Circuit short to power	• Carry out CAN network tests using the manufacturer approved diagnostic system
U2012-08	Car Configuration Parameter(s) - Bus signal/message Failures	• Bus signal/message failures	• Cycle the ignition status and re-test. If DTC remains, re-configure the Auxiliary Junction Box using the manufacturer approved diagnostic system
U2013-24	Switch Pack - Signal stuck high	• Signal stuck high	• Clear DTC and re-test. If DTC remains, install a new driver side window switch pack
U2014-44	Control Module Hardware - Data memory failure	• Data Memory Failure	• Install a new Driver Door Module/Passenger Door Module, refer to the new module installation note at the top of the DTC Index
U2100-00	Initial Configuration Not Complete - No sub type information	• No sub type information	• Re-configure the Driver Door Module/Passenger Door Module using the manufacturer approved diagnostic system
U2101-00	Control Module Configuration Incompatible - No sub type information	• Incorrect component installed • Vehicle not configured correctly	• Check/configure the car configuration using the approved diagnostic system
	Control Module -		

U3000-49	Internal electronic failure	• Internal electronic failure	• Install a new Driver Door Module/Passenger Door Module, refer to the new module installation note at the top of the DTC Index
U3002-55	Vehicle Identification Number (VIN) - Not configured	• Driver/passenger door module is not configured correctly	• Re-configure the relevant module as new using the manufacturer approved diagnostic system and re-test. If DTC remains install a new module, refer to the new module installation note at the top of the DTC Index
U3002-81	Vehicle Identification Number (VIN) - Invalid serial data received	• Vehicle/component mis-match. Corrupt VIN data being transmitted, module previously installed to other vehicle	• Install original module, check for DTCs and refer to relevant DTC Index
U3003-62	Battery Voltage - Signal compare failure	• Mis-match of battery voltage, of 2 volts or lower, between Driver Door Module/Passenger Door Module and Auxiliary Junction Box	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power and ground supply circuits to both modules

3	RH door mirror
4	LH (left-hand) side door mirror
5	Interior mirror
6	Battery
7	BJB (battery junction box)
8	CJB (central junction box)
9	Exterior mirror control switches
	LH door module

System Operation

The rear view mirrors comprise an interior mirror mounted to the windshield, and an exterior mirror mounted on each front door cheater. The types of mirrors and associated operating functions installed depend on the specification and trim level of the vehicle.

Interior Mirrors

The interior rear view mirror is provided as a electrically operated automatic dimming type.

The automatic dimming mirror comprises an electro-chromatic glass housed within a surrounding case that is attached with a ball joint connector to the mirror stem. The mirror stem incorporates an 8-pin electrical connector that is connected to the roof panel wiring harness.

Light sensors are mounted on the front and rear of the mirror surround case. The sensors control the automatic dimming feature to reduce glare from the headlights of following vehicles.

The automatic dimming function is permanently active when the ignition is in power mode 4 (Accessory) and power mode 6 (Ignition). The forward facing light sensor monitors the ambient light level at the front of the vehicle; the rearward facing light sensor monitors the light level coming from the rear of the vehicle. When light from the rear of the vehicle exceeds the ambient light level from the front of the vehicle, the automatic dimming circuit darkens the interior mirror surface.

Automatic dimming is inhibited when reverse gear is selected to provide the driver with maximum vision. On vehicles with automatic transmission, the reverse gear signal is provided by the TCM (transmission control module) via the high speed CAN bus to the CJB . The CJB then provides a power feed to the mirror.

HomeLink® Universal Transmitter Programming Instructions

WARNING: Before programming HomeLink® to a garage door opener or gate operator, make sure that people and objects are out of the way of the device to prevent potential harm or damage.

NOTES:

Garage door openers manufactured after 1996 may be equipped with rolling code protection feature. If this is the case, you may need a stepladder or other sturdy, safe device to reach the 'Learn' or 'Smart' button on the garage door opener.

When programming a garage door opener, it is advised to park outside of the garage.

Additional HomeLink® information can be found at www.HomeLink.com. If additional programming support is needed, please call the toll-free HomeLink Hotline at 1-800-355-3515.

Please note that the instructions below apply to the majority of HomeLink® use cases. However, there are some HomeLink® applications or HomeLink® compatible systems that require slightly different instructions. For more information and for custom training instructions specific to your device, visit http://www.HomeLink.com.

HomeLink® is a registered trademark owned by GENTEX CORPORATION.

The HomeLink® wireless control system provides a convenient way to replace up to three hand-held Radio Frequency (RF) transmitters used to activate devices such as gate operators, garage door openers, entry door locks, security systems, even home lighting.

Programming HomeLink® Universal Transmitter

NOTE: It is recommended that a new battery be placed in the hand-held transmitter of the device being programmed to HomeLink® for quicker training and accurate transmission of the Radio Frequency (RF) signal.

Step 1

Turn the ignition On.

Step 2

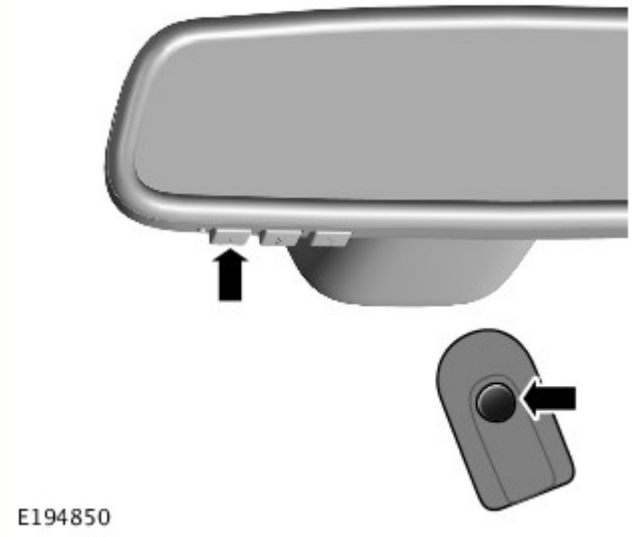
Press and hold the outer two switches of the HomeLink® universal transmitter until the status indicator begins to flash.

Step 3

Release the swiches.

This initializes the HomeLink® universal transmitter and erases previous settings from all three channels.

Step 4



Place the signal emitting end of the hand held transmitter 2 - 8 cm (1 - 3 inches) away against the underside of the rear view mirror. Keep the status indicator in view.

Simultaneously press and hold the activation switch on the hand held transmitter and the chosen switch of the HomeLink® universal transmitter. The status indicator begins to flash slowly.

NOTE: Do not release the buttons until the following step has been completed.

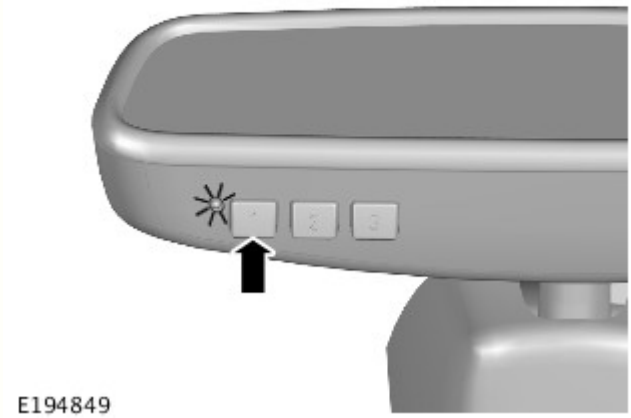
Step 5

The status indicator begins to flash rapidly. This can take up to 60 seconds.

Step 6

Release both switches.

Step 7



Press the programmed HomeLink® universal transmitter switch. The solid status indicator light indicates the successful programming.

To program another channel on the HomeLink® universal transmitter, repeat Steps 4 to 7.

Step 8

Turn the ignition Off.

To operate the previously programmed device, press and hold the chosen switch of the HomeLink® universal transmitter. Release the switch when the device begins to operate.

Programming HomeLink® Universal Transmitter - Devices With Code Protection Feature

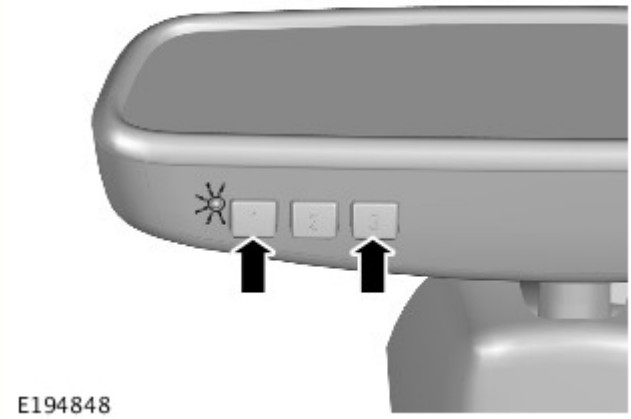
The Radio Frequency (RF) signals used to operate some home/office systems incorporate a code protection feature. After a channel has been programmed from the hand held transmitter, these systems will need to be trained to accept the signal from the HomeLink® universal transmitter. To check if a system is code protected, operate the appropriate HomeLink® universal transmitter switch. If the status indicator flashes rapidly for 1 to 2 seconds before illuminating permanently, the system has a code protection feature.

Locate the 'Learn' or 'Smart' button at the garage door opener receiver (motor-head unit) in the garage before performing the following steps. This can usually be found directly on the motor-head unit (see the Garage Door Opener manual to identify the 'Learn Button').

Step 1

Turn the ignition On.

Step 2



Press and hold the outer two switches of the HomeLink® universal transmitter until the status indicator begins to flash.

Step 3

Release the swiches.

This initializes the HomeLink® universal transmitter and erases previous settings from all three channels.

Step 4

Place the signal emitting end of the hand held transmitter 2 - 8 cm (1 - 3 inches) away against the underside of the rear view mirror. Keep the status indicator in view.

Simultaneously press and hold the activation switch on the hand held transmitter and the chosen switch of the HomeLink® universal transmitter. The status indicator begins to flash slowly.

NOTE: Do not release the buttons until the following step has been completed.

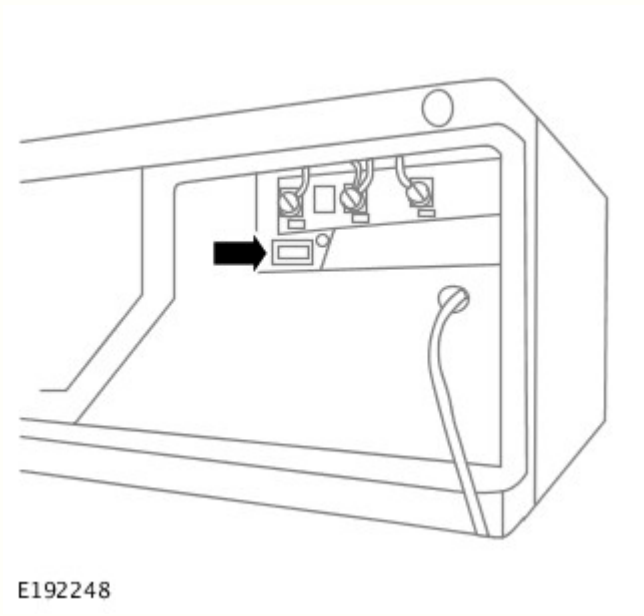
Step 5

The status indicator begins to flash rapidly. This can take up to 60 seconds.

Step 6

Release both switches.

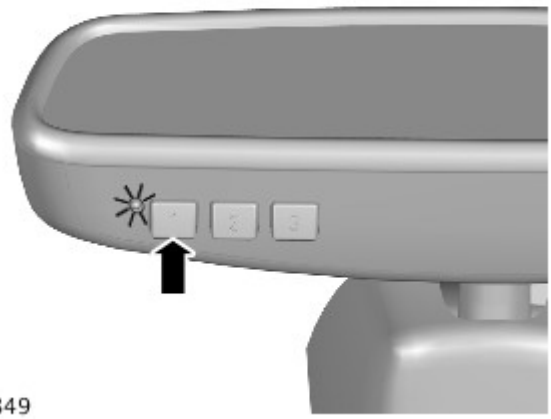
Step 7



Press and release the 'Learn' or 'Smart' switch at the garage door opener receiver. The name and color of the switch may vary by manufacturer.

After the 'Learn' or 'Smart' switch has been released, a status indicator on the garage door opener receiver will continously lit.

Step 8



NOTE: Perform the following step within 30 seconds.

Return to the vehicle and press and hold the chosen switch of the universal transmitter for 3 seconds to activate the device. Repeat this step up to three times to complete the training.

If the device activates, programming is complete.

Step 9

Turn the ignition Off.

To operate the previously programmed device, press and hold the chosen switch of the universal transmitter. Release the switch when the device begins to operate.

Exterior Mirrors

Electrically operated and heated exterior mirrors are installed as standard. Depending on the specification and trim level of the vehicle, the following options are available:

- Power fold (switch pack operated feature) and auto fold (remote handset operated feature)
- Memory recall
- Reverse gear mirror dip

The power fold/auto fold feature is available only when power fold mirrors are installed to the vehicle.

The auto fold and reverse gear mirror dip functions are not customer configurable, but may be enabled or disabled by the dealer using the Jaguar approved diagnostic system.

The LH door mirror incorporates an ambient air temperature sensor that is hardwired to the ECM (engine control module) . The ECM is connected to the CJB and other control modules via the high speed CAN bus. The sensor provides information to the ECM that is then transmitted on the medium speed CAN bus for use by other control modules.

The exterior mirror lamps are controlled by the interior lighting function.

The door mirrors are controlled using a switch pack located on the driver's door. The switch pack contains 2 non-latching mirror select switches labeled 'L' and 'R' and a 4-way directional joystick. The switch pack is connected to the driver door control module via the LIN bus. The driver and front passenger door control modules are connected via the medium speed CAN bus. A hardwired connection between each door control module and the corresponding door mirror, provides the supply and ground paths for the mirror motors.

Each exterior door mirror incorporates 2 motors to control horizontal (left/right) and vertical (up/down) adjustments.

On vehicles installed with a driver's power operated memory seat and memory exterior mirrors, a potentiometer is incorporated within each mirror motor and is used to provide information regarding the actual motor positions. The current position and memory positions of each door mirror motor are maintained and stored within the corresponding door control module.

The memory exterior mirror positions are also monitored and stored within door control module memory when the reverse gear mirror dip function is used.

When reverse gear is selected, the door control module stores the current mirror position and will then dip passenger mirror glass to a default dip position. While reverse gear is selected it is possible to store a preferred dipped mirror position by adjusting the passenger mirror glass to the desired position via the mirror switch pack. When the desired position is achieved using the switch, the new dip position will be automatically stored by the door control module when reverse gear is de-selected. Therefore when reverse gear is re-selected, the dip position recalled by the door control module will be the new reverse gear mirror dip stored position. When reverse gear is deselected the mirror glass will automatically move to the previous stored position prior to reverse gear selection.

Reverse gear mirror dip is only available when memory mirrors are installed, and reverse gear mirror dip is enabled within the instrument cluster.

If the driver selects a memory recall function using the memory seat switch pack, the driver's memory seat and exterior memory mirrors are moved to a stored memory position.

Exterior mirrors with the power fold/auto fold feature incorporate a motor located in the hinge of each exterior mirror arm. Operation of the power fold feature is achieved using the exterior mirror switch pack. Operation of the auto fold feature is achieved using the remote handset.

The power fold function is active when the ignition is in power mode 6 (Ignition).

Both exterior mirrors will power fold when the mirror switch pack 'L' and 'R' switches are pressed together. Pressing the switches again will unfold the mirrors.

When the instrument cluster is configured for the auto fold feature, the mirrors will fold in when the remote handset lock button is pressed. The mirrors will unfold when the vehicle is unlocked using the remote handset unlock button.

NOTE: If the mirrors are folded in using the mirror switch pack (power fold) and the vehicle is then locked, subsequent unlocking of the vehicle will not unfold the mirrors.

When the remote handset unlock button is operated, the CJB recognizes the remote handset for that vehicle and acknowledges the request.

When the vehicle is locked the door control modules reverse the polarity of the mirror fold motor, power and ground connections to operate the mirrors in the opposite direction.

Exterior mirror heating is provided with heater elements bonded to the back of the mirror glass. Power supply for the mirror heating elements is provided by the corresponding driver or passenger door control module.

Operation of the exterior mirror heaters is fully automatic and not controllable by the driver. Exterior mirror heater operation is determined by ambient air temperature and windshield wiper status.

The mirror heating is controlled in two phases, the initial heating phase and a second PWM (pulse width modulation) controlled phase. In the first phase the heater elements in the mirrors are permanently powered for a pre-determined length of time. This length of time varies with the ambient temperature. During the second PWM phase, the heater elements are turned on and off every 30 seconds. The amount of time the exterior mirror heaters are operational increases if the windshield wipers are switched on. This ensures the mirrors remain mist free in damp and wet conditions, where there is an increased risk of misting.

Rear View Mirrors - Rear View Mirrors - Overview

Description and Operation

Overview

The exterior mirrors incorporate the following:

- Blind spot monitoring indicator
- Auto dimming function
- Turn signal indicators
- Approach lamps

- Exterior temperature sensor
- Heated mirror function
- Reverse dipping function

Movement of the door mirrors is controlled from a switch pack located on the drivers door. The switch pack contains 2 non-latching mirror select buttons labeled 'L' and 'R' and a 4-way mirror movement switch. Door mirror movement commands are transmitted to the driver's door module over the LIN (local interconnect network) bus. The drivers door module transmits any mirror movement commands to the passenger door module over the medium speed CAN (controller area network) bus.

Movement of the door mirrors is carried out by the respective door module. The door modules provide supply and ground paths to the mirror motors and monitor mirror position via potentiometers located in the mirror housings.

Both exterior door mirrors and the interior mirror feature an auto dimming function. The interior rear view mirror contains one forward and one reward facing light sensor. The light sensors control the auto dimming feature of the interior mirror to reduce glare from the headlights of following vehicles.

When auto-dimming of the interior mirror is required, a supply is provided by the interior mirror to both door mirrors to initiate the door mirror auto-dimming sequence.

Blind spot monitoring function alerts the driver to a vehicle located in the vehicle blind spot. A warning indicator is located in each exterior mirror towards the outer edge.

Automatic dimming is inhibited when reverse gear is selected to provide the driver with maximum vision. On vehicles with automatic transmission, the reverse gear signal is provided by the TCM (transmission control module) via the high speed CAN bus to the CJB . The CJB then provides a power feed to the mirror.

HomeLink® Universal Transmitter Programming Instructions

WARNING: Before programming HomeLink® to a garage door opener or gate operator, make sure that people and objects are out of the way of the device to prevent potential harm or damage.

NOTES:

Garage door openers manufactured after 1996 may be equipped with rolling code protection feature. If this is the case, you may need a stepladder or other sturdy, safe device to reach the 'Learn' or 'Smart' button on the garage door opener.

When programming a garage door opener, it is advised to park outside of the garage.

Additional HomeLink® information can be found at www.HomeLink.com. If additional programming support is needed, please call the toll-free HomeLink Hotline at 1-800-355-3515.

Please note that the instructions below apply to the majority of HomeLink® use cases. However, there are some HomeLink® applications or HomeLink® compatible systems that require slightly different instructions. For more information and for custom training instructions specific to your device, visit http://www.HomeLink.com.

HomeLink® is a registered trademark owned by GENTEX CORPORATION.

The HomeLink® wireless control system provides a convenient way to replace up to three hand-held Radio Frequency (RF) transmitters used to activate devices such as gate operators, garage door openers, entry door locks, security systems, even home lighting.

Programming HomeLink® Universal Transmitter

NOTE: It is recommended that a new battery be placed in the hand-held transmitter of the device being programmed to HomeLink® for quicker training and accurate transmission of the Radio Frequency (RF) signal.

Step 1

Turn the ignition On.

Step 2

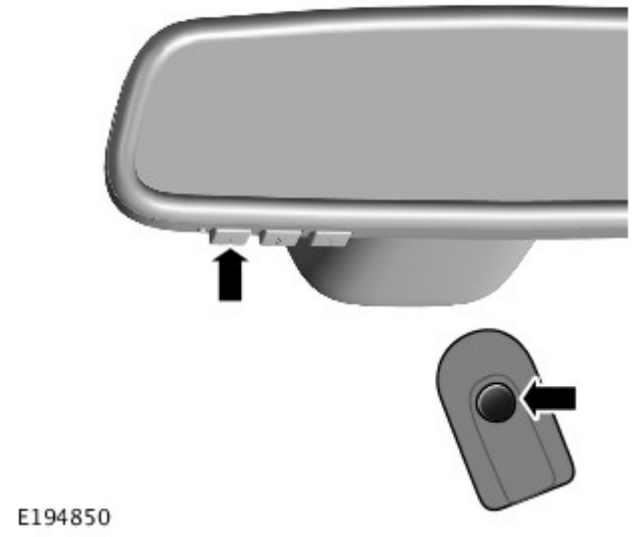
Press and hold the outer two switches of the HomeLink® universal transmitter until the status indicator begins to flash.

Step 3

Release the swiches.

This initializes the HomeLink® universal transmitter and erases previous settings from all three channels.

Step 4



Place the signal emitting end of the hand held transmitter 2 - 8 cm (1 - 3 inches) away against the underside of the rear view mirror. Keep the status indicator in view.

Simultaneously press and hold the activation switch on the hand held transmitter and the chosen switch of the HomeLink® universal transmitter. The status indicator begins to flash slowly.

NOTE: Do not release the buttons until the following step has been completed.

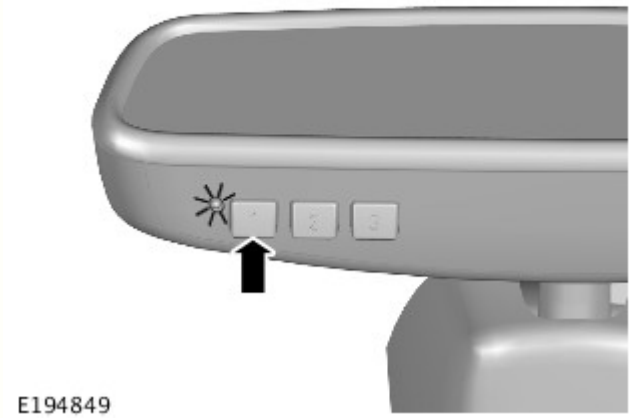
Step 5

The status indicator begins to flash rapidly. This can take up to 60 seconds.

Step 6

Release both switches.

Step 7



Press the programmed HomeLink® universal transmitter switch. The solid status indicator light indicates the successful programming.

To program another channel on the HomeLink® universal transmitter, repeat Steps 4 to 7.

Step 8

Turn the ignition Off.

To operate the previously programmed device, press and hold the chosen switch of the HomeLink® universal transmitter. Release the switch when the device begins to operate.

Programming HomeLink® Universal Transmitter - Devices With Code Protection Feature

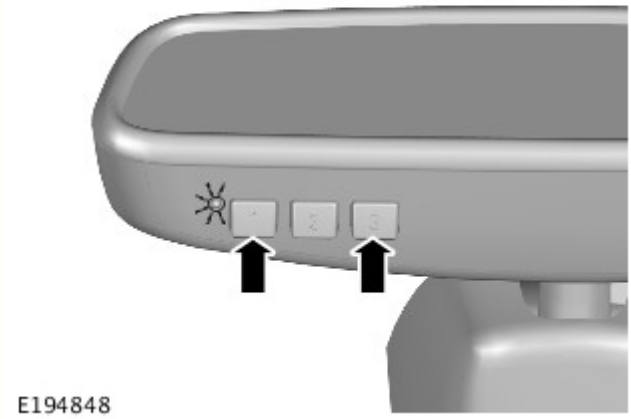
The Radio Frequency (RF) signals used to operate some home/office systems incorporate a code protection feature. After a channel has been programmed from the hand held transmitter, these systems will need to be trained to accept the signal from the HomeLink® universal transmitter. To check if a system is code protected, operate the appropriate HomeLink® universal transmitter switch. If the status indicator flashes rapidly for 1 to 2 seconds before illuminating permanently, the system has a code protection feature.

Locate the 'Learn' or 'Smart' button at the garage door opener receiver (motor-head unit) in the garage before performing the following steps. This can usually be found directly on the motor-head unit (see the Garage Door Opener manual to identify the 'Learn Button').

Step 1

Turn the ignition On.

Step 2



Press and hold the outer two switches of the HomeLink® universal transmitter until the status indicator begins to flash.

Step 3

Release the swiches.

This initializes the HomeLink® universal transmitter and erases previous settings from all three channels.

Step 4

Place the signal emitting end of the hand held transmitter 2 - 8 cm (1 - 3 inches) away against the underside of the rear view mirror. Keep the status indicator in view.

Simultaneously press and hold the activation switch on the hand held transmitter and the chosen switch of the HomeLink® universal transmitter. The status indicator begins to flash slowly.

NOTE: Do not release the buttons until the following step has been completed.

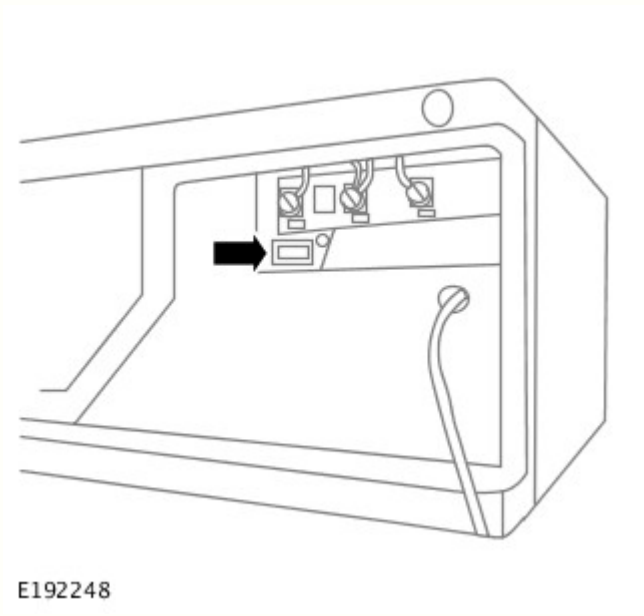
Step 5

The status indicator begins to flash rapidly. This can take up to 60 seconds.

Step 6

Release both switches.

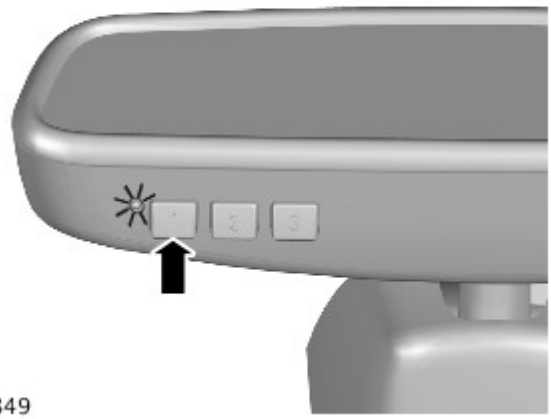
Step 7



Press and release the 'Learn' or 'Smart' switch at the garage door opener receiver. The name and color of the switch may vary by manufacturer.

After the 'Learn' or 'Smart' switch has been released, a status indicator on the garage door opener receiver will continously lit.

Step 8



NOTE: Perform the following step within 30 seconds.

Return to the vehicle and press and hold the chosen switch of the universal transmitter for 3 seconds to activate the device. Repeat this step up to three times to complete the training.

If the device activates, programming is complete.

Step 9

Turn the ignition Off.

To operate the previously programmed device, press and hold the chosen switch of the universal transmitter. Release the switch when the device begins to operate.

Exterior Mirrors

Electrically operated and heated exterior mirrors are installed as standard. Depending on the specification and trim level of the vehicle, the following options are available:

- Power fold (switch pack operated feature) and auto fold (remote handset operated feature)
- Memory recall
- Reverse gear mirror dip

The power fold/auto fold feature is available only when power fold mirrors are installed to the vehicle.

The auto fold and reverse gear mirror dip functions are not customer configurable, but may be enabled or disabled by the dealer using the Jaguar approved diagnostic system.

The LH door mirror incorporates an ambient air temperature sensor that is hardwired to the ECM (engine control module) . The ECM is connected to the CJB and other control modules via the high speed CAN bus. The sensor provides information to the ECM that is then transmitted on the medium speed CAN bus for use by other control modules.

The exterior mirror lamps are controlled by the interior lighting function.

The door mirrors are controlled using a switch pack located on the driver's door. The switch pack contains 2 non-latching mirror select switches labeled 'L' and 'R' and a 4-way directional joystick. The switch pack is connected to the driver door control module via the LIN bus. The driver and front passenger door control modules are connected via the medium speed CAN bus. A hardwired connection between each door control module and the corresponding door mirror, provides the supply and ground paths for the mirror motors.

Each exterior door mirror incorporates 2 motors to control horizontal (left/right) and vertical (up/down) adjustments.

On vehicles installed with a driver's power operated memory seat and memory exterior mirrors, a potentiometer is incorporated within each mirror motor and is used to provide information regarding the actual motor positions. The current position and memory positions of each door mirror motor are maintained and stored within the corresponding door control module.

The memory exterior mirror positions are also monitored and stored within door control module memory when the reverse gear mirror dip function is used.

When reverse gear is selected, the door control module stores the current mirror position and will then dip passenger mirror glass to a default dip position. While reverse gear is selected it is possible to store a preferred dipped mirror position by adjusting the passenger mirror glass to the desired position via the mirror switch pack. When the desired position is achieved using the switch, the new dip position will be automatically stored by the door control module when reverse gear is de-selected. Therefore when reverse gear is re-selected, the dip position recalled by the door control module will be the new reverse gear mirror dip stored position. When reverse gear is deselected the mirror glass will automatically move to the previous stored position prior to reverse gear selection.

Reverse gear mirror dip is only available when memory mirrors are installed, and reverse gear mirror dip is enabled within the instrument cluster.

If the driver selects a memory recall function using the memory seat switch pack, the driver's memory seat and exterior memory mirrors are moved to a stored memory position.

Exterior mirrors with the power fold/auto fold feature incorporate a motor located in the hinge of each exterior mirror arm. Operation of the power fold feature is achieved using the exterior mirror switch pack. Operation of the auto fold feature is achieved using the remote handset.

The power fold function is active when the ignition is in power mode 6 (Ignition).

Both exterior mirrors will power fold when the mirror switch pack 'L' and 'R' switches are pressed together. Pressing the switches again will unfold the mirrors.

When the instrument cluster is configured for the auto fold feature, the mirrors will fold in when the remote handset lock button is pressed. The mirrors will unfold when the vehicle is unlocked using the remote handset unlock button.

NOTE: If the mirrors are folded in using the mirror switch pack (power fold) and the vehicle is then locked, subsequent unlocking of the vehicle will not unfold the mirrors.

When the remote handset unlock button is operated, the CJB recognizes the remote handset for that vehicle and acknowledges the request.

When the vehicle is locked the door control modules reverse the polarity of the mirror fold motor, power and ground connections to operate the mirrors in the opposite direction.

Exterior mirror heating is provided with heater elements bonded to the back of the mirror glass. Power supply for the mirror heating elements is provided by the corresponding driver or passenger door control module.

Operation of the exterior mirror heaters is fully automatic and not controllable by the driver. Exterior mirror heater operation is determined by ambient air temperature and windshield wiper status.

The mirror heating is controlled in two phases, the initial heating phase and a second PWM (pulse width modulation) controlled phase. In the first phase the heater elements in the mirrors are permanently powered for a pre-determined length of time. This length of time varies with the ambient temperature. During the second PWM phase, the heater elements are turned on and off every 30 seconds. The amount of time the exterior mirror heaters are operational increases if the windshield wipers are switched on. This ensures the mirrors remain mist free in damp and wet conditions, where there is an increased risk of misting.

Roof Opening Panel - Roof Opening Panel

Diagnosis and Testing

Principle of Operation

For a detailed description of the roof opening panel system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (501-17 Roof Opening Panel)

Roof Opening Panel (Description and Operation),
Roof Opening Panel (Description and Operation),
Roof Opening Panel (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

1. Verify the customer concern.

2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
• Glass panel assembly • Glass panel seal • Frame assembly • Roller blind(s) • Deflector • Access panel • Roof opening panel cables	• Fuses • Battery Junction Box (BJB) • Central Junction Box (CJB) • Wiring harness • Loose or corroded connector(s) • Roof opening panel motor and control module • Roof opening panel switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
Roof opening panel inoperative	• Roof opening panel calibration lost • Fuse(s) blown • Control circuit fault • Supply circuit fault • Motor fault	• Calibrate the roof opening panel REFER to: Motor Synchronization (501-17 Roof Opening Panel, General Procedures). • Check the fuse(s) • Check the roof opening panel circuits • Carry out hard battery reset • Check the switch and motor function
Roof opening panel creak	• Contact between sunroof frame seal and vehicle body • Sunroof frame twist • Moving panel contact to sunroof frame • Ice formation between the body and sunroof	• GO to Pinpoint Test F.
Roof opening panel sticking or juddering	• Debris in the channels/guides • Cable(s) sticking/damaged • Roof opening panel incorrectly aligned • Switch fault • Motor fault	• Check for general debris • Inspect, clean and lubricate the cable(s) and guides • Check the roof opening panel alignment. REFER to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures). • Check the switch and motor function
	• Debris in the channels/guides • Damage to the glass panel seal	• Check for general debris • Inspect, clean and lubricate the cable(s) and guides • Check the glass panel seal

Water ingress from roof opening panel	• Roof opening panel incorrectly aligned • Failed bond of sunroof frame to body • Failed bond of fixed glass panels to sunroof frame	• Check the roof opening panel alignment REFER to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures).
Roof opening panel blind - gap to headliner	• Miss-alignment of blind closing position • Broken / incorrectly installed headliner clips	• GO to Pinpoint Test A.
Roof opening panel blind noise	• Broken / incorrectly installed blind feet • Warped blind drive mechanism casting • Blind spring rattle	• GO to Pinpoint Test B.
Wind noise	• Damage to the glass panel seal • Cable(s) sticking/damaged • Roof opening panel incorrectly aligned	• Check the glass panel seals • Inspect, clean and lubricate the cable(s) and guides • Check the roof opening panel alignment REFER to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures).

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Central Junction Box (BCM) (100-00 General Information, Description and Operation).

PINPOINT TEST A : ROOF OPENING PANEL BLIND GAP	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: BLIND OPERATION	
	1 Operate the roof opening panel blind from open to closed **twice** , using the console mounted switch
	Does the roof opening panel blind operate correctly? **Yes** GO to A2 . **No** GO to Pinpoint Test B.
A2: BLIND TO HEADLINER GAP	
	1 Carry out a visual inspection of the condition of the closed blind to the headliner
	Is there an excessive or abnormal gap between the blind and headliner? **Yes** GO to A3 . **No** No further action required
A3: GAP ORIENTATION	
	1 Carry out a visual inspection of the condition of the closed blind to the headliner

	Is the gap from the leading edge of the blind to the edge of the headliner in the X-direction (fore/aft)? **Yes** Calibrate the roof opening panel REFER to: Motor Synchronization (501-17 Roof Opening Panel, General Procedures). Then GO to A4 . **No** Check headliner is correctly retained. Re-secure as required. If customer concern is still evident follow the procedure REFER to: Headliner (501-05 Interior Trim and Ornamentation, Removal and Installation). Replace the headliner clips. Then GO to A5 .
A4: BLIND - FEET	
	1 Operate the roof opening panel blind from open to closed **twice** , using the console mounted switch
	2 Carry out a visual inspection of the condition of the closed blind to the headliner
	Is the customer concern still evident? **Yes** Carry out visual inspection of the blind feet for correct installation and damage, re-install or replace as required REFER to: Roof Opening Panel Blind Feet (501-17 Roof Opening Panel, Removal and Installation). Then GO to A5 . **No** No further action required
A5: CLEARANCE APERTURE - VISUAL CHECK	
	1 Operate the roof opening panel blind from open to closed **twice** , using the console mounted switch
	2 Carry out a visual inspection of the condition of the closed blind to the headliner
	Is the customer concern still evident? **Yes** If customer concern is still evident contact dealer technical support **No** No further action required

PINPOINT TEST B : ROOF OPENING PANEL BLIND - MOTOR – NOISE OR INOPERATIVE

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: MOTOR OPERATION	
	1 Operate the roof opening panel blind using the console mounted switch
	2 Listen for noise that would indicate that the motor is operating
	Is there a noise generated when the blind switch is pressed? **Yes** GO to B2 . **No** GO to Pinpoint Test E.

B2: HIGH LEVEL NOISE	
	1 Operate the roof opening panel blind using the console mounted switch
	Does the blind make a loud ratcheting noise when the switch is pressed? **Yes** Replace the glass panel blind drive assembly **(Front)** REFER to: Roof Opening Panel Blind Drive Assembly (501-17 Roof Opening Panel, Removal and Installation). **(Rear)** REFER to: Glass Roof Panel Blind Drive Assembly (501-11 Glass, Frames and Mechanisms, Removal and Installation). **No** Carry out visual inspection of the blind feet for correct installation and damage, replace as required REFER to: Roof Opening Panel Blind Feet (501-17 Roof Opening Panel, Removal and Installation). Then GO to B3 .
B3: HIGH LEVEL NOISE - CHECK	
	1 Operate the roof opening panel blind using the console mounted switch
	Is the customer concern still evident? **Yes** If customer concern is still evident contact dealer technical support **No** No further action required

PINPOINT TEST C : ROOF OPENING PANEL BLIND – NOISE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: BLIND - FEET	
	1 Operate the roof opening panel blind using the console mounted switch
	Is the noise only present during operation of the blind **Yes** Carry out visual inspection of the blind feet for correct installation and damage, replace as required, as per procedure REFER to: Roof Opening Panel Blind Feet (501-17 Roof Opening Panel, Removal and Installation). Then GO to C2 . **No** GO to Pinpoint Test D.
C2: BLIND - RETENSION	
	1 Operate the roof opening panel blind using the console mounted switch
	Is the customer concern still evident? **Yes** Re-tension the blind REFER to: Roof Opening Panel Blind Rewind Procedure (501-17 Roof Opening Panel, General Procedures). Then GO to C3 . **No** No further action required
C3: REPLACEMENT	
	1 Operate the roof opening panel blind using the console mounted switch
	Is the customer concern still evident? **Yes** Replace the blind assembly REFER to: Roof Opening Panel Blind (501-17 Roof Opening Panel, Removal and Installation). Then GO to C4 . **No** No further action required
C4: AUDIBLE NOISE - CHECK	
	1 Operate the roof opening panel blind using the console mounted switch
	Is the customer concern still evident? **Yes** If customer concern is still evident contact dealer technical support **No** No further action required

PINPOINT TEST D : ROOF OPENING PANEL BLIND – NOISE / RATTLE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: RATTLE - VEHICLE IN MOTION	
	1 Verify the customer concern by performing a road test (Observe the road test safety guidelines)
	2 Check if the concern is evident with the blind in open and closed positions
	Is the noise present when the blind is closed? **Yes** Contact dealer technical support **No** GO to D2 .

D2: RATTLE - VEHICLE IN MOTION	
	1 Confirm the vehicle identification number
	Is the VIN number below V17000 **Yes** Replace the blind assembly REFER to: Roof Opening Panel Blind (501-17 Roof Opening Panel, Removal and Installation). If customer concern is still evident contact dealer technical support **No** Contact dealer technical support

PINPOINT TEST E : ROOF BLIND OPERATION

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: OPERATION	
	1 Operate the opening panel using the roof mounted switch
	Does the opening panel operate correctly? **Yes** GO to E2 . **No** Refer to the electrical circuit diagrams. Check the fused links to the roof opening panel, roof blinds module and the front overhead console. Replace as required. If the fused link is intact refer to **(roof opening panel inoperative)** in the symptom chart above
E2: VOLTAGE TO BLIND MOTORS	
NOTE: Blind motor + (red wire) should be at battery voltage during opening movement, blind motor – (black wire) should be at battery voltage during closing movement	
	1 Lower the headliner REFER to: Headliner (501-05 Interior Trim and Ornamentation, Removal and Installation).
	2 **Front** blind failure. Operate to roof blind switch. Refer to the electrical circuit diagrams check for voltage between connector **- C9PR153A/5 -** and **- C9PR153A/1 -**
	3 **Rear** blind failure. Operate to roof blind switch. Refer to the electrical circuit diagrams check for voltage between connector **- C9PR155A/1 -** and **- C9PR155A/5 -**
	Does the supply circuit operate as expected? **Yes** Suspect blind motor internal failure. Replace the glass panel blind drive assembly **(Front)** REFER to: Roof Opening Panel Blind Drive Assembly (501-17 Roof Opening Panel, Removal and Installation). **(Rear)** REFER to: Glass Roof Panel Blind Drive Assembly (501-11 Glass, Frames and Mechanisms, Removal and Installation). GO to E6 . **No** GO to E3 .
E3: SENSOR AND SUPPLY CIRCUIT CHECKS	
	1 **Front** blind failure. Refer to the electrical circuit diagrams check the circuit for continuity and for short to power, ground or open circuit between connectors **- C9PR32A -** and **- C9PR153A -**
	2 **Rear** blind failure. Refer to the electrical circuit diagrams check the circuit for continuity and for short to power, ground or open circuit between connectors **- C9PR32A -** and **- C9PR155A -**
	Did the circuit pass the tests? **Yes** GO to E4 . **No** Repair or replace the blind harness. Then GO to E6 .
E4: SWITCH CIRCUIT CHECK	
	1 Refer to the electrical circuit diagrams check the circuit for continuity and for short to power, ground or open circuit between connectors **- C9PR32A -** and **- C9LN28 -**
	Did the circuit pass the tests? **Yes** GO to E5 . **No** Repair or replace the switch circuit harness. Then GO to E6 .
E5: SWITCH PACK	
NOTE: Blind circuit operation (one touch), a ground is supplied while the switch is pressed	
	1 Refer to the electrical circuit diagrams and monitor voltage on the blind open / close circuits as the switch is pressed
	Did the switch circuits pass the tests? **Yes** GO to E6 . **No**

	If the blind operation is the only fault suspect the front overhead console switch replace as required. Then GO to E6 .
E6: CORRECT OPERATION	
	1 Operate the moving panel using the roof mounted switch
	Does the moving panel operate correctly? **Yes** No further action required **No** If customer concern is still evident contact dealer technical support

PINPOINT TEST F : ROOF OPENING PANEL - FRAME CREAK

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: NOISE - WHEN PANEL IN VENT POSITION	
	NOTE: These tests are to be carried out to determine the cause of the sunroof based creak noises
	1 Verify the customer concern by performing a road test (Observe the road test safety guidelines)
	2 Determine if the issue is present: • When the opening panel is in the vent position • When the opening panel is in the closed position • On flat roads • When the car is under torsion (e.g. driving slowly up a curb, or turning onto an inclined drive-way)
	Is the noise present when the sunroof panel is in the vent position? **Yes** GO to F2 . **No** GO to Pinpoint Test G.
F2: NOISE - WHEN VEHICLE UNDER TORSION	
	1 Using the results obtained
	Is the noise present on flat roads as well as when the vehicle is under torsion? **Yes** GO to F5 . **No** GO to F3 .
F3: VIN RANGE	
	1 Check the vehicle VIN (vehicle identity number).
	Is vehicle VIN below **V25000** ? **Yes** GO to F4 . **No** Contact dealer technical support
F4: FRAME WASHERS - CHECK	
	1 Operate the roof opening panel using the roof mounted switch to the fully open position
	2 Carry out visual inspection of the front corners fixings to confirm the presence of the frame washers
	Are the frame washers present? **Yes** Contact dealer technical support **No** Install frame washers REFER to: (501-17 Roof Opening Panel) Roof Opening Panel Frame Washers - Front (Removal and Installation), Roof Opening Panel Frame Washers - Centre (Removal and Installation), Roof Opening Panel Frame Washers - Rear (Removal and Installation). If the customer concern is still evident contact dealer technical support
F5: REAR PANEL SEAL LUBRICATION	
	1 Lubricate the rear fixed panel seal REFER to: Rear Glass Roof Panel Lubrication (501-11 Glass, Frames and Mechanisms, General Procedures).
	Is the customer concern still evident? **Yes** Contact dealer technical support **No** No further action required

PINPOINT TEST G : ROOF OPENING PANEL - GLASS PANEL CREAK

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: GLASS PANEL PROFILE	

	1 With the glass panel in the closed position. Check the roof opening panel alignment. REFER to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures).
	Is the profile correct? **Yes** GO to G2 . **No** Check the roof opening panel alignment REFER to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures). If the concern persists, GO to G2 .
G2: MECHANISM - CLEARANCE TO FRAME	
	1 Remove the side covers from the glass panel
 E142516	2 With the glass panel in the tilt position carry out a visual inspection of the mechanism clearance to the frame on both left and right side of the vehicle
	Does the mechanism contact the frame? **Yes** Contact dealer technical support **No** GO to G3 .
G3: MECHANISM ARM CREAK	
	1 Remove the moving glass panel REFER to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).
	2 Close the mechanism and gently flex the rear end of the mechanism arm inboard – both left side and right side arms
	Does this produce a creaking noise? **Yes** If customer concern is still evident contact dealer technical support **No** GO to G4 .
G4: DEBRIS IN WIND NOISE SEAL	
	1 Compress the side wind noise seals along their length to check for any debris contaminating the section area
	Is there any debris? **Yes** Remove any debris from the section area by sliding a suitable tool inside the seal GO to G5 . **No** GO to G5 .
G5: MOVING PANEL SEAL LUBRICATION	
	1 Clean all moving panel seals using a damp cloth
	2 Apply AC602/2 lubricant to the all moving panel seals using a suitable clean cloth
	Is the customer concern still evident? **Yes** If customer concern is still evident contact dealer technical support **No**

	No further action required

Interior Trim and Ornamentation - Headliner

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Refer to: Interior Rear View Mirror (501-09 Rear View Mirrors, Removal and Installation).

3. Refer to: Overhead Console (501-12 Instrument Panel and Console, Removal and Installation).

4. NOTE: The procedure must be carried out on both sides.

Refer to: Sun Visor (501-05 Interior Trim and Ornamentation, Removal and Installation).

5. NOTE: The procedure must be carried out on both sides.

Refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

6. NOTE: The procedure must be carried out on both sides.

Refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. NOTE: The procedure must be carried out on both sides.

Refer to: C-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

8. Refer to: Windshield Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

Roof Opening Panel - Motor Synchronization

General Procedures

1. CAUTIONS:

Make sure that the ambient temperature is above 5°C and below 40°C before carrying out this procedure.

Make sure that the gear selector is in the P position.

- Set the ignition to the ON position.
- Start the engine.
- Press and hold the front of the switch, hold down until the roof opening panel is fully closed.

2.
- Press and hold the front of the roof opening panel switch.
- After approximately 45 seconds the roof opening panel will begin to move. Keep the front of the switch pressed until the roof opening panel and the roof blinds have fully opened, then closed.

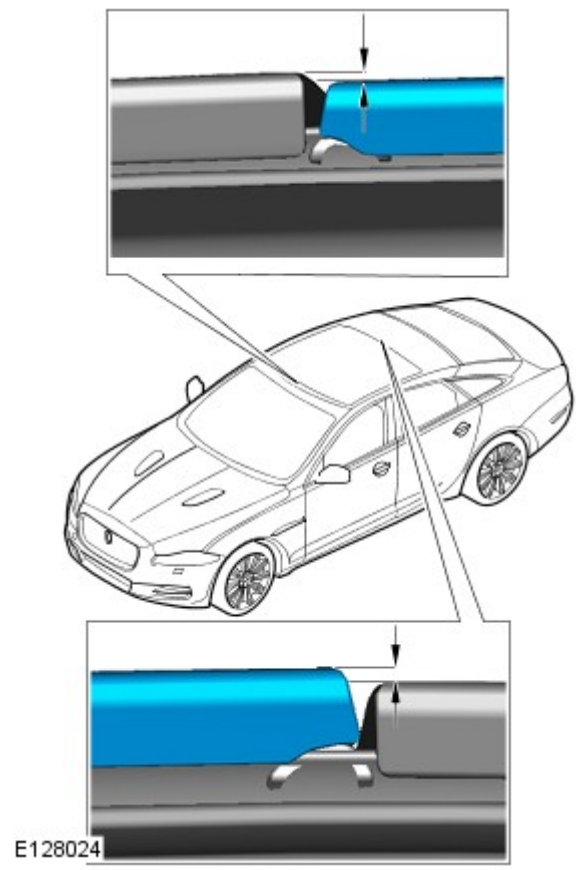
3.
- Once the open/close cycle has completed and the roof opening panel has stopped moving, release the switch.
- The roof opening panel is now synchronized.
- The roof opening panel can now be operated as normal.

4.
- Turn off the engine.
- Set the ignition to the OFF position.

Published: 10-Jan-2012

Roof Opening Panel - Roof Opening Panel Alignment

General Procedures

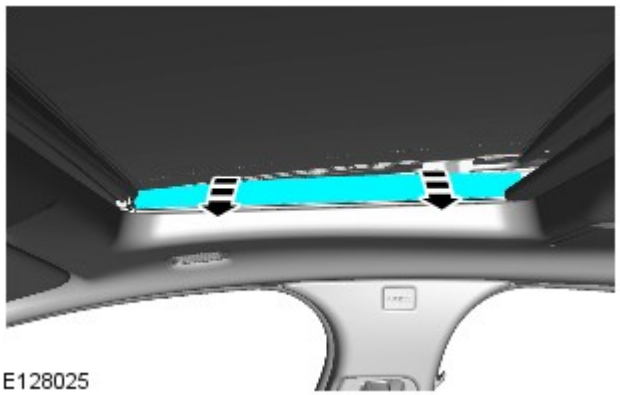


Check

1. NOTE: With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

Adjustment

1. Open the roof opening panel blind.



E128025

2. CAUTION: Note the orientation of the component prior to removal.

NOTE: The procedure must be carried out on both sides.

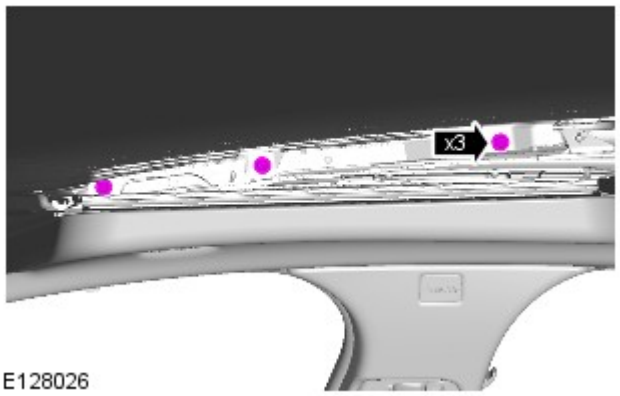
Remove the inner cover.

E141157

3. CAUTION: Note the orientation of the component prior to removal.

NOTE: The procedure must be carried out on both sides.

Remove the outer cover.

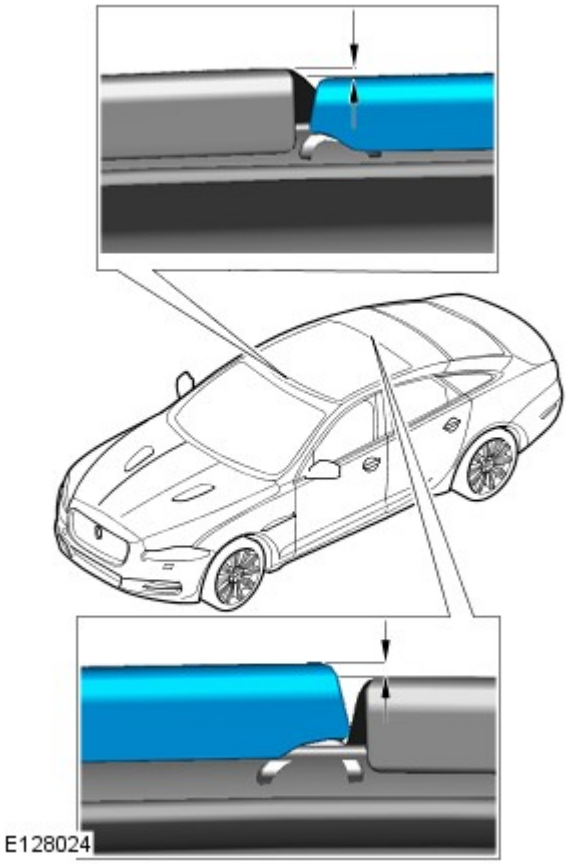


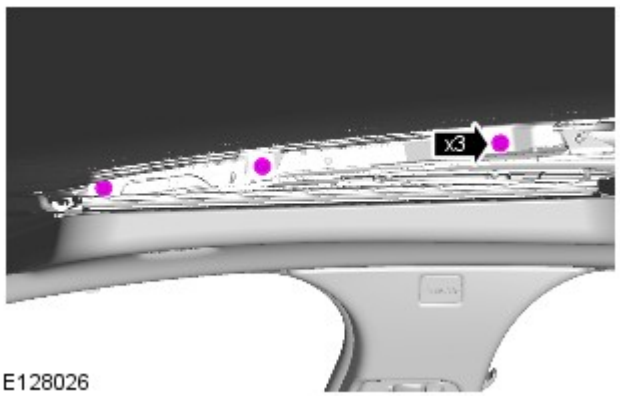
E128026

4. NOTE: The procedure must be carried out on both sides.

Loosen but do not remove the 3 roof opening panel Torx bolts.

5. Align the roof opening panel.





6. NOTES:

With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

Make sure that the alignment of the roof is equal on both sides of the vehicle.

The procedure must be carried out on both sides.

Torque: 7 Nm

7. NOTES:

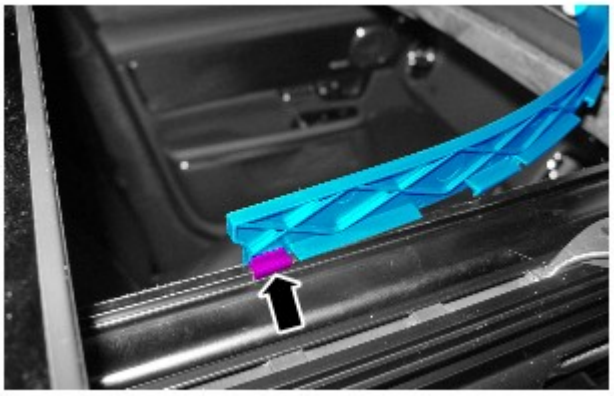
Make sure that the cover is positioned as far forward as possible.

The procedure must be carried out on both sides.

Install the outer cover.

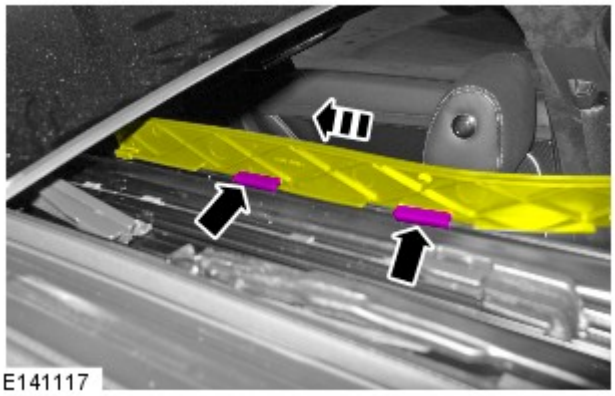
E141158

8. Fully open the roof opening panel glass.



9. NOTE: The procedure must be carried out on both sides.

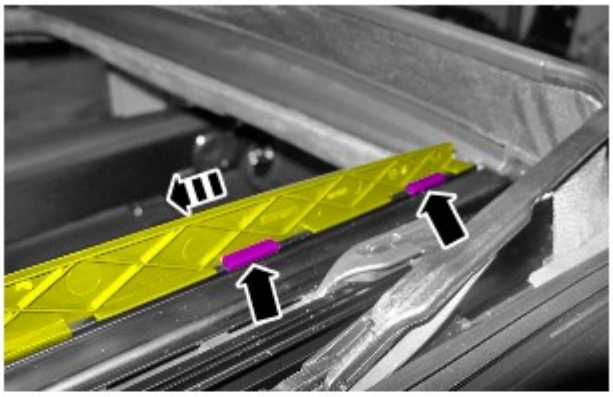
Carefully secure the clips whilst sliding the inner cover rearwards.

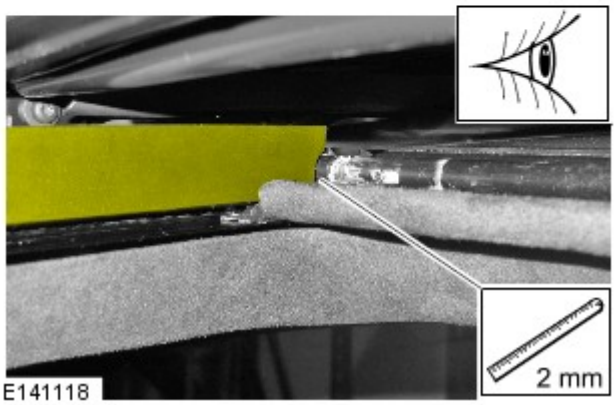


E141117

10. NOTE: The procedure must be carried out on both sides.

Secure the clips and slide the inner cover rearward until it is 2mm from the roof opening panel blind drive spindle .





11. Close the roof opening panel glass.

12. Close the roof opening panel blind.

Published: 26-Sep-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Central Junction Box (BCM)

Description and Operation

Central Junction Box (CJB)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If a control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Central Junction Box (CJB). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.For additional information, refer to: Communications Network (418-00 Module Communications Network, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1008-11	Wiper Mode Switch - Circuit short to ground	• Master wipe switch input circuit at ground for more than 1 second	• Refer to electrical circuit diagrams and check the master wipe switch circuit between the wiper switch and the central junction box for short to ground. Repair wiring harness as required. If no fault is found in the harness suspect the switch. Check switch for short to ground, install a new switch as required. If the switch is not at fault suspect the central junction box
B1008-15	Wiper Mode Switch - Circuit short to battery or open	• Master wipe switch input circuit at battery voltage or open load for more than 1 second	• Refer to electrical circuit diagrams and check the master wipe switch circuit between the wiper switch and the central junction box for short to power or open circuit. Repair wiring harness as required. If no fault is found in the harness suspect the switch. Check switch for short to power or open circuit, install a new switch as required. If the switch is not at fault suspect the central junction box
B1008-1E	Wiper Mode Switch - Circuit resistance out of range	• Master wipe switch input circuit signal out of range for more than 1 second	• Refer to electrical circuit diagrams and check the master wipe switch circuit between the wiper switch and the central junction box for partial short or open circuit, high resistance across connectors, or short to another circuit. Repair wiring harness as required. If no fault is found in the harness suspect the switch. Check switch for damaged connector pins, install a new switch as required
B1009-51	Ignition Authorization - Not programmed	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Security identifier not programmed in central junction box (Part of immobilization set-up)	• Configure the central junction box as a new module using the manufacturers approved diagnostic system
B1009-62	Ignition Authorization - Signal compare failure	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Encrypted data exchange between instrument cluster and the central junction box does not match	• Configure the module using the manufacturers approved diagnostic system. If problem persists carry out CAN network integrity test and on demand self-test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuit
		• Circuit/component protection time-out	

B1009-63	Ignition Authorization - Circuit/component protection time-out	• CAN circuit fault • Instrument cluster fault • Central junction box fault • Battery voltage too low	NOTE: Only diagnose this DTC if the Customer is reporting a start related issue • Clear the DTC and retest. Check for additional ignition related DTCs and rectify as necessary. If problem persists, carry out CAN network integrity test and on demand self-test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1009-81	Ignition Authorization - Invalid serial data received	• Invalid serial data received • CAN circuit fault • Instrument Cluster fault	NOTE: Only diagnose this DTC if the Customer is reporting a start related issue • Clear the DTC and retest. Check for additional ignition related DTCs and rectify as necessary. If problem persists, carry out CAN network integrity test and on demand self-test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B100D-51	Column Lock Authorization - Not programmed	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Security identifier not programmed in central junction box (Part of Immobilization set-up)	• Configure the central junction box as a new module using the manufacturers approved diagnostic system
B100D-64	Column Lock Authorization - Signal plausibility failure	• Signal plausibility failure • Steering column lock unable to perform lock action • CAN network fault • Anti-lock braking system, engine control module, central junction box fault	NOTE: Prior to clearing this DTC, carry out the Vehicle Functional Reset application using the manufacturer approved diagnostic system • Check the serviceability of the steering column and lock. Clear the DTC and retest. If problem persists, carry out CAN network integrity test and on demand self test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B100D-67	Column Lock Authorization - Signal incorrect after event	• Signal incorrect after event • Instrument cluster fault • CAN network fault	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Check for additional related DTCs. Clear the DTC and retest. If problem persists, carry out CAN network integrity test and on demand self test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B100D-81	Column Lock Authorization - Invalid serial data received	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Encrypted data exchange between steering column lock and the central junction box does not match	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits

B100D-87	Column Lock Authorisation - Missing message	• Missing message • CAN fault • No response from electric steering column lock control module, instrument cluster, central junction box • Battery voltage at electric steering column lock control module too low • Electric steering column lock control module, instrument cluster, central junction box fault	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Clear DTC, repeatedly lock and unlock car using the key fob and retest. Check for related DTCs and refer to the relevant DTC index • If the fault is cleared, notify the customer that the steering column lock may fail to unlock if the vehicle is parked with a high steering angle or with the road wheel against a curb. If the column lock is failing to disengage, the customer may be able to rectify this by rotating the steering wheel while pressing the engine start button • If fault persists, complete a CAN network integrity test using the manufacturers approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits between the central junction box, the instrument cluster and the electronic steering column lock. Refer to the electrical circuit diagrams and check the central junction box, the instrument cluster and the electronic steering column lock power and ground supply circuits for short circuit to ground, short circuit to power, open circuit, high resistance. Repair circuit(s) as required. Clear DTC, perform an on demand self-test and retest • If fault persists, check that the vehicle battery supply voltage is between 9-16 volts. Rectify as required
B100D-96	Column Lock Authorisation - Component internal failure	• Battery voltage at electric steering column lock control module too low • Torque load on steering column • CAN fault • Electric steering column lock control module - Internal failure	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Clear DTC, repeatedly lock and unlock car using the key fob and retest • If fault persists, check that the vehicle battery supply voltage is between 9-16 volts. Rectify as required • Ensure the column lock bolt movement is not obstructed or restricted (the parked position of the road wheels may be exerting a turning force through the steering column, preventing the lock from releasing. The steering wheel may need to be held against the force to allow the column lock to release). Clear DTC, repeatedly lock and unlock car using the key fob and retest • If fault persists, complete a CAN network integrity test using the manufacturers approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits between the central junction box, the instrument cluster and the electronic steering column lock. Refer to the electrical circuit diagrams and check the central junction box, the instrument cluster and the electronic steering column lock power and ground supply circuits for short circuit to ground, short circuit to power, open circuit, high resistance. Repair circuit(s) as required. Clear DTC, perform an on demand self-test and retest • If fault persists, check and install a new electric steering column lock control module as required
B1024-83	Start Control Unit - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect • Immobilizer antenna unit fault • LIN network fault	• Clear the DTC and retest. Refer to the electrical circuit diagrams and check immobilizer antenna unit circuits. If the problem persists, renew the immobilizer antenna unit
B1024-87	Start Control Unit -	• Value of signal protection calculation incorrect	• Clear the DTC and retest. Refer to the electrical circuit diagrams and check immobilizer antenna unit circuits.

	Missing message	• Immobilizer antenna unit fault • LIN network fault	If the problem persists, renew the immobilizer antenna unit
B1026-11	Steering Column Lock - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check electric steering column lock circuits
B102B-67	Passive Key - Signal incorrect after event	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Passive key authorization signal incorrect after event • Encrypted data exchange between electric steering column lock control module and central junction box does not match • Low speed CAN fault • Keyless vehicle module fault • Central junction box fault	• Configure the central junction box as a new module using the manufacturers approved diagnostic system. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B102B-87	Passive Key - Missing message	• Passive key authorization missing message • Confirm placement of key within vehicle • Low speed CAN fault • Key fob battery low/battery contact issue • Interference from other RF signal • Electromagnetic compatibility/noise • Keyless vehicle module fault • Receiver fault • Receiver not programmed correctly • Serial communication fault (between receiver and keyless vehicle module) • Key fault • Passive antenna fault • Central junction box fault	NOTE: The action below is only required if this DTC and DTC B1B01-87 have been stored, or vehicle start issue has been reported • Check whereabouts of keys, including spare and confirm correct functionality • Refer to the electrical circuit diagrams and check the power and ground circuits to the keyless vehicle module and receiver • Check CAN communications between central junction box and keyless vehicle module • Check key fob battery • Check vehicle surroundings for possible sources of interference, move vehicle and retest. Check CAN network for interference/electromagnetic compatibility related issues • Check serial circuit between receiver and keyless vehicle module. Refer to the electrical circuit diagrams and check circuits to all three antennas • Disconnect battery, then re-connect - confirm correct operation by re-programming keys using the manufacturer approved diagnostic system
B1046-23	Front Fog Lamp Control Switch - Signal stuck low	• Switch signal stuck low • Switch circuit short to ground • Switch activated for more than one minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1047-11	Rear Fog Lamp Control Switch - Circuit short to ground	• Switch signal stays at ground for more than 1 second	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to ground. Clear the DTC and retest. If the DTC persists, renew the switch

B1047-15	Rear Fog Lamp Control Switch - Circuit short to battery or open	• Switch signal stays at battery voltage level or open load level for more than one second	• Refer to the electrical circuit diagrams and check the switch circuit for short circuit to power or open circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1047-1E	Rear Fog Lamp Control Switch - Circuit resistance out of range	• Switch circuit resistance stays out of range for more than one second	• Refer to the electrical circuit diagrams and check the switch circuit for short circuit to other circuits, or high resistance. Clear the DTC and retest. If the DTC persists, renew the switch
B1047-23	Rear Fog Lamp Control Switch - Signal stuck low	• Switch signal stuck low • Switch circuit short to ground • Switch activated for more than 1 minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-11	Front Washer Switch - Circuit short to ground	• Washer switch input circuit stays at ground for more than 1 second • Switch circuit short circuit to ground • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to ground. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-15	Front Washer Switch - Circuit short to battery or open	• Washer switch input circuit stays at battery voltage level or open load for more than 1 second • Switch circuit short circuit to power • Switch circuit open • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to power or open circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-1E	Front Washer Switch - Circuit resistance out of range	• Washer switch input circuit resistance stays out of range for more than 1 second • Switch circuit short circuit to another circuit • Switch circuit high resistance • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to another circuit, high resistance. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-23	Front Washer Switch - Signal stuck low	• Switch signal stuck low • Switch circuit short to ground • Switch activated for more than one minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1052-23	Rear Washer Switch - Signal stuck low	• Switch signal stuck low • Switch circuit short to ground • Switch activated for more than one minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch

B1087-86	LIN Bus "A" - Signal invalid	• The header of the LIN message received is incorrect	• Clear the stored DTC and retest, if the DTC returns localize the fault, refer to the electrical circuit diagrams and disconnect the analogue clock (by removing the supply fuse) and retest • Check the operation of the steering wheel switches on the LIN bus circuit (i.e. cruise, gearshift paddles, information and entertainment lower switchpack where installed). If a fault is evident with either the analogue clock or the left-side steering wheel module, replace as required
B1087-88	LIN Bus "A" - Bus off	• LIN bus circuit short to power or ground	• Refer to the electrical circuit diagrams and check the LIN circuit between the central junction box, the right-side steering wheel module and the analogue clock module for short circuit to power or short circuit to ground
B1088-86	LIN Bus "B" - Signal invalid	• Signal invalid	• Refer to the electrical circuit diagrams and check the LIN B circuit between the central junction box and the rain/light sensor, battery backed sounder and volumetric sensor (where installed)
B1088-88	LIN Bus "B" - Bus off	• Bus off	• Refer to the electrical circuit diagrams and check the LIN B circuit between the central junction box and the rain/light sensor, battery backed sounder and volumetric sensor (where installed)
B108B-11	Start Button Circuit "A" - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the start button circuit
B108B-12	Start Button Circuit "A" - Circuit short to battery	• Circuit short to power	• Refer to the electrical circuit diagrams and check the start button circuit
B108B-13	Start Button Circuit "A" - Circuit open	• Circuit open circuit	• Refer to the electrical circuit diagrams and check the start button circuit
B108B-23	Start Button Circuit "A" - Signal stuck low	• Start button signal stuck low • Switch activated for more than one minute • SW1 constantly active for a long period of time while button press detected at SW2 • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the start button circuit. Renew the start switch as required
B108C-11	Start Button Circuit "B" - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the start button circuit
B108C-12	Start Button Circuit "B" - Circuit short to battery	• Circuit short to power	• Refer to the electrical circuit diagrams and check the start button circuit
B108C-13	Start Button Circuit "B" - Circuit open	• Circuit open circuit	• Refer to the electrical circuit diagrams and check the start button circuit
B108C-23	Start Button Circuit "B" - Signal stuck low	• Start button signal stuck low • Switch activated for more than one minute • SW1 constantly active for a long	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the start button circuit. Renew the start switch as required

		period of time while button press detected at SW2 • Switch failure	
B1095-11	Wiper On/Off Relay - Circuit short to ground	• Wiper on/off relay circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1095-12	Wiper On/Off Relay - Circuit short to battery	• Wiper on/off relay circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B1095-13	Wiper On/Off Relay - Circuit open	• Wiper on/off relay circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit
B1096-11	Wiper High/Low Relay - Circuit short to ground	• Wiper circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1096-12	Wiper High/Low Relay - Circuit short to battery	• Wiper circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B1096-13	Wiper High/Low Relay - Circuit open	• Wiper circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit
B1097-11	Heated Windshield Relay - Circuit short to ground	• Heated windshield relay circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1097-12	Heated Windshield Relay - Circuit short to battery	• Heated windshield relay circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B1097-13	Heated Windshield Relay - Circuit open	• Heated windshield relay circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit
B109B-11	License Plate Light - Circuit short to ground	• License plate light circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B109B-13	License Plate Light - Circuit open	• License plate light circuit open	• Refer to the electrical circuit diagrams and check the circuit
B109B-15	License Plate Light - Circuit short to battery or open	• License plate light circuit short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the circuit
B109E-51	Remote Keyless Entry - Not programmed	• Not programmed	• Configure the system using the manufacturers approved diagnostic system
B10A2-31	Crash Input - No signal	• No signal	• Check the supplemental restraints system and engine control module for related DTCs. Refer to the electrical circuit diagrams and check the circuit between the supplemental restraints system, the central junction box and the engine control module
B10A2-38	Crash Input - Signal frequency incorrect	• Signal frequency incorrect	• Check the restraints control module for DTCs and rectify first
	Remote Keyless Entry		

B10AB-51	Synchronization - Not programmed	• Not programmed	• Configure the system using the manufacturers approved diagnostic system
B10AD-09	Rain Sensor - Component Failures	• Rain/light sensor obscured • Battery supply voltage below 9 volts • Sensor incorrectly installed • Component failure	• Check the rain/light sensor is not obscured. Check for related low voltage stored DTCs • Check the security and installation of the rain/light sensor. Clear the DTC and retest • If the DTC returns suspect an internal fault
B10AD-83	Rain Sensor - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect • Sensor fault	• Clear the DTC and retest. If the problem persists, renew the rain/light sensor
B10AD-87	Rain Sensor - Missing message	• Missing message - LIN slave node is not responding	• Check the operation of the rain/light sensor. Refer to the electrical circuit diagrams and check the LIN circuit between the rain/light sensor and the central junction box. Should also check LIN control unit and rain/light sensor power and ground circuits
B10AD-96	Rain Sensor - Component internal failure	• Component internal failure	• Clear the DTC and retest. If the problem persists, renew the rain/light sensor
B10E5-11	PCM Wake-Up Signal - Circuit short to ground	• Engine control module wake-up signal short to ground	• Refer to the electrical circuit diagrams and test the early wake-up signal circuit
B10E5-15	PCM Wake-Up Signal - Circuit short to battery or open	• Engine control module wake-up signal short circuit to power or open circuit	• Refer to the electrical circuit diagrams and test the early wake-up signal circuit
B10E7-11	Ignition On Relay - Circuit short to ground	• Output circuit to ignition control relay short circuit to ground	• Refer to the electrical circuit diagrams and check the output circuit to the ignition control relay (between central junction box and engine junction box) for short circuit to ground. Repair harness as required, clear the DTC and retest
B10E7-12	Ignition On Relay - Circuit short to battery	• Output circuit to ignition control relay short circuit to power • Ignition on relay fault	• Check ignition relay for correct operation, install a new relay if required. Refer to the electrical circuit diagrams and check the output circuit to the ignition control relay (between central junction box and engine junction box) for short circuit to ground. Repair harness as required, clear the DTC and retest
B10E7-13	Ignition On Relay - Circuit open	• Output circuit to ignition control relay open circuit	• Check ignition relay for correct operation, install a new relay if required. Refer to the electrical circuit diagrams and check the output circuit to the ignition control relay (between central junction box and engine junction box) for short circuit to ground. Repair harness as required, clear the DTC and retest
B10F2-4B	Sunroof Control - Over temperature	• Sunroof control motor over temperature • Temperature sensor defective or not calibrated • Debris in the channels/guides • Cable(s) sticking/damaged • Roof opening panel not correctly aligned	• Check the sunroof for smooth operation and obstructions that would cause the motor to overheat. If necessary, renew the motor

		• Motor fault	
B10F2-74	Sunroof Control - Actuator slipping	• Sunroof control motor slipping due to mechanical failure • Debris in the channels/guides • Cable(s) sticking/damaged • Roof opening panel not correctly aligned • Motor fault	• Remove the motor and check the cables for free movement and damage. Check the sunroof for smooth operation and obstructions that would cause the motor to slip. If necessary, renew the motor
B10F2-93	Sunroof Control - No operation	• No operation, roof position is not valid • Motor position not calibrated	• Configure the module using the manufacturers approved diagnostic system
B10F2-9A	Sunroof Control - Component or system operating conditions	• Roof opening panel/roof blinds module circuit fault • Roof opening panel/roof blinds module internal fault • Excessive continuous motor operation	• This DTC is not necessarily a fault and may be logged when the sunroof has been operated continuously and the sunroof has temporarily been disabled to prevent motor over-heat. Clear the DTC and check the operation of the switch and sunroof operation
B10F8-11	Accessory Socket 'A' Relay - Circuit short to ground	• Accessory socket 'A' relay circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B10F8-12	Accessory Socket 'A' Relay - Circuit short to battery	• Accessory socket 'A' relay circuit short to power	• Refer to the electrical circuit diagrams and check the circuit
B10F8-13	Accessory Socket 'A' Relay - Circuit open	• Accessory socket 'A' relay circuit open ground	• Refer to the electrical circuit diagrams and check the circuit
B10F9-11	Accessory Socket 'B' Relay - Circuit short to ground	• Accessory socket 'B' relay circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B10F9-12	Accessory Socket 'B' Relay - Circuit short to battery	• Accessory socket 'B' relay circuit short to power	• Refer to the electrical circuit diagrams and check the circuit
B10F9-13	Accessory Socket 'B' Relay - Circuit open	• Accessory socket 'B' relay circuit open ground	• Refer to the electrical circuit diagrams and check the circuit
B1115-11	High Mounted Stop Lamp Control - Circuit short to ground	• High mounted stop lamp control circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B111E-11	Boot/Trunk Lamps - Circuit short to ground	• Boot/trunk lamp control circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B111E-15	Boot/Trunk Lamps - Circuit short to battery or open	• Boot/trunk lamp control circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
	Steering Wheel		

B112B-83	Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Check the steering wheel switch functions to localize the failure. Clear the stored DTC and retest. If the DTC returns suspect the right-side steering wheel module and replace as required
B112B-87	Steering Wheel Module - Missing message	• Missing message	• Check the operation of the steering wheel switches on the LIN bus circuit (i.e. cruise, gearshift paddles where installed) • Refer to the electrical circuit diagrams and check the LIN circuit between the steering wheel module and the central junction box • Check the right-side steering wheel module power and ground circuits
B112B-96	Steering Wheel Module - Component internal failure	• Component internal failure	• Clear the stored DTC and retest. If the DTC returns suspect the right-side steering wheel module and replace as required
B112C-83	Interior Motion Sensor - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the problem persists, renew the volumetric sensor
B112C-87	Interior Motion Sensor - Missing message	• Missing message	• Check the operation of the volumetric sensor • Refer to the electrical circuit diagrams and check the LIN circuit between the volumetric sensor and the central junction box. Should also check LIN control unit power and ground circuits. Clear the DTC and retest • If the DTC persists, renew the volumetric sensor
B112C-96	Interior Motion Sensor - Component internal failure	• The central junction box has detected an internal error in the volumetric sensor	• Clear the DTC and retest. If the problem persists, renew the volumetric sensor
B113C-11	Hazard Switch Illumination - Circuit short to ground	• Hazard switch illumination circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B113C-12	Hazard Switch Illumination - Circuit short to battery	• Hazard switch illumination circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B113C-13	Hazard Switch Illumination - Circuit open	• Hazard switch illumination circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B113E-23	External Boot/Trunk Release Switch - Signal stuck low	• External luggage compartment lid release switch digital input circuit - Signal stuck low • Switch activated for more than one minute	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the external luggage compartment lid release switch digital input circuit for short to ground
B1140-11	Engine Crank Authorization - Circuit short to ground	• Engine crank authorization signal circuit short circuit to ground	• Refer to the electrical circuit diagrams and check engine crank authorization signal circuit
B1140-15	Engine Crank Authorization - Circuit short to battery or open	• Engine crank authorization signal circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check engine crank authorization signal circuit

B1144-11	Heated Steering Wheel Supply - Circuit short to ground	Please note that this output is currently not used, but there is a possibility that the on demand self-test could detect a circuit fault on this pin	No action necessary, clear/ignore DTC
B1146-11	Passive Sounder Supply - Circuit short to ground	• Security passive sounder control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the security passive sounder control circuit
B1146-15	Passive Sounder Supply - Circuit short to battery or open	• Security passive sounder control circuit short circuit to power, open circuit	• Refer to the electrical circuit diagrams and check the security passive sounder control circuit
B1182-51	Tire Pressure Monitoring System - Not programmed	• Diagnostic test to verify reception of all tire low pressure sensors has failed	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
B1186-62	Trunk Power Striker - Signal compare failure	• Both power striker status switches are active at the same time (open and closed) • Status switch circuit short circuit to ground or short circuit to each other	• Refer to the electrical circuit diagrams and check the power striker status switch circuits for short circuit to ground or short circuit to other circuits. Repair wiring harness as required, clear the DTC and retest the system
B11A2-11	Master Exterior Light Switch - Circuit short to ground	• Short circuit to ground on master exterior light switch circuit detected for more than 1 second	• Refer to the electrical circuit diagrams and check the master exterior light switch circuit for short circuit to ground. Repair wiring harness as required, clear the DTC and retest the system
B11A2-15	Master Exterior Light Switch - Circuit short to battery or open	• Short circuit to power or open load on master exterior light switch circuit detected for more than 1 second • Master exterior lighting switch fault	• Refer to the electrical circuit diagrams and check the master exterior light switch circuit for short circuit to power or open load. Repair wiring harness as required, clear the DTC and retest the system. If the DTC remains suspect the master exterior light switch
B11A2-1E	Master Exterior Light Switch - Circuit resistance out of range	• Master exterior light switch circuit resistance out of range detected for more than 1 second • Master exterior lighting switch fault	• Refer to the electrical circuit diagrams and check the master exterior light switch circuit for short circuit to other circuits or high resistance in connectors. Repair wiring harness as required, clear the DTC and retest the system. If the DTC remains suspect the master exterior light switch
B11D1-86	LIN Bus "C" - Signal invalid	• Signal invalid	• Refer to the electrical circuit diagrams and check the roof opening panel LIN circuit between the roof opening panel control module, passenger fuse box and the central junction box
B11D1-88	LIN Bus "C" - Bus off	• Bus off • Roof opening panel LIN network short to power, ground	• Refer to the electrical circuit diagrams and check the roof opening panel LIN circuit between the roof opening panel control module, passenger fuse box and the central junction box
B11D9-92	Vehicle Battery - Performance or incorrect operation	• Internal electronic failure	• Renew the battery monitoring system control module

B11DB-49	Battery Monitoring Module - Internal electronic failure	• Internal electronic failure	• Renew the battery monitoring system control module
B11DB-83	Battery Monitoring Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the problem persists, renew the battery monitoring system control module
B11DB-87	Battery Monitoring Module - Missing message	• Missing message • Battery monitoring system control module connector dis-connected/poor connection • Battery monitoring system control module to passenger fuse box LIN circuit - Open circuit • Battery monitoring system control module to battery positive monitor circuit open circuit • Battery monitoring system control module/passenger fuse box failure	NOTE: Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging • Check the operation of the monitoring system control module. Refer to the electrical circuit diagrams and check the LIN circuit between the monitoring system control module and the central junction box. Should also check LIN control unit power and ground circuits
B123A-11	Left Front Turn Indicator - Circuit short to ground	• Left front turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check left front turn signal lamp circuit
B123A-15	Left Front Turn Indicator - Circuit short to battery or open	• Left front turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check left front turn signal lamp circuit
B123B-11	Right Front Turn Indicator - Circuit short to ground	• Right front turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check right front turn signal lamp circuit
B123B-15	Right Front Turn Indicator - Circuit short to battery or open	• Right front turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check right front turn signal lamp circuit
B1247-11	Left Rear Turn Indicator - Circuit short to ground	• Left rear turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check left rear turn signal lamp circuit
B1247-15	Left Rear Turn Indicator - Circuit short to battery or open	• Left rear turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check left rear turn signal lamp circuit
B1248-11	Right Rear Turn Indicator - Circuit short to ground	• Right rear turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check right rear turn signal lamp circuit
B1248-15	Right Rear Turn Indicator - Circuit short to battery or open	• Right rear turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check right rear turn signal lamp circuit
B1249-11	Start Button Illumination - Circuit short to ground	• Short circuit to ground detected in output to stop/start button illumination	• Refer to electrical circuit diagrams and check output circuit to stop/start button illumination. Repair wiring as required, clear DTC and retest system

B1249-15	Start Button Illumination - Circuit short to battery or open	• Short circuit to power or open circuit detected in output to stop/start button illumination	• Refer to electrical circuit diagrams and check output circuit to stop/start button illumination. Repair wiring as required, clear DTC and retest system
B124A-11	Right Daytime Running Light - Circuit short to ground	• Short circuit to ground detected in output to running light	• Refer to the electrical circuit diagrams and check right daytime running light control circuit
B124A-15	Right Daytime Running Light - Circuit short to battery or open	• Short circuit to power or open circuit detected in output to running light	• Refer to the electrical circuit diagrams and check right daytime running light control circuit
B124B-11	Left Daytime Running Light - Circuit short to ground	• Short circuit to ground detected in output to running light	• Refer to the electrical circuit diagrams and check left daytime running light control circuit
B124B-15	Left Daytime Running Light - Circuit short to battery or open	• Short circuit to power or open circuit detected in output to running light	• Refer to the electrical circuit diagrams and check left daytime running light control circuit
B1277-11	Reverse Lamp - Circuit short to ground	• Short circuit to ground detected in reverse lamp control circuit	• Refer to the electrical circuit diagrams and check reverse light control circuit from central junction box to both rear lamp clusters
B1277-15	Reverse lamp - Circuit short to battery or open	• Short circuit to power or open circuit detected in reverse lamp control circuit	• Refer to the electrical circuit diagrams and check reverse light control circuit from central junction box to both rear lamp clusters
B1298-73	Steering Column Adjust Up Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
B1299-73	Steering Column Adjust Down Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
B129A-86	LIN Bus "D" - Signal invalid	• Signal invalid	• Refer to the electrical circuit diagrams and check the immobilizer antenna LIN circuit between the central junction box and the immobilizer antenna unit. Check for other immobilizer DTCs
B129A-88	LIN Bus "D" - Bus off	• Bus off • Immobilizer antenna LIN network short to power, ground - this is detected when nothing is read back after a header is transmitted	• Refer to the electrical circuit diagrams and check the immobilizer antenna LIN circuit between the central junction box and the immobilizer antenna unit. Check for other immobilizer DTCs
B12A1-73	Steering Column Adjust Out Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
B12A2-73	Steering Column Adjust In Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
	Steering Column Adjust Motor Drive A	• Motor circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and

B12A3-11	- Circuit short to ground	• Motor fault	the central junction box. If no circuit faults are evident, suspect the steering column adjust motor
B12A3-15	Steering Column Adjust Motor Drive A - Circuit short to battery or open	• Motor circuit short to power or open circuit • Motor fault	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and the central junction box. If no circuit faults are evident, suspect the steering column adjust motor
B12A4-11	Steering Column Adjust Motor Drive B - Circuit short to ground	• Motor circuit short to ground • Motor fault	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and the central junction box. If no circuit faults are evident, suspect the steering column adjust motor
B12A4-15	Steering Column Adjust Motor Drive B - Circuit short to battery or open	• Motor circuit short to power or open circuit • Motor fault	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and the central junction box. If no circuit faults are evident, suspect the steering column adjust motor
B12C9-86	LIN Bus "E" - Signal invalid	• Battery monitoring system signal invalid	• Refer to the electrical circuit diagrams and check the battery monitoring system LIN circuit between the central junction box and the battery monitoring system control module. Check for other battery monitoring system related DTCs
B12C9-88	LIN Bus "E" - Bus off	• Bus off • Battery monitoring system LIN network short to power, ground - This is detected when nothing is read back after a header is transmitted	• Refer to the electrical circuit diagrams and check the battery monitoring system LIN circuit between the central junction box and the battery monitoring system control module. Check for other battery monitoring system related DTCs
B12E7-23	Glove Box Switch - Signal stuck low	• Jag Sense switch activated for more than 1 minute	• Refer to the electrical circuit diagrams and check the glove box release circuit between the central junction box and the Jag Sense module for short to other circuits. Check operation of Jag Sense module. Clear DTC and retest system, if DTC remains suspect Jag Sense module
B12EE-11	Tailgate/Trunk Release - Circuit short to ground	• Tailgate/Trunk release circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B12EE-15	Tailgate/Trunk Release - Circuit short to battery or open	• Tailgate/Trunk release circuit short to power, open circuit	• Refer to the electrical circuit diagrams and check the circuit
B12F4-12	Vehicle Speed Output - Circuit short to battery	• Circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B12F5-12	Fridge Relay Control - Circuit short to battery	• Circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B12F7-11	Single Wipe Switch - Circuit short to ground	• Short to ground detected on flick wipe switch circuit for more than 1 second	• Check the operation of the flick wipe switch stalk. Refer to the electrical circuit diagrams and check the flick wipe switch circuit for a short to ground. Repair wiring harness as required, clear the DTC and retest
B12F7-15	Single Wipe Switch - Circuit short to battery or open	• Short to power or open load detected on flick wipe switch circuit for more than 1 second	• Check the operation of the flick wipe switch stalk. Refer to the electrical circuit diagrams and check the flick wipe switch circuit for a short to power or open circuit. Repair wiring harness as required, clear the DTC and retest

B12F7-1E	Single Wipe Switch - Circuit resistance out of range	• Resistance out of range detected on flick wipe switch circuit for more than 1 second	• Check the operation of the flick wipe switch stalk. Refer to the electrical circuit diagrams and check the flick wipe switch circuit for a short to another circuit or high resistance. Repair wiring harness as required, clear the DTC and retest
B12FA-11	Power Steering Solenoid Control A - Circuit short to ground	• Servotronic valve circuit short circuit to ground (customer may complain of heavy steering or variable steering effort required)	• Refer to the electrical circuit diagrams and check the circuit between the servotronic valve and the central junction box
B12FA-13	Power Steering Solenoid Control A - Circuit open	• Servotronic valve circuit open circuit (customer may complain of heavy steering or variable steering effort required)	• Refer to the electrical circuit diagrams and check the circuit between the servotronic valve and the central junction box
B12FB-12	Power Steering Solenoid Control B - Circuit short to battery	• Servotronic valve circuit short circuit to power (customer may complain of heavy steering or variable steering effort required)	• Refer to the electrical circuit diagrams and check the circuit between the servotronic valve and the central junction box
B130B-11	Right Rear Fog Lamp - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit for short to ground
B130B-15	Right Rear Fog Lamp - Circuit short to battery or open	• Circuit short to power or open	• Refer to the electrical circuit diagrams and check the circuit for short to power or open circuit
B130E-11	Left Rear Fog Lamp - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit for short to ground
B130E-15	Left Rear Fog Lamp - Circuit short to battery or open	• Circuit short to power or open	• Refer to the electrical circuit diagrams and check the circuit for short to power or open circuit
B1311-83	Clock Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect • LIN 1 circuit fault	• Clear the DTC and retest. Refer to electrical circuit diagrams and check power and ground connections to clock module, check LIN circuit. Rectify any wiring faults. If the problem persists, renew the clock module
B1311-87	Clock Module - Missing message	• Clock status signal not received • LIN 1 circuit fault	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported an analogue clock concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Refer to the electrical circuit diagrams to locate the fused supply circuit to the analogue clock. With the ignition supply in the OFF state, remove and reinstall the fuse. Clear the DTC and retest. Refer to electrical circuit diagrams and check power and ground connections to clock module, check LIN circuit. Rectify any wiring faults. If the problem persists, renew the clock module
	Clock Module -		• Refer to the electrical circuit diagrams to locate the fused supply circuit to the analogue clock. With the ignition supply in the OFF state, remove and reinstall the fuse. The clock hands will now set to the 12 position

B1311-96	Component internal failure	• Component internal failure	• Cycle the ignition state to ON (the clock should now have self-adjusted to the time currently set within the central junction box) • Record then clear the stored DTC, cycle the ignition state to OFF, return the state to ON, retest, if the DTC returns, renew the analogue clock module
B134E-14	Switch Illumination Adjustment Control - Circuit short to ground or open	• Circuit short to ground or open circuit	• Refer to the electrical circuit diagrams and check the circuit
B134F-11	Headlamp Flash Switch - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B134F-15	Headlamp Flash Switch - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit
B134F-1E	Headlamp Flash Switch - Circuit resistance out of range	• Circuit resistance out of range	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit
B134F-23	Headlamp Flash Switch - Signal stuck low	• Circuit signal stuck low • Switch activated for more than 1 minute	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit
B136B-11	Suspension Control Module Wake-up Signal - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B136B-15	Suspension Control Module Wake-up Signal - Circuit short to battery or open	• Circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit
B136C-11	Headlamp Delay Control - Circuit short to ground	• Exit delay switch input circuit stays at ground for more than 1 second	• Refer to the electrical circuit diagrams and check the exit delay circuit between the lighting switch and the central junction box for short to ground
B136C-15	Headlamp Delay Control - Circuit short to battery or open	• Exit delay switch input circuit stays at battery volts or open circuit for more than 1 second	• Refer to the electrical circuit diagrams and check the exit delay circuit between the lighting switch and the central junction box for short to power or open circuit
B136C-1E	Headlamp Delay Control - Circuit resistance out of range	• Exit delay switch input circuit resistance stays out of range for more than 1 second • External lighting switch fault	• Refer to the electrical circuit diagrams and check the exit delay circuit between the lighting switch and the central junction box for short to other circuits, high resistance. If no wiring harness fault found suspect lighting switch
B136D-11	Front Wiper Intermittent Delay Control - Circuit short to ground	• Circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B136D-15	Front Wiper Intermittent Delay Control - Circuit short to battery or open	• Circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit
B136D-1E	Front Wiper Intermittent Delay Control - Circuit resistance out of range	• Circuit resistance out of range	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit
	Glove Box Release	• Circuit short to ground detected on	• Refer to the electrical circuit diagrams and check the glove box release/inhibit circuit between the glove box

B136E-11	Motor - Circuit short to ground	glove box release/inhibit circuit	latch and the central junction box for short to ground. Repair wiring as required, clear the DTC and retest the system. If the DTC returns suspect the latch
B136E-15	Glove Box Release Motor - Circuit short to battery or open	• Circuit short to power or open circuit detected on glove box release/inhibit circuit	• Refer to the electrical circuit diagrams and check the glove box release/inhibit circuit between the glove box latch and the central junction box for short to power or open circuit. Repair wiring as required, clear the DTC and retest the system. If the DTC returns suspect the latch
B1A84-51	Car Configuration Data - Not programmed	• Not programmed	• Configure the module using the manufacturers approved diagnostic system
B1A85-96	Ambient Light Sensor - Component internal failure	• Rain/light sensor obscured • Sensor incorrectly installed • Component failure	• Check the rain/light sensor is not obscured. Check the security and installation of the rain/light sensor. Clear the DTC and retest. If the DTC returns suspect an internal fault
B1A91-31	Speed/Position Sensor A - No signal	• Rear roof blind circuit fault • Rear roof blind internal fault • No signal from sensor • Roof opening panel/roof blinds module internal fault	• Refer to the electrical circuit diagrams and check the circuit between the rear roof blind motor and the roof opening panel/roof blinds module
B1A92-31	Speed/Position Sensor B - No signal	• Front roof blind circuit fault • Front roof blind internal fault • No signal from sensor • Roof opening panel/roof blinds module internal fault	• Refer to the electrical circuit diagrams and check the circuit between the front roof blind motor and the roof opening panel/roof blinds module
B1B01-55	Key Transponder - Not configured	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Key not programmed (this is part of the immobilization set up)	• Configure the central junction box as a new module using the manufacturer approved diagnostic system
B1B01-64	Key Transponder - Signal plausibility failure	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Encrypted data exchange between key fob and the central junction box does not match when using alternative start method (not passive)	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. Clear the DTC and retest. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
		NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion	• Configure the central junction box as a new module using the manufacturer approved diagnostic system.

B1B01-81	Key Transponder - Invalid serial data received	• Encrypted data exchange between immobilizer antenna unit and the central junction box does not match when using alternative start method (not passive)	Clear the DTC and retest. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B01-87	Key Transponder - Missing message	• This DTC could be logged if 'Smart Key Not Found' warning message is displayed, and the start button is pressed without the key in the correct location as defined in the driver handbook • No communication from key transponder during alternative (not passive) start event	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • First confirm that the customer has not performed a start event with the key incorrectly located when the warning message 'Smart Key Not Found' is displayed • Re-synchronize ID by re-configuring the immobilizer antenna unit as a new module. Refer to the electrical circuit diagrams and check the power and ground circuits to the immobilizer antenna unit
B1B33-51	Target ID Transfer - Not programmed	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Security identifier not programmed in central junction box (Part of immobilization set-up) • A new engine control module has been installed	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. Clear the DTC and retest
B1B33-64	Target ID Transfer - Signal plausibility failure	• Signal plausibility failure • Failed communication with engine control module	NOTE: Only diagnose this DTC if the Customer is reporting a start related issue • Clear DTC and retest. If problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B33-81	Target ID Transfer - Invalid serial data received	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Invalid serial data received • Encrypted data exchange between engine control module and central junction box does not match	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B33-87	Target ID Transfer - Missing message	• Missing message • Failed communication with engine control module	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Clear DTC and retest. If problem persists, carry out CAN network integrity test and on demand self-test

			using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B56-46	Sunroof Module - Calibration/parameter memory failure	• Roof opening panel control module - Calibration/parameter memory failure	• Clear the DTC and retest. Re-calibrate the roof opening panel using the manufacturers approved diagnostic system. If the problem persists, renew the roof opening panel control module
B1B56-83	Sunroof Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the DTC resets, renew the roof opening panel control module
B1B56-87	Sunroof Module - Missing message	• Missing message • LIN 3 circuit fault	NOTE: Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging. • Check the operation of the roof opening panel control module. Refer to the electrical circuit diagrams and check the LIN circuit between the roof opening panel control module and the central junction box. Check LIN control unit power and ground circuits
B1C32-11	Steering Column Tilt Solenoid - Circuit short to ground	• Steering column tilt solenoid circuit short to ground	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt solenoid circuit for short to ground
B1C32-15	Steering Column Tilt Solenoid - Circuit short to power or open circuit	• Steering column tilt solenoid circuit short to power or open circuit	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt solenoid circuit for short to power or open circuit
B1C33-12	Steering Column Tilt Feedback Signal - Circuit short to power	• Steering column tilt feedback signal circuit short to power	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt feedback signal circuit for short to power
B1C33-14	Steering Column Tilt Feedback Signal - Circuit short to ground or open circuit	• Steering column tilt feedback signal circuit short to ground or open circuit	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt feedback signal for circuit short to ground or open circuit
B1C34-11	Steering Column Telescopic Solenoid - Circuit short to ground	• Steering column telescopic solenoid circuit short to ground	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column telescopic solenoid circuit for short to ground
B1C34-15	Steering Column Telescopic Solenoid - Circuit short to power or open circuit	• Steering column telescopic solenoid circuit short to power or open circuit	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column telescopic solenoid circuit for short to power or open circuit
B1C35-12	Steering Column Telescopic Feedback Signal - Circuit short to power	• Steering column telescopic feedback signal circuit short to power	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column telescopic feedback signal circuit for short to power
B1C35-14	Steering Column Telescopic Feedback Signal - Circuit short	• Steering column telescopic feedback	NOTE: This component is a serviceable item

	to ground or open circuit	signal circuit short to ground or open circuit	• Refer to the electrical circuit diagrams and check the column telescopic feedback signal circuit for short to ground or open circuit
B1C36-11	Steering Column Adjust Switch - Circuit short to ground	• Steering column adjust switch circuit short to ground	• Refer to the electrical circuit diagrams and check the column adjust switch circuit for short to ground
B1C43-23	Master Interior Lamp Switch Stuck - Signal stuck low	• Interior lamp circuit short to ground • Switch activated for more than 1 minute • Interior lamp switch fault	• Refer to the electrical circuit diagrams and check the interior lamp circuit. Check the switch operation, renew as necessary
B1C45-67	Front Wiper Park Position Switch Stuck - Signal incorrect after event	• Front wiper park position circuit short to power, ground, open circuit • Front wiper motor park switch fault	• Ensure motor/mechanism is not jammed or seized. Clear the DTC and retest. If the DTC returns refer to the electrical circuit diagrams and check the front wiper park position circuit. If no circuit fault found suspect an internal fault with the front wiper motor, check and renew as required
B1C55-12	Horn Relay - Circuit short to battery	• Horn relay coil circuit short to power	• Refer to the electrical circuit diagrams and check the horn relay circuit, repair as necessary
B1C82-11	Headlamp Washer Relay A - Circuit short to ground	• Headlamp washer relay output circuit short to ground	• Refer to the electrical circuit diagrams and check the headlamp washer pump relay circuit, repair/renew as necessary
B1C82-12	Headlamp Washer Relay A - Circuit short to battery	• Headlamp washer relay output circuit short to power	• Refer to the electrical circuit diagrams and check the headlamp washer pump relay circuit, repair/renew as necessary
B1C82-13	Headlamp Washer Relay A - Circuit open	• Headlamp washer relay output circuit open circuit	• Refer to the electrical circuit diagrams and check the headlamp washer pump relay circuit, repair/renew as necessary
B1C98-11	Left Corner Lamp Circuit - Circuit short to ground	• Left-hand corner lamp short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1C98-15	Left Corner Lamp Circuit - Circuit short to battery or open	• Left-hand corner lamp short circuit short circuit to power or open circuit	• No action necessary, clear/ignore DTC
B1C99-11	Right Corner Lamp Circuit - Circuit short to ground	• Right-hand corner lamp short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1C99-15	Right Corner Lamp Circuit - Circuit short to battery or open	• Right-hand corner lamp short circuit short circuit to power or open circuit	• No action necessary, clear/ignore DTC
B1D00-11	Left Low Beam - Circuit short to ground	• Left low beam circuit short to ground	• Refer to the electrical circuit diagrams and check left low beam circuit for short to ground
B1D00-15	Left Low Beam - Circuit short to battery or open	• Left low beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check left low beam circuit for short circuit to power or open circuit
	Right Low Beam -		

B1D01-11	Circuit short to ground	• Right low beam circuit short to ground	• Refer to the electrical circuit diagrams and check right low beam circuit for short to ground
B1D01-15	Right Low Beam - Circuit short to battery or open	• Right low beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check right low beam circuit for short circuit to power or open circuit
B1D02-11	Left High Beam - Circuit short to ground	• Left high beam circuit short to ground	• Refer to the electrical circuit diagrams and check left high beam circuit for short to ground
B1D02-15	Left High Beam - Circuit short to battery or open	• Left high beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check left high beam circuit for short circuit to power or open circuit
B1D03-11	Right High Beam - Circuit short to ground	• Right high beam circuit short to ground	• Refer to the electrical circuit diagrams and check right high beam circuit for short to ground
B1D03-15	Right High Beam - Circuit short to battery or open	• Right high beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check right high beam circuit for short circuit to power or open circuit
B1D13-11	Interior Lights Circuit "A" - Circuit short to ground	• Circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1D17-83	Battery Backed Sounder - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the problem persists, renew the battery backed sounder
B1D17-87	Battery Backed Sounder - Missing message	• Missing message	NOTE: Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging • Check the operation of the battery backed sounder. Refer to the electrical circuit diagrams and check the LIN circuit between the battery backed sounder and the central junction box. Should also check LIN control unit power and ground circuits
B1D17-96	Battery Backed Sounder - Component internal failure	• Component internal failure	• Clear the DTC and retest, if the problem persists renew battery backed sounder
B1D27-11	Heater Coolant Pump - Circuit short to ground	• Short to ground detected on heater coolant pump control circuit	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1D35-23	Hazard Switch Stuck - Signal stuck low	• Hazard switch circuit short to ground • Switch activated for more than 1 minute • Hazard switch fault	• Check the hazard switch operation, refer to the electrical circuit diagrams and check the hazard switch circuit. Repair/renew as necessary
B1D36-11	Turn Indicator Switch - Circuit short to ground	• Circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1D36-15	Turn Indicator Switch - Circuit short to battery or open	• Circuit to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1D36-1E	Turn Indicator Switch - Circuit resistance out of range	• Circuit resistance out of range	• Check the switch operation. Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary

B1D97-96	Tilt Sensor - Component internal failure	• Component internal failure	• Clear the DTC and retest, if the problem persists renew the battery backed sounder
C0079-54	Variable Effort Steering - Missing calibration	• Missing calibration	• Calibrate/configure the feature using the manufacturers approved diagnostic system
C111A-11	Right Stop Lamp - Circuit short to ground	• Right stop lamp circuit short to ground	• Refer to the electrical circuit diagrams and check right stop lamp circuit
C111A-15	Right Stop Lamp - Circuit short to battery or open	• Right stop lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check right stop lamp circuit
C111B-11	Left Stop Lamp - Circuit short to ground	• Left stop lamp circuit short to ground	• Refer to the electrical circuit diagrams and check left stop lamp circuit
C111B-15	Left Stop Lamp - Circuit short to battery or open	• Left stop lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check left stop lamp circuit
C1A56-16	Left Front Tire Pressure Sensor and Transmitter Assembly - Circuit voltage below threshold	• Front left tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A56-86	Left Front Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Front left tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A56-93	Left Front Tire Pressure Sensor and Transmitter Assembly - No operation	• Front left tire pressure sensor not installed • Front left tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a front left tire pressure sensor is installed • Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A57-12	Left Front Initiator - Circuit short to battery	• Tire pressure monitoring system front left initiator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front left initiator circuit for short circuit to power
C1A57-14	Left Front Initiator - Circuit short to ground or open	• Tire pressure monitoring system front left initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front left initiator circuit for short circuit to ground, open circuit, high resistance
C1A58-16	Right Front Tire Pressure Sensor and	• Front right tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required

	Transmitter Assembly - Circuit voltage below threshold		
C1A58-86	Right Front Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Front right tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A58-93	Right Front Tire Pressure Sensor and Transmitter Assembly - No operation	• Front right tire pressure sensor not installed • Front right tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a front right tire pressure sensor is installed • Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A59-12	Right Front Initiator - Circuit short to battery	• Tire pressure monitoring system front right initiator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front right initiator circuit for short circuit to power
C1A59-14	Right Front Initiator - Circuit short to ground or open	• Tire pressure monitoring system front right initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front right initiator circuit for short circuit to ground, open circuit, high resistance
C1A60-16	Left Rear Tire Pressure Sensor and Transmitter Assembly - Circuit voltage below threshold	• Rear left tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A60-86	Left Rear Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Rear left tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A60-93	Left Rear Tire Pressure Sensor and Transmitter Assembly - No operation	• Rear left tire pressure sensor not installed • Rear left tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a rear left tire pressure sensor is installed • Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A61-12	Left Rear Initiator - Circuit short to	• Tire pressure monitoring system rear left initiator	

	battery	circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear left initiator circuit for short circuit to power
C1A61-14	Left Rear Initiator - Circuit short to ground or open	• Tire pressure monitoring system rear left initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear left initiator circuit for short circuit to ground, open circuit, high resistance
C1A62-16	Right Rear Tire Pressure Sensor and Transmitter Assembly - Circuit voltage below threshold	• Rear right tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A62-86	Right Rear Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Rear right tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A62-93	Right Rear Tire Pressure Sensor and Transmitter Assembly - No operation	• Rear right tire pressure sensor not installed • Rear right tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a rear right tire pressure sensor is installed • Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A63-12	Right Rear Initiator - Circuit short to battery	• Tire pressure monitoring system rear right initiator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear right initiator circuit for short circuit to power
C1A63-14	Right Rear Initiator - Circuit short to ground or open	• Tire pressure monitoring system rear right initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear right initiator circuit for short circuit to ground, open circuit, high resistance
C1D18-00	Wheel Localization Failed - No sub type information	• Two or more tire pressure sensor faults • Two or more initiator faults • Two or more initiators incorrectly installed	NOTE: If additional tire pressure monitoring system related DTCs are also set, perform the relevant corrective action(s) first. • Refer to pinpoint test D in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed
		• Tire pressure sensor(s) removed	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Complete a visual inspection to ensure tire pressure sensors are fitted

C1D21-05	Wheel Module - System programming failures	• Incorrect tire pressure sensor(s) fitted (type, frequency, part number) • Tire pressure sensor(s) damaged • Tire pressure sensor RF receiver interference	• Using the manufacturer approved diagnostic system check datalogger signal 0x4127 - Number of Tire pressure sensors failed • If all 4 sensors fail - Check that the RF receiver is correct part number - Review potential electrical interference to RF receiver, e.g. charging units, power adaptors, laptop/navigation screens, etc. • If 1-3 sensors fail - Identify faulty sensors by using the manufacturer approved diagnostic system and running application - Tire Pressure Monitoring Wheel Sensor Test - Replace faulty sensors
P0230-12	Fuel Pump Primary Circuit - Circuit short to battery	• Circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
P0801-11	Reverse Inhibit Control Circuit - Circuit short to ground	• Mirror dim reverse gear inhibit circuit short circuit to ground detected	• Refer to electrical circuit diagrams and check the mirror dim reverse gear inhibit circuit between the central junction box and the electro chromatic rear view mirror for short to ground. Repair wiring as required, clear DTC and test system operation
U0001-88	High Speed CAN Communication Bus - Bus off	• Bus off	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0004-00	High Speed CAN Communication Bus (+) Low - No sub type information	• High speed CAN communication Bus (+) short to ground	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0005-00	High Speed CAN Communication Bus (+) High - No sub type information	• High speed CAN communication Bus (+) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0008-00	High Speed CAN Communication Bus (-) High - No sub type information	• High speed CAN communication Bus (-) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0009-00	High Speed CAN Communication Bus (-) shorted to Bus (+) - No sub type information	• High speed CAN communication Bus (-) shorted to (+)	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0010-88	Medium Speed CAN Communication Bus - Bus off	• Bus off	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0013-00	Medium Speed CAN Communication Bus (+) Low - No sub type information	• Medium speed CAN communication Bus (+) short to ground	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network

U0014-00	Medium Speed CAN Communication Bus (+) High - No sub type information	• Medium speed CAN communication Bus (+) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0017-00	Medium Speed CAN Communication Bus (-) High - No sub type information	• Medium speed CAN communication Bus (-) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0018-00	Medium Speed CAN Communication Bus (-) shorted to Bus (+) - No sub type information	• Medium speed CAN communication Bus (-) shorted to (+)	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0100-00	Lost Communication With ECM/PCM "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the engine control module and central junction box
U0101-00	Lost Communication With Transmission Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the transmission control module and central junction box
U0103-00	Lost Communication With Gear Shift Control Module A - No sub type information	• Loss of CAN communications with transmission control switch	• Refer to the electrical circuit diagrams and check the power and ground connections to the transmission control switch. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the transmission control switch and the central junction box
U0121-00	Lost Communication With Anti-Lock Braking System (ABS) Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Anti-lock Braking System Module and Central Junction Box
U0128-00	Lost Communication With Park Brake Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the electric park brake control module and central junction box
U0132-00	Lost Communication With Suspension Control Module "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the suspension control module and central junction box
	Lost Communication		• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using

U0138-00	with All Terrain Control Module - No sub type information	• No sub type information	the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the terrain response switchpack and central junction box
U0139-00	Lost Communication With Suspension Control Module "B" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the suspension control module and central junction box
U0151-00	Lost Communication With Restraints Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the restraints control module and central junction box
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the instrument cluster and central junction box
U0164-00	Lost Communication With HVAC Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the automatic temperature control module and central junction box
U0199-00	Lost communication with Driver Door Module (DDM) - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the driver door module and central junction box
U0200-00	Lost Communication With "Door Control Module "B" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the passenger door module and central junction box
U0208-00	Lost Communication With "Seat Control Module "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the driver seat module and central junction box
U0214-00	Lost Communication With Remote Function Actuation - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the keyless vehicle module and central junction box

U0230-00	Lost Communication With Rear Gate Module - No sub type information	• Module power supply fault • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the luggage compartment lid control module and central junction box
U0241-00	Lost Communication With Headlamp Control Module "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the headlamp leveling control module and central junction box
U0242-00	Lost Communication With Headlamp Control Module "B" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the auto high beam control module and central junction box
U0257-00	Lost Communication With Front Controls / Display Interface Module - No sub type information	• Lost communication with the touch screen • Power supply to module fault • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the touch screen and the central junction box
U025D-00	Lost Communication With Front Controls Interface Module "B" - No sub type information	• Lost communication with the touch screen switchpack • Power supply to module fault • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the touch screen switchpack and the central junction box
U1000-00	Solid State Driver Protection Active - Driver Disabled - No sub type information	• Central junction box output circuit - Short circuit to ground, short circuit to power	NOTE: The relevant output is disabled while this DTC is set. Do not clear the DTC until the fault has been rectified • Using the manufacturer approved diagnostic system, check for other central junction box short circuit to ground and/or short circuit to power DTCs and refer to the relevant DTC index for corrective actions • Once circuit faults have been rectified, clear DTC and retest
U2004-11	Auxiliary Switch Pack - Circuit short to ground	• Circuit short to ground detected on the auxiliary switch circuit	• Refer to the electrical circuit diagrams and check the auxiliary switch signal circuit between the central junction box and the outboard facia switch for a short to ground. Repair wiring harness as required, clear the DTC and test the system
U2004-1E	Auxiliary Switch Pack - Circuit resistance out of range	• Circuit resistance out of range detected on the auxiliary switch circuit	• Check trunk release and/or forward alert buttons are not stuck/sticking. Refer to the electrical circuit diagrams and check the auxiliary switch signal circuit between the central junction box and the outboard facia switch for a short to another circuit or high resistance. Repair wiring harness as required, clear the DTC and test the system. If the DTC remains suspect the outboard facia switchpack
	Auxiliary Switch Pack	• Signal stuck low detected on the	• Check trunk release and/or forward alert buttons are not stuck/sticking. Refer to the electrical circuit diagrams and check the auxiliary switch signal circuit between the central junction box and the outboard

U2004-23	- Signal stuck low	auxiliary switch circuit	facia switch for a short to another circuit or high resistance. Repair wiring harness as required, clear the DTC and test the system. If the DTC remains suspect the outboard facia switchpack
U200D-11	Control Module Output Power A - Circuit short to ground	• Short to ground detected on output control circuit to ignition relay located in engine bay junction box	• Check operation of ignition relay in engine bay junction box. Refer to the electrical wiring diagrams and check the circuit for short to ground between the central junction box and the engine bay junction box
U200D-14	Control Module Output Power A - Circuit short to ground or open	• Short to ground or open circuit detected on output control circuit to ignition relay located in engine bay junction box	• Check operation of ignition relay in engine bay junction box. Refer to the electrical wiring diagrams and check the circuit for short to ground or open circuit between the central junction box and the engine bay junction box
U200D-15	Control Module Output Power A - Circuit short to battery or open	• Short to power or open circuit detected on output control circuit to ignition relay located in engine bay junction box	• Check operation of ignition relay in engine bay junction box. Refer to the electrical wiring diagrams and check the circuit for short to power or open circuit between the central junction box and the engine bay junction box
U200E-11	Control Module Output Power B - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit, repair as necessary
U2010-11	Switch Illumination - Circuit short to ground	• Switch illumination circuit short to ground	• Refer to electrical circuit diagrams and check the switch illumination circuit
U2017-51	Control Module Software #2 - Not programmed	• Not programmed	• Configure the module using the manufacturers approved diagnostic system
U201B-54	Control Module Calibration Data #2 - Missing calibration	• Missing calibration	• Configure the module using the manufacturers approved diagnostic system by running the relevant configuration and set up application for calibrating the steering column
U201F-04	External Receiver - System internal failures	• Tire pressure monitoring system RF receiver power or ground circuit open circuit, high resistance • Tire pressure monitoring system RF receiver internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to the electrical circuit diagrams and check the tire pressure monitoring system RF receiver power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new tire pressure monitoring system RF receiver
U201F-11	External Receiver - Circuit short to ground	• Tire pressure monitoring system RF receiver LIN circuit short circuit to ground • Tire pressure monitoring system RF receiver internal failure • Central junction box internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to pinpoint test A in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed

U201F-12	External Receiver - Circuit short to battery	• Tire pressure monitoring system RF receiver LIN circuit short circuit to power • Tire pressure monitoring system RF receiver internal failure • Central junction box internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to pinpoint test B in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed
U201F-87	External Receiver - Missing message	• Tire pressure monitoring system RF receiver power or ground circuit open circuit, high resistance • Tire pressure monitoring system RF receiver LIN circuit open circuit, high resistance • Tire pressure monitoring system RF receiver internal failure • Central junction box internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to pinpoint test C in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed
U2101-00	Control Module Configuration Incompatible - No sub type information	• Car configuration file incorrect	• Check and amend the car configuration file as required using the manufacturer approved diagnostic system
U2104-11	Trip Meter Reset Button - Circuit short to ground	• Circuit short to ground for more than 1 second • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2104-15	Trip Meter Reset Button - Circuit short to battery or open	• Circuit short to power for more than 1 second • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2104-1E	Trip Meter Reset Button - Circuit resistance out of range	• Circuit resistance out of range for more than 1 second • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2104-23	Trip Meter Reset Button - Signal stuck low	• Signal stuck low • Switch activated for more than 1 minute • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2300-64	Central Configuration - Signal plausibility failure	• Tire pressure monitoring system configuration data is invalid caused by incorrect car / local configuration file(s)	• Using the manufacturer approved diagnostic system check and amend the car / local configuration file (s)
U3000-49	Control Module - Internal electronic failure	• Central junction box - Internal failure	NOTE: The relevant output is disabled while this DTC is set • Using the manufacturer approved diagnostic system, check for other central junction box short circuit to ground and/or short circuit to power DTCs and refer to the relevant DTC index for corrective actions • Install a new central junction box as required. Clear DTCs and retest

U3001-54	Control Module Improper Shutdown - Missing calibration	• Missing calibration • EEPROM hasn't stored the final axis position of the steering column telescope/tilt position	• Check for other steering column telescope/tilt DTCs. Clear the DTC and operate the steering column through the complete telescope and tilt functions ranges. If the DTC returns, configure the steering column module using the manufacturers approved diagnostic system by running the relevant configuration and set up application

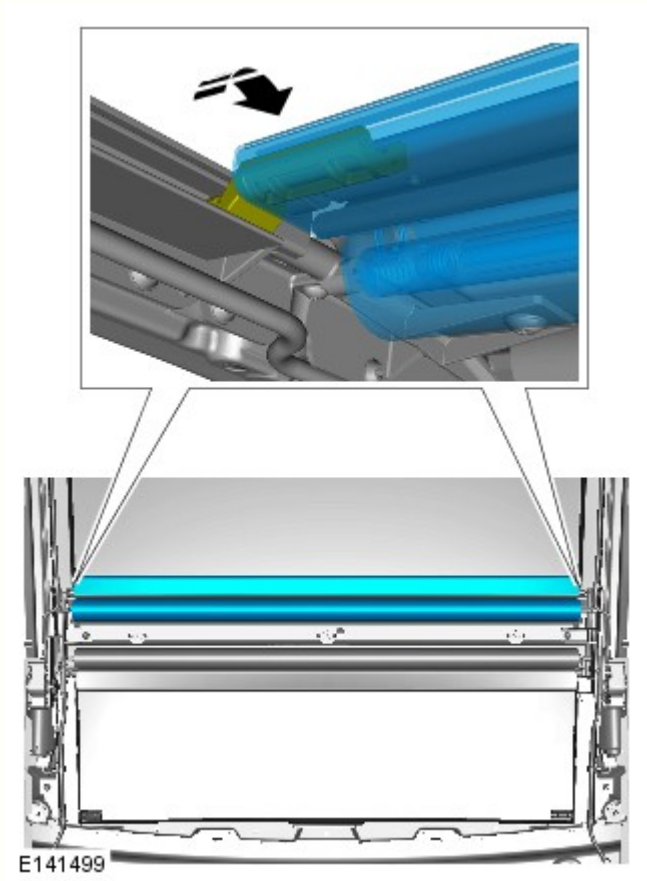
Roof Opening Panel - Roof Opening Panel Blind Drive Assembly

Removal and Installation

Removal

1. Refer to: Roof Opening Panel Blind (501-17 Roof Opening Panel, Removal and Installation).



2. CAUTION: Make sure that the clips are correctly located.

NOTES:

Follow the animation to make sure the roof opening panel blind is removed and installed correctly from and to the guides.

Roof opening panel blind shown, glass roof panel blind similar.

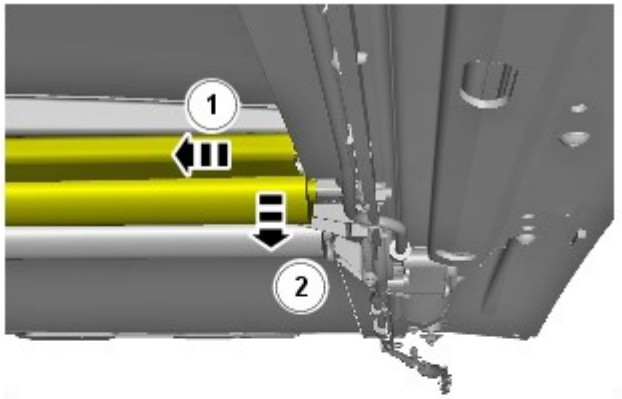
Release the glass roof panel blind

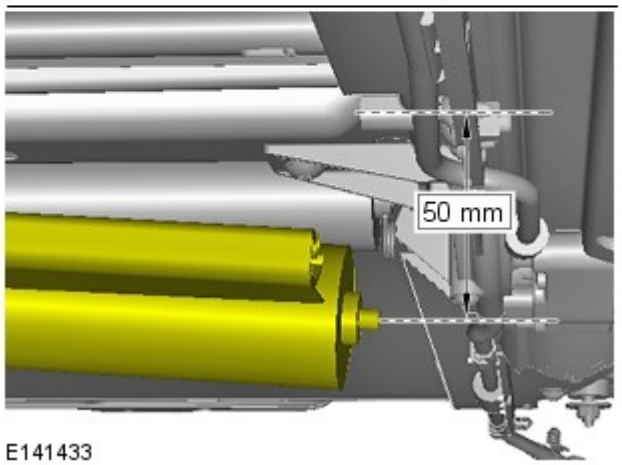
3. CAUTIONS:

Make sure that the roof opening panel blind is not lowered by more than 50 mm at one end whilst the other end is still located in to the drive mechanism.

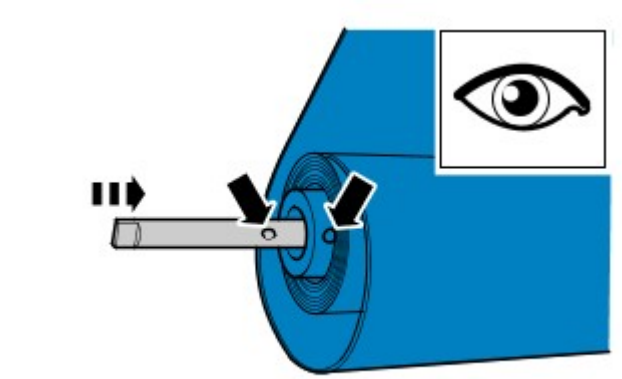
Make sure that a firm pressure is applied to the roof opening panel blind so that tension is maintained until the retaining clip is correctly located.

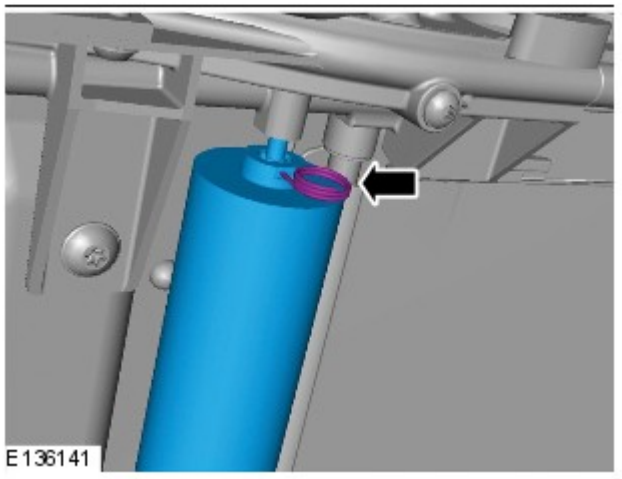
NOTE: Roof opening panel blind shown, glass roof panel blind similar.





E141433





E136141

4. CAUTIONS:

Make sure that the clip is correctly located.

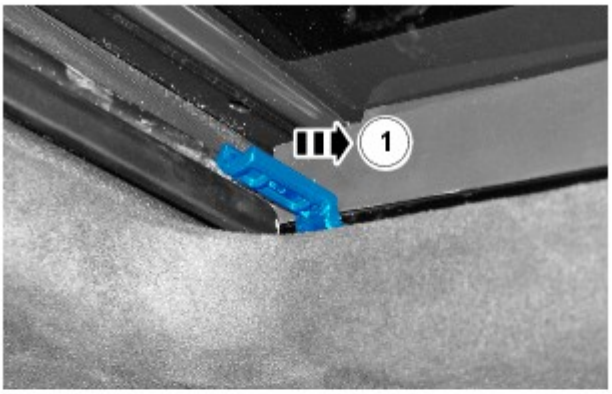
If the correct clip is not available, make sure that a suitable hardened pin is used such as a drill bit, do not use a paperclip.

Make sure that the roof opening panel blind is not released from the drive mechanism until the clip has been correctly located.

NOTE: Roof opening panel blind shown, glass roof panel blind similar.

Install the retaining clip.

5. CAUTION: Note the installed position of the component prior to removal.



NOTE: The procedure must be carried out on the front and rear blind feet.

E141337

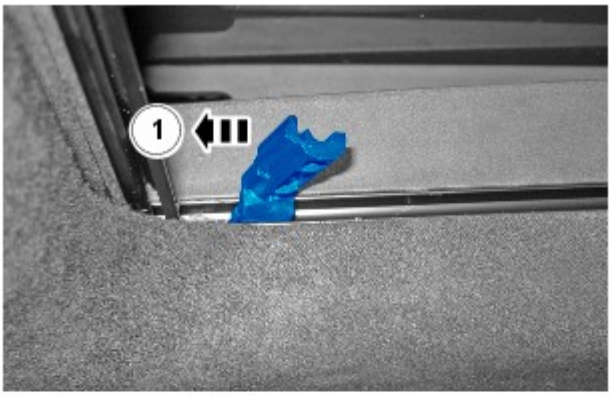
12. CAUTION: Do not directly force the blind feet in to the installed position. Failure to follow this instruction may result in damage to the component.

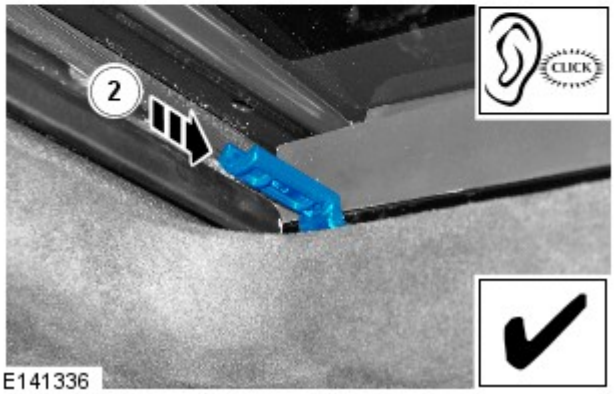
13. NOTES:

An audible click can be heard when the component is correctly located.

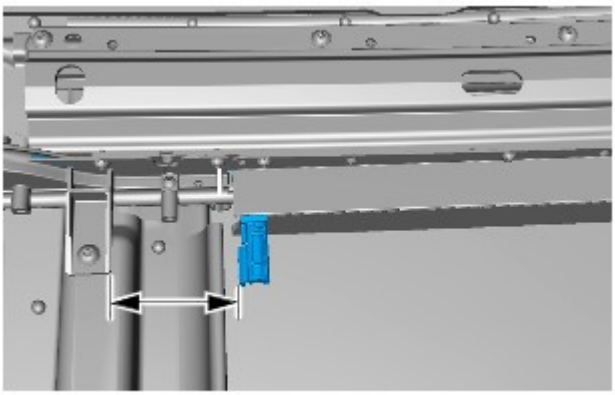
The procedure must be carried out on the front and rear blind feet.

1. Hold the blind foot at an angle and slide it along the rail until contact is made with the drive mechanism.
2. Rotate the blind foot in to the installed position.





E141336



14. CAUTION: Make sure that the blind feet for each blind are positioned at an equal distance from the center of the vehicle.

NOTE: The procedure must be carried out on the front and rear blind feet.

Slide the blind foot along the guide until it is level with the foot on the other side of the vehicle.

1. Refer to: Roof Opening Panel Blind (501-17 Roof Opening Panel, Removal and Installation).

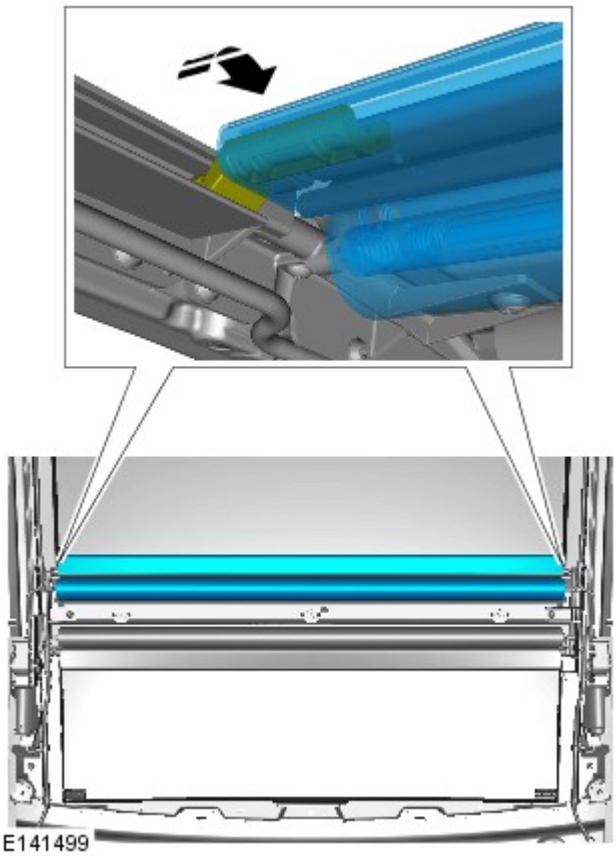
2. CAUTION: Make sure that the clips are correctly located.

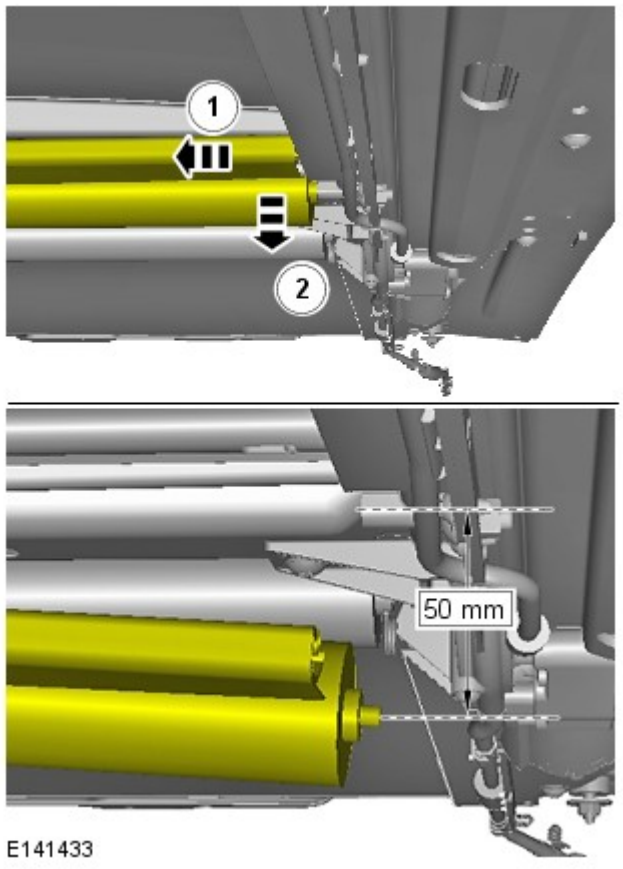
NOTES:

Follow the animation to make sure the roof opening panel blind is removed and installed correctly from and to the guides.

Roof opening panel blind shown, glass roof panel blind similar.

Release the glass roof panel blind





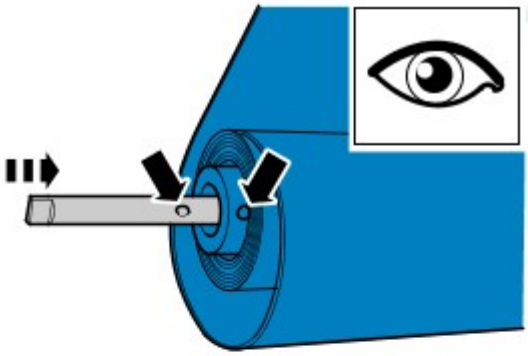
3. CAUTIONS:

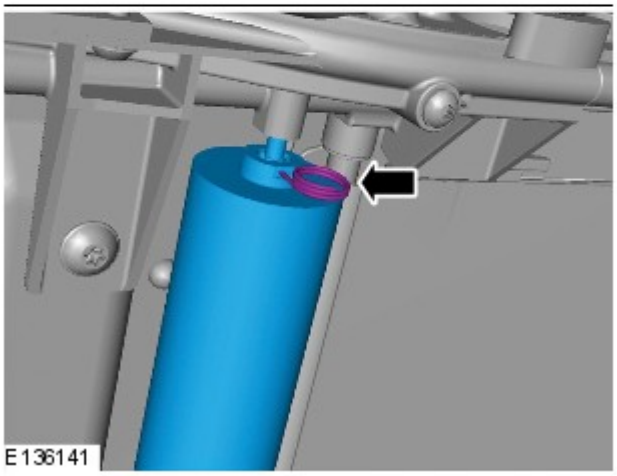
Make sure that the roof opening panel blind is not lowered by more than 50 mm at one end whilst the other end is still located in to the drive mechanism.

Make sure that a firm pressure is applied to the roof opening panel blind so that tension is maintained until the retaining clip is correctly located.

NOTE: Roof opening panel blind shown, glass roof panel blind similar.

4. CAUTIONS:





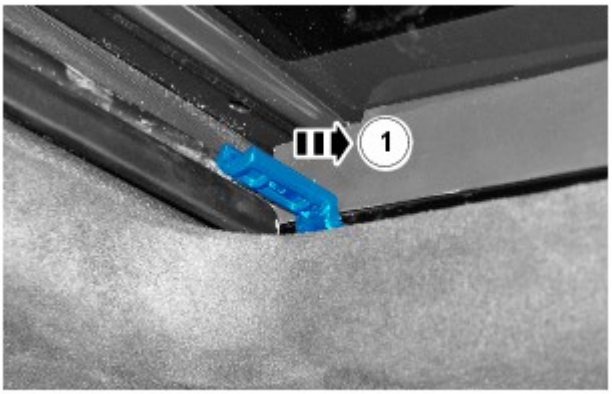
⚠ Make sure that the clip is correctly located.

⚠ If the correct clip is not available, make sure that a suitable hardened pin is used such as a drill bit, do not use a paperclip.

⚠ Make sure that the roof opening panel blind is not released from the drive mechanism until the clip has been correctly located.

NOTE: Roof opening panel blind shown, glass roof panel blind similar.

Install the retaining clip.



5. ⚠ CAUTION: Note the installed position of the component prior to removal.

NOTE: The procedure must be carried out on the front and rear blind feet.

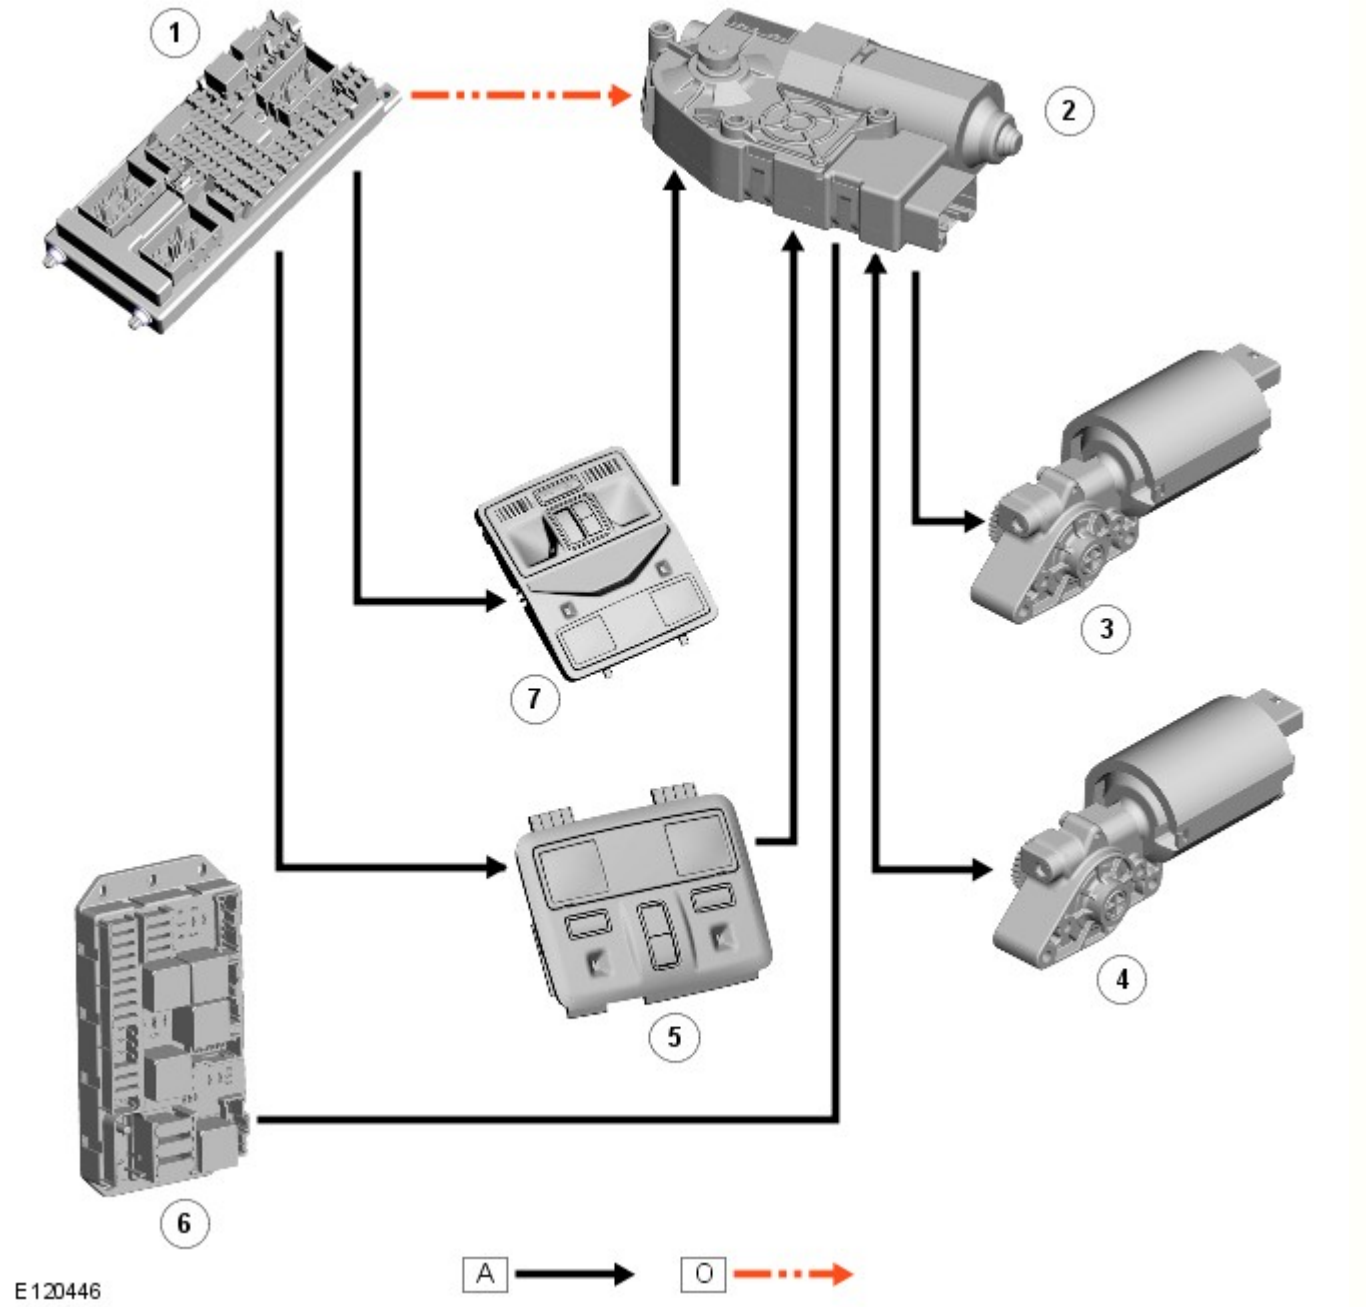
Roof Opening Panel - Roof Opening Panel - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: **A** = Hardwired; **O** = LIN Bus

Roof Opening Panel - Control Diagram



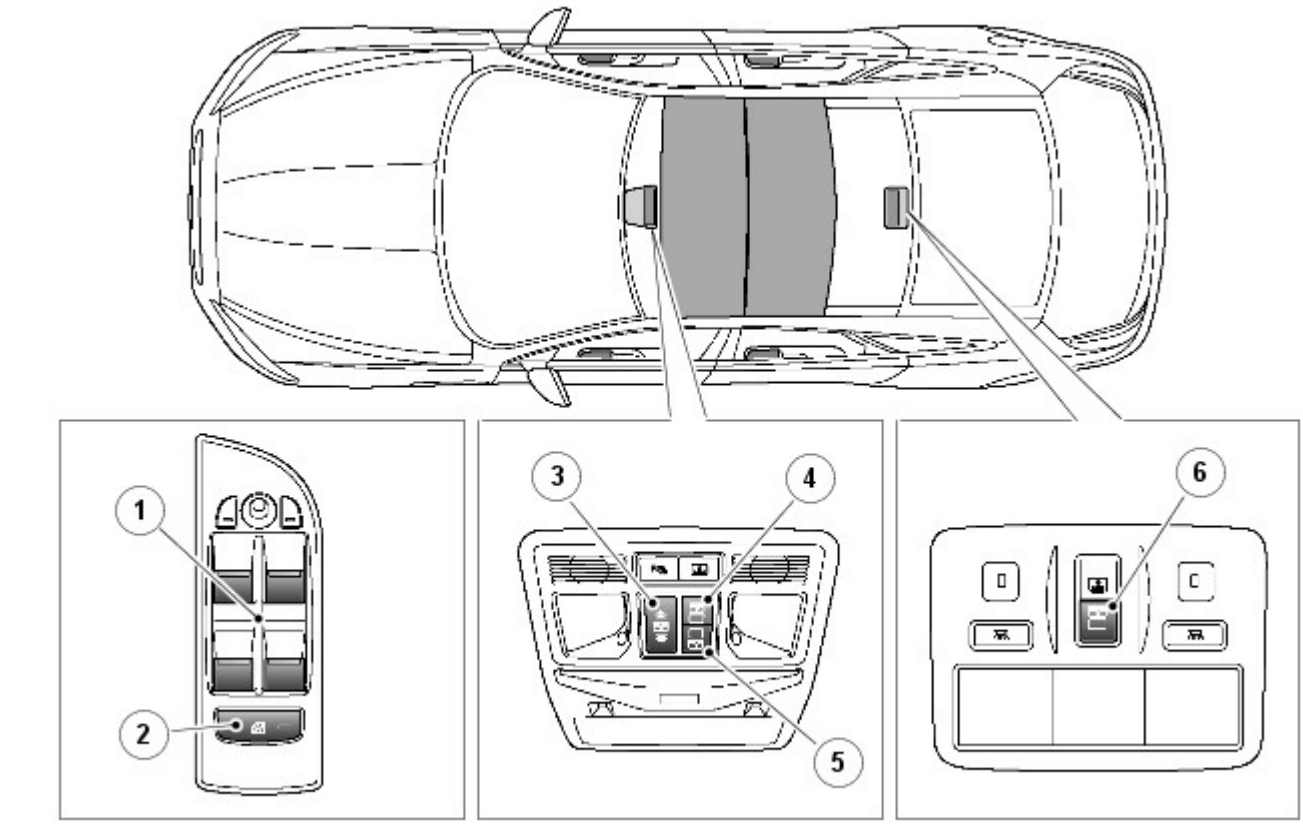
Item	Description
1	CJB (central junction box)
2	Sliding glass panel - motor and module
3	Roller blind motor
4	Roller blind motor
5	Rear overhead console
6	RJB (rear junction box)
7	Front overhead console

System Operation

Roof Opening Panel Operation

The sliding glass panel and roller blinds are controlled by the switch pack in the front overhead console. The rear roller blind can also be controlled by a button in the rear overhead console. The rear overhead switch function can be isolated by isolating the rear electric windows on the drivers window switch pack.

Roof Opening Panel



E128731

Item	Description
1	Window switch pack - driver door
2	Isolator switch - rear windows and roof panel rear-blind
3	Switch - roof sliding glass panel
4	Switch - roof panel rear-blind
5	Switch - roof panel front-blind
6	Switch - roof panel rear-blind

A rocker switch in the front overhead console controls the opening and closing of the sliding glass panel with a one-touch function in the direction required:

- Press (3) once to tilt the panel.
- Once tilted, press (3) again to open the panel.
- Press (3) to close the panel from tilt.
- From the fully open position, press (3) once to close to the tilt position, then press again to close fully.
- Sliding glass panel movement can be halted at any time by pressing the button (3) again.

Anti-trap mechanism

If the roof panel encounters resistance when closing it will stop, and then open a set distance in the opposite direction. This is to prevent serious injury or damage to the mechanism. The anti-trap mechanism can be overridden to allow the roof to be closed when movement is restricted by dirt. To override the anti-trap mechanism, press and hold the front of the switch until the roof reaches the closed position.

Roof Blinds

CAUTION: To prevent damage to the roof blind mechanism the blinds must not be operated manually.

Front blind

One push of the button (5) will fully open or close the blind. The blind is either fully open or closed and cannot be halted part way.

The front blind opens automatically as the roof panel is opened, preventing wind affecting the blind. The blind cannot be closed when the roof is open.

Rear blind

One push of the buttons (4) or (6) will fully open or close the blind. The blind is either fully open or closed and cannot be halted part way.

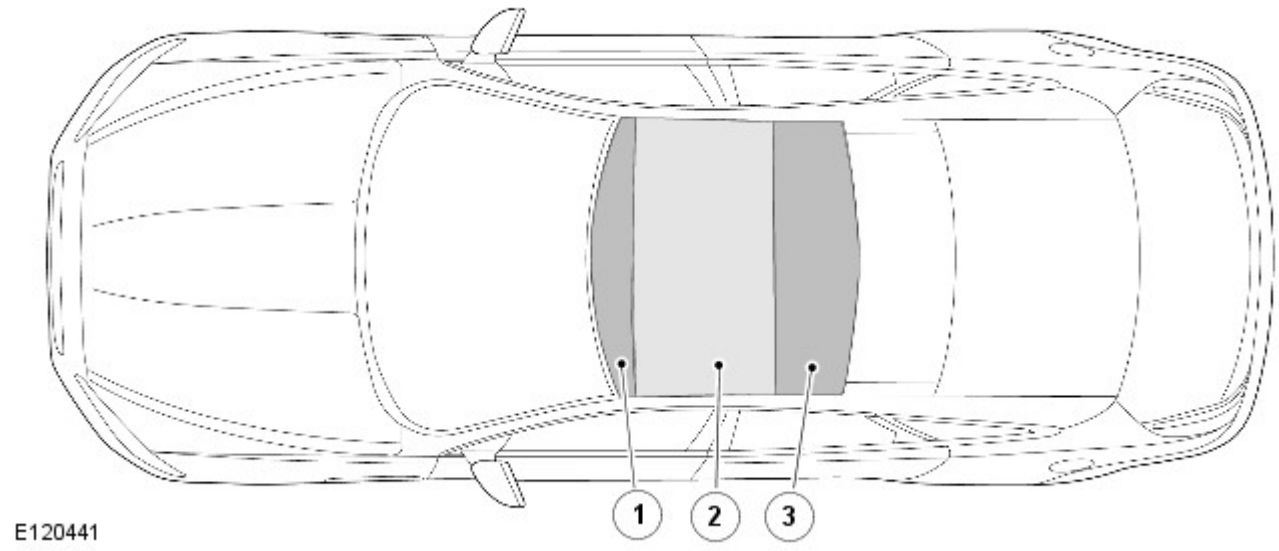
Pressing the dual purpose isolator switch (2) in the driver's door switch pack (1) will inhibit the rear passenger's operating the rear windows and roof panel rear-blind.

NOTE: Global open/close functionality is not enabled on the roof module.

Component Description

The front half of the roof opening panel components are common for both long and short wheelbase vehicles, although the frames are unique to each type of vehicle. The steel frame forms a structural contribution to the vehicle body, helping maintain the rigidity of the shell even with the majority of the aluminum roof removed.

Glass Panels



Glass panels

Item	Description
1	Fixed front glass panel
2	Sliding glass panel
3	Fixed rear glass panel

The glass section of the roof begins at the top edge of the windscreen and extends back to a line mid-way between the 'B' and 'C' pillars. The external surface of the roof opening panel comprises the following three glass elements:

- Fixed front glass panel (5mm thick)
- Sliding glass panel (4mm thick)
- Fixed rear glass panel (4mm thick)

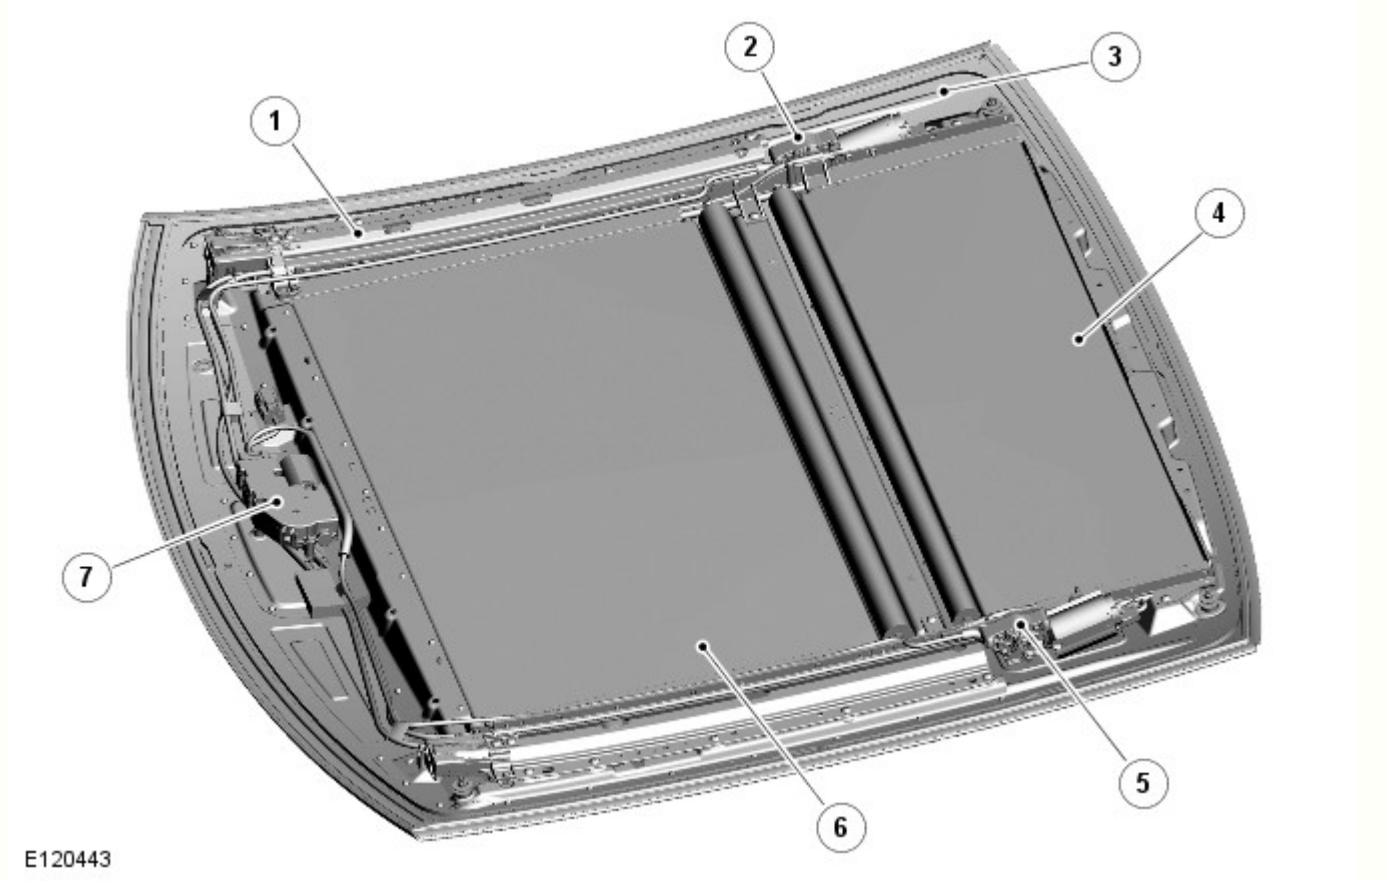
All three panels are manufactured in a tinted toughened glass with a Protec safety film bonded onto the lower surface to prevent shards of glass entering the vehicle cabin in the event of a breakage.

The tinted glass provides a high degree of solar protection allowing only 8.2 percent heat transmission into the vehicle. The fixed front panel fills the space between the windscreen and the sliding center panel. The fixed rear panel above the rear passenger compartment sits between the rear of the sliding panel and the rear section of the aluminum roof.

A wider rear glass panel accommodates the 125mm difference in roof length between standard and long wheelbase vehicles.

The sliding glass panel features an electrically powered tilt and slide mechanism. On opening, the rear of the panel tilts upwards before moving rearwards above the fixed glass panel. As the sliding panel opens a wind deflector rises automatically across the leading edge of the aperture. The deflector manufactured from a mesh type material is used to reduce wind-noise.

Roof Opening Panel Components - Interior View



Roof Components - Interior View

Item	Description
1	Perimeter frame
2	Roller blind motor
3	Roller blind guide rails and drive assembly
4	Rear blind
5	Roller blind motor
6	Front blind
7	Sliding glass panel motor and control module

The roof opening panel assembly features electrically powered front and rear roller blinds that can be independently operated. Guided by side rails, each blind rolls to-and-from the center of the roof opening panel with the:

- front blind closing forwards, and the
- rear blind closing rearwards.

Control Module and Motor

The opening and closing function of the sliding glass panel and roller-blinds are controlled by the roof module which is integral with the sliding glass panel motor. The module receives a permanent battery power supply from the RJB .

To open or close the sliding glass panel and blinds the module receives hardwired 'open/close' inputs from the switches located in the front and rear overhead console panels.

The control module has a non-volatile memory, if battery power to the module is lost the sliding roof panel and blind positions are retained and the one-touch feature does not require re-initializing. However due to the software condition if the battery power to the control module is interrupted when the ignition is switched on, the one-touch feature must be re-initialized.

Once the power supply is restored, reset the roof mechanism as follows:

1. Switch the ignition on.
2. Fully close the roof.
3. Press the front of the roof switch, and hold for 45 seconds.
4. NOTE: The roof blinds do not close on completion of the one touch setup sequence.

   After 45 seconds the roof will begin to move. Keep the front of the switch pressed until the roof and the roof blinds have fully opened, then the roof panel is fully closed.

5. Once the open/close cycle has completed and the roof has stopped moving, release the switch.
6. The roof can now be operated as normal.

The motor that operates the sliding glass panel uses a drive gear which engages and drives two cables within a sleeved tube. Each cable is linked to the sliding glass panel's open and close mechanism located either side of the panel. The rotation of the motor drives the cables in the required direction. Signals from a Hall effect sensor located in the motor enables the control module to calculate the exact position and operating speed of the glass sliding panel.

The Hall effect sensor is also an operational component of the anti-trap function. The control module uses the operating speed of the sliding glass panel and the current draw of the motor to detect an obstruction. If the sliding glass panel closing speed decreases below a set threshold and the current draw from the motor increases the power feed to the motor is reversed. This will then open the sliding glass panel a set distance in the opposite direction of travel. In an emergency the anti-trap function can be overridden by holding the operating switch in the close position.

Depending on vehicle speed the closing threshold of the anti-trap function is adjusted to counteract the force of air pressure acting upon the sliding roof panel. Vehicle speed signal is transmitted from the ABS module via the high-speed CAN bus to the CJB where the signal is processed and transmitted over a LIN bus connection to the roof module. As vehicle speed increases, air pressure forces acting upon the sliding panel simultaneously increase, affecting the anti-trap functionality. The vehicle speed signal is used by the control module to re-calibrate the anti-trap algorithm, accounting for the extra force acting on the sliding panel. This function adapts the sliding panel closing speed threshold of the anti-trap function, dependant on vehicle speed.

Both the sliding glass panel and front blind motors have a thermal protection device built into the control module software to protect them from overheating. The operating parameters are as follows:

- If the motor temperature is between 60 and 77 degrees C the roof operation is restricted to a close only function.
- If the motor temperature exceeds 77 degrees C during the closing function the movement will not be interrupted.
- If the motor temperature exceeds 77 degrees C when the roof is closed movement will be inhibited.
- If the anti-trap function is operational when closing, the reverse movement of the motor will complete its movement regardless of motor temperature.

Thermal protection for the sliding glass panel motor and front blind motor are functioned in unison, therefore if one motor exceeds 60 or 77 degrees C the same restrictions, as defined above, will apply to both motors. For example if the front blind cannot be opened due to thermal protection the sliding glass panel will also ignore the opening command.

Roof Opening Panel - Roof Opening Panel Frame Washers - Rear

Removal and Installation

Removal

CAUTION: Make sure that no more than one fixing is removed from the roof assembly at any one time.

NOTES:

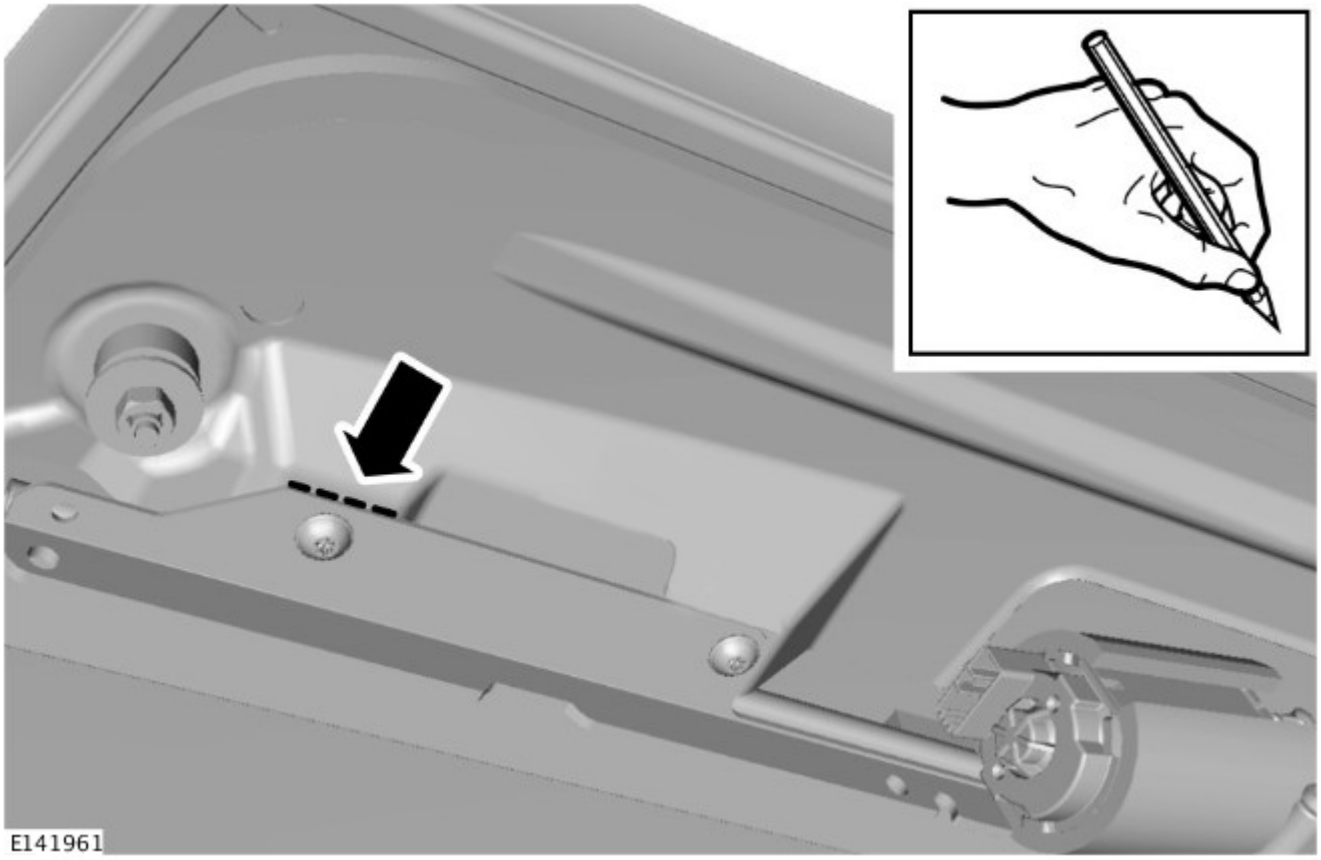
Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. CAUTION: Make sure that the front and centre washers are replaced prior to replacing the rear washers.

NOTE: Do not secure the headlining until the front, centre and rear washers have been replaced.

Refer to: Roof Opening Panel Frame Washers - Centre (501-17 Roof Opening Panel, Removal and Installation).



3. CAUTION: Make sure that the thread is free from foreign material and debris

NOTES:

If installed, remove and discard the washers.

LWB shown, SWB similar.

LWB may have one or two Torx bolts installed, SWB has one Torx bolt installed

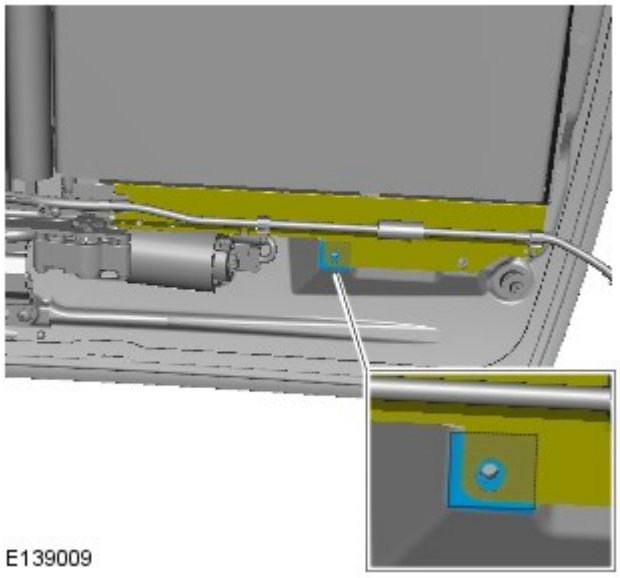
- Remove and discard the Torx bolt(s)
- Remove any traces of locking adhesive from the thread.

Installation

Long wheelbase

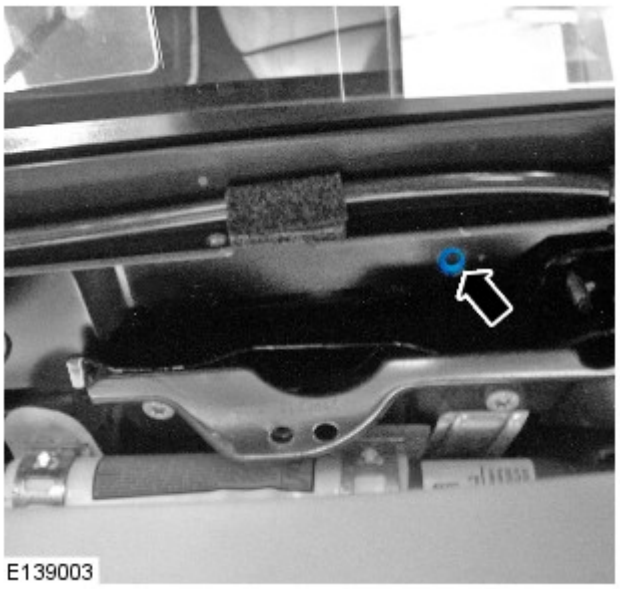
1. NOTE: Make sure that an adhesive pad is installed above the front fixing hole.

If not already installed, install an adhesive pad above the front fixing hole.



E139009

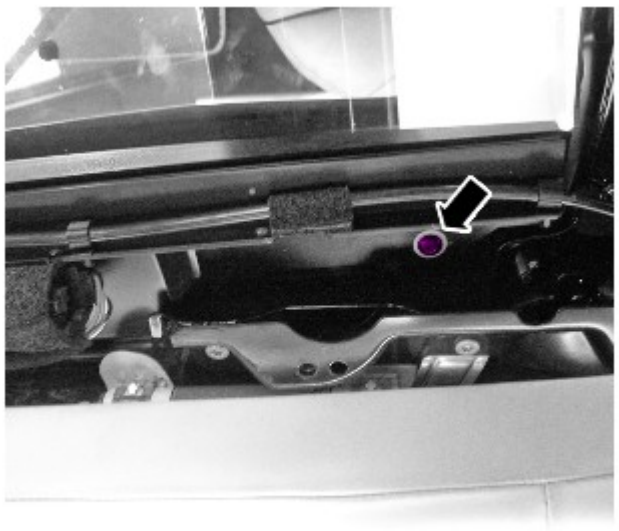
All vehicles



E139003

2. CAUTION: Do not install the front Torx bolt on LWB vehicles.

Slide the washer in from the centre of the vehicle until it is aligned with the threaded hole.



E139005

3. CAUTIONS:

Make sure that the thread is free from foreign material and debris

Make sure that the roof rail is correctly aligned.

Torque: 4 Nm

4. Repeat the above procedure for the other side.

Published: 11-May-2011

Roof Opening Panel - Roof Opening Panel - Overview

Description and Operation

Overview

The roof opening panel assembly is built into a steel perimeter frame and incorporates the:

- fixed glass panels
- sliding glass panel
- roller blinds
- electric operating motors and mechanisms
- wiring harness, and
- wind deflector.

The motor located at the front of the assembly powers the sliding glass panel. The motors operating the roller blinds are in the side rails. The steel frame is bonded into an aperture extending the full width of the roof, between the cant rails of the vehicle’s aluminum body.

The sliding glass panel and roller blinds are controlled by the switch pack in the front overhead console. The rear roller blind can also be controlled by a button in the rear overhead console. The rear overhead switch function can be isolated by isolating the rear electric windows on the drivers window switch pack.

Roof Opening Panel - Roof Opening Panel Blind Feet

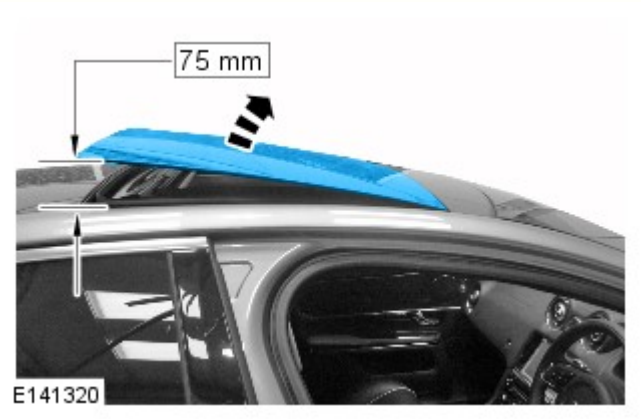
Removal and Installation

Removal

NOTES:

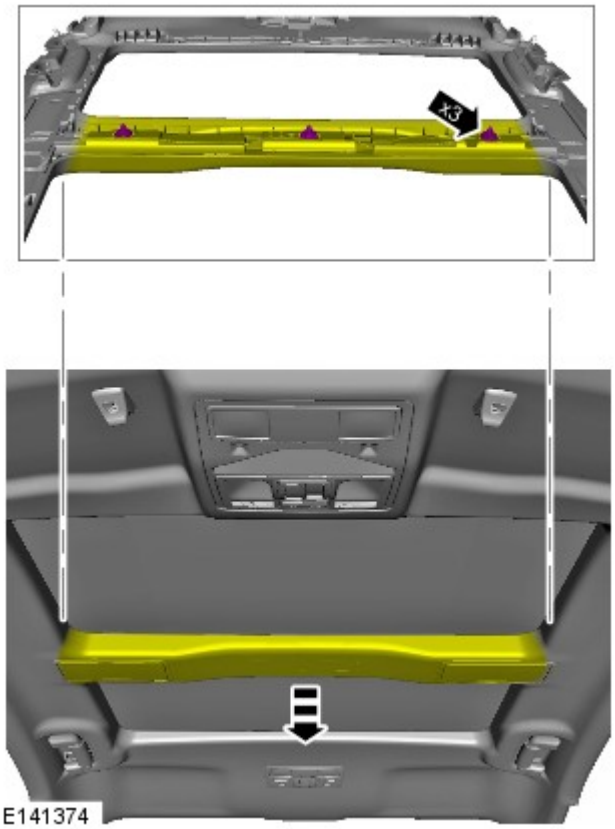
Removal steps in this procedure may contain installation details.

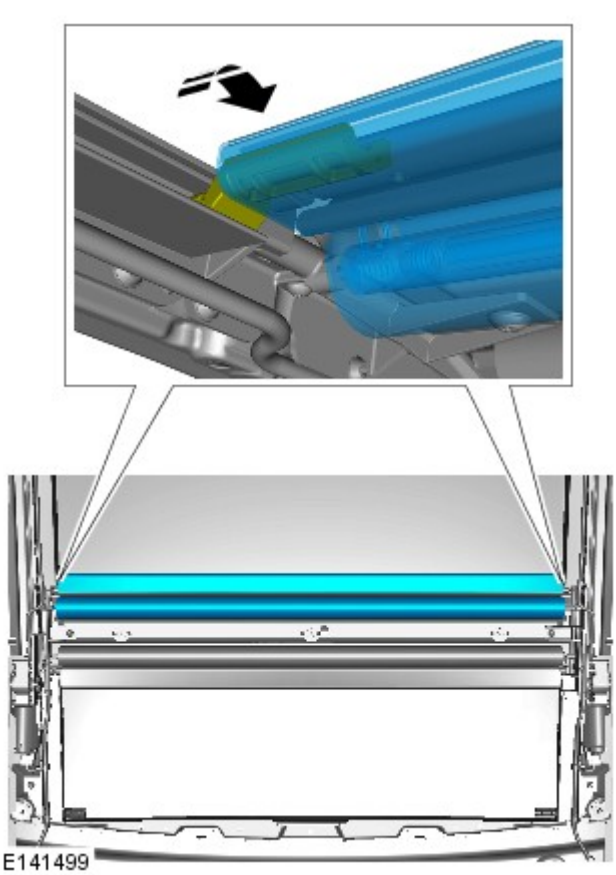
Some variation in the illustrations may occur, but the essential information is always correct.



1. Open the roof opening panel glass to the full tilt position.

2. CAUTION: Carefully release the 3 clips on the headliner. Do not use excessive force





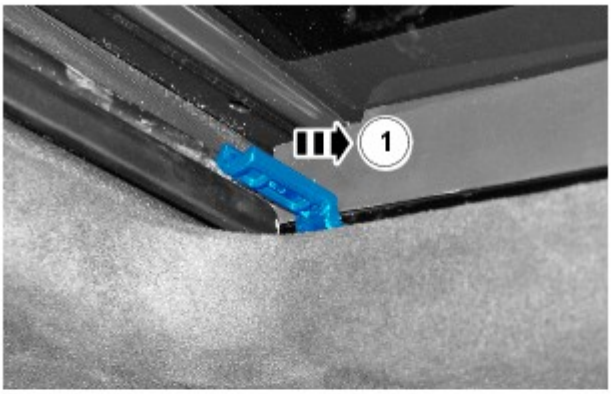
3. CAUTION: Make sure that the clips are correctly located.

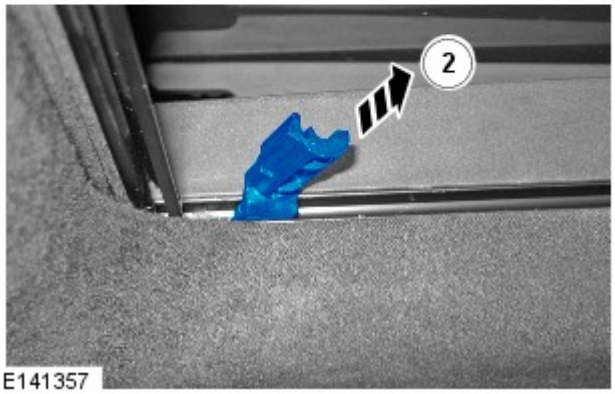
NOTES:

Follow the animation to make sure the roof opening panel blind is removed and installed correctly from and to the guides.

Carefully allow the roof opening panel blind to retract in to the aperture above the headliner.

4.

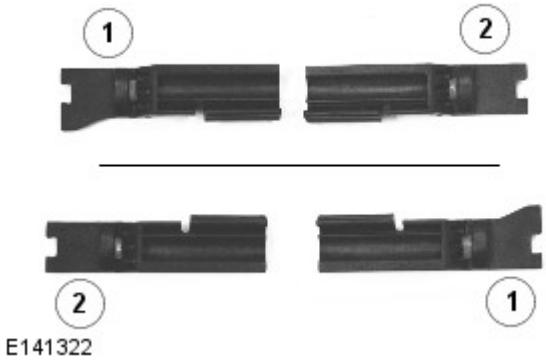




CAUTION: Note the orientation of the component prior to removal.

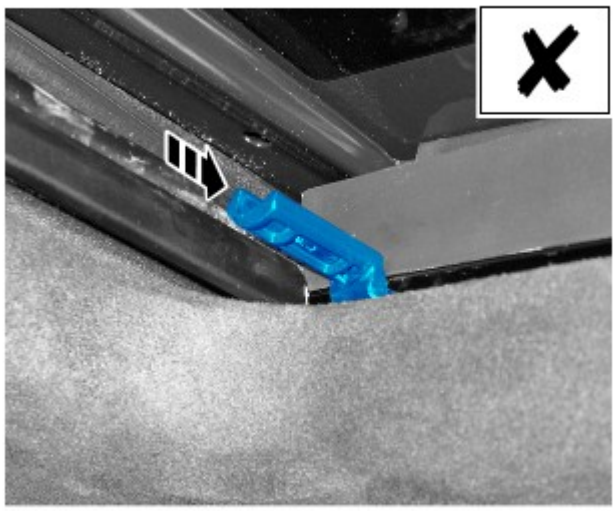
NOTE: The procedure must be carried out on both sides.

Installation

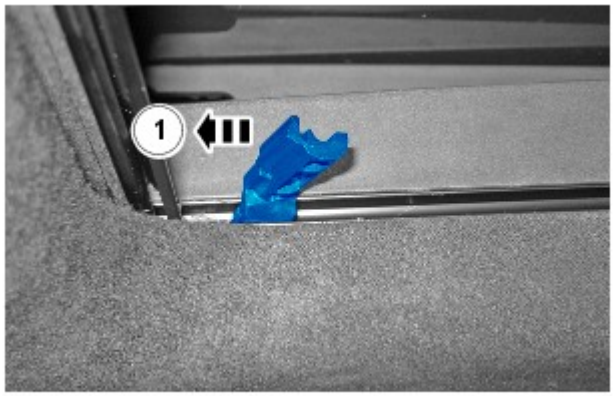


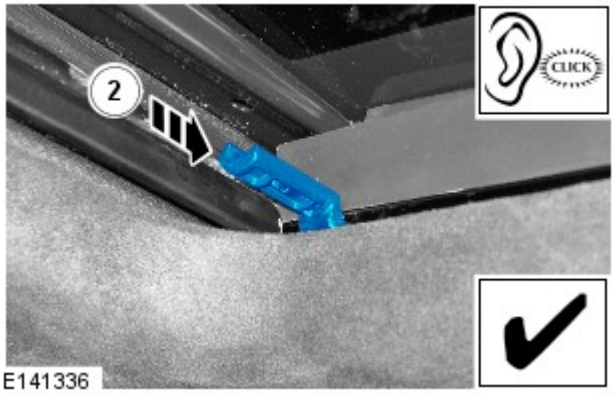
1. CAUTION: The roof opening panel blind feet are handed. Make sure that the feet labelled 1 are installed to the left hand side of the roof opening panel blind and to the right hand side of the glass roof panel blind. Make sure that the feet labelled 2 are installed to the right hand side of the roof opening panel blind and to the left hand side of the glass roof panel blind.

2. CAUTION: Do not directly force the blind feet in to the fitted position. Failure to follow this instruction may result in damage to the component.



E141337





E141336

3. NOTES:

An audible click can be heard when the component is correctly located.

The procedure must be carried out on both sides.

1. Hold the blind foot at an angle and slide it along the rail until contact is made with the drive mechanism.
2. Rotate the blind foot in to the fitted position.

4. CAUTION: Make sure that the clips are correctly located.

NOTE: Follow the animation to make sure the roof opening panel blind is removed and installed correctly from and to the guides.

Glass, Frames and Mechanisms - Rear Glass Roof Panel Lubrication

General Procedures

Check

CAUTIONS:

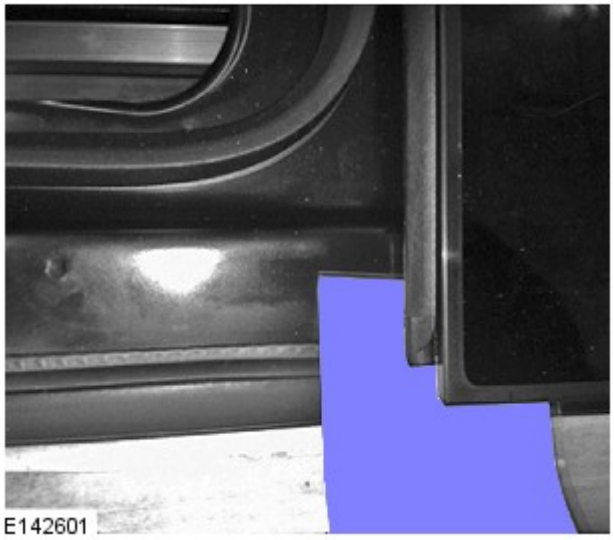
Make sure that the vehicle is clean and dry prior to commencing this procedure.

Make sure that the vehicle is kept in a dry environment and is not washed within 24 hours of completing this procedure, failure to follow this instruction will prevent the slip coat from curing correctly.

NOTE: The lubricant used in this procedure (LIP AC612/21) is part of the Squeaks & Rattles Kit. For more information on the Squeaks & Rattles Kit, safety data sheets and details of how to order the kit or parts thereof, please visit (www.squeaksandrattles.info).

1. Open the roof opening panel glass to the full tilt position.

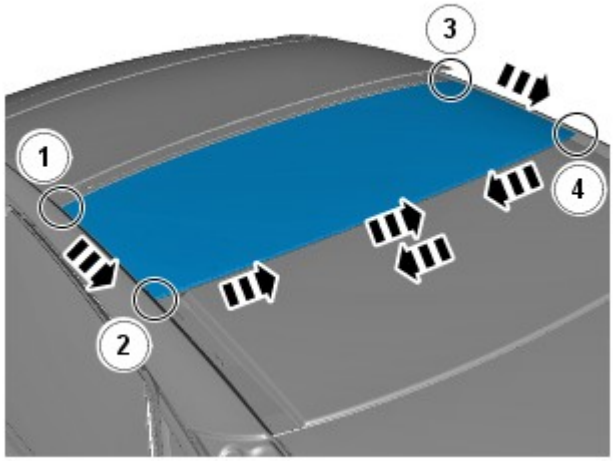
2. Insert a suitable applicator card in to the position shown at the left hand front corner of the rear glass roof panel.



E142601

3. CAUTION: Make sure that the two areas that are cleaned with the applicator card overlap at the centre of the vehicle.

- Starting at position 1 in the left hand front corner of the rear glass roof panel, carefully slide the applicator card around the rear glass roof panel through position 2 and past the centre point of the vehicle.
- Remove and clean the applicator card.
- Starting at position 3 in the right hand front corner of the rear glass roof panel, carefully slide the applicator card around the rear glass roof panel through position 4 and past the centre point of the vehicle.
- Remove and clean the applicator card.



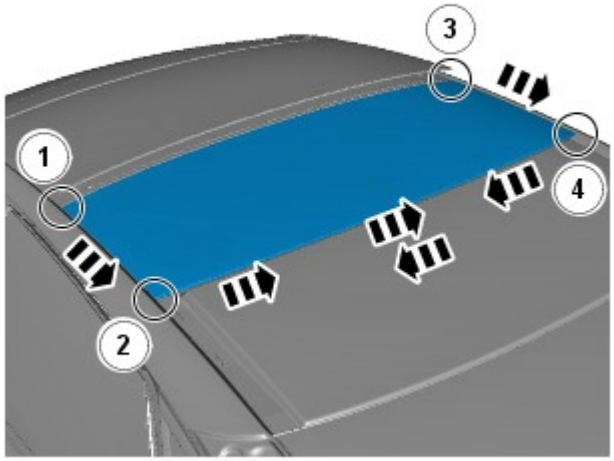
E142600

4. CAUTION: Make sure that the bottle is well shaken before applying the fluid to the applicator card.

- Insert a suitable applicator card in to the position shown at the left hand front corner of the rear glass roof panel.

E142602

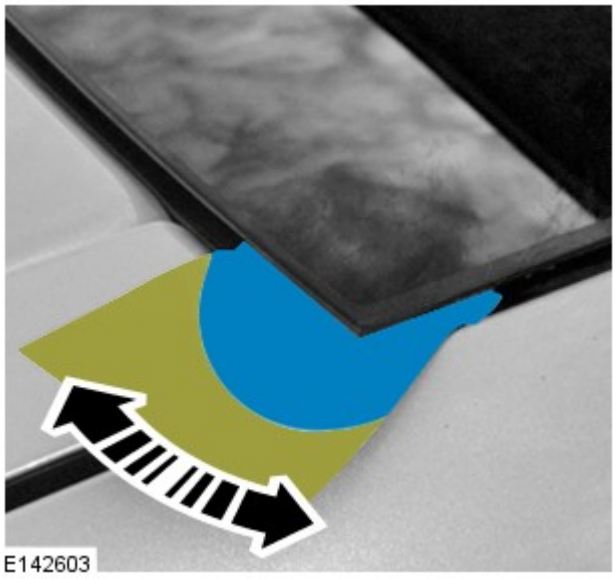
- Spray a sufficient amount of LIP AC612/21 fluid on to the applicator card until the fluid runs between the rear glass fixed panel and the seal.



E142600

5. CAUTION: Make sure that the applicator card does not slip from under the rear glass roof panel as the card is rotated around the corners.

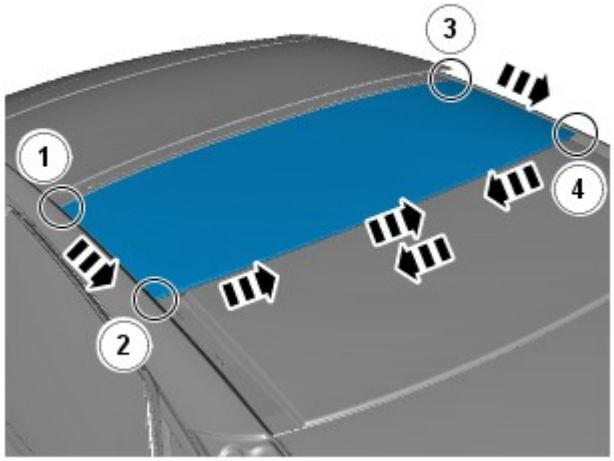
- Carefully slide the applicator card along the edge of the rear fixed glass panel to position 2.
- Slide the applicator card backwards and forwards from position 1 to 2 to make sure that a sufficient amount of fluid is applied to the rear fixed glass panel.
- If required, apply more fluid to the applicator card and repeat the above step.



E142603

6. CAUTION: Make sure that the applicator card does not slip from under the rear glass roof panel as the card is rotated around the corners.

- At the position 2, spray a sufficient amount of LIP AC612/21 fluid on to the applicator card until the fluid runs between the rear glass fixed panel and the seal.
- Rotate the applicator card backwards and forwards 5 times at the corner of the rear fixed glass panel.



E142600

7. CAUTION: Make sure that the applicator card does not slip from under the rear glass roof panel as the card is rotated around the corners.

- Carefully slide the applicator card along the edge of the rear fixed glass panel from position 2 past the centre of the vehicle.
- If required, apply more fluid to the applicator card and repeat the above step.
- Remove and clean the applicator card.

8. Repeat steps 4 to 7 for the other side of the vehicle.

9. Wipe away any excess fluid.

Roof Opening Panel - Motor Synchronization

General Procedures

1. CAUTIONS:

Make sure that the ambient temperature is above 5°C and below 40°C before carrying out this procedure.

Make sure that the gear selector is in the P position.

- Set the ignition to the ON position.
- Start the engine.
- Press and hold the front of the switch, hold down until the roof opening panel is fully closed.

2.
- Press and hold the front of the roof opening panel switch.
- After approximately 45 seconds the roof opening panel will begin to move. Keep the front of the switch pressed until the roof opening panel and the roof blinds have fully opened, then closed.

3.
- Once the open/close cycle has completed and the roof opening panel has stopped moving, release the switch.
- The roof opening panel is now synchronized.
- The roof opening panel can now be operated as normal.

4.
- Turn off the engine.
- Set the ignition to the OFF position.

Roof Opening Panel - Roof Opening Panel - Overview

Description and Operation

Overview

The roof opening panel assembly is built into a steel perimeter frame and incorporates the:

- fixed glass panels
- sliding glass panel
- roller blinds
- electric operating motors and mechanisms
- wiring harness, and
- wind deflector.

The motor located at the front of the assembly powers the sliding glass panel. The motors operating the roller blinds are in the side rails. The steel frame is bonded into an aperture extending the full width of the roof, between the cant rails of the vehicle’s aluminum body.

The sliding glass panel and roller blinds are controlled by the switch pack in the front overhead console. The rear roller blind can also be controlled by a button in the rear overhead console. The rear overhead switch function can be isolated by isolating the rear electric windows on the drivers window switch pack.

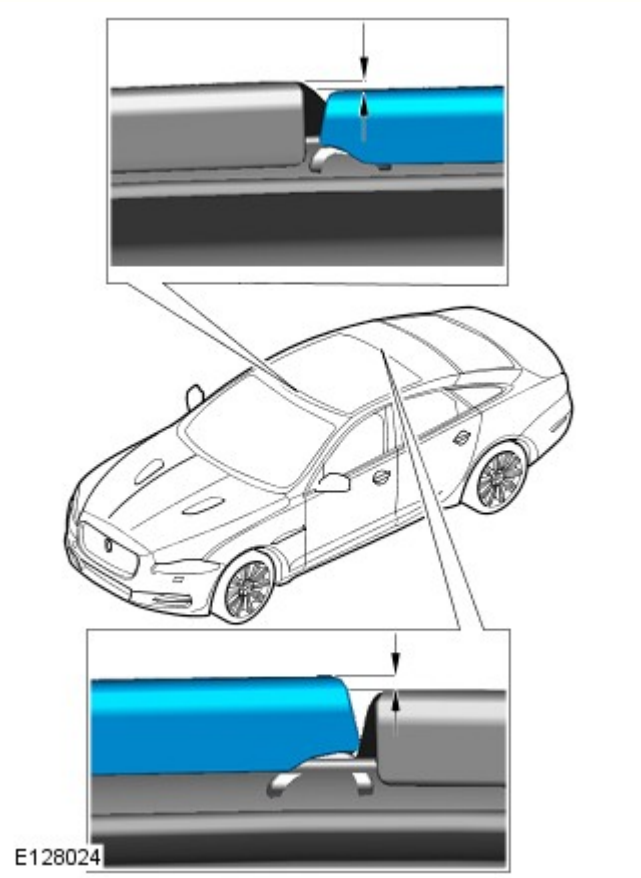
Roof Opening Panel - Roof Opening Panel Alignment

General Procedures

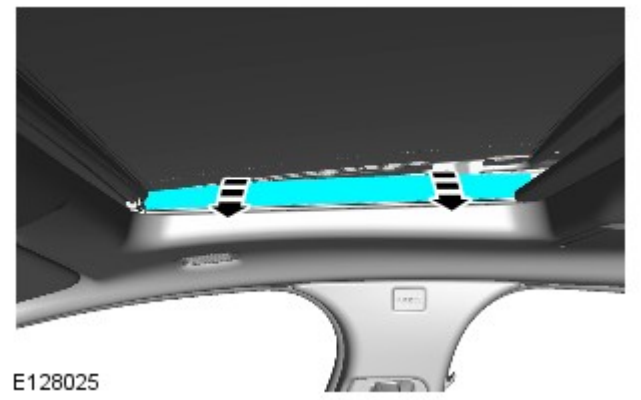
Check



1. NOTE: With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

Adjustment

1. Open the roof opening panel blind.



2. CAUTION: Note the orientation of the component prior to removal.

NOTE: The procedure must be carried out on both sides.

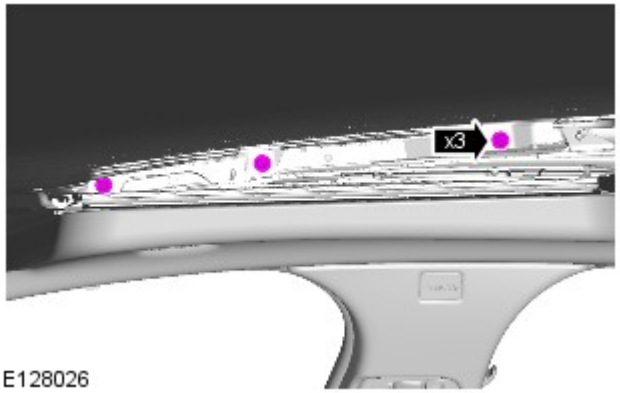
Remove the inner cover.

3. CAUTION: Note the orientation of the component prior to removal.

NOTE: The procedure must be carried out on both sides.

Remove the outer cover.

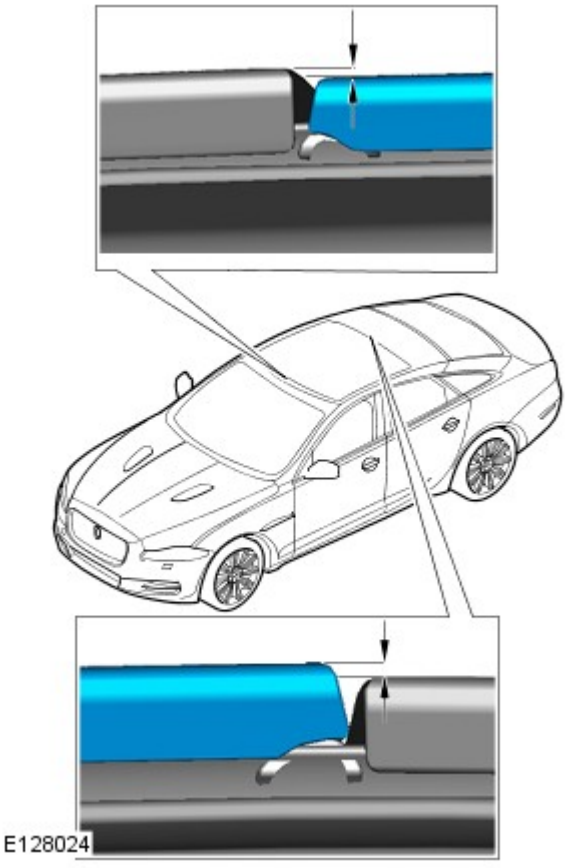
E141157



E128026

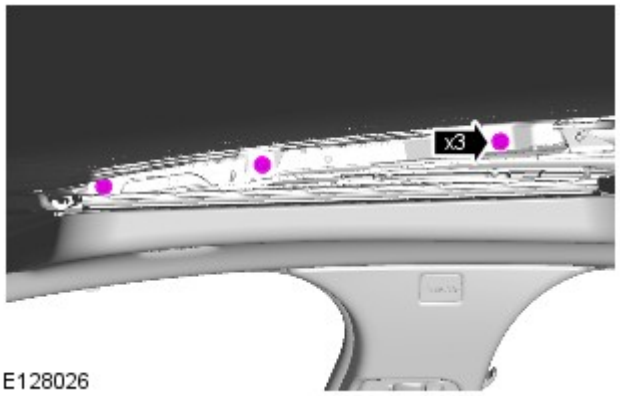
4. NOTE: The procedure must be carried out on both sides.

Loosen but do not remove the 3 roof opening panel Torx bolts.



E128024

5. Align the roof opening panel.



E128026

6. NOTES:

With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

Make sure that the alignment of the roof is equal on both sides of the vehicle.

The procedure must be carried out on both sides.

Torque: 7 Nm

E141158

7. NOTES:

Make sure that the cover is positioned as far forward as possible.

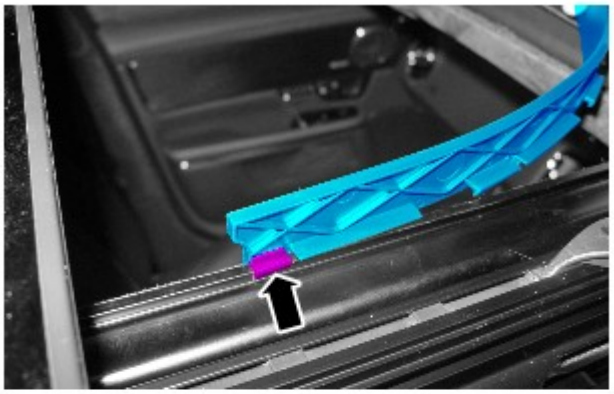
The procedure must be carried out on both sides.

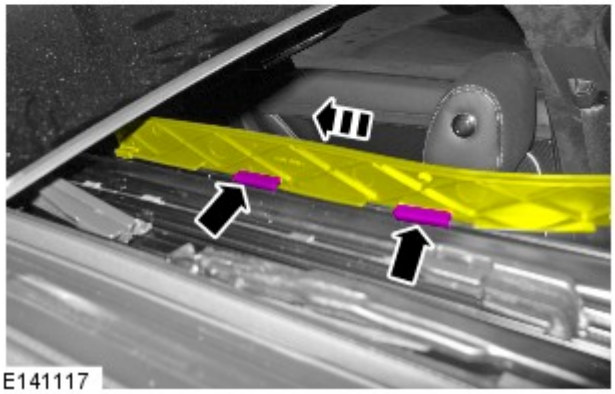
Install the outer cover.

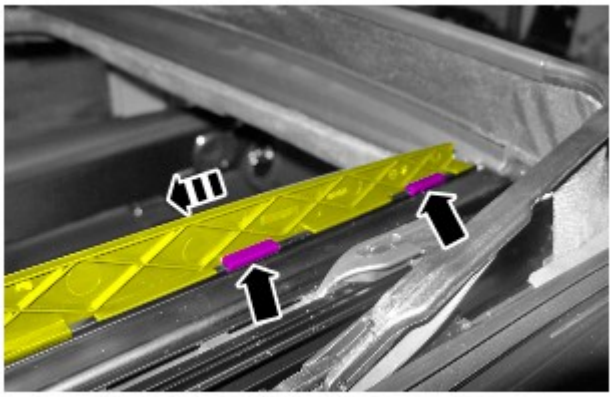
8. Fully open the roof opening panel glass.

9. NOTE: The procedure must be carried out on both sides.

Carefully secure the clips whilst sliding the inner cover rearwards.

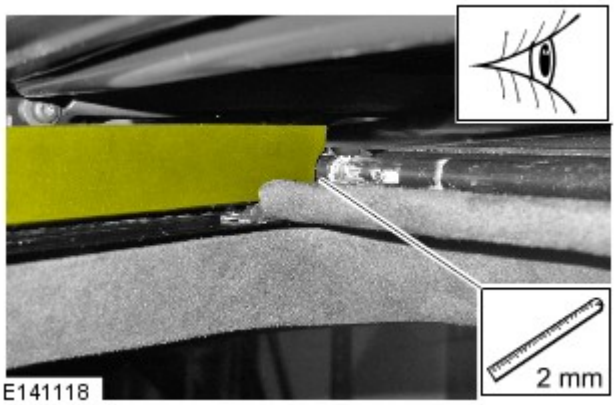






10. NOTE: The procedure must be carried out on both sides.

Secure the clips and slide the inner cover rearward until it is 2mm from the roof opening panel blind drive spindle .



11. Close the roof opening panel glass.

12. Close the roof opening panel blind.

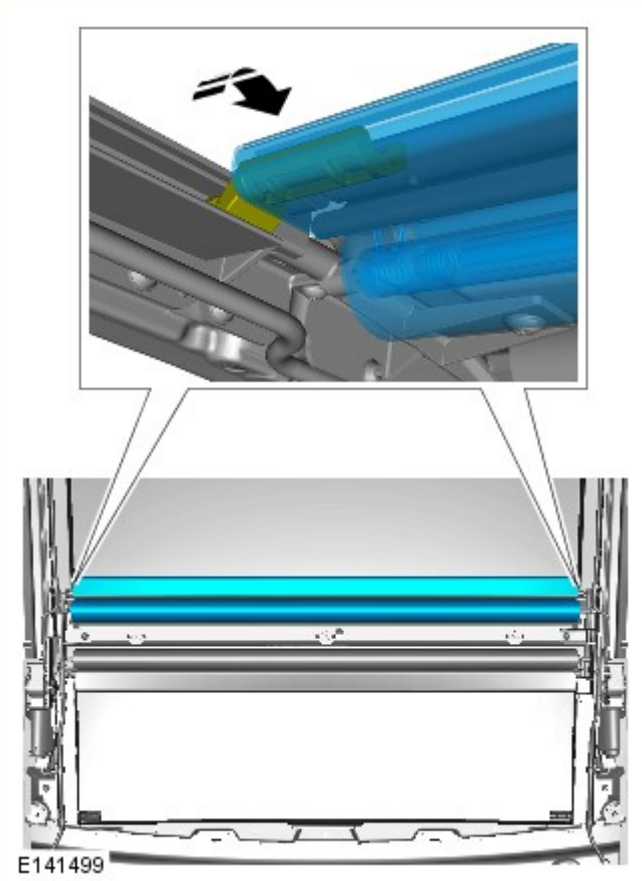
Roof Opening Panel - Roof Opening Panel Blind Drive Assembly

Removal and Installation

Removal

1. Refer to: Roof Opening Panel Blind (501-17 Roof Opening Panel, Removal and Installation).



2. CAUTION: Make sure that the clips are correctly located.

NOTES:

Follow the animation to make sure the roof opening panel blind is removed and installed correctly from and to the guides.

Roof opening panel blind shown, glass roof panel blind similar.

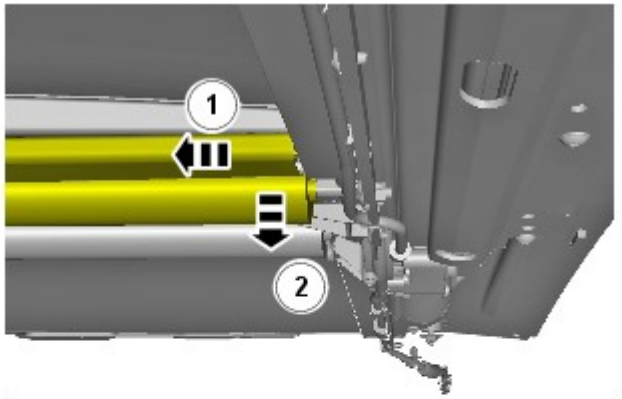
Release the glass roof panel blind

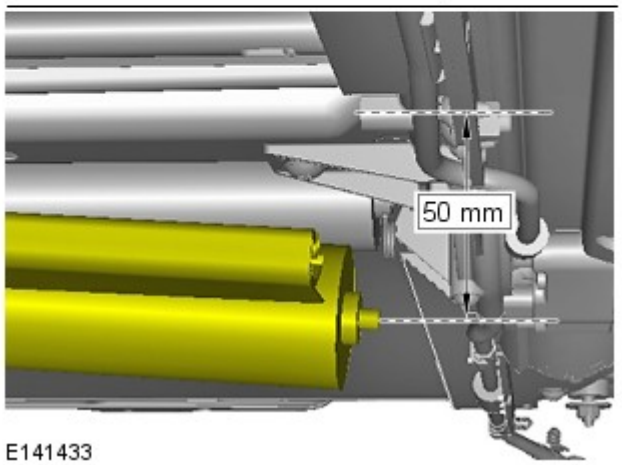
3. CAUTIONS:

Make sure that the roof opening panel blind is not lowered by more than 50 mm at one end whilst the other end is still located in to the drive mechanism.

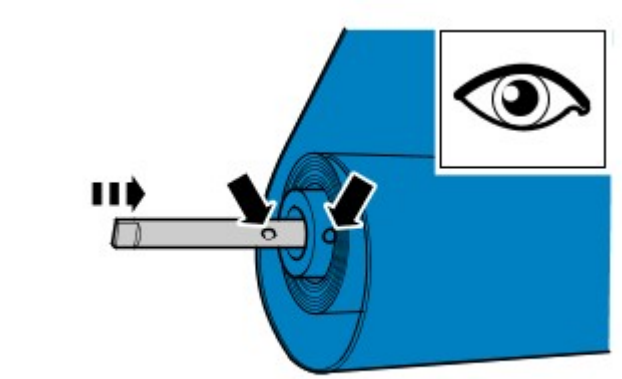
Make sure that a firm pressure is applied to the roof opening panel blind so that tension is maintained until the retaining clip is correctly located.

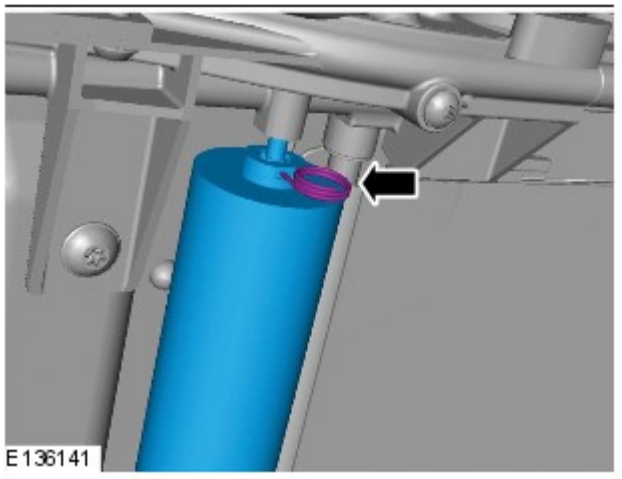
NOTE: Roof opening panel blind shown, glass roof panel blind similar.





E141433





E136141

4. CAUTIONS:

Make sure that the clip is correctly located.

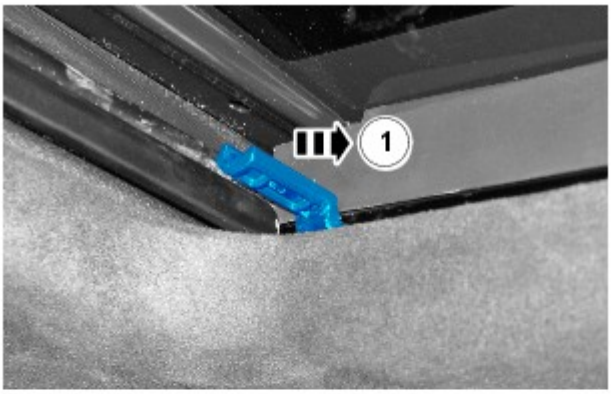
If the correct clip is not available, make sure that a suitable hardened pin is used such as a drill bit, do not use a paperclip.

Make sure that the roof opening panel blind is not released from the drive mechanism until the clip has been correctly located.

NOTE: Roof opening panel blind shown, glass roof panel blind similar.

Install the retaining clip.

5. CAUTION: Note the installed position of the component prior to removal.



NOTE: The procedure must be carried out on the front and rear blind feet.

17. CAUTION: Protect the surrounding trim to avoid damage.

NOTE: Lower and reposition the headliner to aid access.

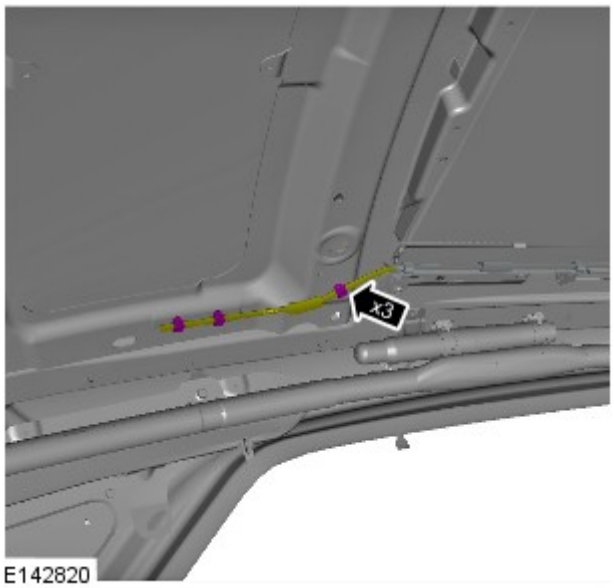
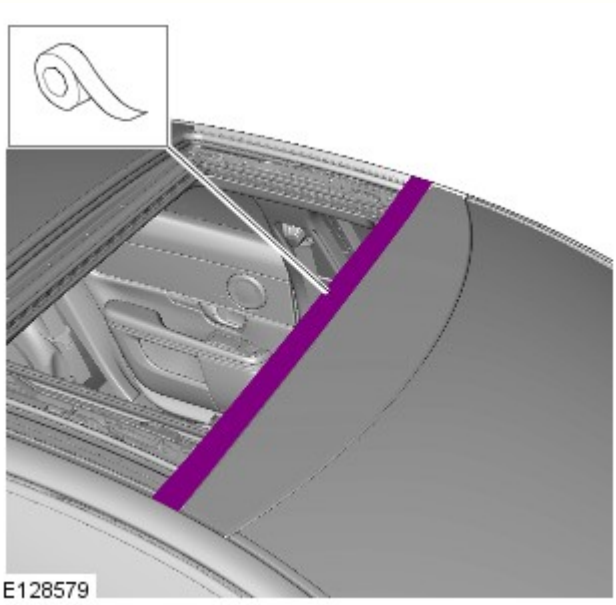
18. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

19. Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

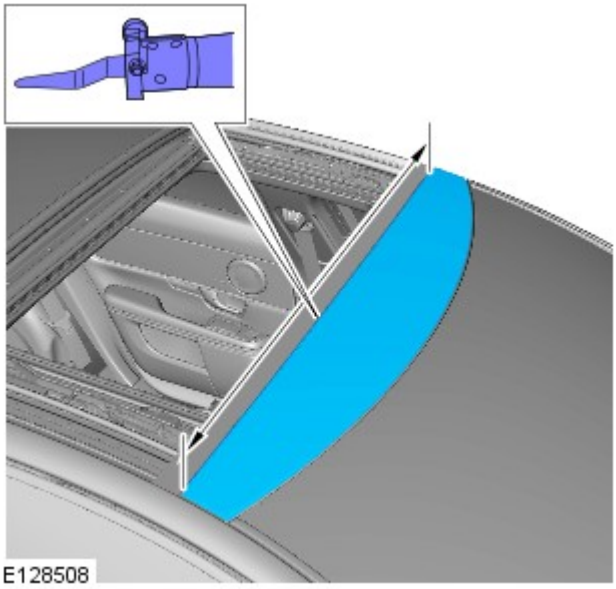


E142820

20. NOTE: The procedure must be carried out on both sides.

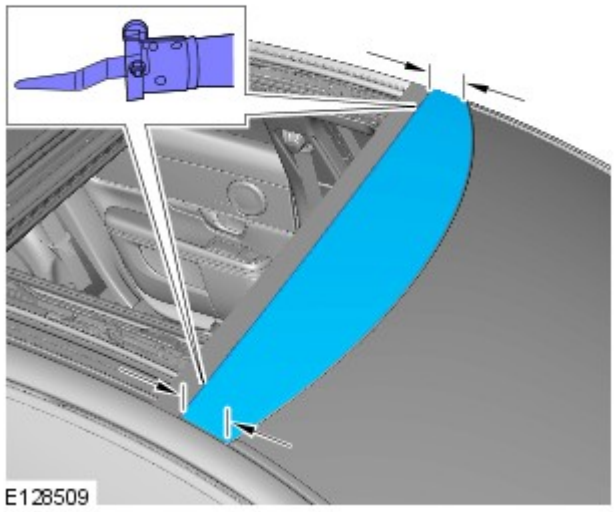


21. CAUTION: Use suitable tape to protect the roof opening panel weather strip.



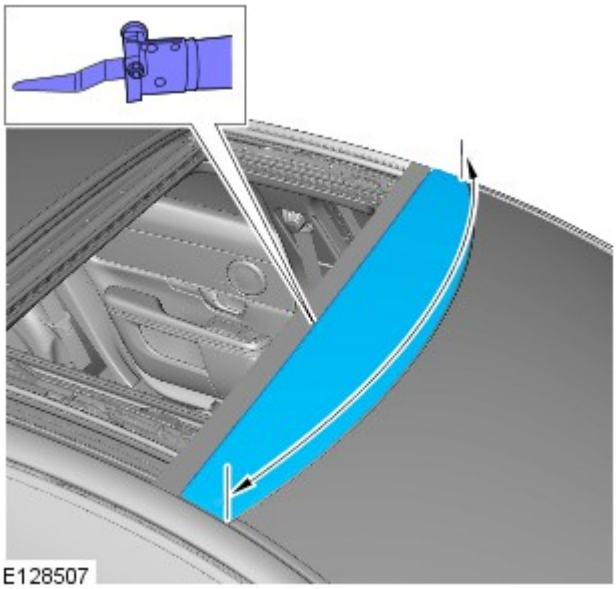
22. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

- Use a WK24ZS blade, cutting with the flat side against the body.



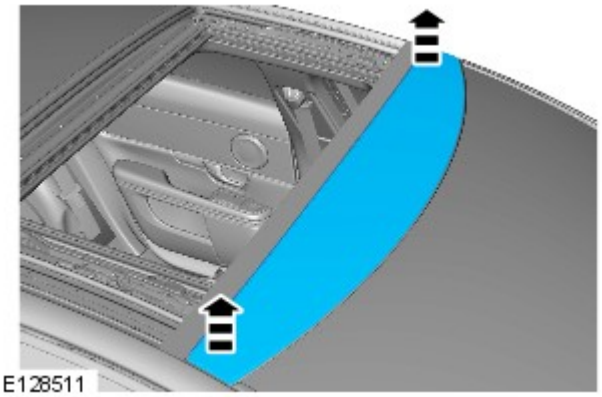
23. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, set to 75 mm to control the cutting depth.

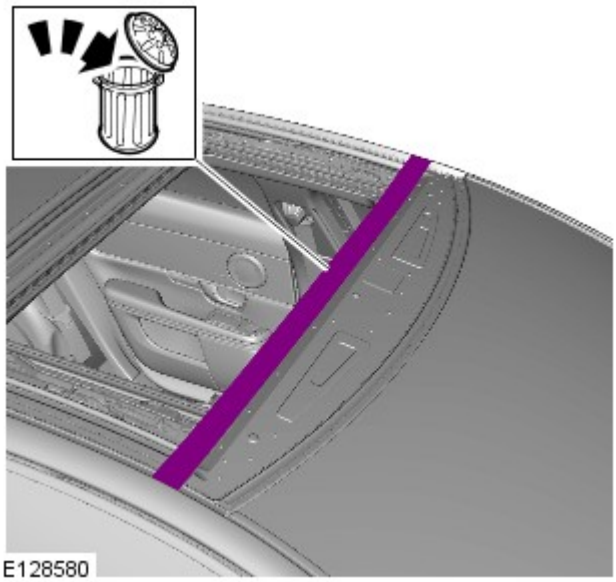


24. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use a WK2S blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, the depth of the cut will vary from 75 mm to 160 mm as the glass widens towards the centre.

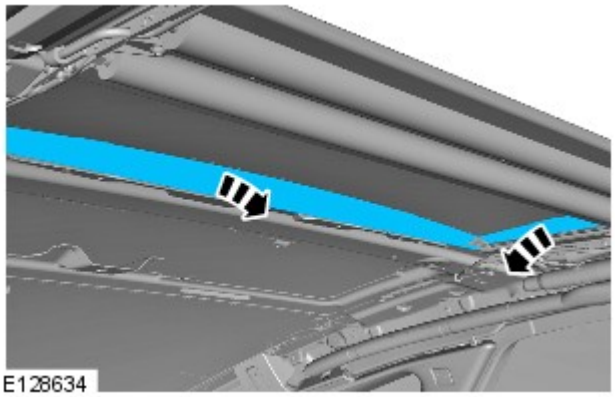


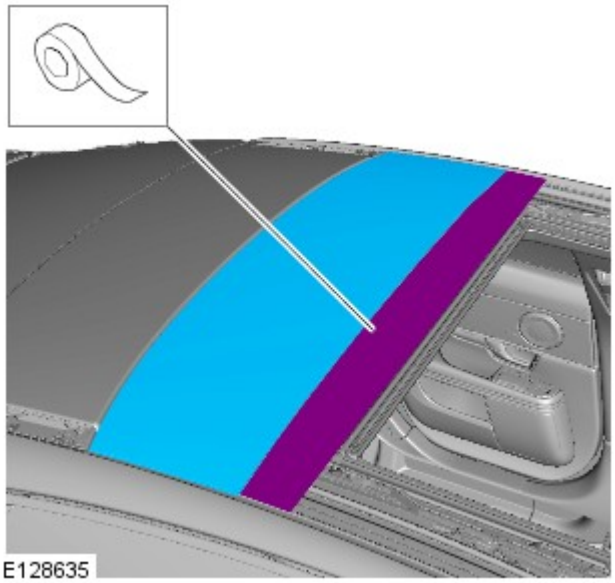
25.



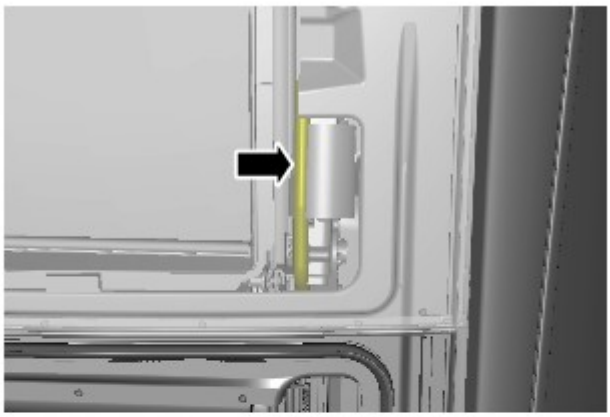
26. NOTE: Remove the tape.

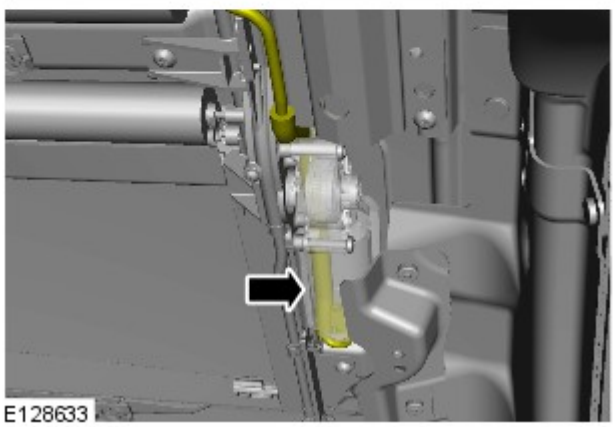
27.





28. CAUTION: Use suitable tape to protect the roof opening panel weather strip.

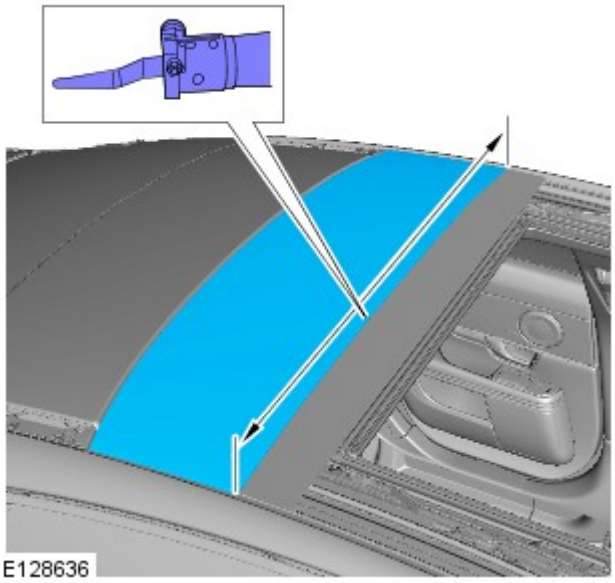




29. CAUTIONS:

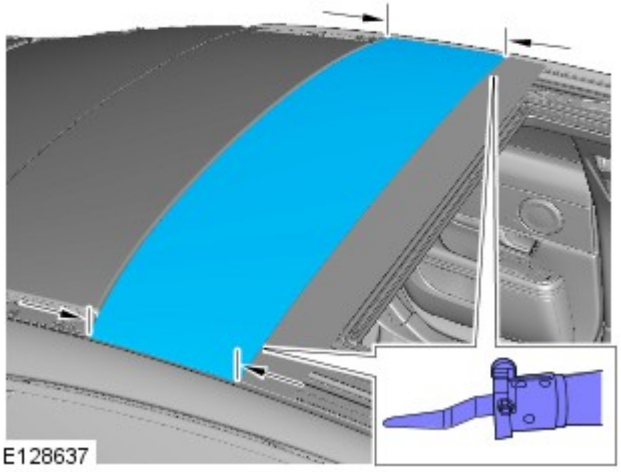
Use suitable tape to protect the roof opening panel blind motor wiring harness.

Use suitable tape to protect the bodywork around the roof aperture.



30. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

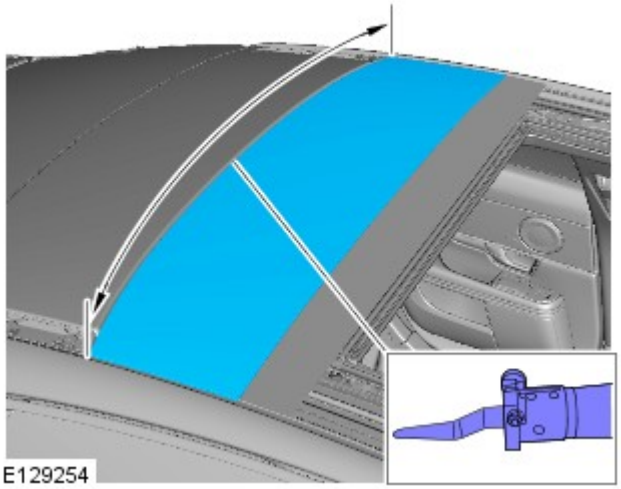
Use a WK2S blade, cutting with the flat side against the body.



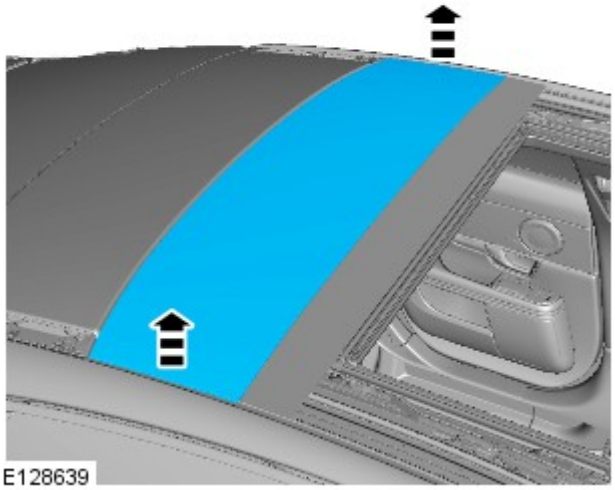
31. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.

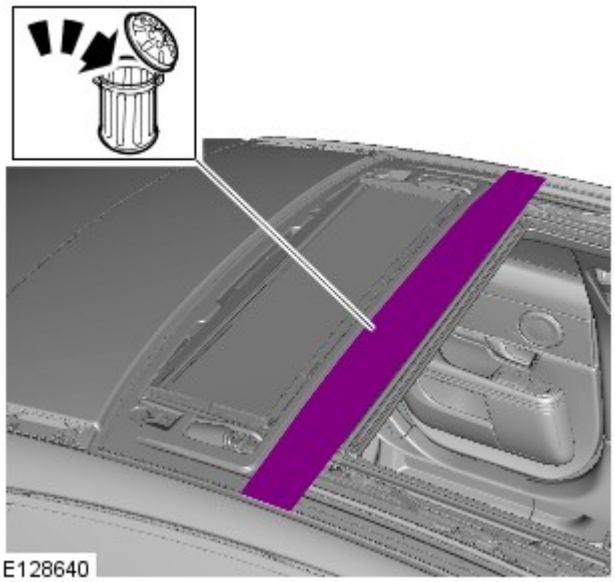
32. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



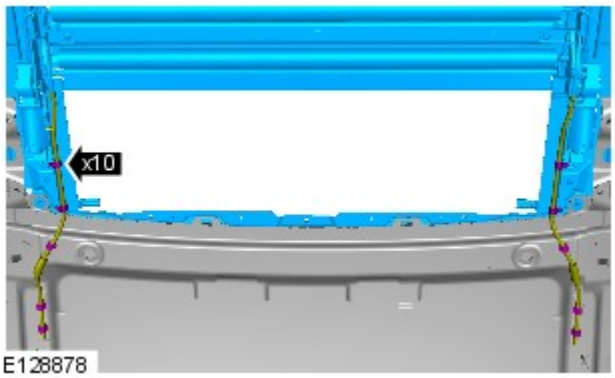
33.



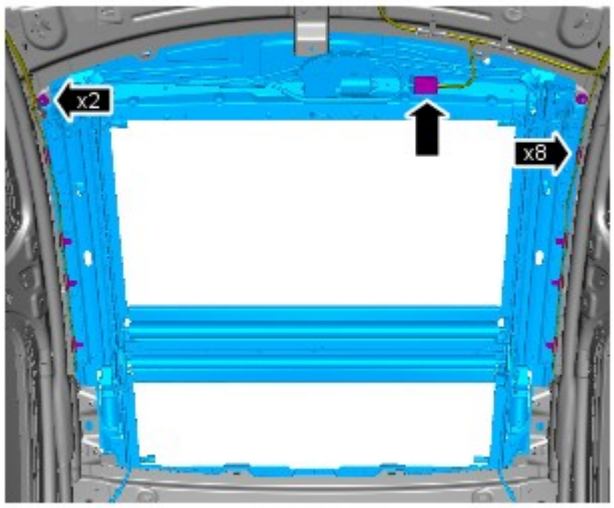
34. NOTE: Remove the tape.



35.



36. CAUTION: Take extra care not to damage the wiring harnesses.



E129217

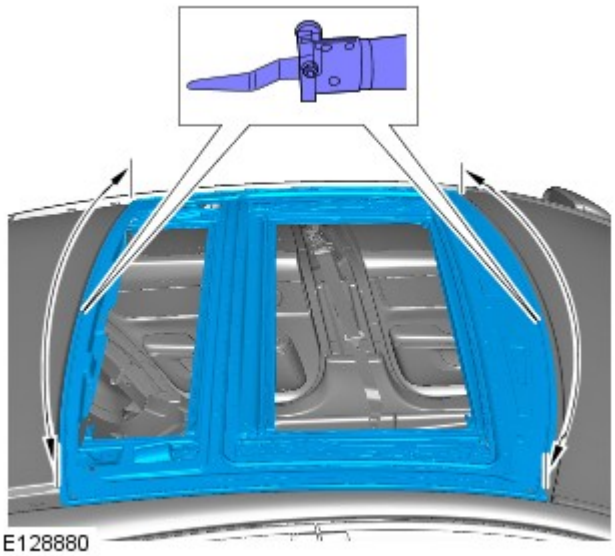
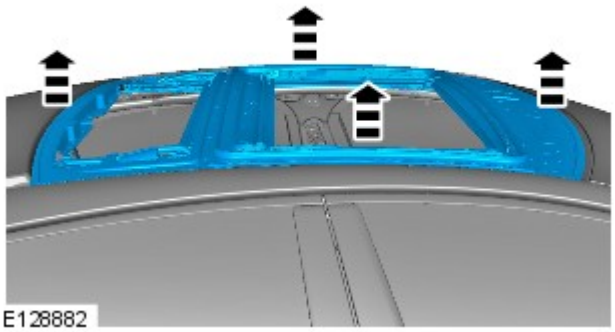
37. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



E128880

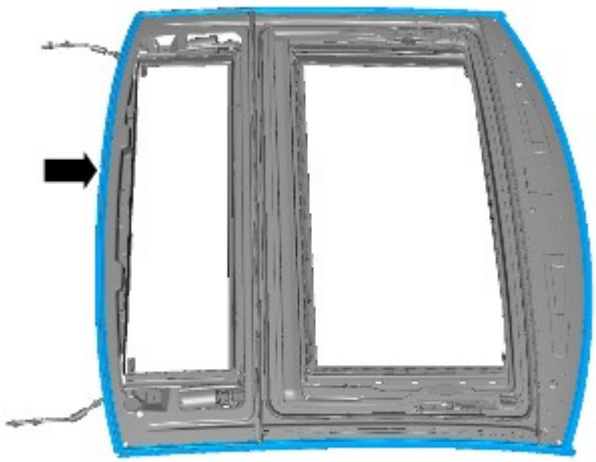
38. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



E128882

39. NOTE: This step requires the aid of another technician.

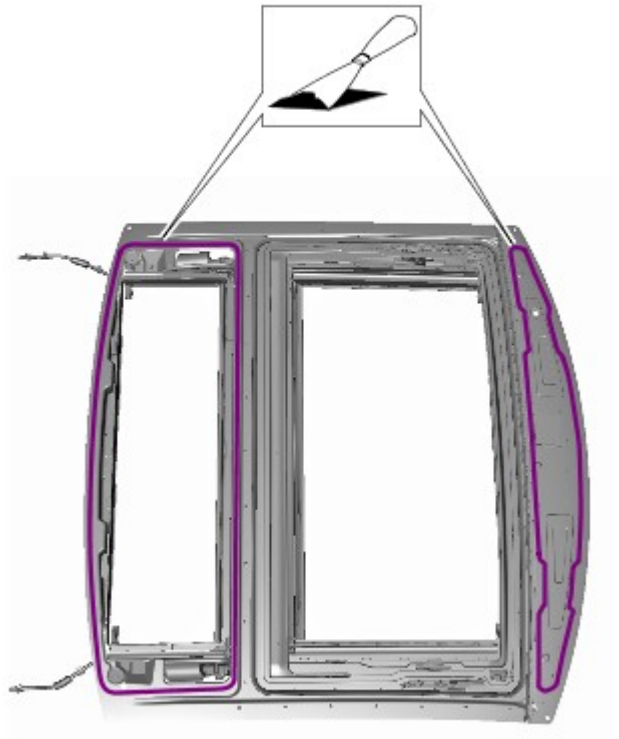
40.



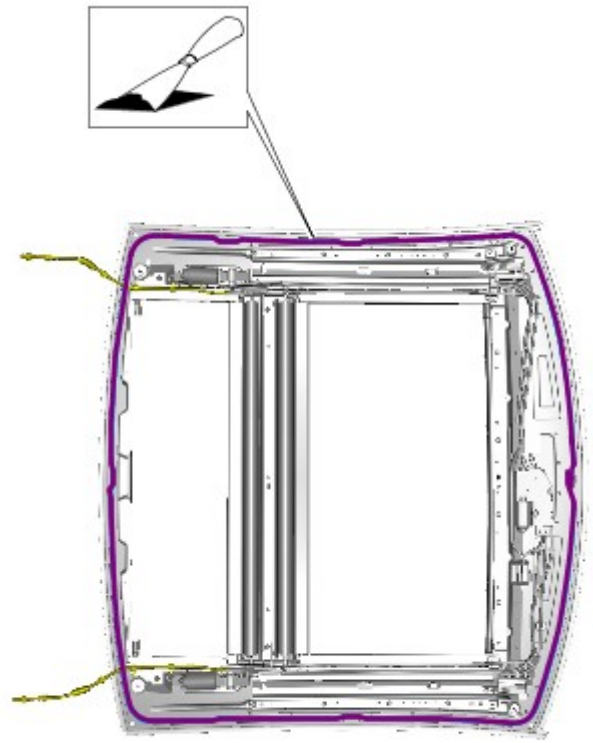
E128883

41. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

Prepare the glass roof cassette flange and trim the PU adhesive in accordance with the instructions included with the PU adhesive kit.

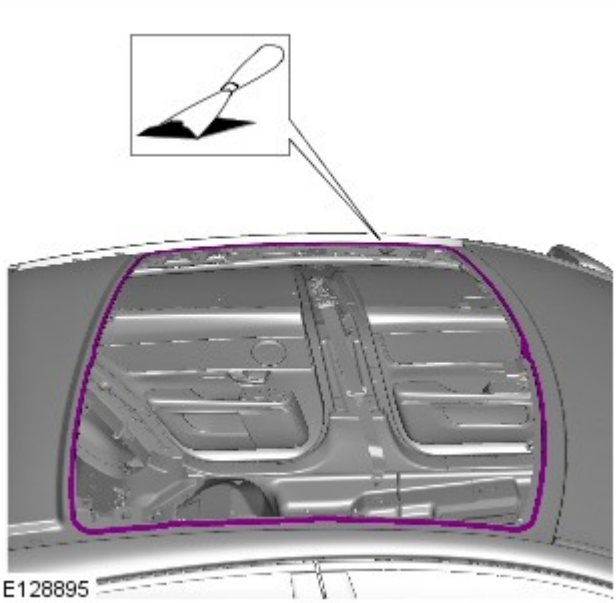


E128896



E128894

42. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

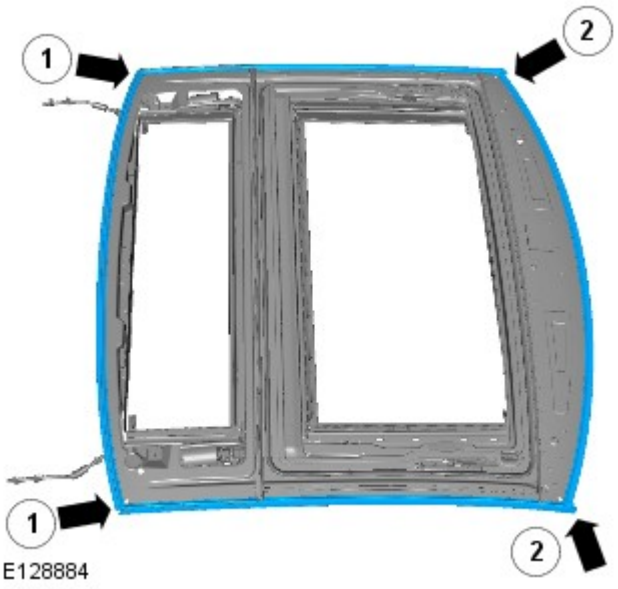


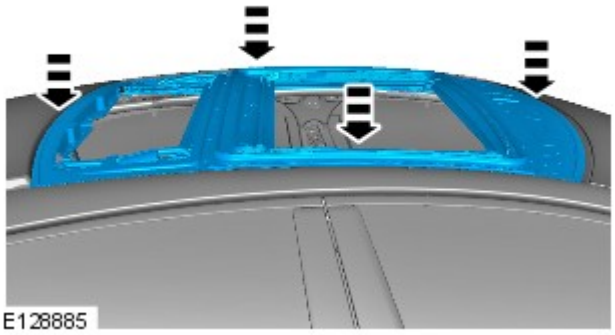
E128895

43. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

Installation

1. Fit the cassette frame edge seal back corners first, then fit the front corners, as the sequence depicts in the graphic.





2. CAUTION: Make sure that the component is correctly located on the locating dowels.

NOTES:

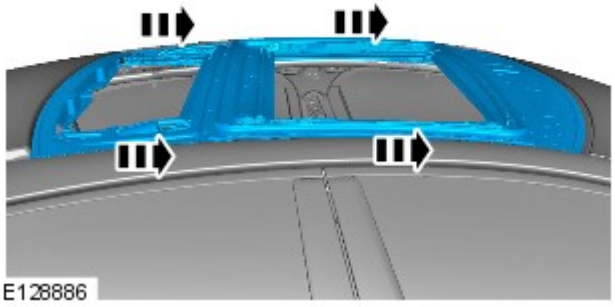
This step requires the aid of another technician.

Install new spacers.

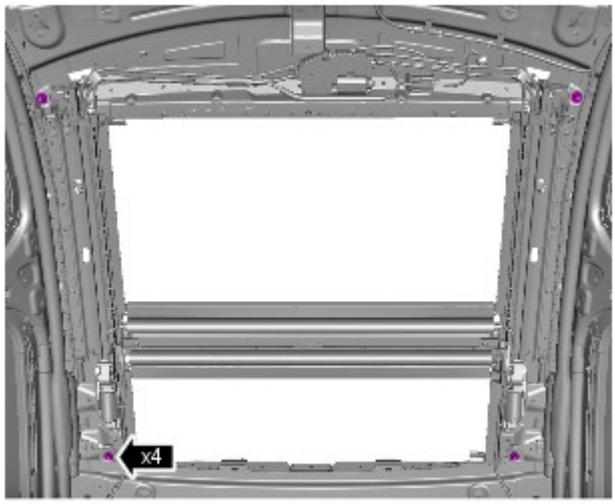
Make sure that the cassette frame edge seal is in contact with the cant rail evenly across both sides of the vehicle. It is critical that the cassette is central.



3. With the 4 installation pins correctly located into the holes in the cant rail assemblies, push the cassette fully forward towards the front of the vehicle.

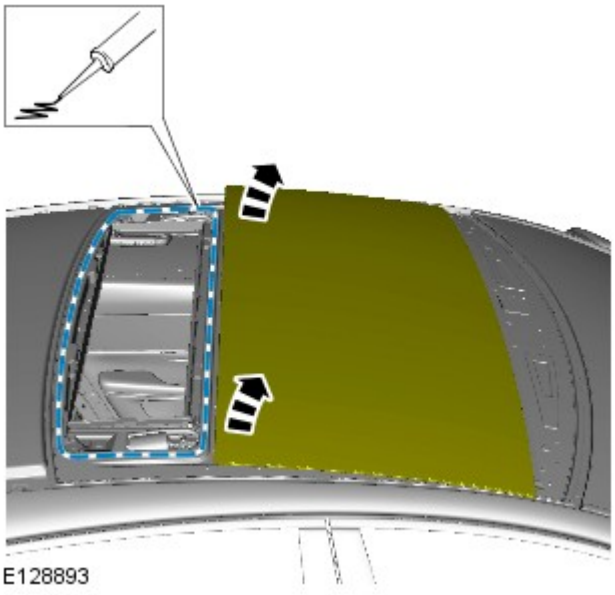
4. CAUTION: Only tighten the nuts finger-tight at this stage.

Install the 2 new nuts to the rear of the cassette frame to ensure correct alignment to the body.



E128887

5. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

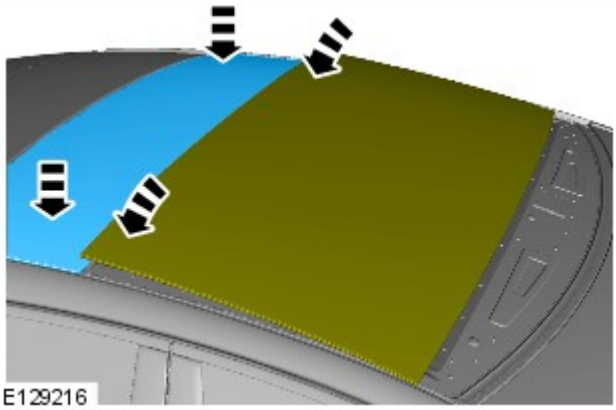


E128893

6. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.
- Using the mechanical adjuster on the roof opening panel motor, wind the motor until the glass is slightly raised from the cassette frame edge seal, to aid the installation of the rear glass panel.



E129216

7. NOTES:

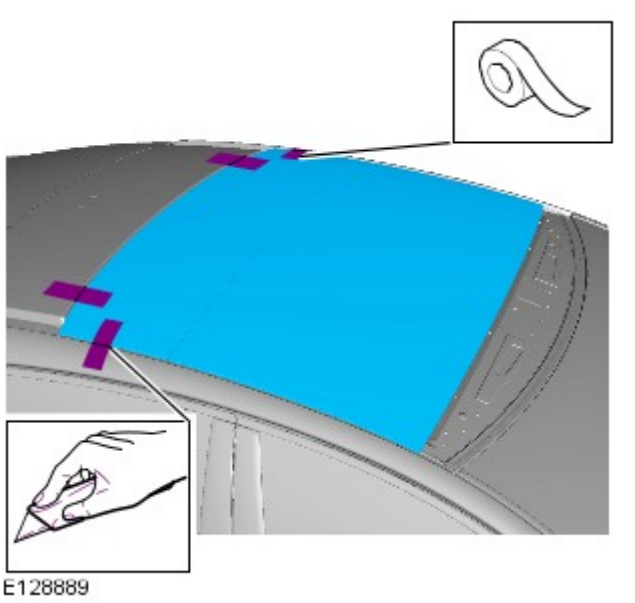
With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

With the sunroof closed, check the alignment of the rear glass roof panel to the sunroof glass panel. The glass should be central in its aperture. Profile of rear glass roof panel to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

- Using the mechanical adjuster on the roof opening panel motor, wind the motor until the glass is sitting flush against the cassette frame edge seal.
- Make sure the component is aligned with the measurements taken prior to removal. Failure to

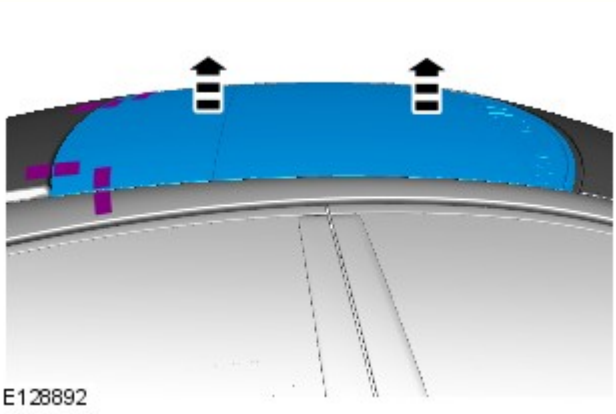
follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature of the glass.

8. Refer to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures).



E128889

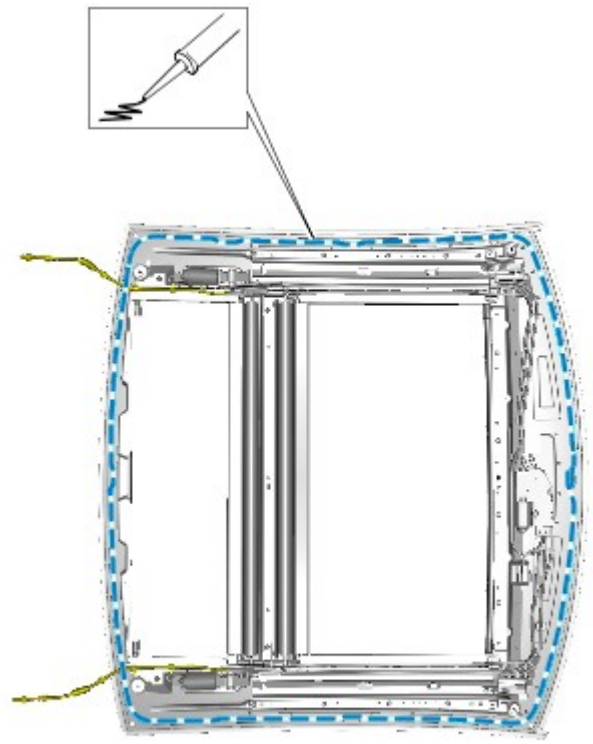
9.
- Apply tape to the rear corners of the glass roof to create alignment markings to aid installation.



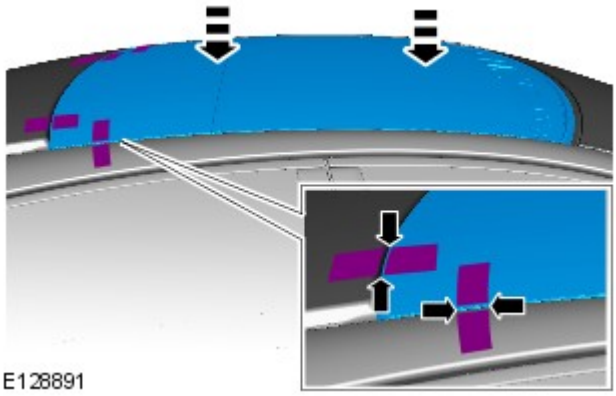
E128892

10. NOTE: This step requires the aid of another technician.

11. CAUTION: Touching the adhesive surface will impair rebonding.



E128888



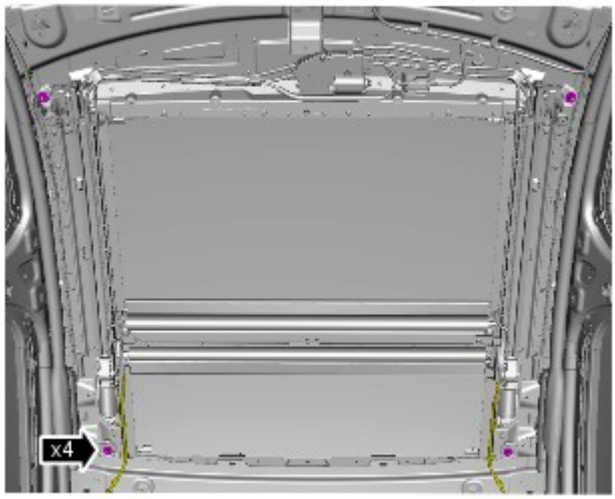
E128891

12. CAUTION: The component must be aligned with the installation markings.

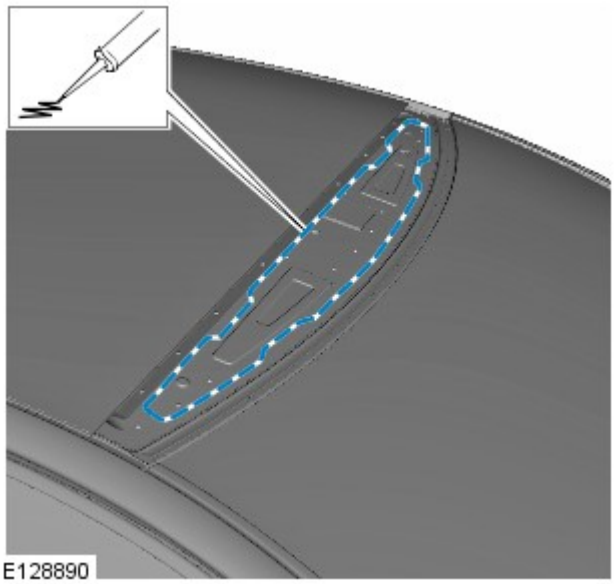
NOTE: This step requires the aid of another technician.

Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

13. *Torque:* 9 Nm



E128934

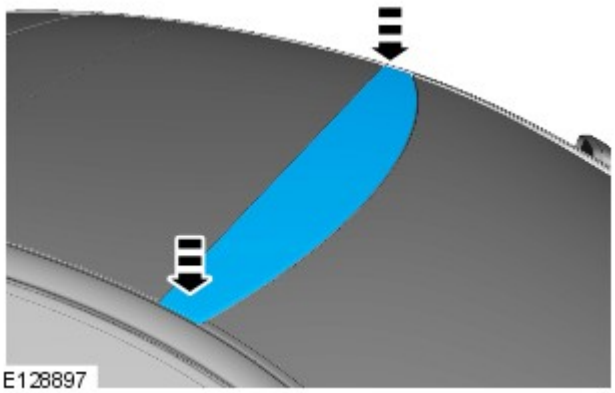


E128890

14. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

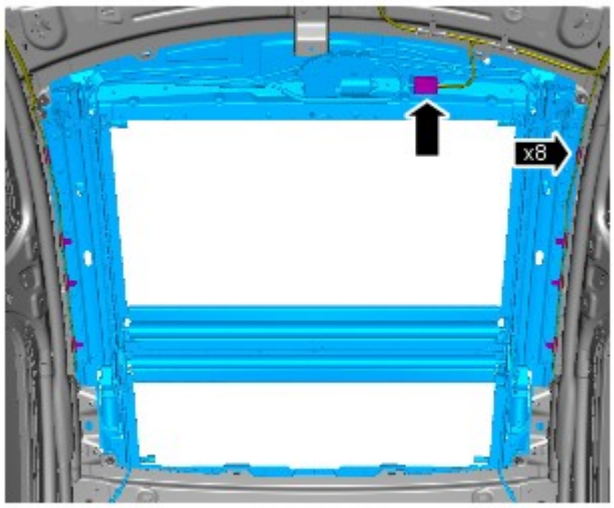
Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.



E128897

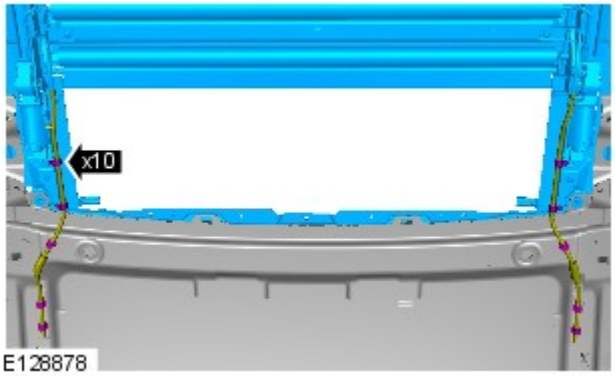
15.
- Make sure the component is aligned with the measurements taken prior to removal. Failure to follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature of the glass.

16.



E128935

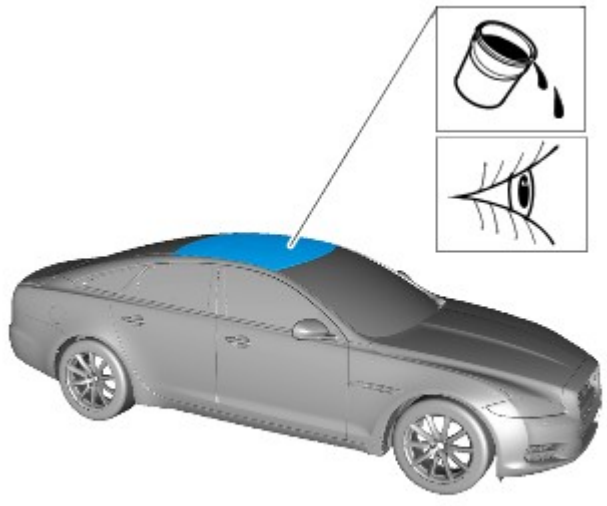
17.



E128878

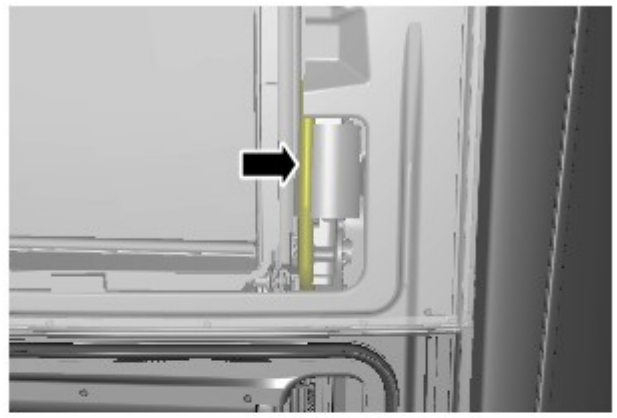
18. CAUTION: Make sure that no excess sealant residue is evident.

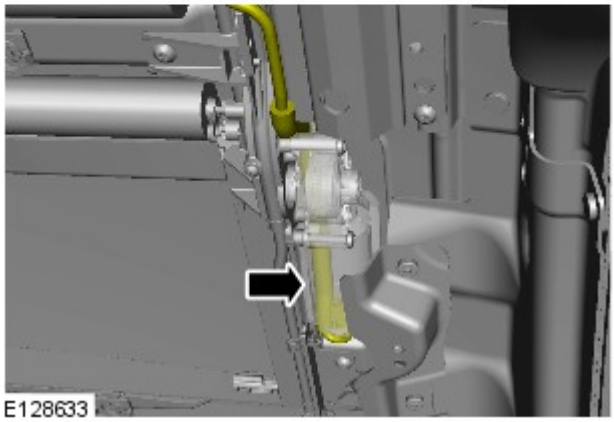
- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.
- Spray water around the roof area and mark any area that leaks. Dry the roof glass and sealant before applying additional sealant.



E128899

19. NOTE: Remove the tape.





20.

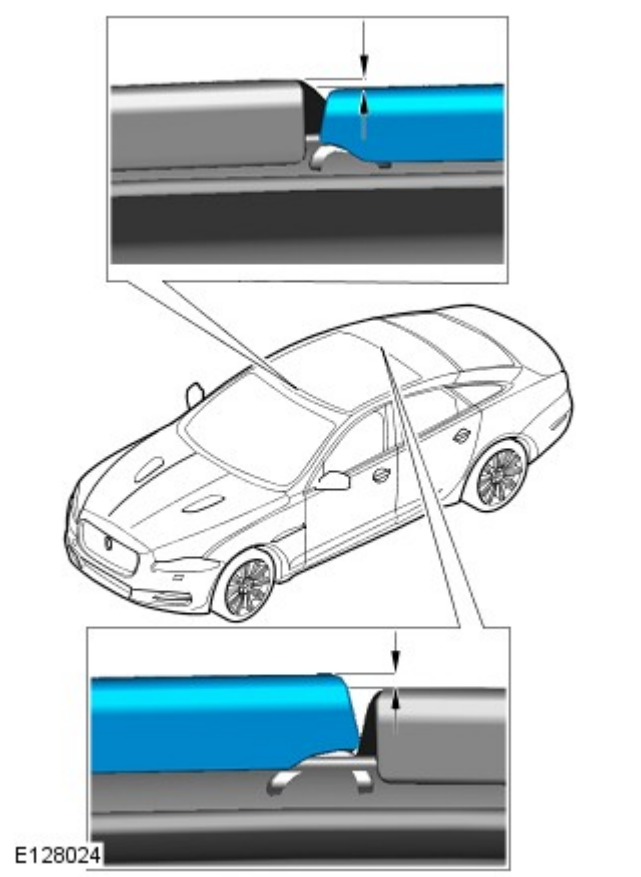
Roof Opening Panel - Roof Opening Panel Alignment

General Procedures

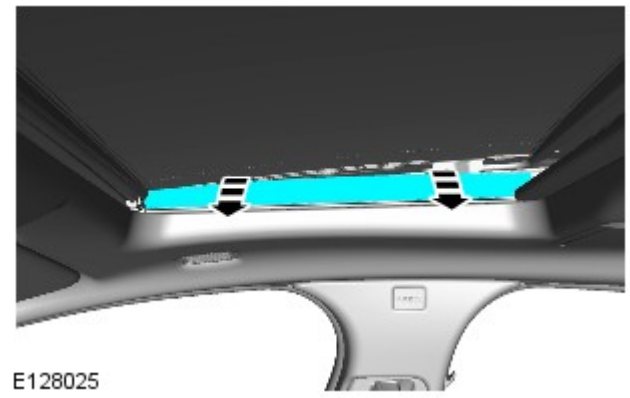
Check

1. NOTE: With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.



Adjustment

1. Open the roof opening panel blind.



2. CAUTION: Note the orientation of the component prior to removal.

NOTE: The procedure must be carried out on both sides.

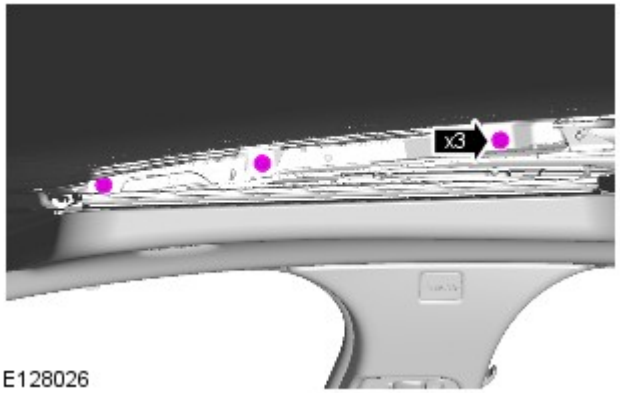
Remove the inner cover.

3. CAUTION: Note the orientation of the component prior to removal.

NOTE: The procedure must be carried out on both sides.

Remove the outer cover.

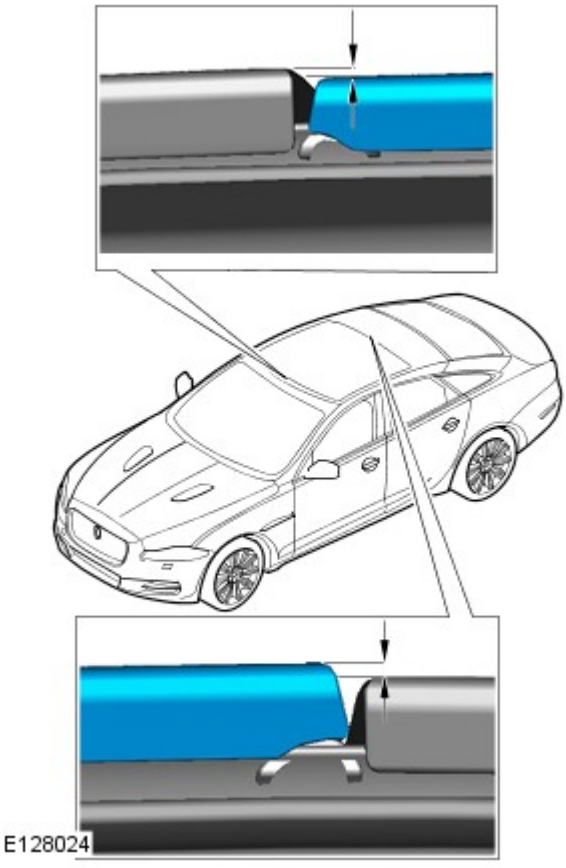
E141157



E128026

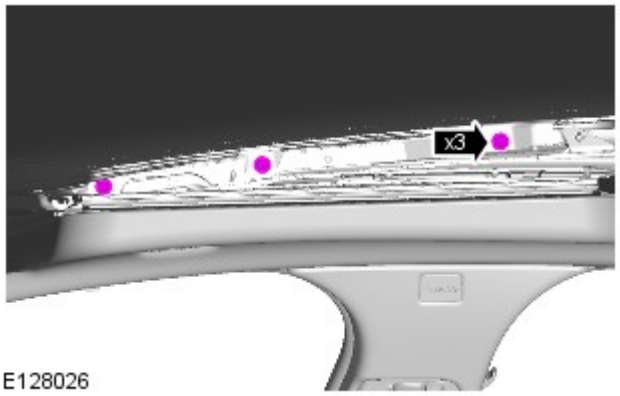
4. NOTE: The procedure must be carried out on both sides.

Loosen but do not remove the 3 roof opening panel Torx bolts.



E128024

5. Align the roof opening panel.



E128026

6. NOTES:

With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

Make sure that the alignment of the roof is equal on both sides of the vehicle.

The procedure must be carried out on both sides.

Torque: 7 Nm

E141158

7. NOTES:

Make sure that the cover is positioned as far forward as possible.

The procedure must be carried out on both sides.

Install the outer cover.

Roof Opening Panel - Motor Synchronization

General Procedures

1. CAUTIONS:

Make sure that the ambient temperature is above 5°C and below 40°C before carrying out this procedure.

Make sure that the gear selector is in the P position.

- Set the ignition to the ON position.
- Start the engine.
- Press and hold the front of the switch, hold down until the roof opening panel is fully closed.

2.
- Press and hold the front of the roof opening panel switch.
- After approximately 45 seconds the roof opening panel will begin to move. Keep the front of the switch pressed until the roof opening panel and the roof blinds have fully opened, then closed.

3.
- Once the open/close cycle has completed and the roof opening panel has stopped moving, release the switch.
- The roof opening panel is now synchronized.
- The roof opening panel can now be operated as normal.

4.
- Turn off the engine.
- Set the ignition to the OFF position.

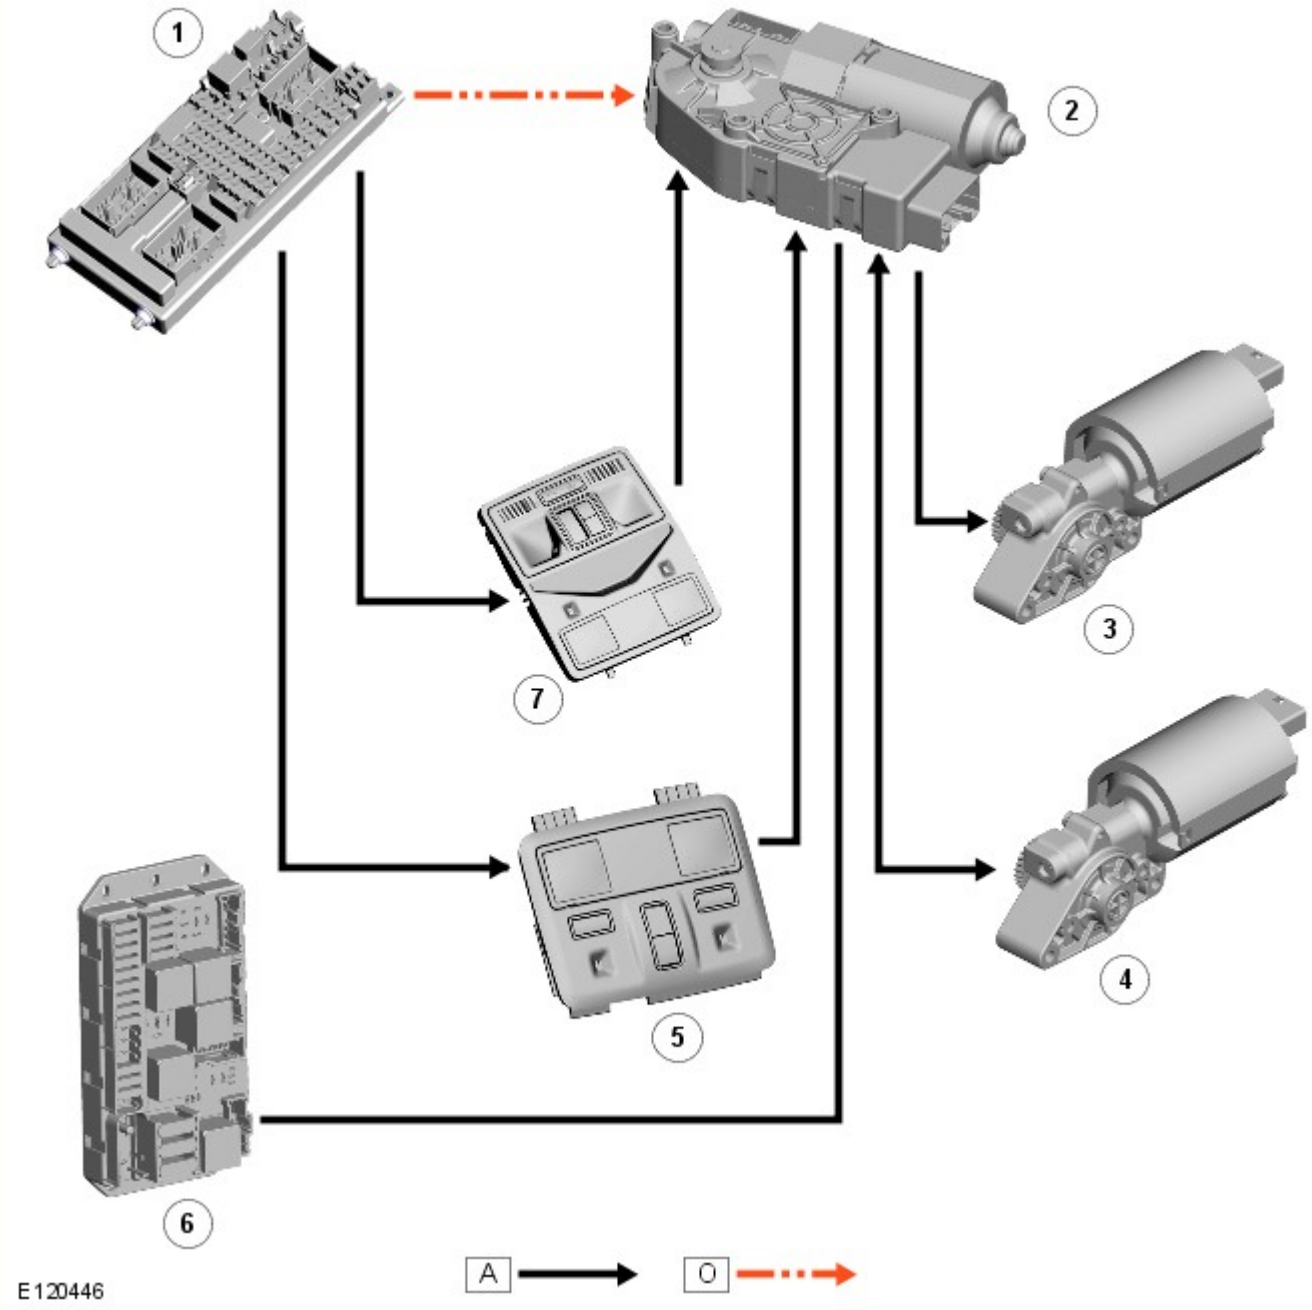
Roof Opening Panel - Roof Opening Panel - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: A = Hardwired; O = LIN Bus

Roof Opening Panel - Control Diagram



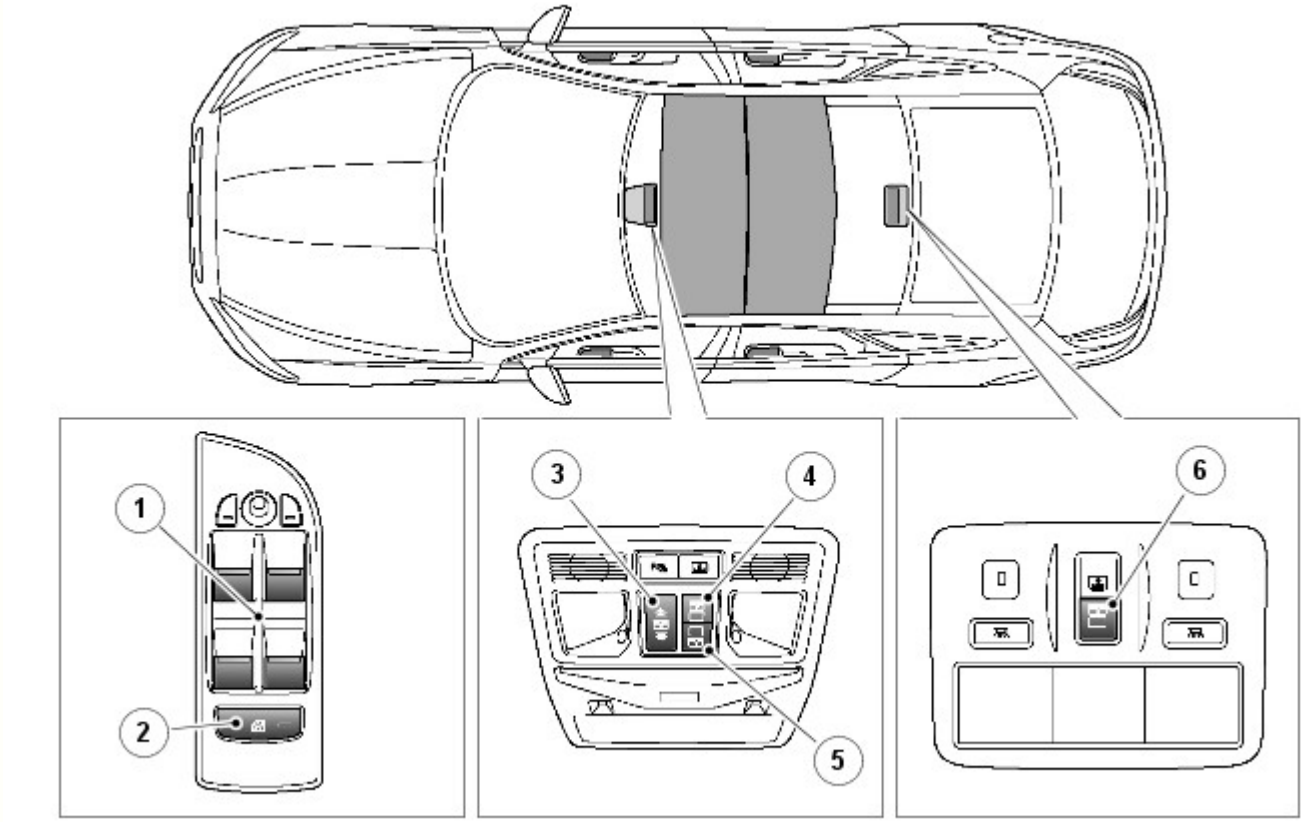
Item	Description
1	CJB (central junction box)
2	Sliding glass panel - motor and module
3	Roller blind motor
4	Roller blind motor
5	Rear overhead console
6	RJB (rear junction box)
7	Front overhead console

System Operation

Roof Opening Panel Operation

The sliding glass panel and roller blinds are controlled by the switch pack in the front overhead console. The rear roller blind can also be controlled by a button in the rear overhead console. The rear overhead switch function can be isolated by isolating the rear electric windows on the drivers window switch pack.

Roof Opening Panel



E128731

Item	Description
1	Window switch pack - driver door
2	Isolator switch - rear windows and roof panel rear-blind
3	Switch - roof sliding glass panel
4	Switch - roof panel rear-blind
5	Switch - roof panel front-blind
6	Switch - roof panel rear-blind

A rocker switch in the front overhead console controls the opening and closing of the sliding glass panel with a one-touch function in the direction required:

- Press (3) once to tilt the panel.
- Once tilted, press (3) again to open the panel.
- Press (3) to close the panel from tilt.
- From the fully open position, press (3) once to close to the tilt position, then press again to close fully.
- Sliding glass panel movement can be halted at any time by pressing the button (3) again.

Anti-trap mechanism

If the roof panel encounters resistance when closing it will stop, and then open a set distance in the opposite direction. This is to prevent serious injury or damage to the mechanism. The anti-trap mechanism can be overridden to allow the roof to be closed when movement is restricted by dirt. To override the anti-trap mechanism, press and hold the front of the switch until the roof reaches the closed position.

Roof Blinds

CAUTION: To prevent damage to the roof blind mechanism the blinds must not be operated manually.

Front blind

One push of the button (5) will fully open or close the blind. The blind is either fully open or closed and cannot be halted part way.

The front blind opens automatically as the roof panel is opened, preventing wind affecting the blind. The blind cannot be closed when the roof is open.

Rear blind

One push of the buttons (4) or (6) will fully open or close the blind. The blind is either fully open or closed and cannot be halted part way.

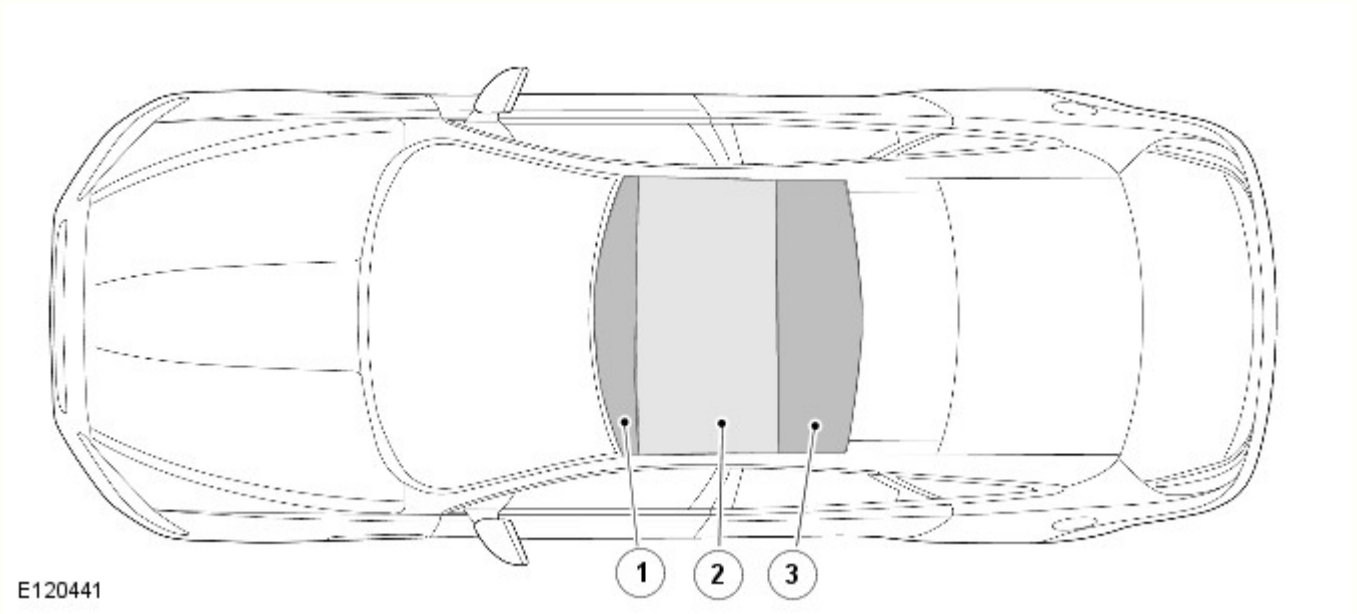
Pressing the dual purpose isolator switch (2) in the driver's door switch pack (1) will inhibit the rear passenger's operating the rear windows and roof panel rear-blind.

NOTE: Global open/close functionality is not enabled on the roof module.

Component Description

The front half of the roof opening panel components are common for both long and short wheelbase vehicles, although the frames are unique to each type of vehicle. The steel frame forms a structural contribution to the vehicle body, helping maintain the rigidity of the shell even with the majority of the aluminum roof removed.

Glass Panels



Glass panels

Item	Description
1	Fixed front glass panel
2	Sliding glass panel
3	Fixed rear glass panel

The glass section of the roof begins at the top edge of the windscreen and extends back to a line mid-way between the 'B' and 'C' pillars. The external surface of the roof opening panel comprises the following three glass elements:

- Fixed front glass panel (5mm thick)
- Sliding glass panel (4mm thick)
- Fixed rear glass panel (4mm thick)

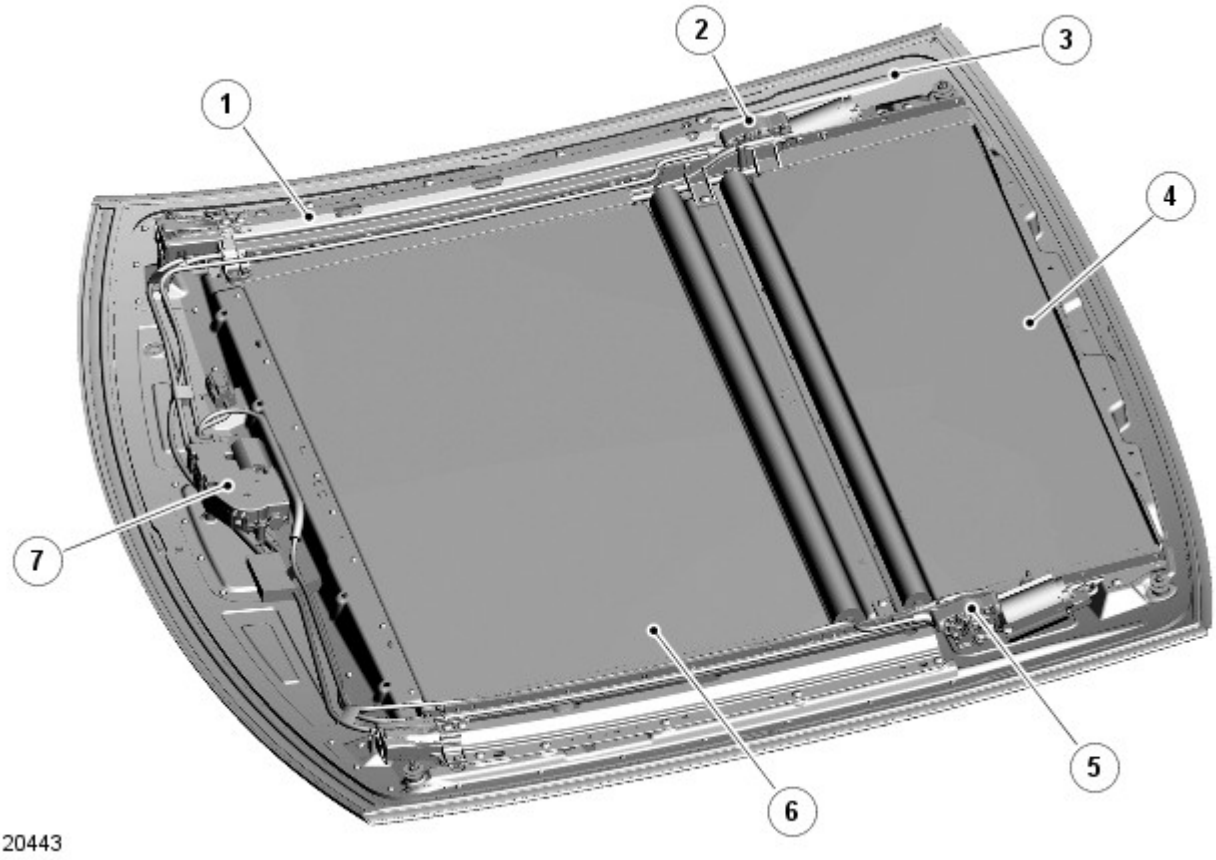
All three panels are manufactured in a tinted toughened glass with a Protec safety film bonded onto the lower surface to prevent shards of glass entering the vehicle cabin in the event of a breakage.

The tinted glass provides a high degree of solar protection allowing only 8.2 percent heat transmission into the vehicle. The fixed front panel fills the space between the windscreen and the sliding center panel. The fixed rear panel above the rear passenger compartment sits between the rear of the sliding panel and the rear section of the aluminum roof.

A wider rear glass panel accommodates the 125mm difference in roof length between standard and long wheelbase vehicles.

The sliding glass panel features an electrically powered tilt and slide mechanism. On opening, the rear of the panel tilts upwards before moving rearwards above the fixed glass panel. As the sliding panel opens a wind deflector rises automatically across the leading edge of the aperture. The deflector manufactured from a mesh type material is used to reduce wind-noise.

Roof Opening Panel Components - Interior View



Roof Components - Interior View

Item	Description
1	Perimeter frame
2	Roller blind motor
3	Roller blind guide rails and drive assembly
4	Rear blind
5	Roller blind motor
6	Front blind
7	Sliding glass panel motor and control module

The roof opening panel assembly features electrically powered front and rear roller blinds that can be independently operated. Guided by side rails, each blind rolls to-and-from the center of the roof opening panel with the:

- front blind closing forwards, and the
- rear blind closing rearwards.

Control Module and Motor

The opening and closing function of the sliding glass panel and roller-blinds are controlled by the roof module which is integral with the sliding glass panel motor. The module receives a permanent battery power supply from the RJB .

To open or close the sliding glass panel and blinds the module receives hardwired 'open/close' inputs from the switches located in the front and rear overhead console panels.

The control module has a non-volatile memory, if battery power to the module is lost the sliding roof panel and blind positions are retained and the one-touch feature does not require re-initializing. However due to the software condition if the battery power to the control module is interrupted when the ignition is switched on, the one-touch feature must be re-initialized.

Once the power supply is restored, reset the roof mechanism as follows:

1. Switch the ignition on.
2. Fully close the roof.

3. Press the front of the roof switch, and hold for 45 seconds.
4. NOTE: The roof blinds do not close on completion of the one touch setup sequence.

   After 45 seconds the roof will begin to move. Keep the front of the switch pressed until the roof and the roof blinds have fully opened, then the roof panel is fully closed.
5. Once the open/close cycle has completed and the roof has stopped moving, release the switch.
6. The roof can now be operated as normal.

The motor that operates the sliding glass panel uses a drive gear which engages and drives two cables within a sleeved tube. Each cable is linked to the sliding glass panel's open and close mechanism located either side of the panel. The rotation of the motor drives the cables in the required direction. Signals from a Hall effect sensor located in the motor enables the control module to calculate the exact position and operating speed of the glass sliding panel.

The Hall effect sensor is also an operational component of the anti-trap function. The control module uses the operating speed of the sliding glass panel and the current draw of the motor to detect an obstruction. If the sliding glass panel closing speed decreases below a set threshold and the current draw from the motor increases the power feed to the motor is reversed. This will then open the sliding glass panel a set distance in the opposite direction of travel. In an emergency the anti-trap function can be overridden by holding the operating switch in the close position.

Depending on vehicle speed the closing threshold of the anti-trap function is adjusted to counteract the force of air pressure acting upon the sliding roof panel. Vehicle speed signal is transmitted from the ABS module via the high-speed CAN bus to the CJB where the signal is processed and transmitted over a LIN bus connection to the roof module. As vehicle speed increases, air pressure forces acting upon the sliding panel simultaneously increase, affecting the anti-trap functionality. The vehicle speed signal is used by the control module to re-calibrate the anti-trap algorithm, accounting for the extra force acting on the sliding panel. This function adapts the sliding panel closing speed threshold of the anti-trap function, dependant on vehicle speed.

Both the sliding glass panel and front blind motors have a thermal protection device built into the control module software to protect them from overheating. The operating parameters are as follows:

- If the motor temperature is between 60 and 77 degrees C the roof operation is restricted to a close only function.
- If the motor temperature exceeds 77 degrees C during the closing function the movement will not be interrupted.
- If the motor temperature exceeds 77 degrees C when the roof is closed movement will be inhibited.
- If the anti-trap function is operational when closing, the reverse movement of the motor will complete its movement regardless of motor temperature.

Thermal protection for the sliding glass panel motor and front blind motor are functioned in unison, therefore if one motor exceeds 60 or 77 degrees C the same restrictions, as defined above, will apply to both motors. For example if the front blind cannot be opened due to thermal protection the sliding glass panel will also ignore the opening command.

Roof Sheet Metal Repairs - Roof Panel

Removal and Installation

Removal

1. The roof panel is a category A repair.

2. NOTE: The roof panel is manufactured from aluminium alloy 6111-T4.

The roof panel is serviced as a separate riveted and bonded panel.

3. The roof panel is replaced in conjunction with:

NOTE: The headliner is released and lowered only and not removed from the vehicle.

- Headliner
- Roof opening panel frame
- Rear window glass

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove the roof opening panel frame.
For additional information, refer to: Roof Opening Panel Frame (501-17 Roof Opening Panel, Removal and Installation).

7. Remove the rear window glass.
For additional information, refer to: Rear Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

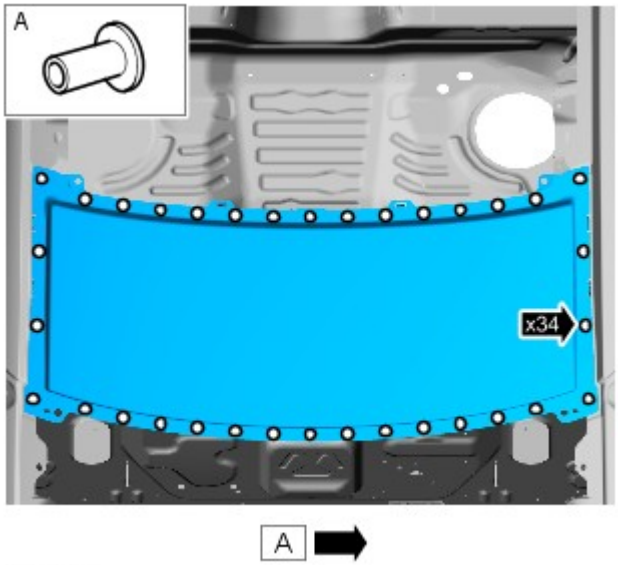
8. Remove the right-hand and left-hand side air curtain module(s).
For additional information, refer to: Side Air Curtain Module (501-20B Supplemental Restraint System, Removal and Installation).

9. Remove the right-hand and left-hand roof mouldings.

10.

Remove any electrical components in the local area of repair to prevent damage.

11. Release and position the roof panel wiring harness to one side.



12. NOTE: Prior to removal, mark the position of the roof panel within its aperture for ease of alignment on installation.

Using the ESN50, remove the self piercing rivets.

13. Separate the joints and remove the old panel.

Installation

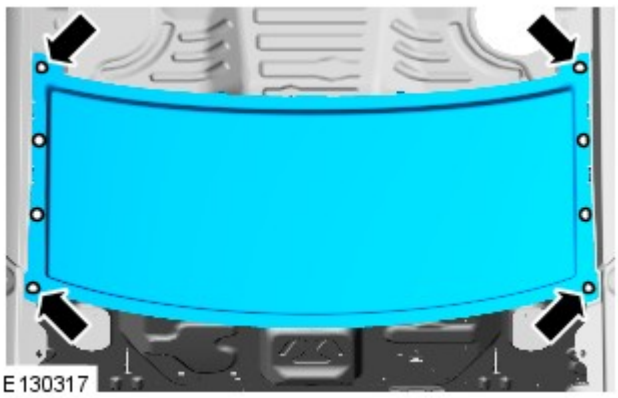
1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, removing any adhesive residue.

4. NOTE: Use the marks made prior to removal to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



5. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed.

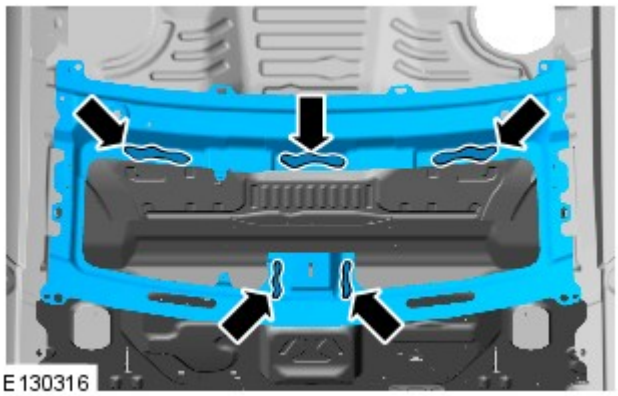
6. Remove the new panel.

7. Deburr the drilled holes.

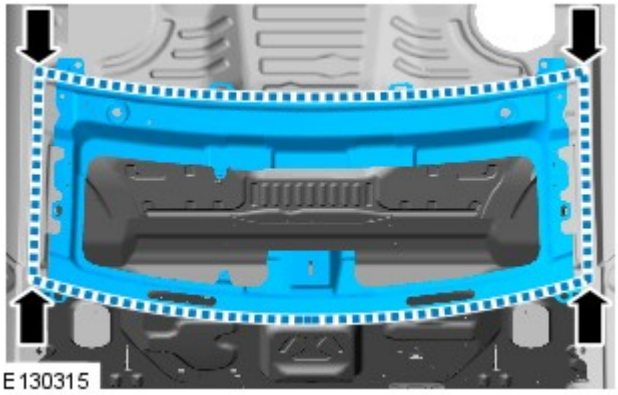
8. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

9. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

10. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.



11. Apply semi-rigid sealer to the body at the points indicated.

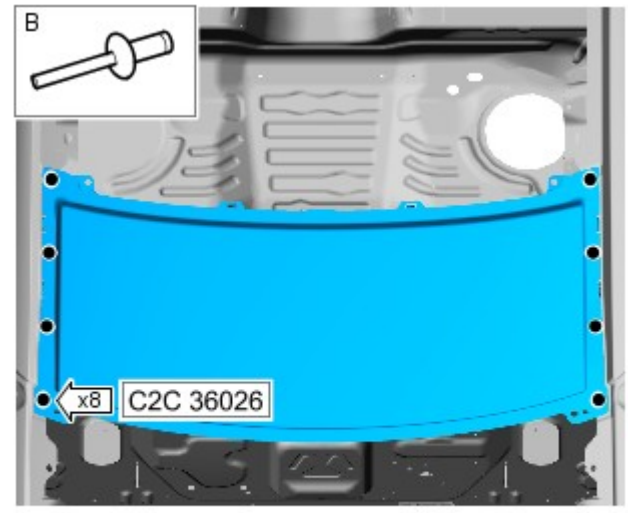


12. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

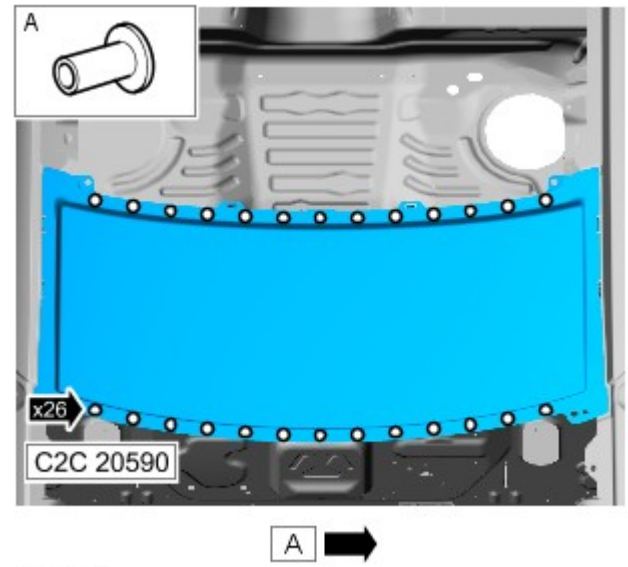
Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

13. Offer up the new panel, align and clamp into position.

14. Using the Genesis G4, install the Hemloks.



E130318



E130319

15. Using the ESN50, install the self piercing rivets.

16. Remove any excess adhesive.

17. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

18. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Glass, Frames and Mechanisms - Rear Window Glass

Removal and Installation

Removal

CAUTIONS:

Always protect paintwork and glass when removing exterior components.

Always protect the interior components when removing body glass.

Lay the glass on felt covered supports. Do not stand on edge as this can cause chips which subsequently develop into cracks.

NOTES:

The following equipment is required: l Cutting wire and handles l Kent knife l Glazing knife l Windshield replacement kit l Sealant applicator gun l Suction cups l A felt covered table or stand to support glass

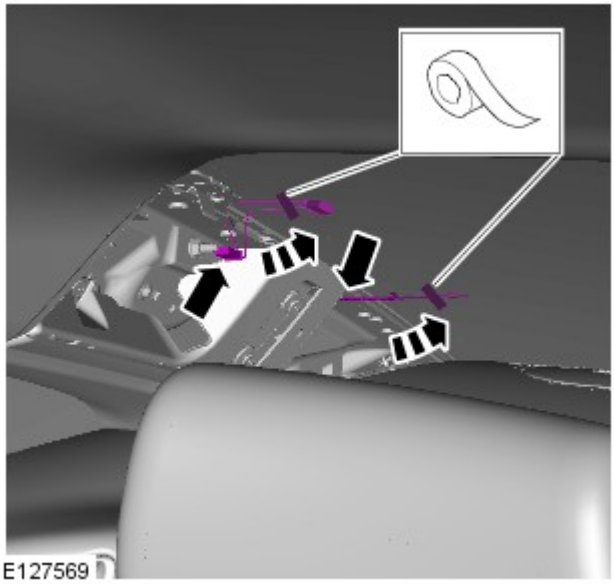
Removal steps in this procedure may contain installation details.

1. NOTE: The procedure must be carried out on both sides.

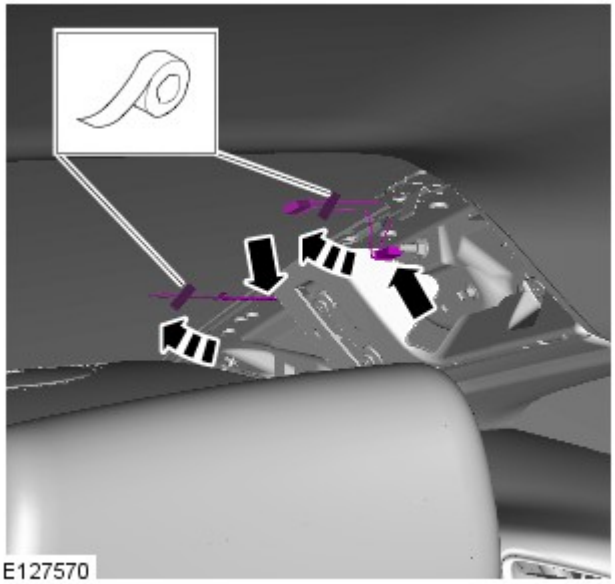
   Refer to: C-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.
   - Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

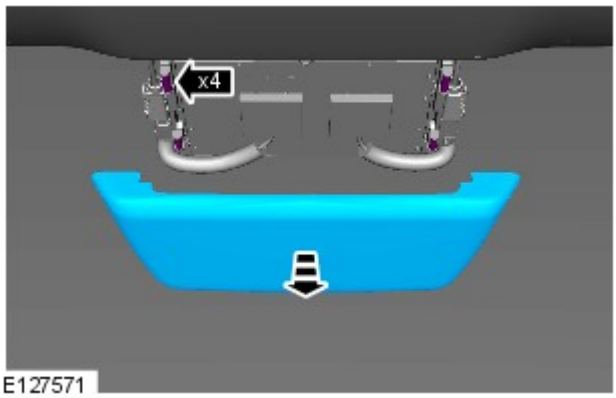
3.



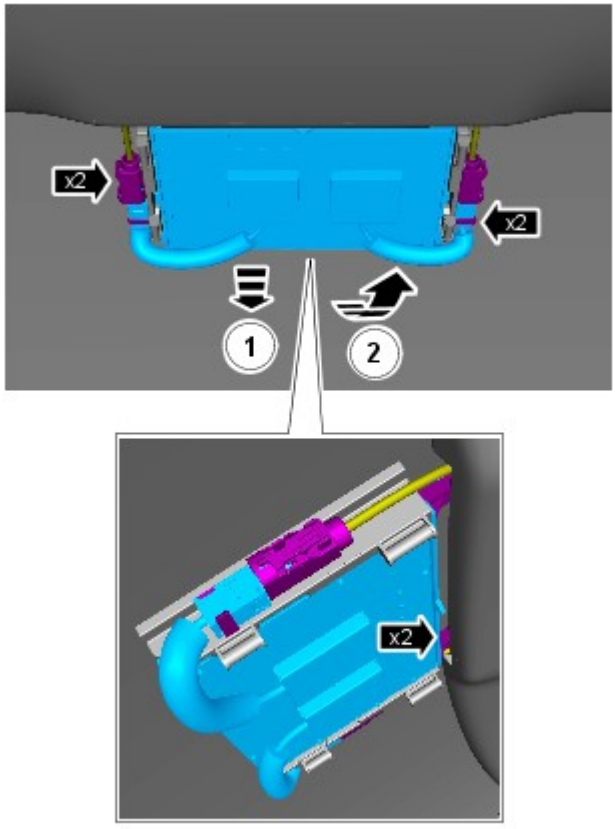
4.



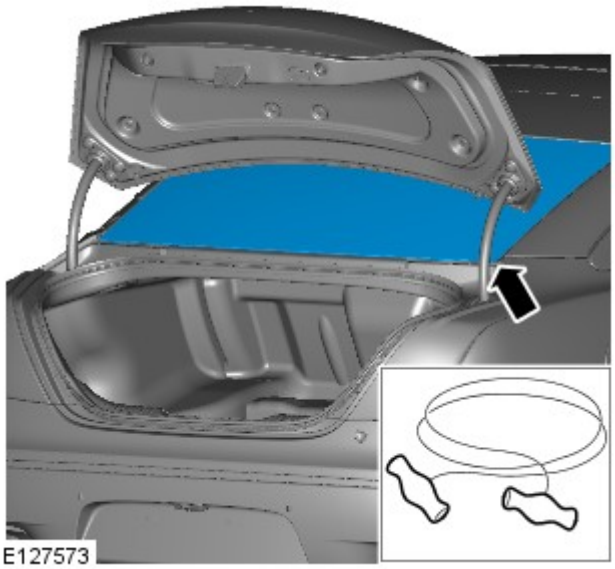
5.



6.



E127572

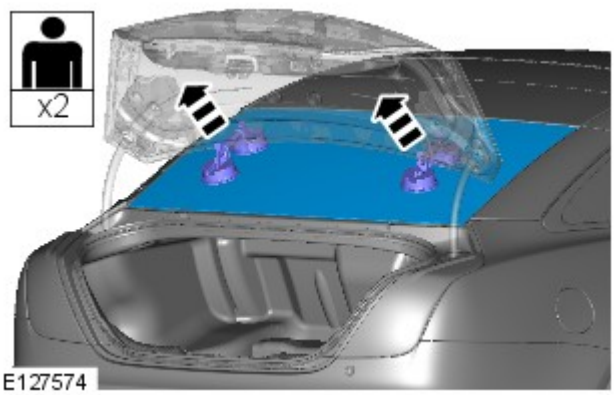


E127573

7. CAUTIONS:

Protect the surrounding components.

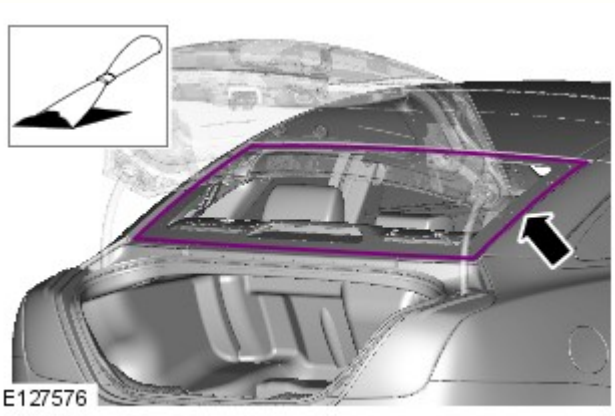
Protect the surrounding paintwork to avoid damage.



E127574

8. WARNING: This step requires the aid of another technician.

Installation

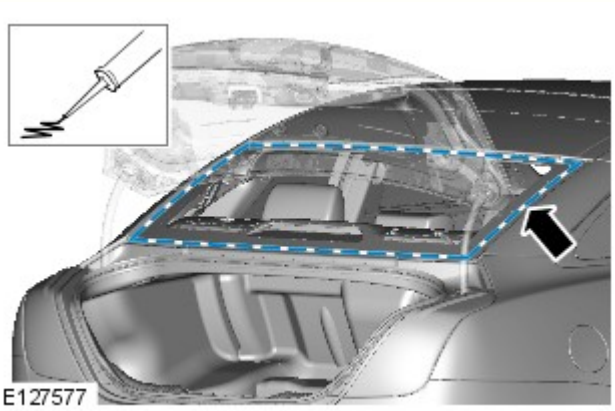


1. CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

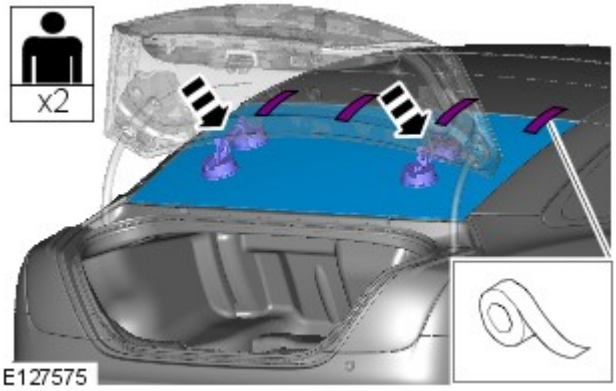
Correct preparation of body apertures "post painting" to ensure satisfactory glass adhesion, must be carried out in line with industry practise.

- Prepare the window glass, window glass flange and trimmed PU adhesive in accordance with the instructions included with the PU adhesive kit.



2. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.



3. WARNING: This step requires the aid of another technician.

CAUTIONS:

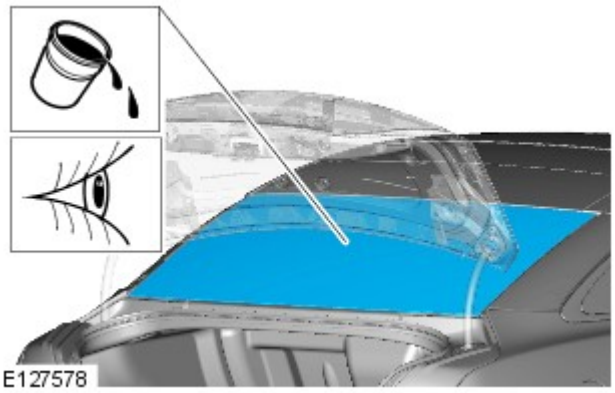
Make sure that the component is correctly located on the locating dowels.

Make sure that equal pressure is applied to the full length of the component.

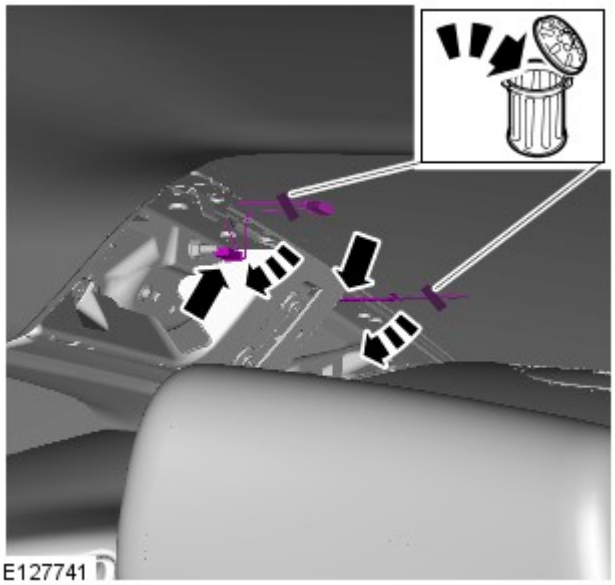
- With assistance, install and align the windshield glass.
- If the ambient temperature falls below 10 degrees C, apply warm air (25 degrees C) continuously for 15 minutes.

4. CAUTION: Make sure that no excess sealant residue is evident.

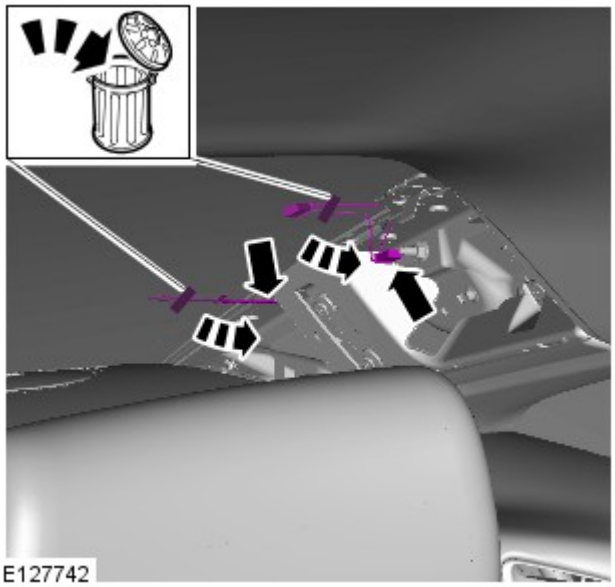
- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.



5.



6.



7.

Battery, Mounting and Cables - Battery Disconnect and Connect

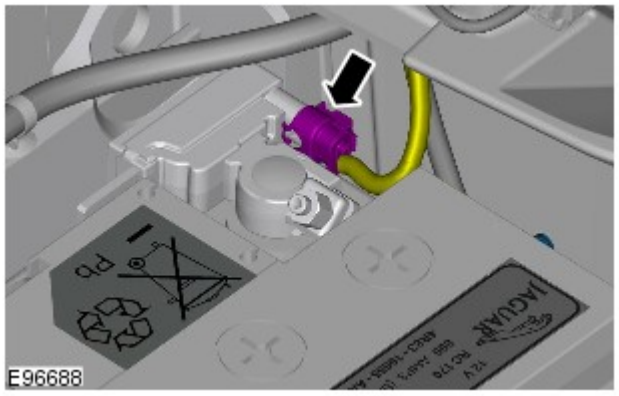
General Procedures

Disconnect

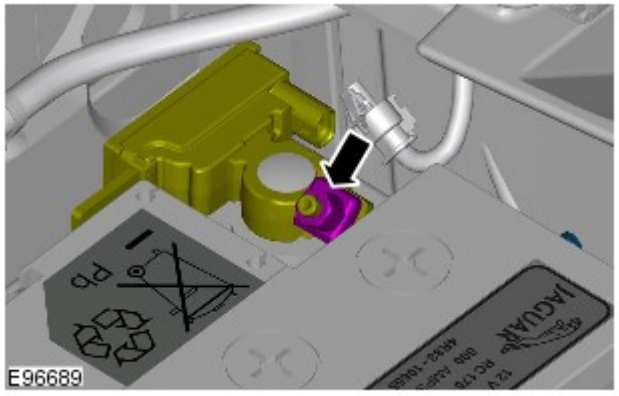
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

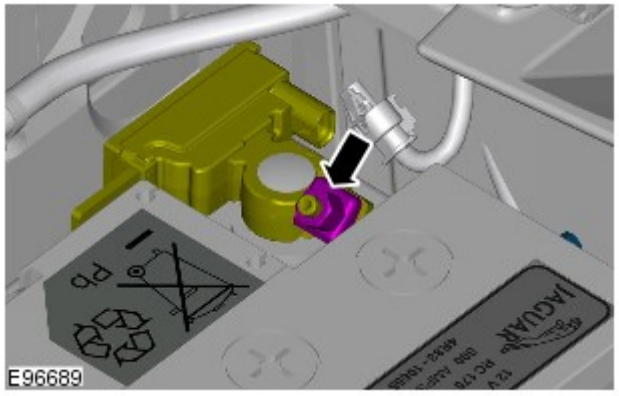


4. CAUTION: Take extra care not to damage the wiring harness.

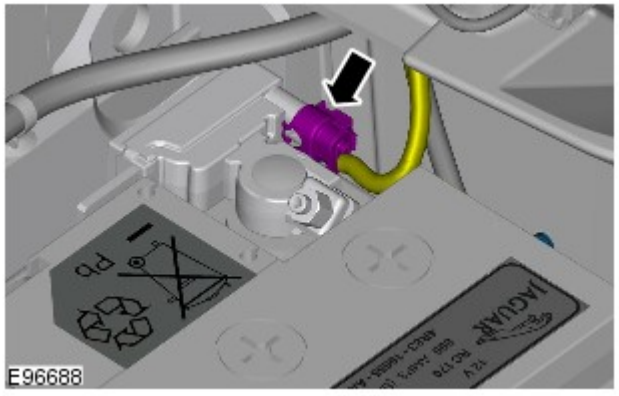


5.

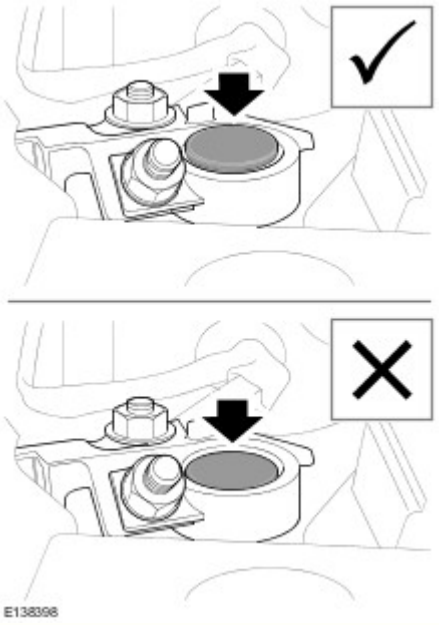
Connect



1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing

technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel

- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual

- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A

- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During	Yes - **caution** material sensitive to heat.	Yes - **must** be heated to maintain original alloy properties. Ideal

Repair	Range: 140 - 160°C Ideal panel temperature: **150°C**	panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

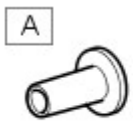
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

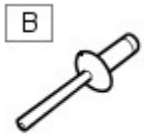
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

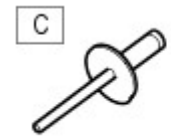
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

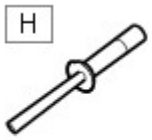
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

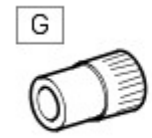
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

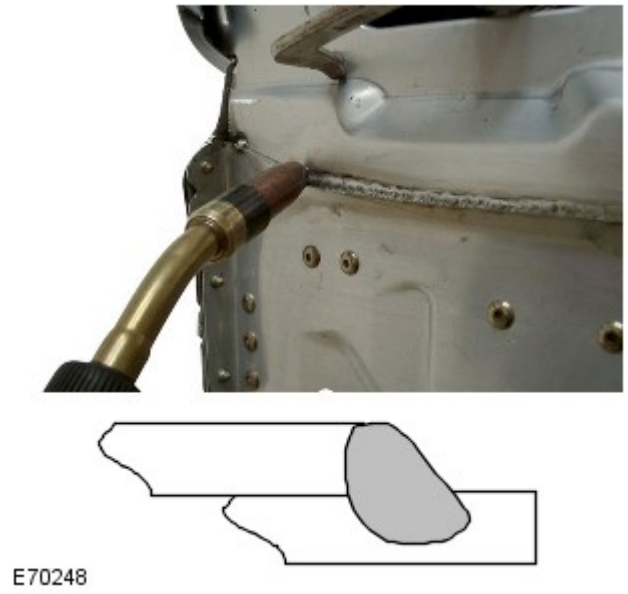
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

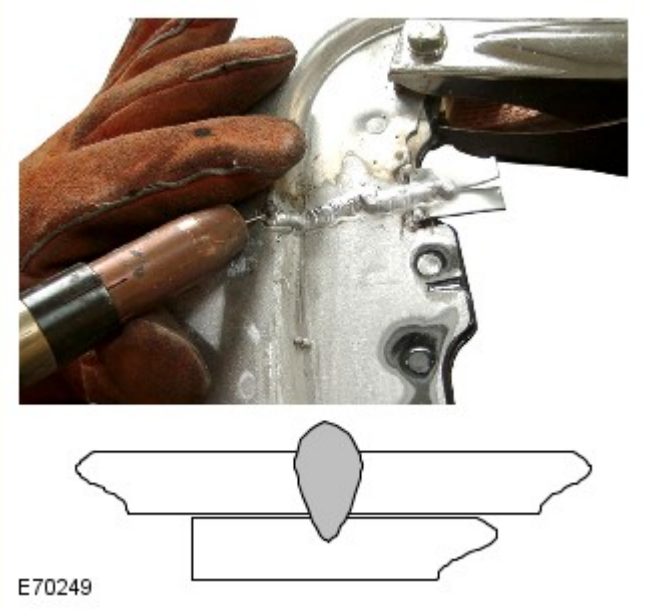
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

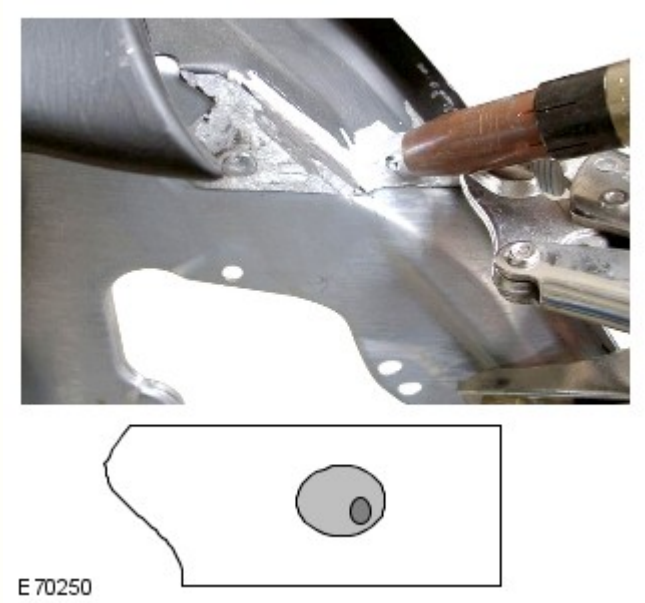
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Roof Opening Panel - Roof Opening Panel Frame

Removal and Installation

Removal

CAUTIONS:

Always protect the interior components when removing body glass.

Protect the surrounding paintwork to avoid damage.

Measure all gaps between the glass roof panels before prior to removal to help aid installation.

NOTES:

The cutting blades used in this procedure are from the standard BTB glass removal kit.

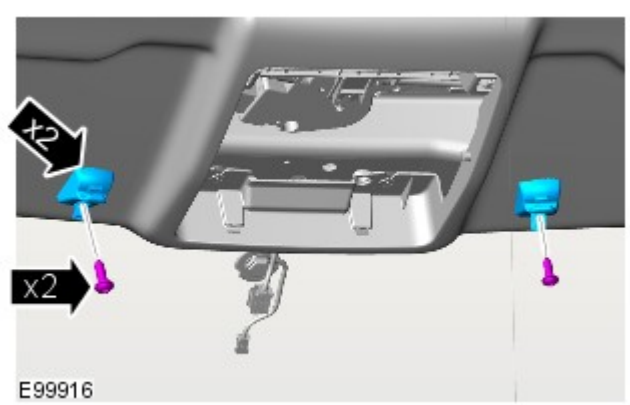
In addition to the standard BTB glass removal kit, cutting blades WK29L and WK30L will be required.

1. NOTE: The procedure must be carried out on both sides.

   Refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2. NOTE: The procedure must be carried out on both sides.

   Refer to: Sun Visor (501-05 Interior Trim and Ornamentation, Removal and Installation).

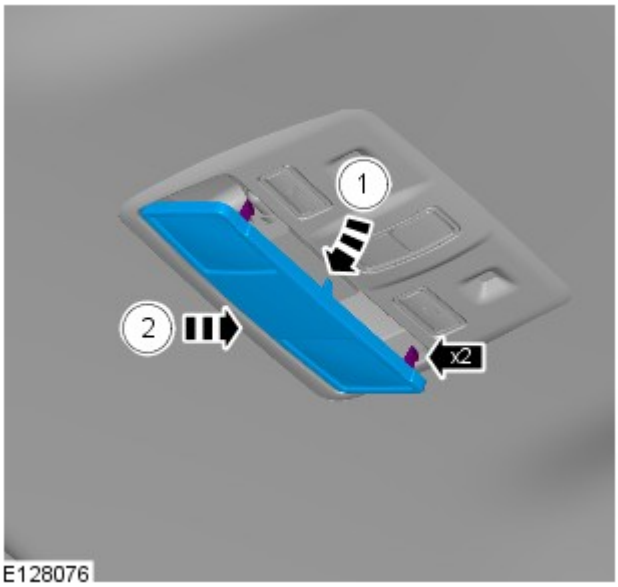


3. *Torque:* 2 Nm

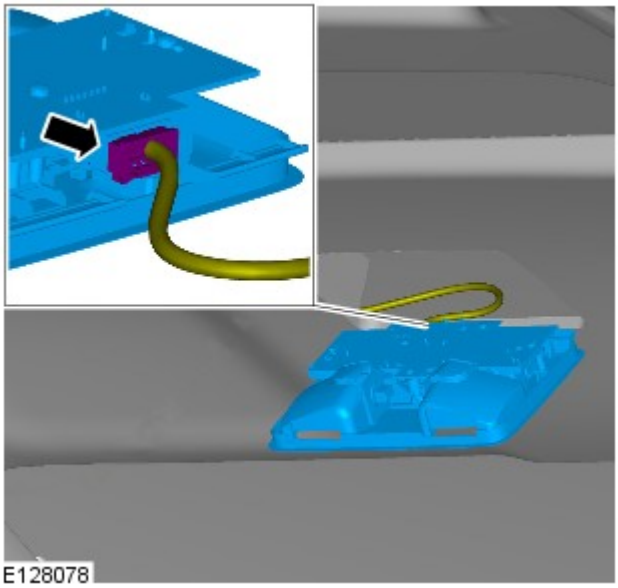
4. NOTE: The procedure must be carried out on both sides.

   Refer to: C-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

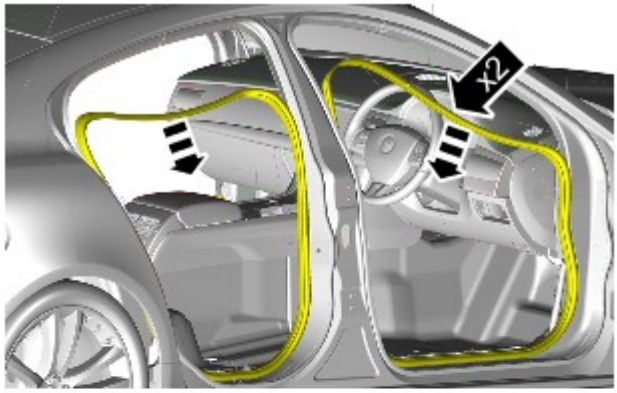
5.



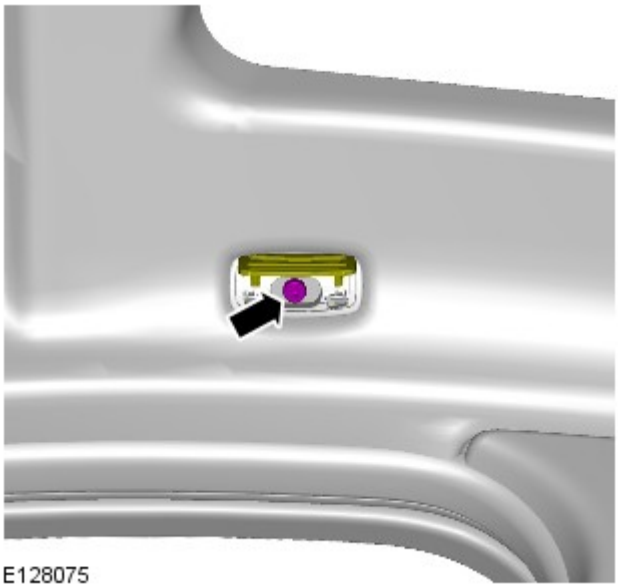
6.



7.



E100343



E128075

8. CAUTION: Note the fitted position of the component prior to removal.

NOTES:

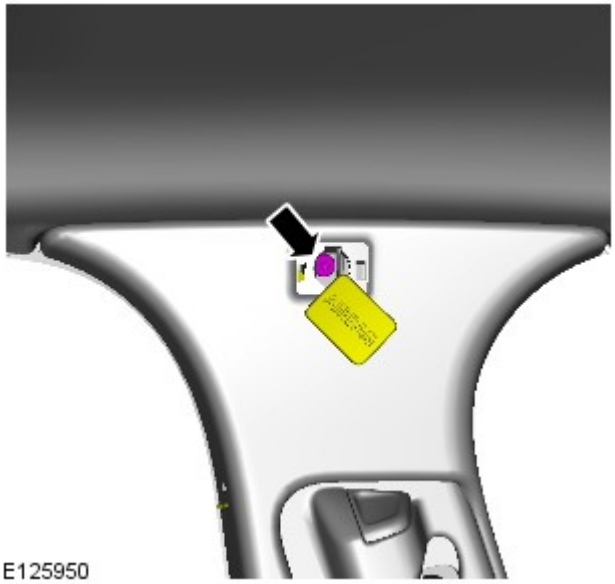
Right-hand shown, left-hand similar.

The procedure must be carried out on both sides.

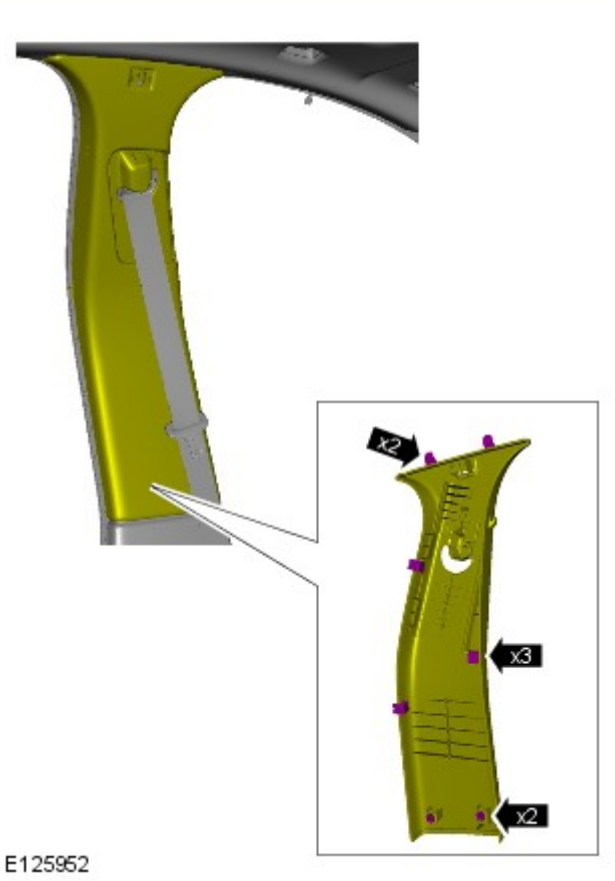
Torque: 2 Nm

9. NOTE: The procedure must be carried out on both sides.

Torque: 6 Nm



10. NOTE: The procedure must be carried out on both sides.



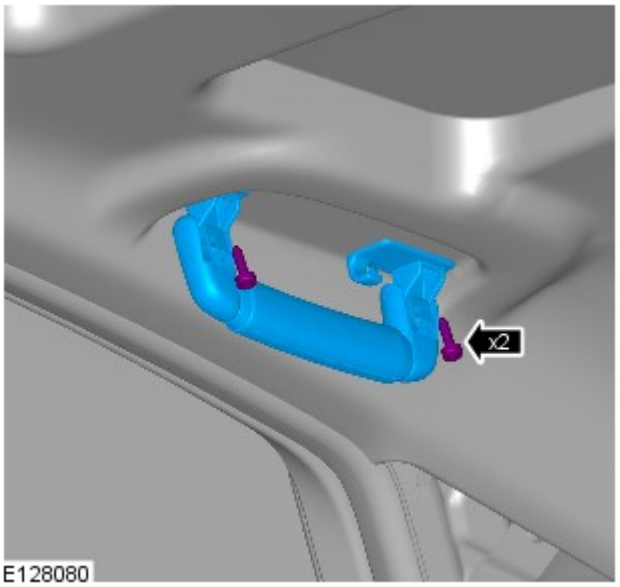
11. CAUTION: Note the fitted position of the component prior to removal.

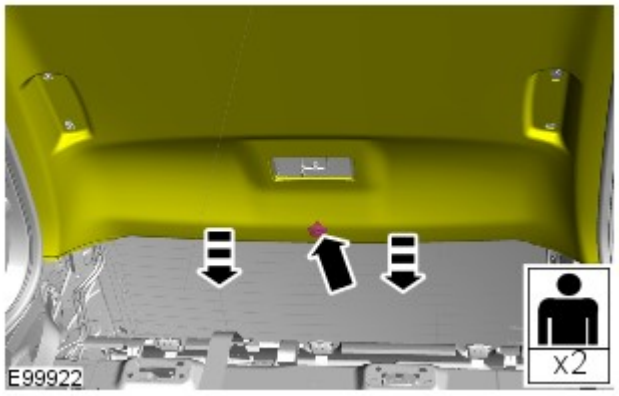
NOTES:

Right-hand shown, left-hand similar.

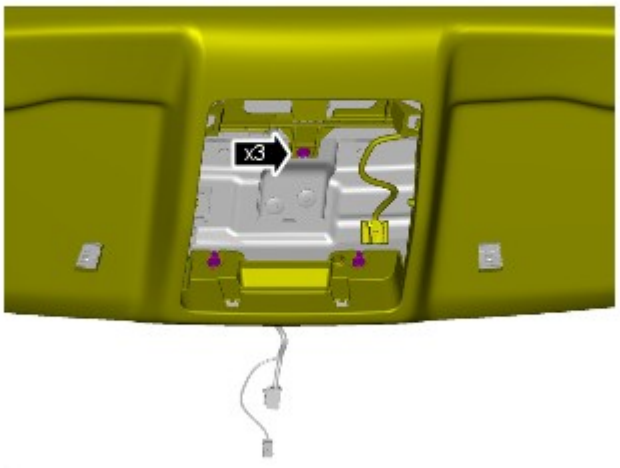
The procedure must be carried out on both sides.

Torque: 2 Nm





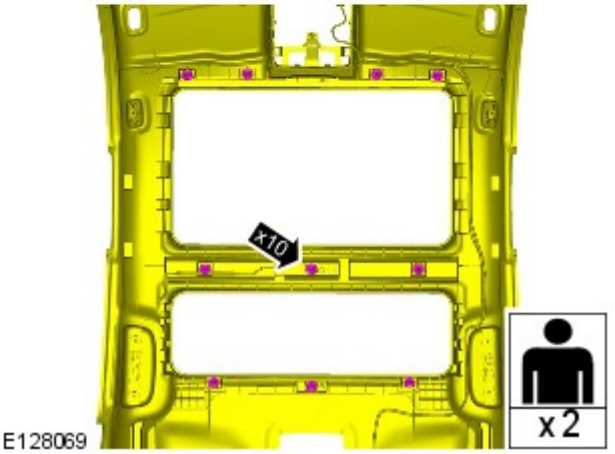
12. WARNING: This step requires the aid of another technician.

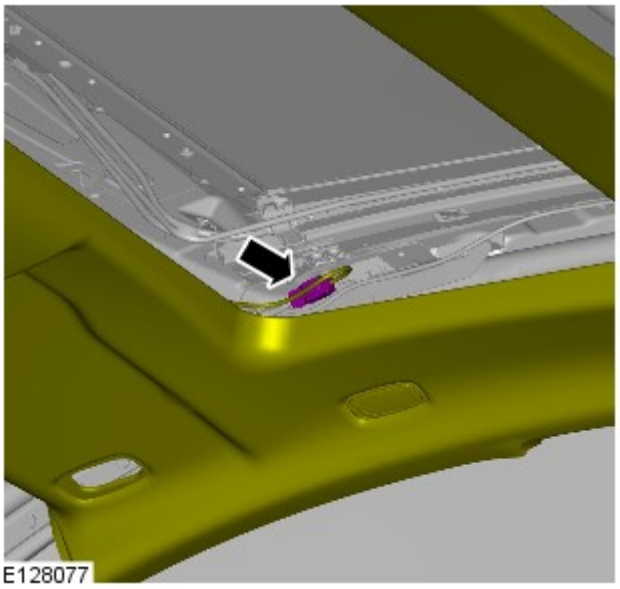


13. WARNING: This step requires the aid of another technician.

CAUTION: Note the fitted position of the component prior to removal.

14. NOTE: This step requires the aid of another technician.

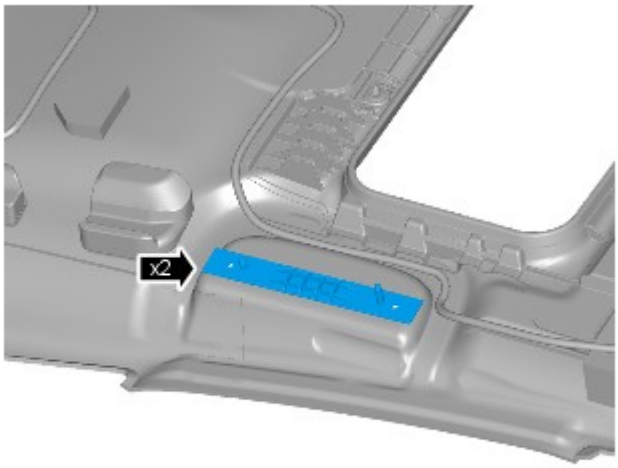




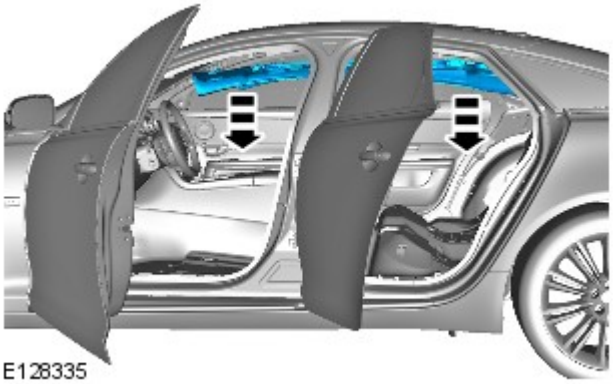
15. NOTE: This step requires the aid of another technician.

16. CAUTION: Note the fitted position of the component prior to removal.

NOTE: Right-hand shown, left-hand similar.



E128068



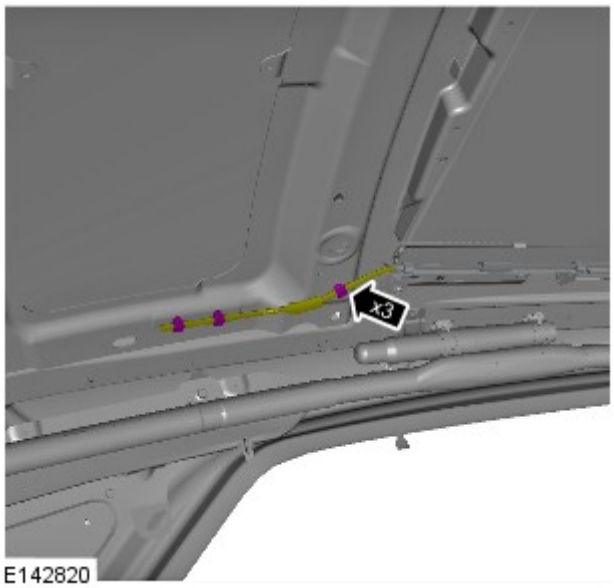
E128335

17. CAUTION: Protect the surrounding trim to avoid damage.

NOTE: Lower and reposition the headliner to aid access.

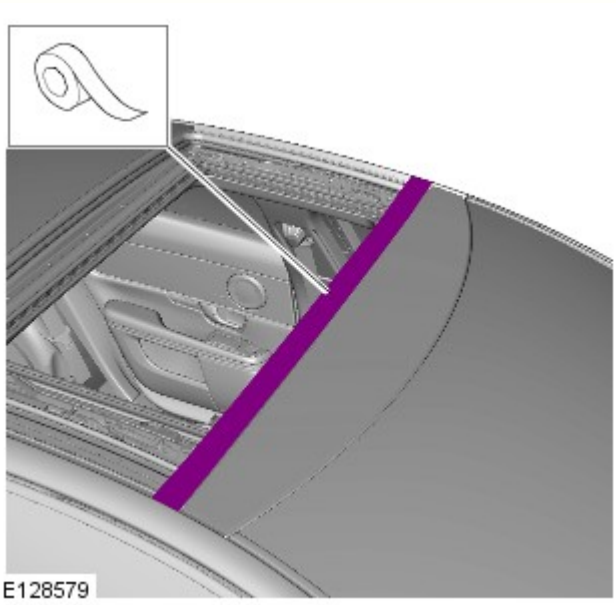
18. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

19. Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

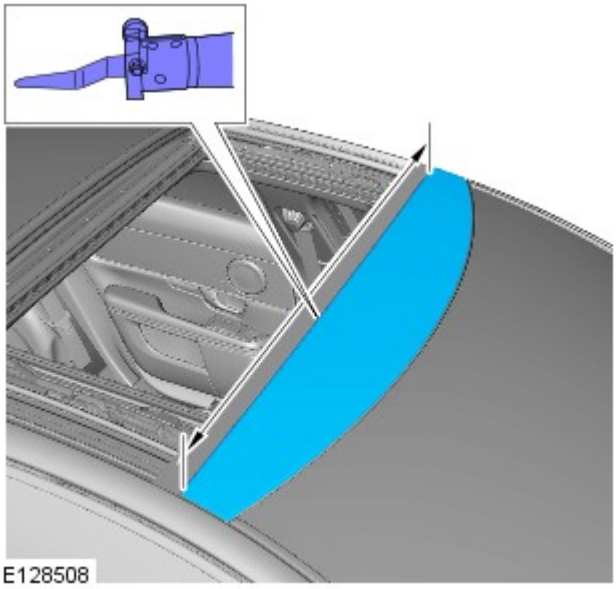


E142820

20. NOTE: The procedure must be carried out on both sides.

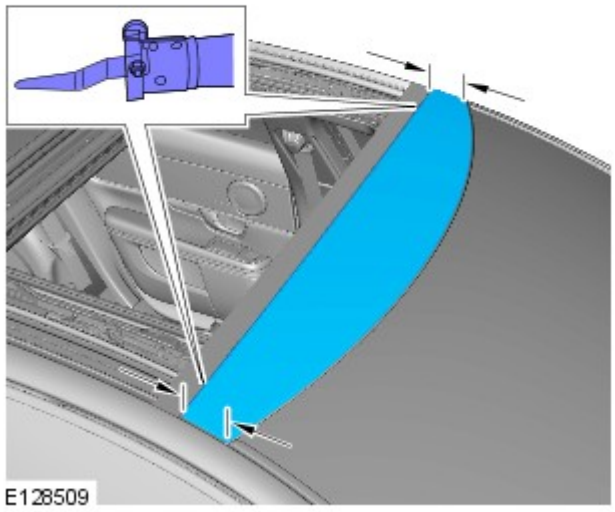


21. CAUTION: Use suitable tape to protect the roof opening panel weather strip.



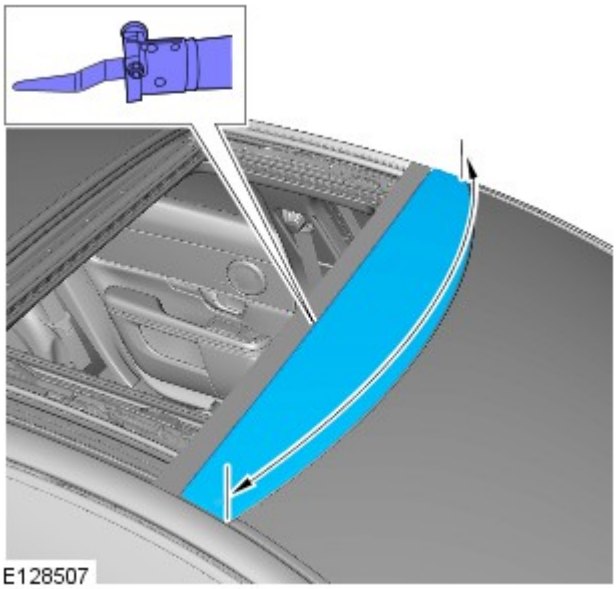
22. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

- Use a WK24ZS blade, cutting with the flat side against the body.



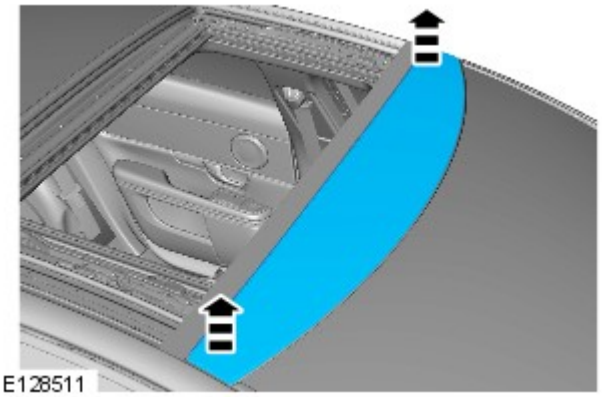
23. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, set to 75 mm to control the cutting depth.

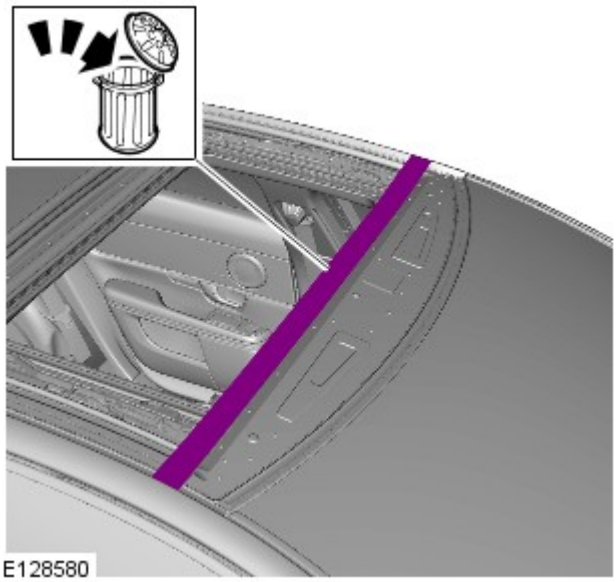


24. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use a WK2S blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, the depth of the cut will vary from 75 mm to 160 mm as the glass widens towards the centre.

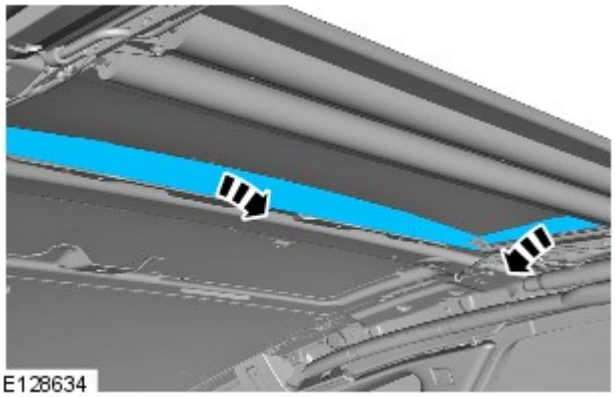


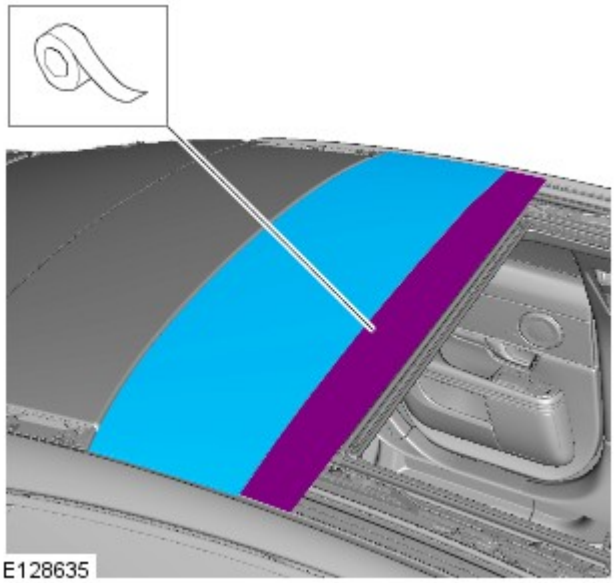
25.



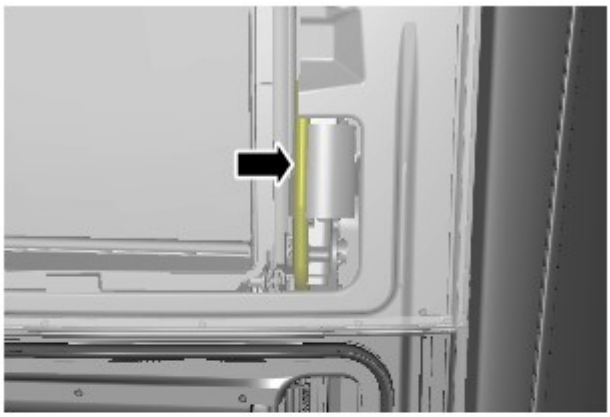
26. NOTE: Remove the tape.

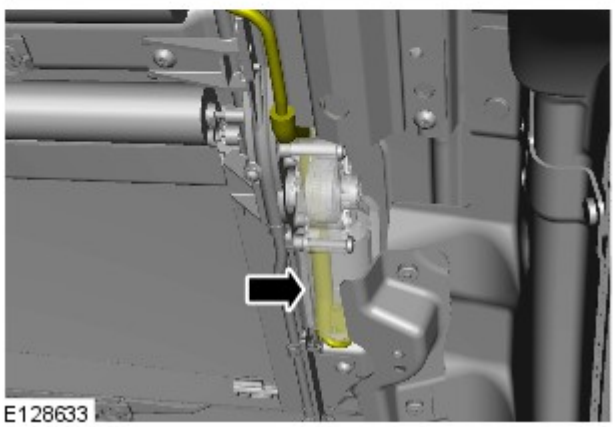
27.





28. CAUTION: Use suitable tape to protect the roof opening panel weather strip.

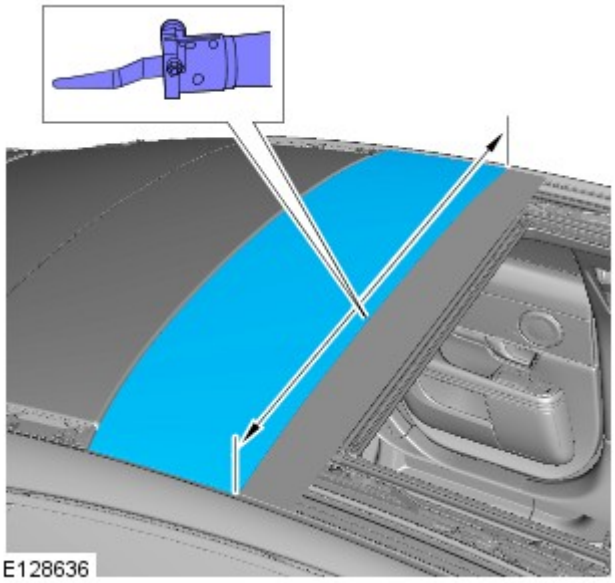




29. CAUTIONS:

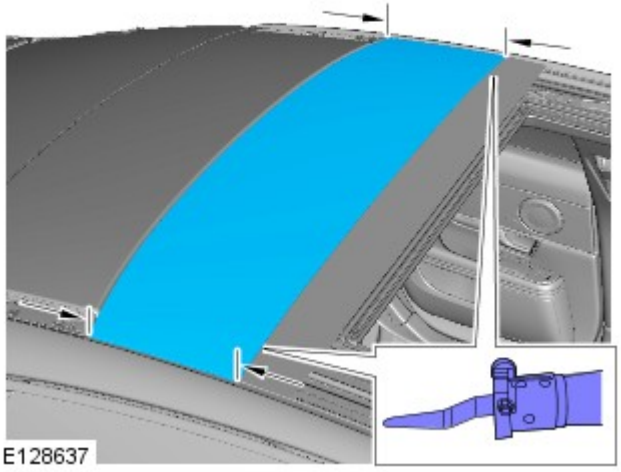
Use suitable tape to protect the roof opening panel blind motor wiring harness.

Use suitable tape to protect the bodywork around the roof aperture.



30. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

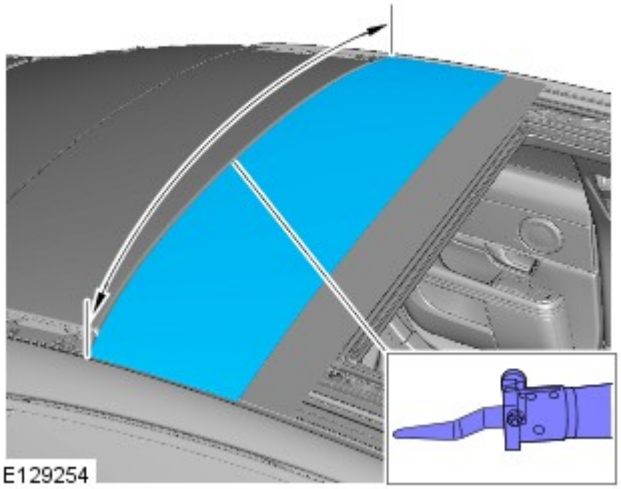
Use a WK2S blade, cutting with the flat side against the body.



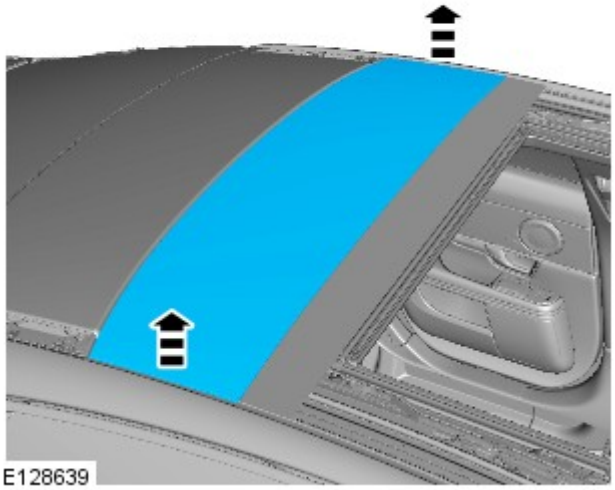
31. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.

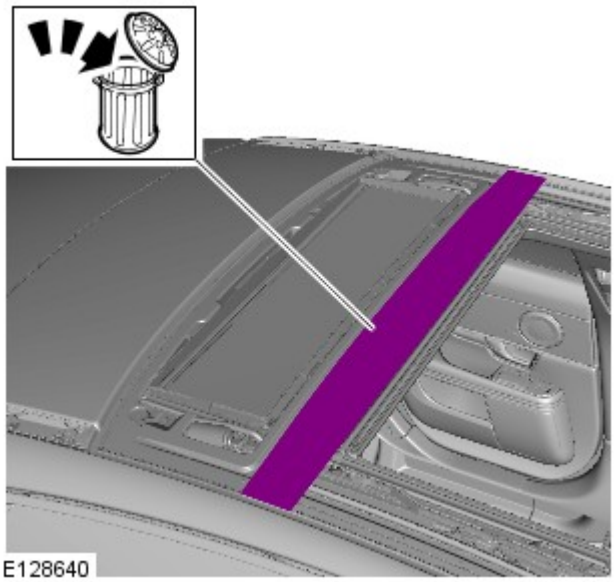
32. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



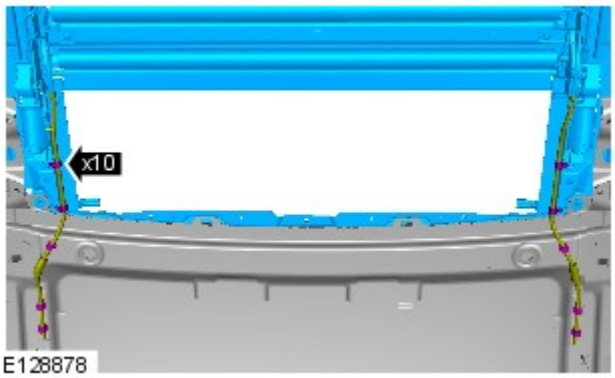
33.



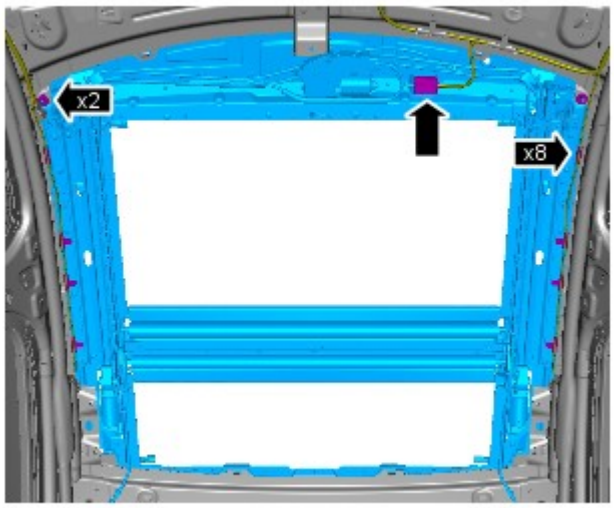
34. NOTE: Remove the tape.



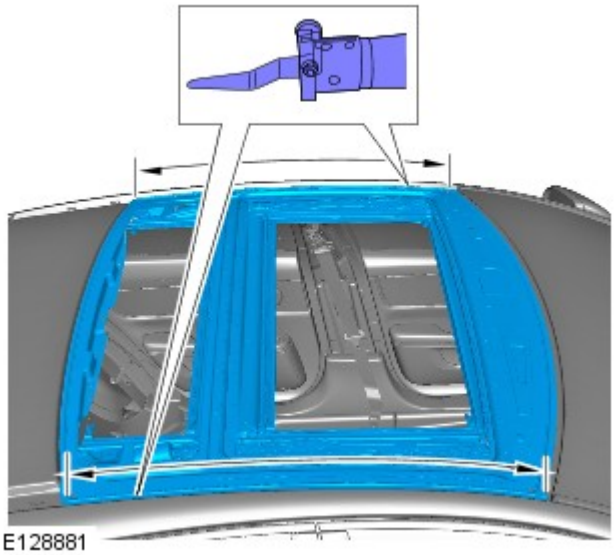
35.



36. CAUTION: Take extra care not to damage the wiring harnesses.

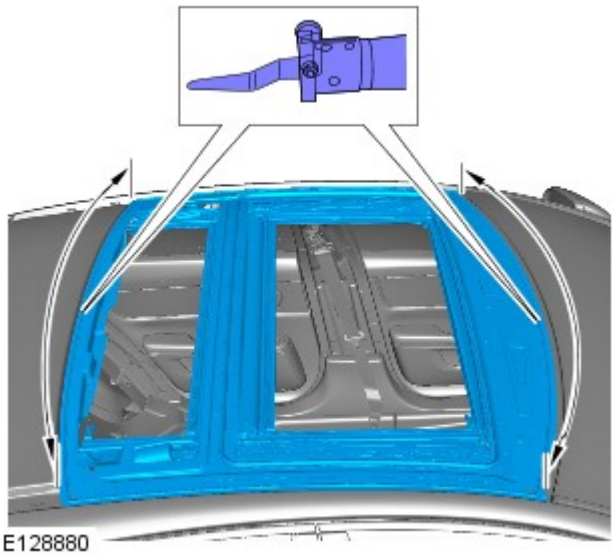


E129217



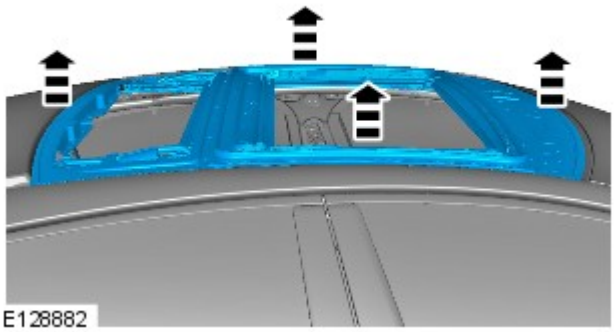
E128881

37. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



E128880

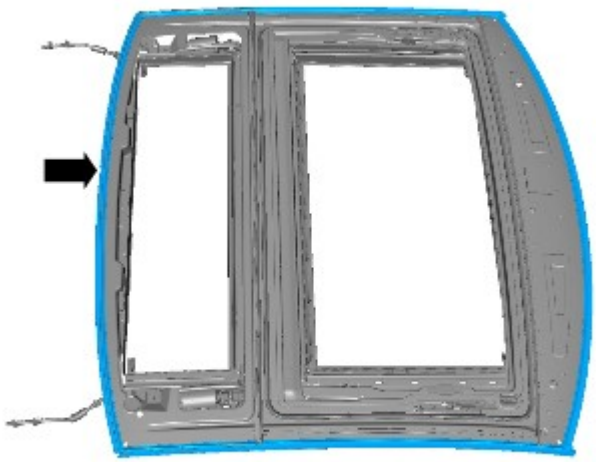
38. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



E128882

39. NOTE: This step requires the aid of another technician.

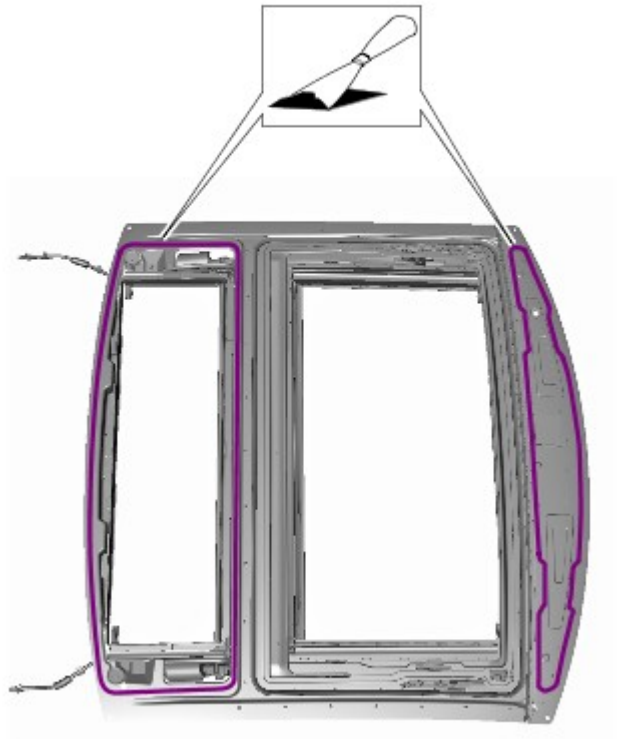
40.



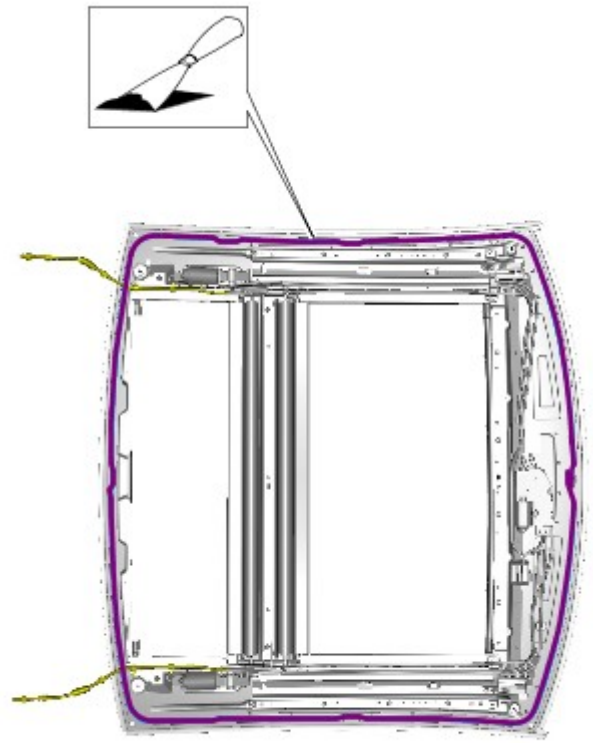
E128883

41. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

Prepare the glass roof cassette flange and trim the PU adhesive in accordance with the instructions included with the PU adhesive kit.

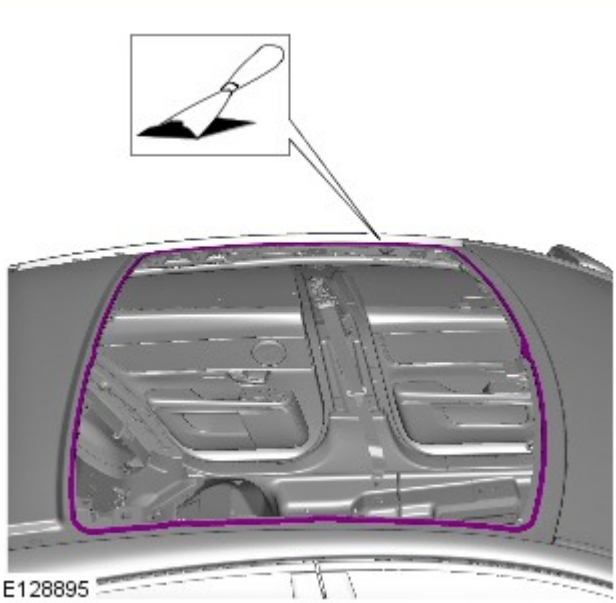


E128896



E128894

42. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

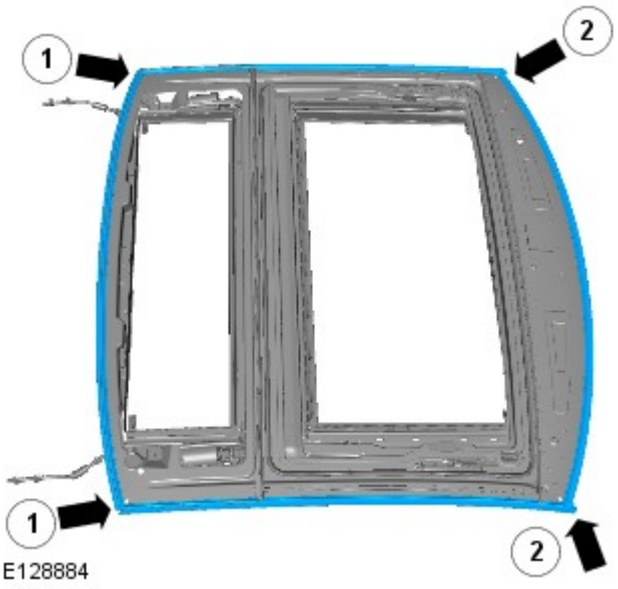


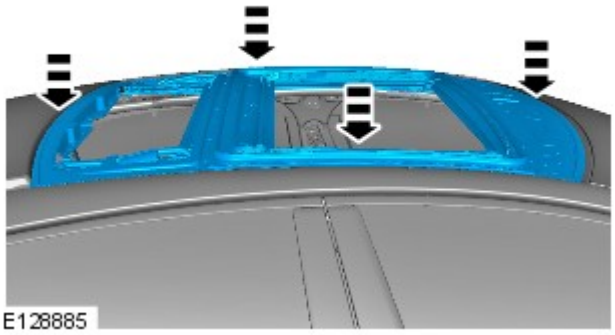
E128895

43. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

Installation

1. Fit the cassette frame edge seal back corners first, then fit the front corners, as the sequence depicts in the graphic.





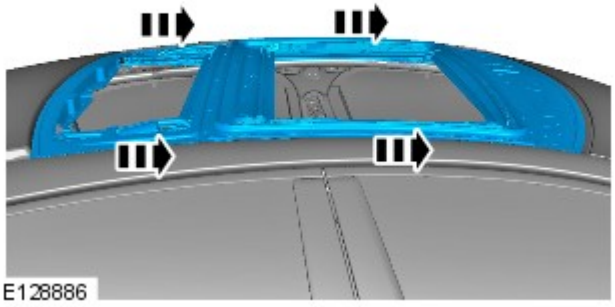
2. CAUTION: Make sure that the component is correctly located on the locating dowels.

NOTES:

This step requires the aid of another technician.

Install new spacers.

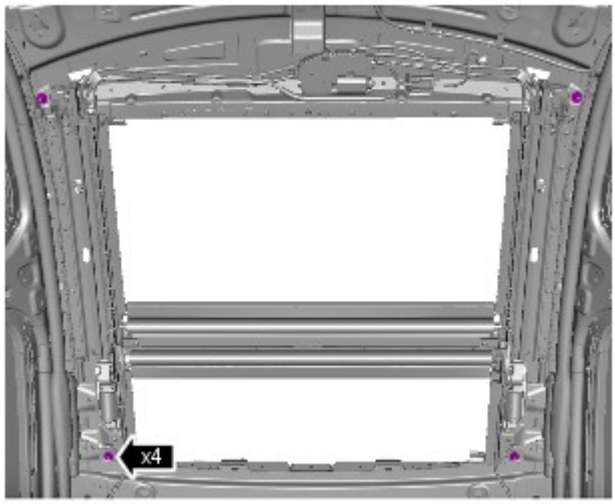
Make sure that the cassette frame edge seal is in contact with the cant rail evenly across both sides of the vehicle. It is critical that the cassette is central.



3. With the 4 installation pins correctly located into the holes in the cant rail assemblies, push the cassette fully forward towards the front of the vehicle.

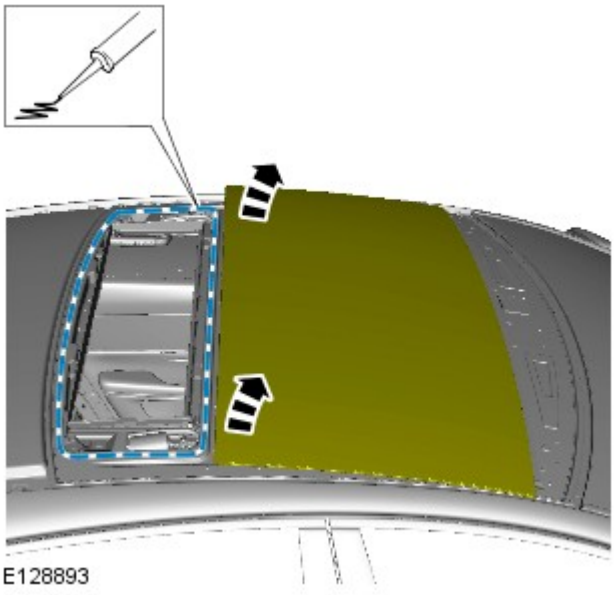
4. CAUTION: Only tighten the nuts finger-tight at this stage.

Install the 2 new nuts to the rear of the cassette frame to ensure correct alignment to the body.



E128887

5. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

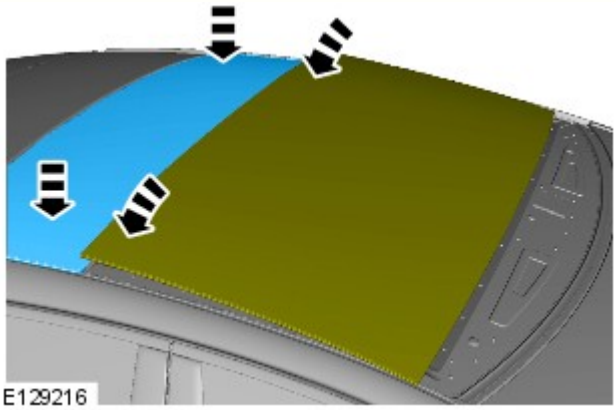


E128893

6. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.
- Using the mechanical adjuster on the roof opening panel motor, wind the motor until the glass is slightly raised from the cassette frame edge seal, to aid the installation of the rear glass panel.



E129216

7. NOTES:

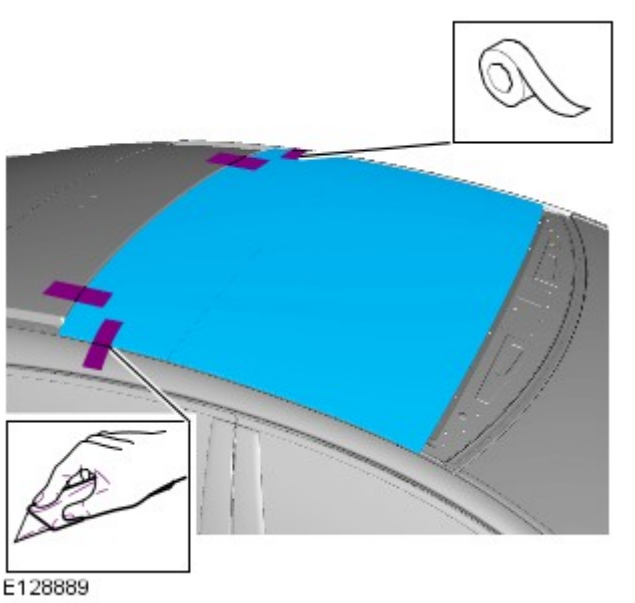
With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

With the sunroof closed, check the alignment of the rear glass roof panel to the sunroof glass panel. The glass should be central in its aperture. Profile of rear glass roof panel to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

- Using the mechanical adjuster on the roof opening panel motor, wind the motor until the glass is sitting flush against the cassette frame edge seal.
- Make sure the component is aligned with the measurements taken prior to removal. Failure to

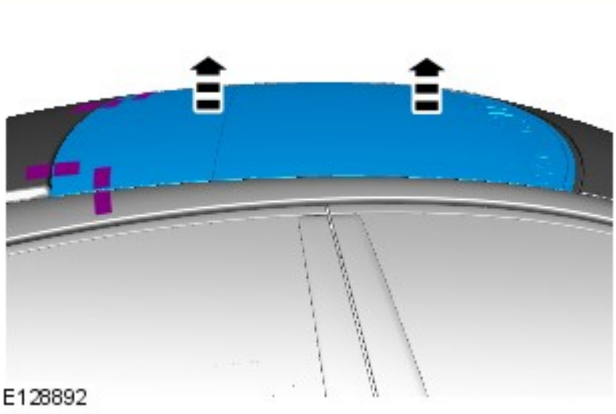
follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature of the glass.

8. Refer to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures).



E128889

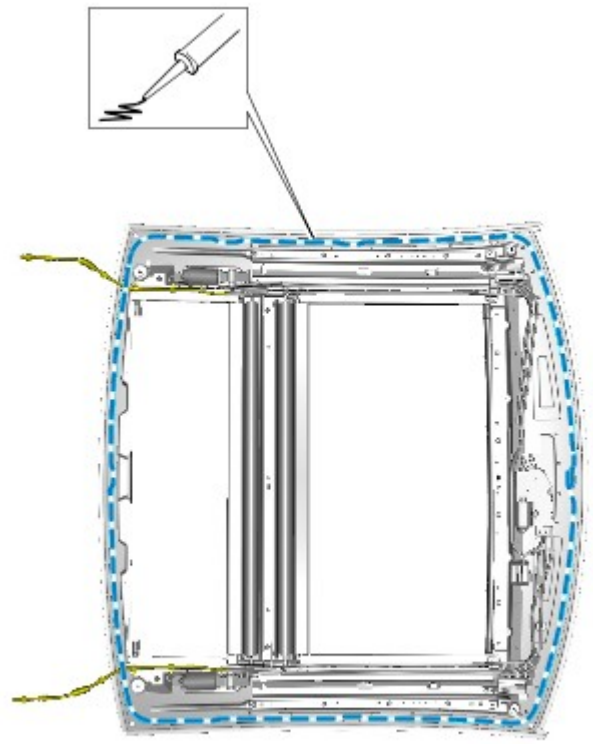
9.
- Apply tape to the rear corners of the glass roof to create alignment markings to aid installation.



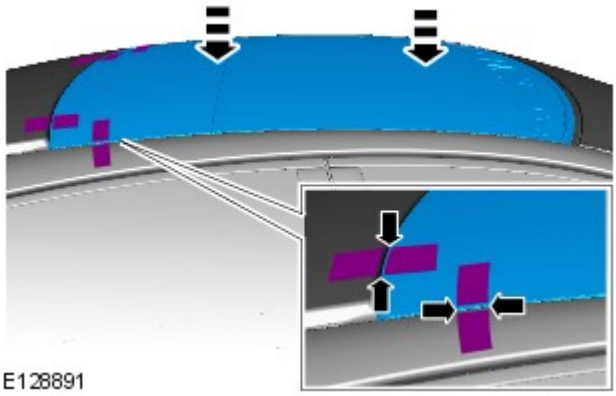
E128892

10. NOTE: This step requires the aid of another technician.

11. CAUTION: Touching the adhesive surface will impair rebonding.



E128888



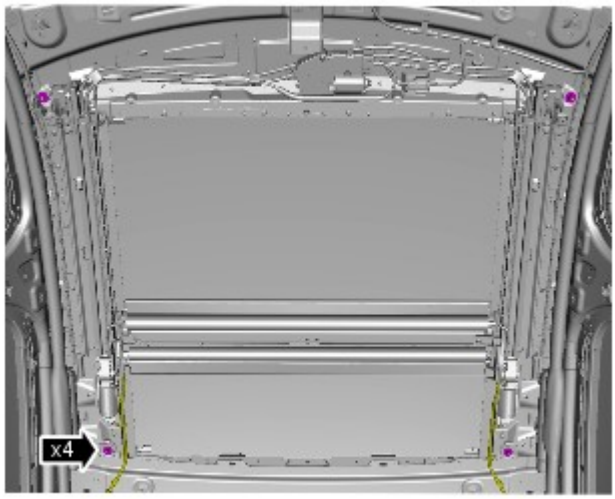
E128891

12. CAUTION: The component must be aligned with the installation markings.

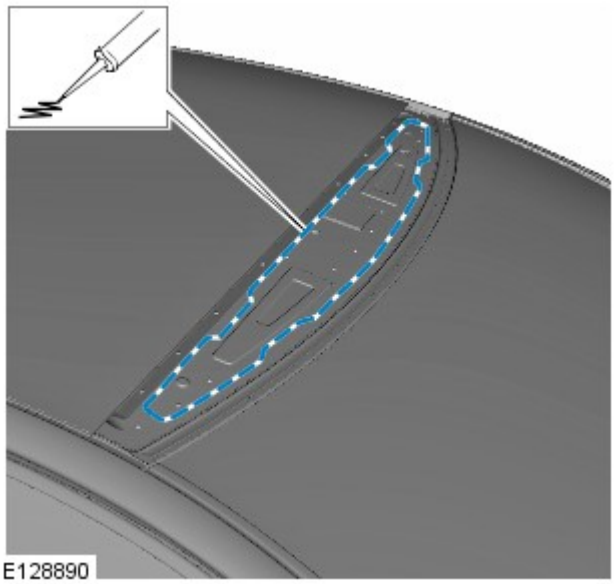
NOTE: This step requires the aid of another technician.

Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

13. *Torque:* 9 Nm



E128934

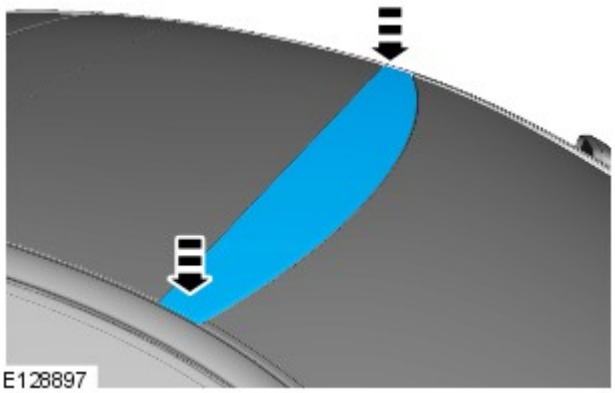


E128890

14. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

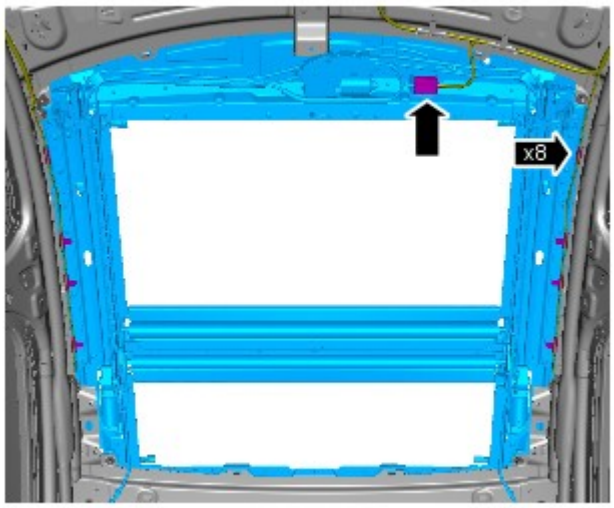
Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.



E128897

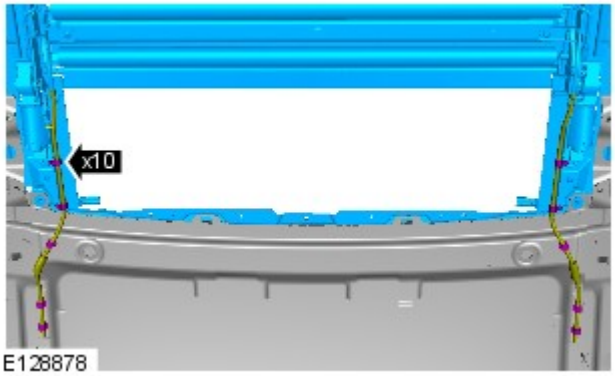
15.
- Make sure the component is aligned with the measurements taken prior to removal. Failure to follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature of the glass.

16.



E128935

17.



E128878

18. CAUTION: Make sure that no excess sealant residue is evident.

- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.
- Spray water around the roof area and mark any area that leaks. Dry the roof glass and sealant before applying additional sealant.

Body Repairs - Vehicle Specific Information and Tolerance Checks - Body and Frame

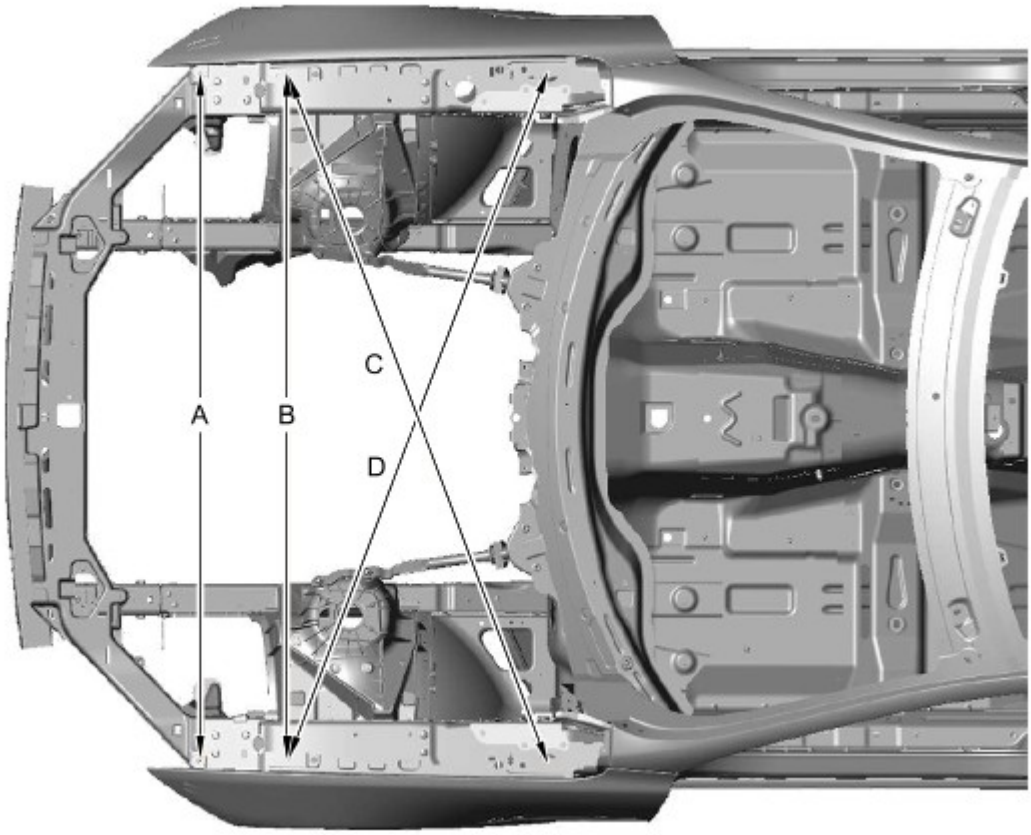
Description and Operation

Front End Body Dimensions

NOTES:

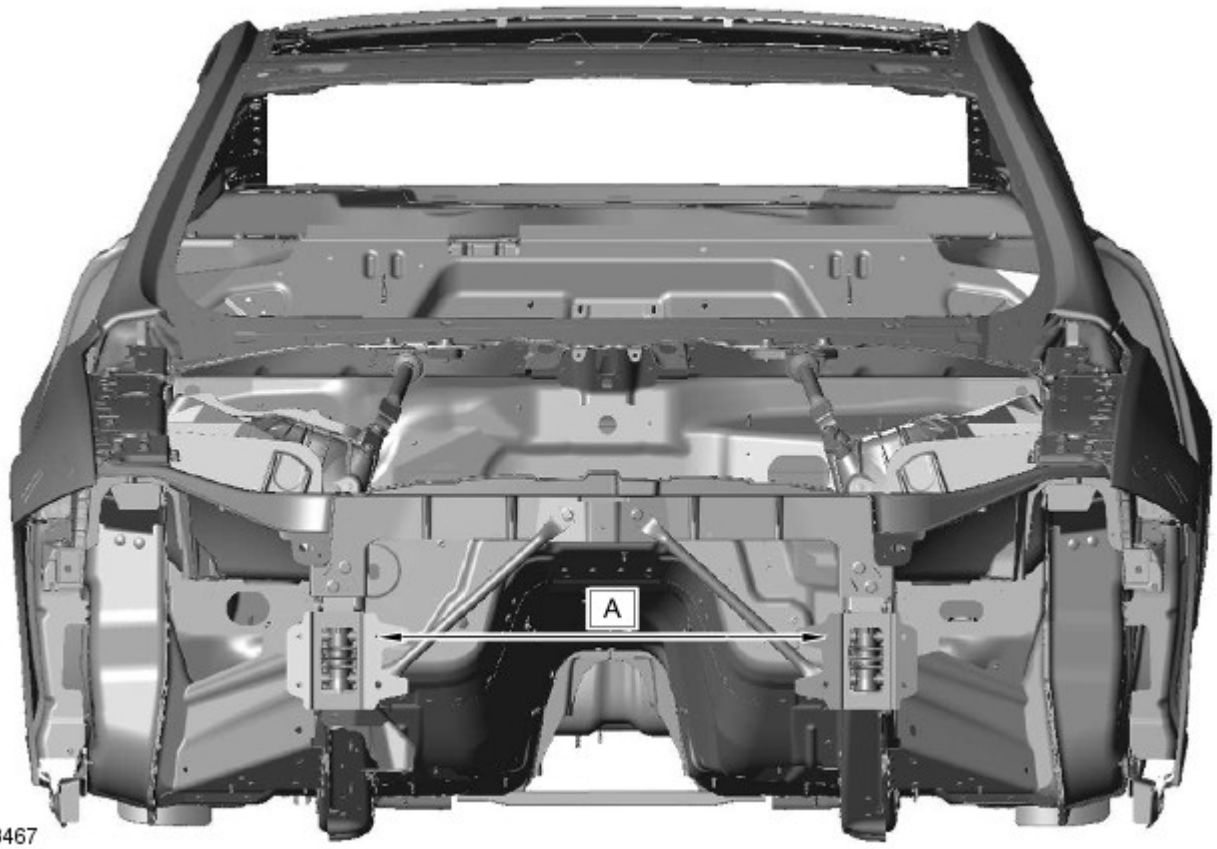
All dimensions shown are in millimetres (mm).

Dimensions shown to holes, are always taken from/to the hole centre. They are also always to the body panel surface, not to the top of bolts or components.



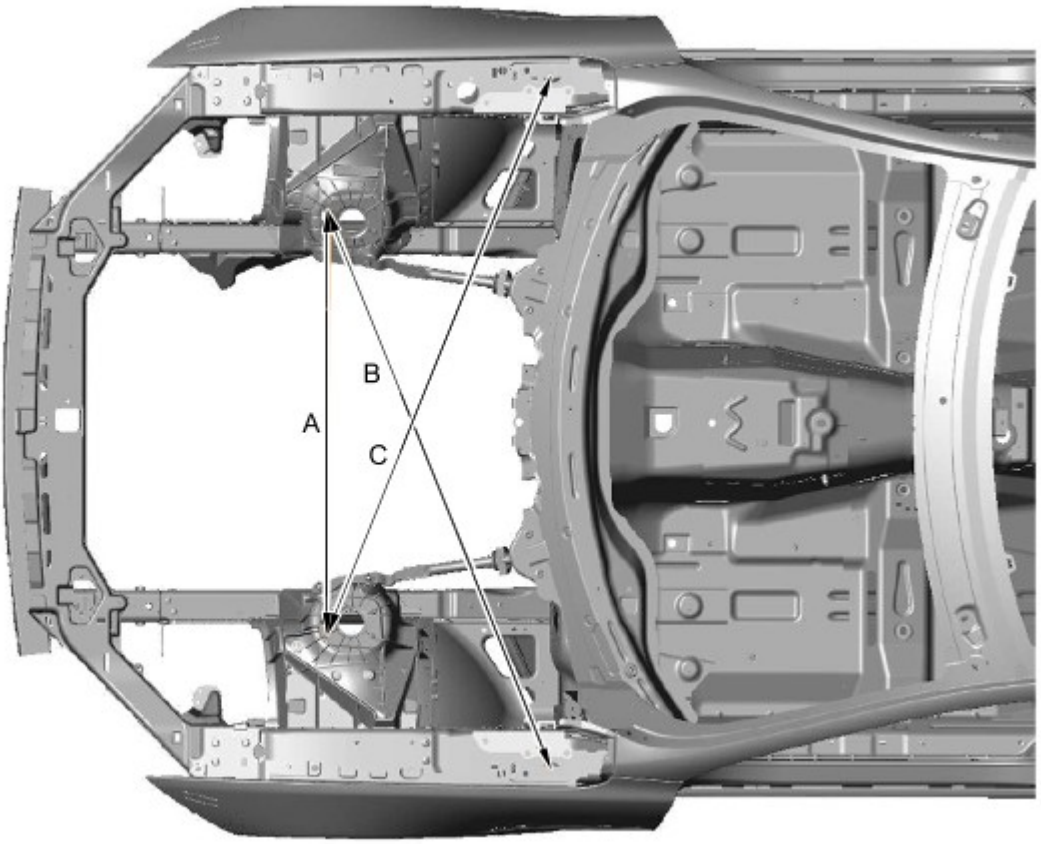
E133463

Item	From	To	Dimension
A	Front fender RH, front fixing hole	Front fender LH, front fixing hole	1580.0
B	Front fender RH, second front fixing hole	Front fender LH, second front fixing hole	1570.0
C	Front fender RH, second front fixing hole	Front fender LH, rear fixing hole	1689.4
D	Front fender LH, second front fixing hole	Front fender RH, rear fixing hole	1689.4



E133467

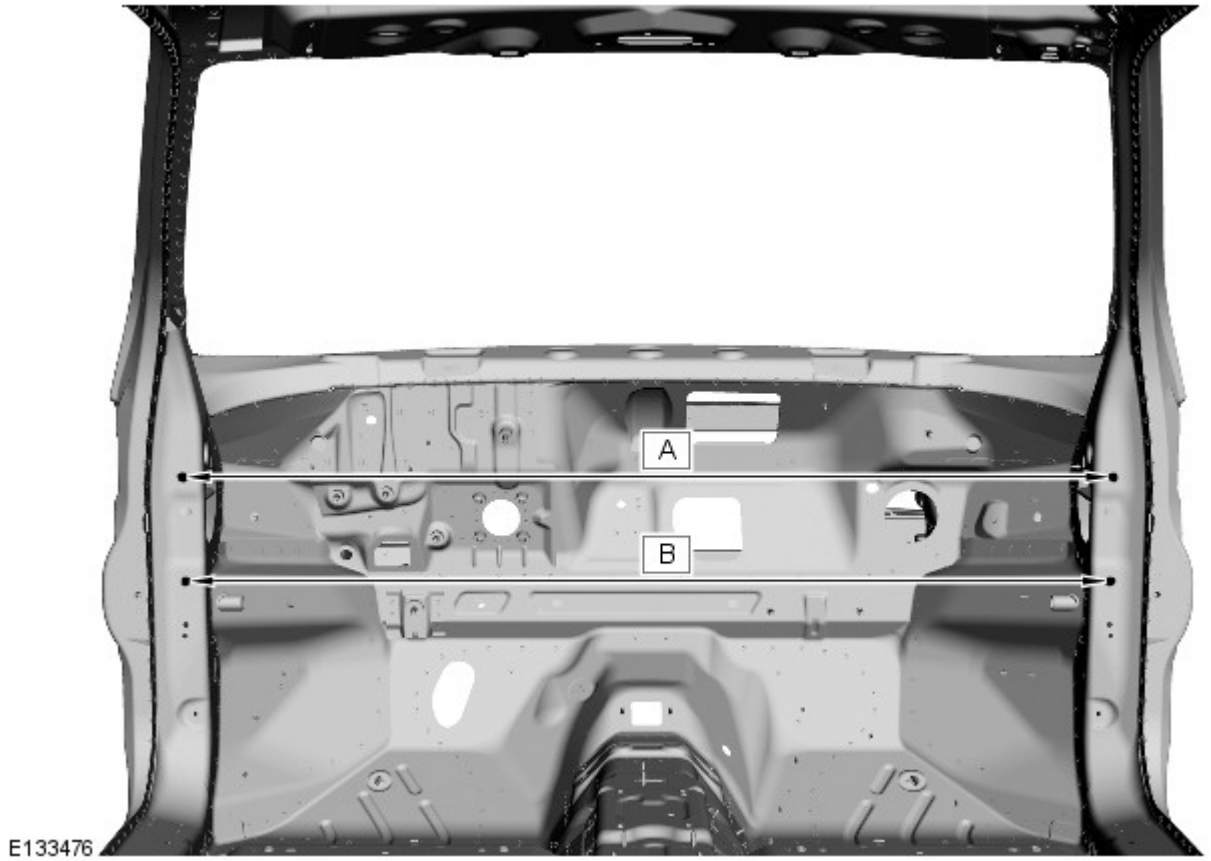
Item	From	To	Dimension
A	Side member deformation element RH, top inboard fixing hole	Side member deformation element LH, top inboard fixing hole	712.5



E133468

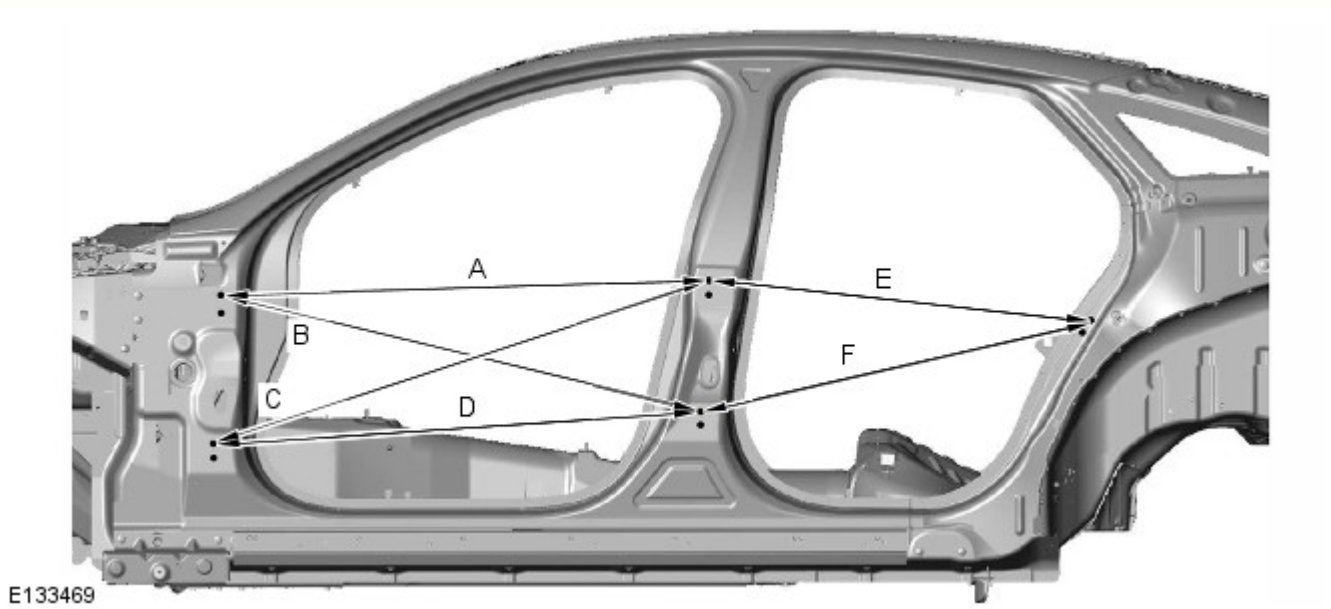
Item	From	To	Dimension
A	Suspension top mount RH, front outboard fixing	Suspension top mount LH, front outboard fixing	986.5
B	Suspension top mount RH, front outboard fixing	Front fender LH, rear fixing	1379.9

C	Suspension top mount LH, front outboard fixing	Front fender RH, rear fixing	1379.9



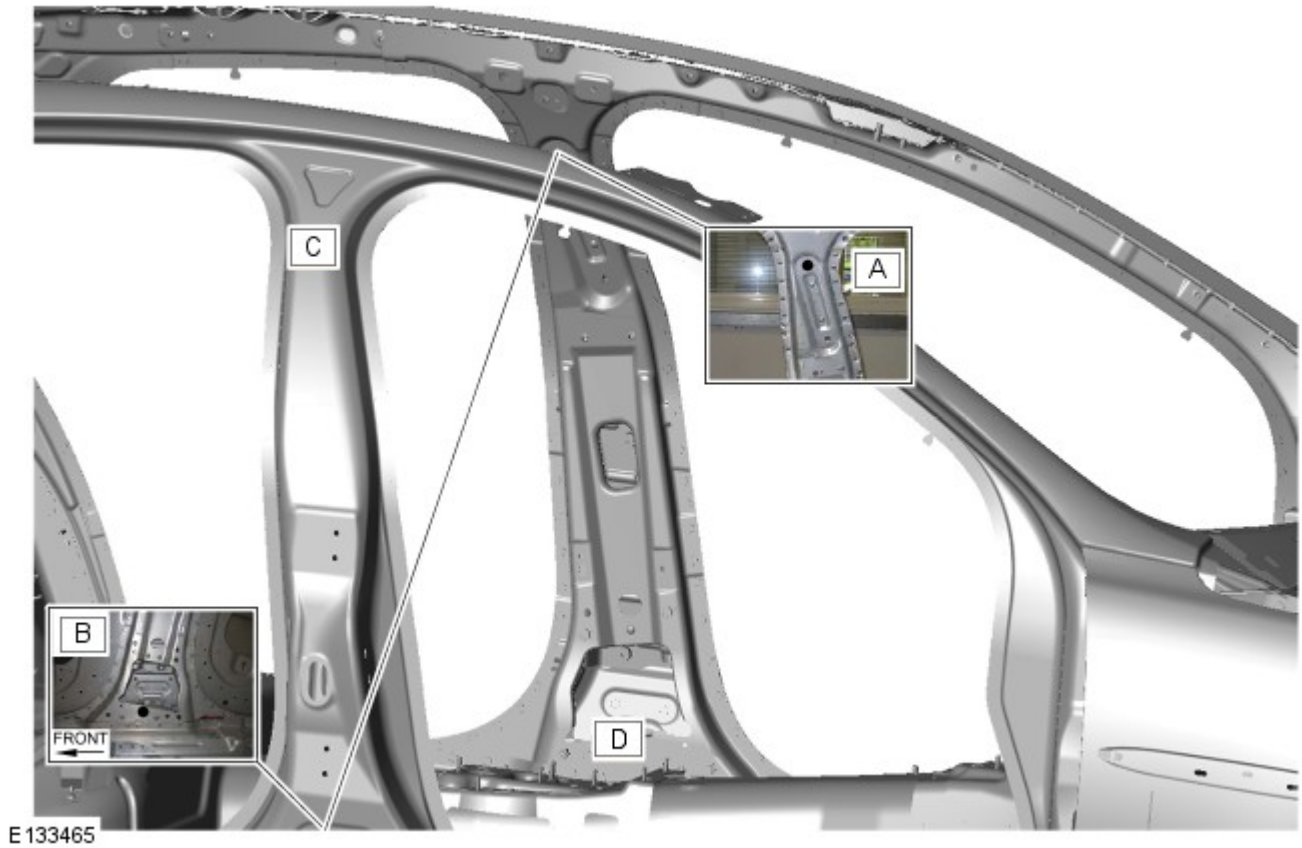
Item	From	To	Dimension
A	Instrument panel carrier RH top fixing hole	Instrument panel carrier LH top fixing hole	1416
B	Instrument panel carrier RH bottom fixing hole	Instrument panel carrier LH bottom fixing hole	1416

Side Panel Dimensions



Item	From	To	Dimension
A	Front door top hinge, top fixing hole	Rear door top hinge, top fixing hole	1109.1
B	Front door top hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1119.9
C	Front door bottom hinge, top fixing hole	Rear door top hinge, top fixing hole	1184.8
D	Front door bottom hinge, top fixing hole	Rear door bottom hinge, top fixing hole	1108.9
E (short wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	885.6
E (long wheel base)	Rear door top hinge, top fixing hole	Rear door striker, top fixing hole	1009.5
F (short wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	914.0

F (long wheel base)	Rear door bottom hinge, top fixing hole	Rear door striker, top fixing hole	1036.8



E133465

Item	From	To	Dimension

A-G (long wheel base)	Front subframe, RH front fixing hole	Rear subframe, RH front fixing hole	3306.6
B-H (long wheel base)	Front subframe, LH front fixing hole	Rear subframe, LH front fixing hole	3306.6
A-H (long wheel base)	Front subframe, RH front fixing hole	Rear subframe, LH front fixing hole	3419.9
B-G (long wheel base)	Front subframe, LH front fixing hole	Rear subframe, RH front fixing hole	3419.9

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

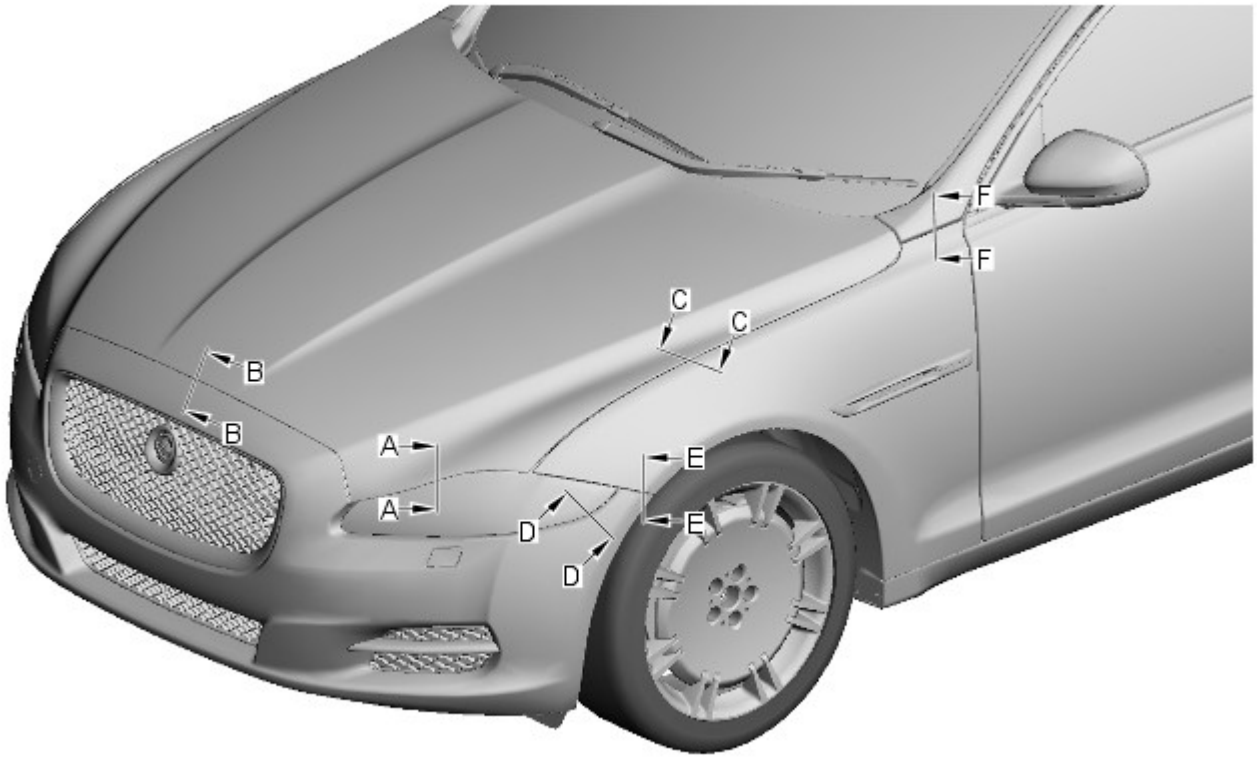
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

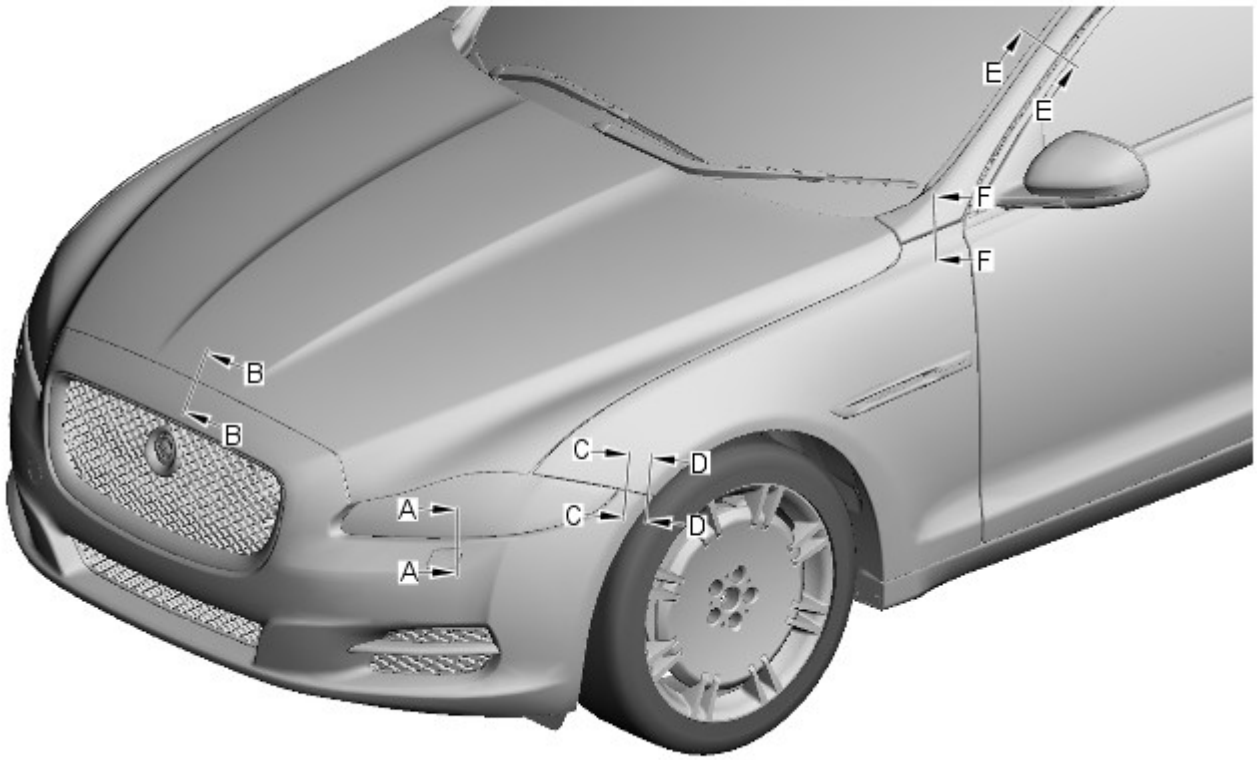
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



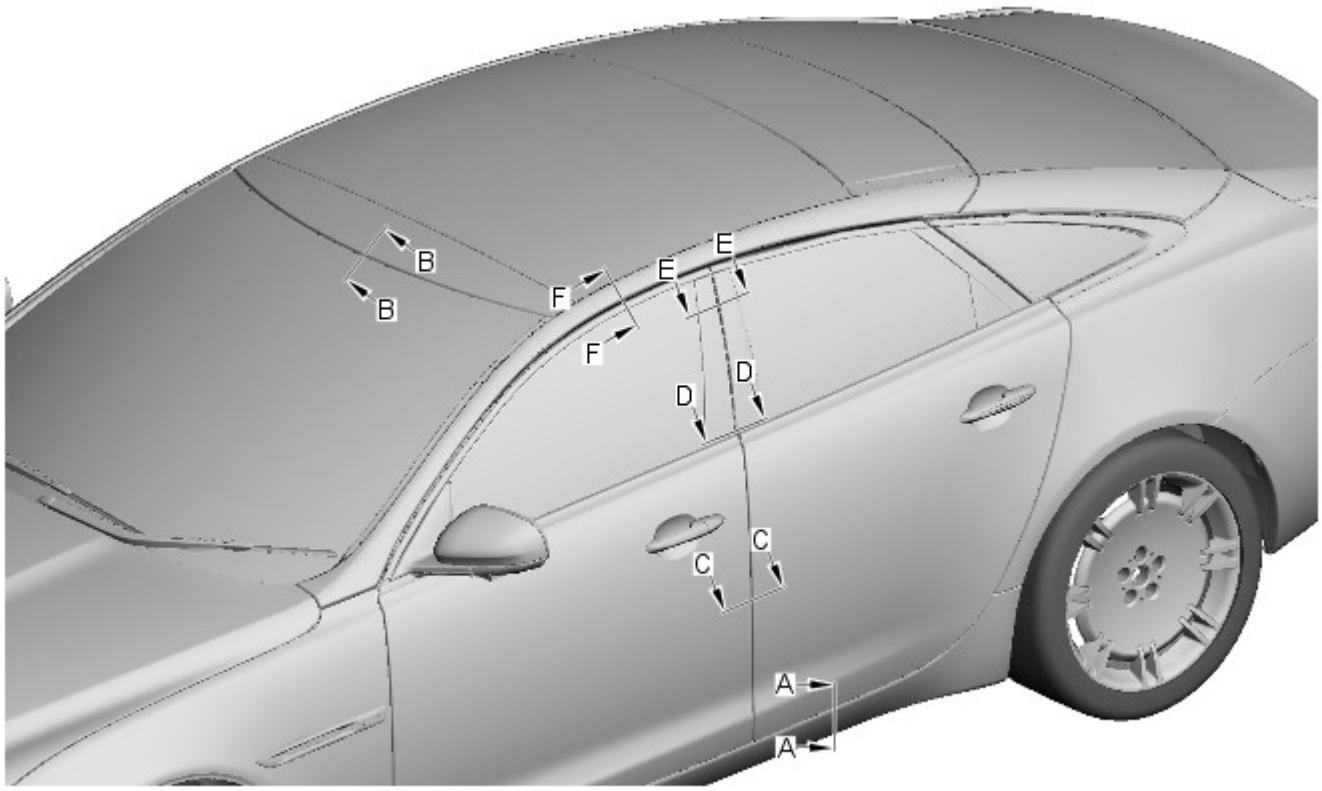
E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



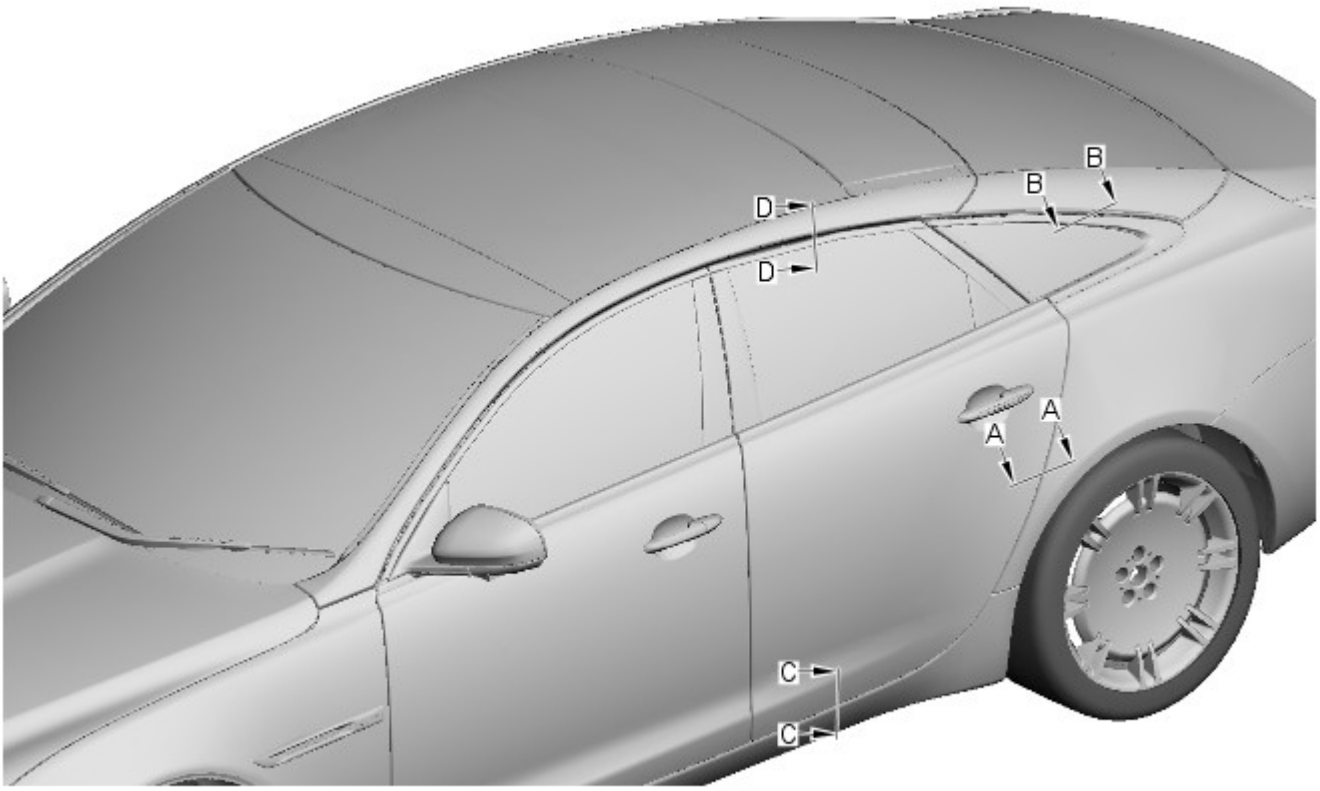
E133472

A-A	Front bumper cover to headlamp	1.0 ± 0.5
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Front bumper cover to front fender	0.0 + 1.0
D-D	Front bumper cover to front fender	0.0 + 1.0
E-E	Front door to A-pillar	4.0 ± 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



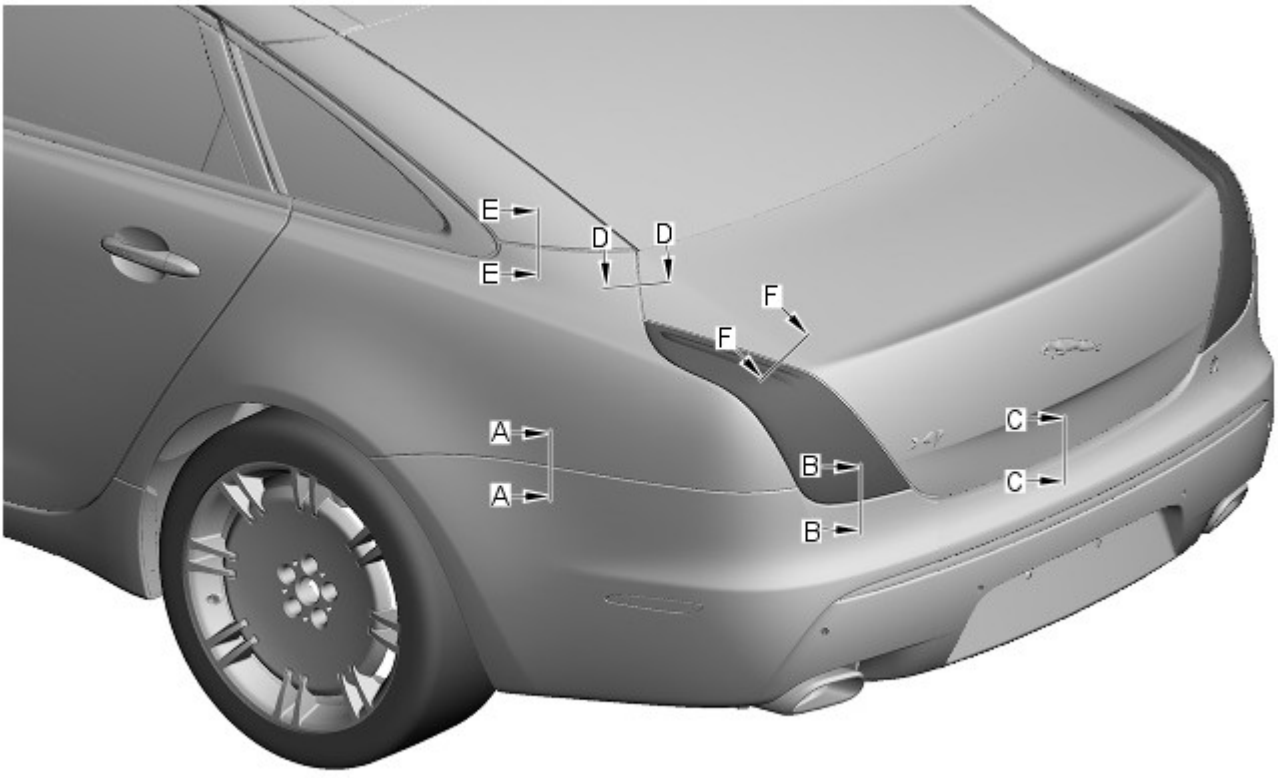
E133473

A-A	Rear door to rocker panel	5.0 ± 1.0
B-B	Windshield encapsulation to front glass roof panel encapsulation	0.0
C-C	Front door to rear door	4.0 ± 1.0
D-D	Front door to rear door	4.0 ± 1.0
E-E	Front door to rear door	4.0 ± 1.0
F-F	Front door to A-pillar / roof panel	6.5 ± 1.0



E133474

A-A	Rear door to quarter panel	4.0 ± 1.0
B-B	Rear quarter window glass encapsulation to quarter panel finisher	0.0
C-C	Rear door to rocker panel	5.0 ± 1.0
D-D	Rear door to roof panel	6.5 ± 1.0



E133475

A-A	Rear bumper cover to quarter panel	0.0 + 1.0
B-B	Rear bumper cover to rear lamp assembly	1.0 ± 0.5
C-C	Rear bumper cover to luggage compartment lid	6.0 ± 1.0
D-D	Quarter panel to luggage compartment lid	6.0 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

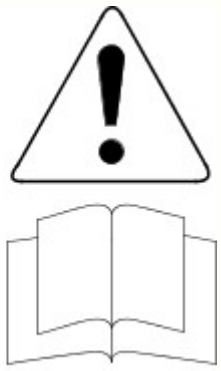
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

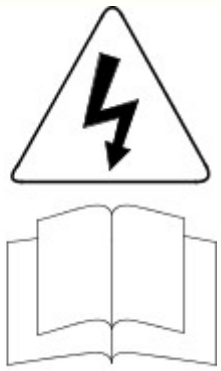
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



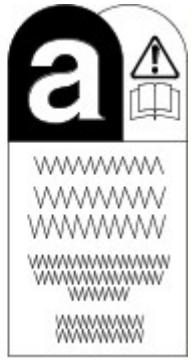
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



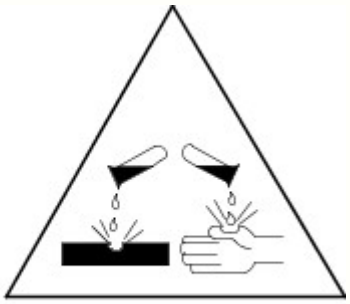
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Supplemental Restraint System - Side Air Curtain Module

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Take extra care when handling supplemental restraint system (SRS) components.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

Safety Information

WARNINGS:

To avoid accidental deployment the back-up power supply must be depleted before beginning any work on the SRS system or its components. Failure to follow this instruction may result in personal injury

Do not use a multimeter to probe an SRS module. It is possible for the power from the multimeter battery to trigger the activation of the module. Failure to follow this instruction may result in personal injury

NOTE: Do not to use a cellular phone or to have a cellular phone in close proximity when working on the SRS system or components

Power supply depletion

Before beginning any work on the SRS system or related components:

1. Remove the ignition key
2. Disconnect the battery leads, ground first
3. Wait 2 minutes for the power circuit to discharge

There are comprehensive instructions on the correct procedures for SRS system repairs, refer to the relevant section of the workshop manual

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTE: Check and rectify basic faults before beginning diagnostic routines including pinpoint tests

1. Verify the customer concern by operating the seatbelt
2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection

Mechanical	Electrical
• Check for the installation of non-standard accessories which may affect or obstruct the function of the seatbelt system • Frayed or damaged webbing • Missing or damaged button stop • Pretensioner(s) Buckles/Stalks	• Fuses • Wiring harness fault • Correct engagement of electrical connectors • Loose or corroded connections • Warning lamp bulb(s) • Impact sensor(s) • Buckle sensor(s) • Pretensioner(s) • Belt tension sensor(s) • Restraints control module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

4. If the cause is not visually evident, carry out the test methods described below, alternatively check for diagnostic trouble codes and refer to the relevant diagnostic trouble code index

For a complete list of all diagnostic trouble codes that could be logged on this vehicle, please refer to section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Active Safety Belt Module (SPMA/SPMB) (100-00 General Information, Description and Operation) /
Diagnostic Trouble Code (DTC) Index - DTC: Restraints Control Module (RCM) (100-00 General Information, Description and Operation).

Symptom Chart for Seatbelt Rows 1, 2

Symptom	Possible Causes	Action
Seatbelt jammed - Webbing tight	• Backlock effect in action (webbing retracted quickly and came to sudden stop) • Seatbelt retractor not installed correctly • Automatic locking retractor activated (clicking – during retraction only)	• GO to Pinpoint Test A. • GO to Pinpoint Test F. • See the automatic locking retractor description below
Seatbelt jammed - Webbing loose	• Seatbelt webbing trapped in seat • Seatbelt retractor webbing guide loose • Twist in webbing • Interference in webbing routing • D-loop not rotating correctly	• GO to Pinpoint Test B. • GO to Pinpoint Test C. • GO to Pinpoint Test D. • GO to Pinpoint Test E. • GO to Pinpoint Test G.
Seatbelt - Intermittent jamming	• Seatbelt retractor not installed correctly	• GO to Pinpoint Test F.
Seatbelt - Slow retraction	• Seatbelt retractor webbing guide loose • Twist in seatbelt webbing • Interference in webbing routing • Seatbelt retractor not installed correctly • D-loop not rotating correctly • Foreign object/debris	• GO to Pinpoint Test C. • GO to Pinpoint Test D. • GO to Pinpoint Test E. • GO to Pinpoint Test F. • GO to Pinpoint Test G. • GO to Pinpoint Test E.
Seatbelt - Not retracting	• Seatbelt retractor webbing guide loose • Twist in seatbelt webbing • D-loop not rotating correctly • Interference in webbing routing • Foreign object/debris	• GO to Pinpoint Test C. • GO to Pinpoint Test D. • GO to Pinpoint Test G. • GO to Pinpoint Test E. • GO to Pinpoint Test E.
Seatbelt - Not extracting	• Backlock effect-in action (webbing retracted quickly and came to sudden stop) • Seatbelt retractor not installed correctly • Seatbelt retractor webbing guide loose • Twist in seatbelt webbing • D-loop not rotating correctly • Interference in webbing routing • Foreign object/debris • Automatic locking retractor activated (clicking – during retraction only)	• GO to Pinpoint Test A. • GO to Pinpoint Test F. • GO to Pinpoint Test C. • GO to Pinpoint Test D. • GO to Pinpoint Test G. • GO to Pinpoint Test E. • GO to Pinpoint Test E. • See the automatic locking retractor description below
Seatbelt - Noisy during operation	• Automatic locking retractor activated (clicking–during retraction only) • Interference in webbing routing (rubbing)	• GO to Pinpoint Test B. • GO to Pinpoint Test E.
Seatbelt buckle - Not latching / jammed	• Foreign object/debris	CAUTION: Do not insert any objects or tools into the buckle head • GO to Pinpoint Test H.

Inertia Reel Seatbelts

The vehicle is equipped with (two row one) and (three row two) inertia reel seatbelts

These seatbelts are **"dual sensitive"** which means that they have:

- **Car sense system - A vehicle motion sensor, which locks the seatbelt webbing under braking, cornering, on steep hills and in adverse camber conditions, when parked on a steep incline or driveway or two wheels on a high curb**
- **Web sense system - A webbing motion sensor, which locks when the seatbelt webbing is extracted suddenly**

The seatbelts in the following positions are equipped with an automatic locking retractor function:

Carline	Market	Seat position	Automatic Locking Retractor Installed	From Model Year
XK (X150)	All	Driver	No	2007
XK (X150)	ROW	Passenger	No	2007
XK (X150)	US	Passenger	Yes	2007
XK (X150)	ROW	Row 2	Yes	2007
XK (X150)	US	Row 2	Yes	2007
XF (X250)	All	Driver	No	2009
XF (X250)	ROW	Passenger	No	2009
XF (X250)	US	Passenger	Yes	2009
XF (X250)	ROW	Row 2	No	2009
XF (X250)	US	Row 2	Yes	2009
XJ (X351)	All	Driver	No	2010
XJ (X351)	ROW	Passenger	No	2010
XJ (X351)	US	Passenger	Yes	2010
XJ (X351)	ROW	Row 2	No	2010
XJ (X351)	US	Row 2	Yes	2010

The **automatic locking retractor function** is a feature to secure a child seat or heavy load to the seat

Activation	Deactivation
NOTE: When automatic locking retractor is activated, no further webbing can be drawn from the seatbelt retractor, prior to disengagement of the automatic locking. This can be mistaken as a jammed seatbelt retractor Activated by total extraction of the webbing	Automatic locking retractor is deactivated by allowing the webbing to retract until the clicking stops (close to park position)
When activated the automatic locking retractor is identified by a clicking noise during webbing retraction	When deactivated the automatic locking retractor seatbelt changes state, from a **static** seatbelt to an **automatic** seatbelt

Seatbelt Locking Test

With the vehicle stationary and on level ground take firm hold of the seatbelt webbing (on the tongue side of the upper seatbelt anchor) and withdraw sharply, **the retractor should lock** . Preventing further webbing release **(repeat this test 3 times)** . Any seatbelt retractor which fails to lock **must not be used** and a **new seatbelt must be installed** .

DTC Index

For a list of diagnostic trouble codes that could be logged on this vehicle, please refer to Section 100-00 or for removal and installation/description and operation see Section 501-20.

Diagnostic Guide Inertia Reel Seatbelts

PINPOINT TEST A : BACKLOCK		
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS	
A1: BACKLOCK		
	1	Visually inspect the condition of the suspect seatbelt
	2	Draw a maximum of 20mm of the webbing from the seatbelt retractor with moderate force. Then release the webbing
	3	Check for correct operation twice
	Does the webbing move freely then retract correctly? **Yes** No further action required **No** For first row seatbelt GO to Pinpoint Test C. For second and third row seatbelts GO to Pinpoint Test B.	

PINPOINT TEST B : WEBBING-TRAPPED IN SEAT		
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS	
B1: WEBBING-TRAPPED IN SEAT		
	1	Visually inspect the condition of the suspect seatbelt
	2	Lift the seat base or release the seat backrest as required
	3	Free the trapped webbing, allow the webbing to retract **Note: If the automatic locking retractor is activated, allow the webbing to retract until the clicking stops**
	4	Check for correct operation **twice**

	Does the webbing move freely then retract correctly? **Yes** No further action required **No** GO to Pinpoint Test C.

PINPOINT TEST C : SEATBELT RETRACTOR-WEBBING GUIDE LOOSE	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
C1: SEATBELT RETRACTOR-WEBBING GUIDE LOOSE	
	1 Refer to 501-20 removal and installation section of the workshop manual, remove any trim panels required to expose the D loop (anchor point) and seatbelt retractor
	2 Check the webbing is not trapped or twisted and is centrally located on the seatbelt retractor spindle
	3 Attempt to withdraw the webbing from the seatbelt retractor **NOTE: If the seatbelt webbing is jammed, the automatic locking retractor could be engaged**
	4 To release the automatic locking retractor, manually wind the webbing onto the spindle until the automatic locking retractor deactivates (clicking stops)
	5 Fully extract webbing
	6 Confirm webbing guide location is correct , Confirm the fixing lugs are correctly located in the retractor frame
	7 Allow webbing to retract
	8 Check for correct operation **twice**
	Does the webbing move freely then retract correctly? **Yes** Refer to the 501-20 removal and installation section of the workshop manual, reinstall any trim panels, ensure there are no obstructions and the webbing does not catch or rub. No further action required **No** GO to Pinpoint Test D.

PINPOINT TEST D : TWIST IN WEBBING	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
D1: TWIST IN WEBBING	
	1 Refer to section 501-20 removal and installation section of the workshop manual, remove any trim panels required to expose the D loop (anchor point)
	2 Twist the webbing back the correct way in the loop
	3 Pass the twist through the pillar loop or escutcheon as required
	4 Check for correct operation **twice**
	Does the webbing move freely then retract correctly? **Yes** Refer to the 501-20 removal and installation section of the workshop manual, reinstall any trim panels, ensure there are no obstructions and the webbing does not catch or rub. No further action required **No** GO to Pinpoint Test E.

PINPOINT TEST E : INTERFERENCE-WEBBING ROUTING	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
E1: INTERFERENCE-WEBBING ROUTING	
	1 Refer to the 501-20 removal and installation section of the workshop manual, remove any trim panels required to expose the D loop (anchor point)
	2 Remove obstructions and foreign objects ensure the webbing does not catch or rub
	3 Confirm the seatbelt does not contact the wiring harness
	4 Check for correct operation **twice**
	Does the webbing move freely then retract correctly? **Yes** Refer to the 501-20 removal and installation section of the workshop manual, reinstall any trim panels, ensure there are no obstructions and the webbing does not catch or rub. No further action required **No** GO to Pinpoint Test F.

PINPOINT TEST F : SEATBELT RETRACTOR-INCORRECT INSTALLATION	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
F1: SEATBELT RETRACTOR-INCORRECT INSTALLATION	
	1 Refer to the 501-20 removal and installation section of the workshop manual, remove any trim panels required to expose the D loop (anchor point) and the seatbelt retractor
	2 Refer to the 501-20 removal and installation section of the workshop manual, correctly reinstall the seatbelt retractor ensure that the locating "T bar" and "anti rotation pins" are correctly located
	3 Check for correct operation **twice**

	Does the webbing move freely then retract correctly? **Yes** Refer to the 501-20 removal and installation section of the workshop manual, reinstall any trim panels, ensure there are no obstructions and the webbing does not catch or rub. No further action required **No** GO to Pinpoint Test G.

PINPOINT TEST G : D-LOOP NOT ROTATING CORRECTLY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: D-LOOP NOT ROTATING CORRECTLY	
	1 Refer to the 501-20 removal and installation section of the workshop manual, remove any trim panels required to expose the D loop (anchor point) and the seatbelt retractor
	2 Ensure there are no obstructions and the webbing does not catch or rub, the D loop (anchor point) rotates correctly and if installed the confirm the height adjuster operates correctly
	3 Check for correct operation **twice**
	Does the webbing move freely then retract correctly? **Yes** Refer to the 501-20 removal and installation section of the workshop manual, reinstall any trim panels, ensure there are no obstructions and the webbing does not catch or rub. No further action required **No** Replace as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component

PINPOINT TEST H : SEATBELT BUCKLE – NOT LATCHING/JAMMED	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: SEATBELT BUCKLE – NOT LATCHING/JAMMED	
CAUTION: Do not insert any objects or tools into the buckle head	
	1 Visually inspect the buckle head for evidence of damage. If damaged replace as required
	2 Depress the buckle release (red button) and **(Using a torch)** carry out visual inspection for any evidence of debris/material or foreign objects in the buckle head
	3 If required remove the pretensioner from the vehicle. Remove the seat. Remove the pretensioner from the seat frame
	4 **Do not insert any objects or tools buckle head** With the buckle removed invert and attempt to shake out any debris
	5 Attempt to latch the tongue in the buckle
	Does the seat belt buckle operate correctly **Yes** Reinstall any components, no further action required **No** Replace the pretensioner, REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Restraints Control Module (RCM) (100-00 General Information, Description and Operation), Rear Safety Belt Buckle (501-20A Safety Belt System, Removal and Installation).

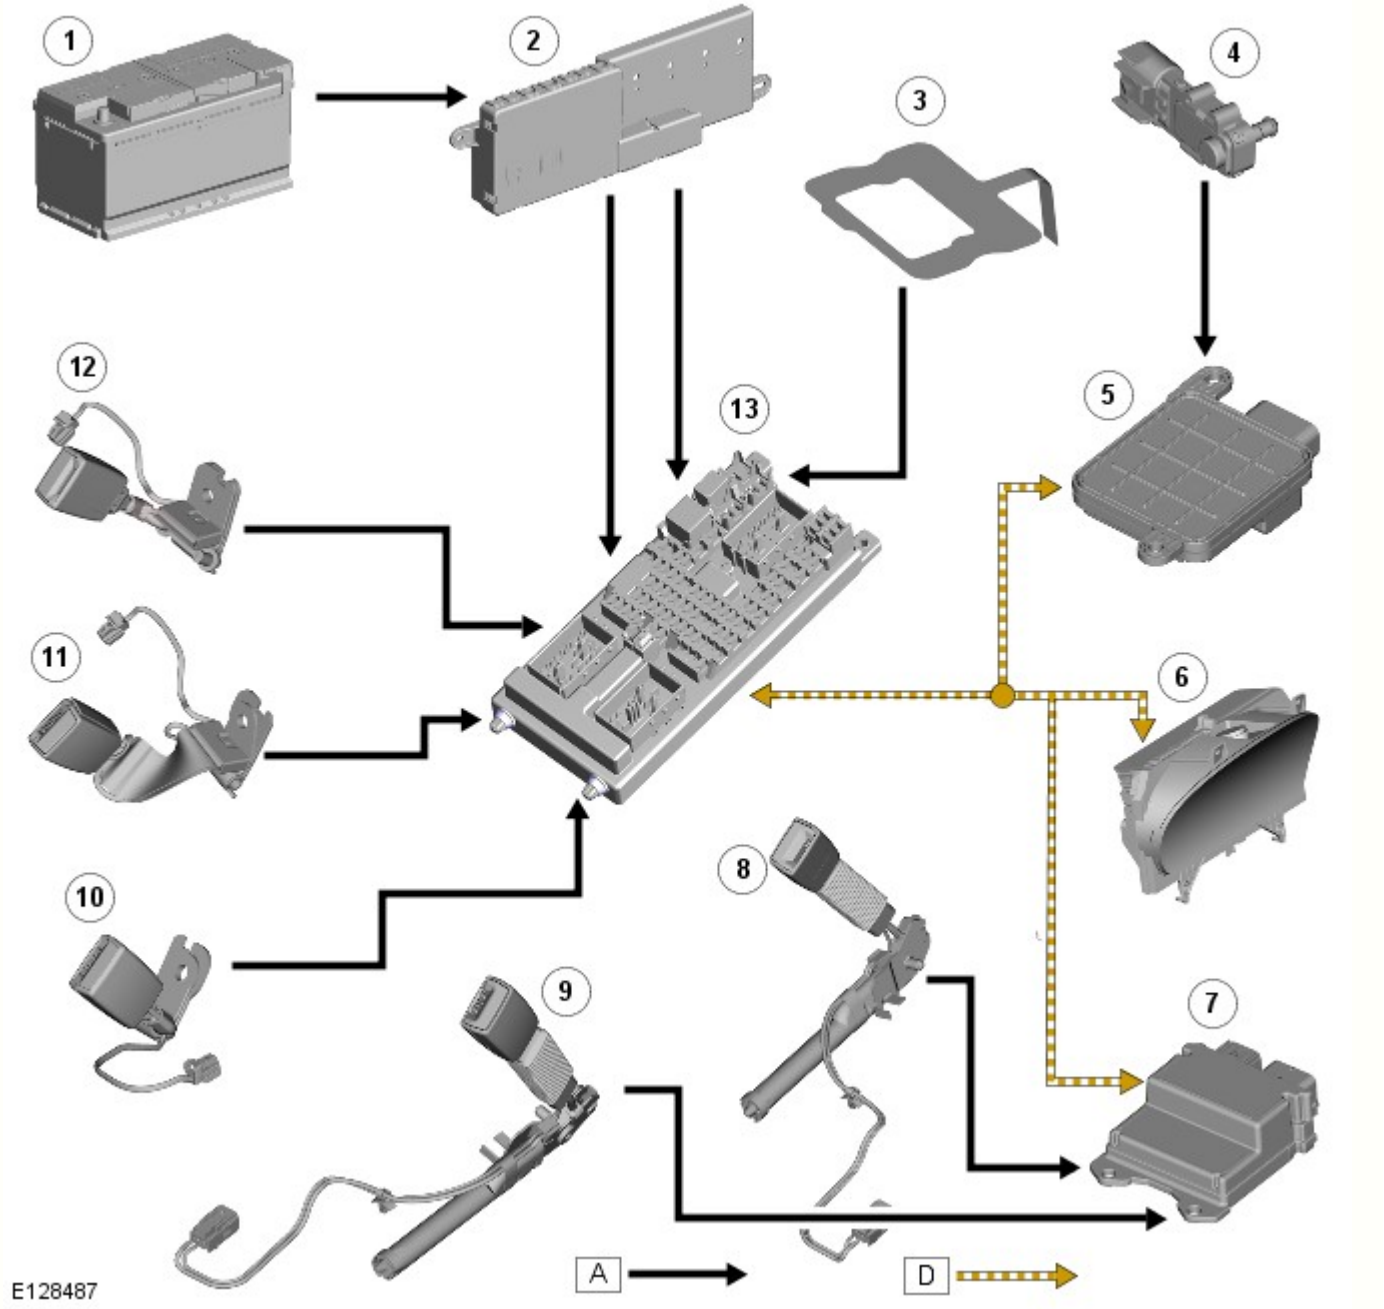
Safety Belt System - Safety Belt System - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: A = Hardwired; D = High speed CAN (controller area network) bus.

SAFETY BELT REMINDER/BELTMINDER SYSTEM



Item	Description
1	Battery
2	BJB (battery junction box) (40 A midi fuse (2 off))
3	Occupant detection sensor (where fitted)
4	Pressure sensor (where fitted)
5	Occupant classification module (where fitted)
6	Instrument cluster
7	RCM (restraints control module)
8	LH (left-hand) front buckle switch
9	RH (right-hand) front buckle switch
10	RH rear buckle switch
11	Center rear buckle switch
12	LH rear buckle switch
13	CJB (central junction box)

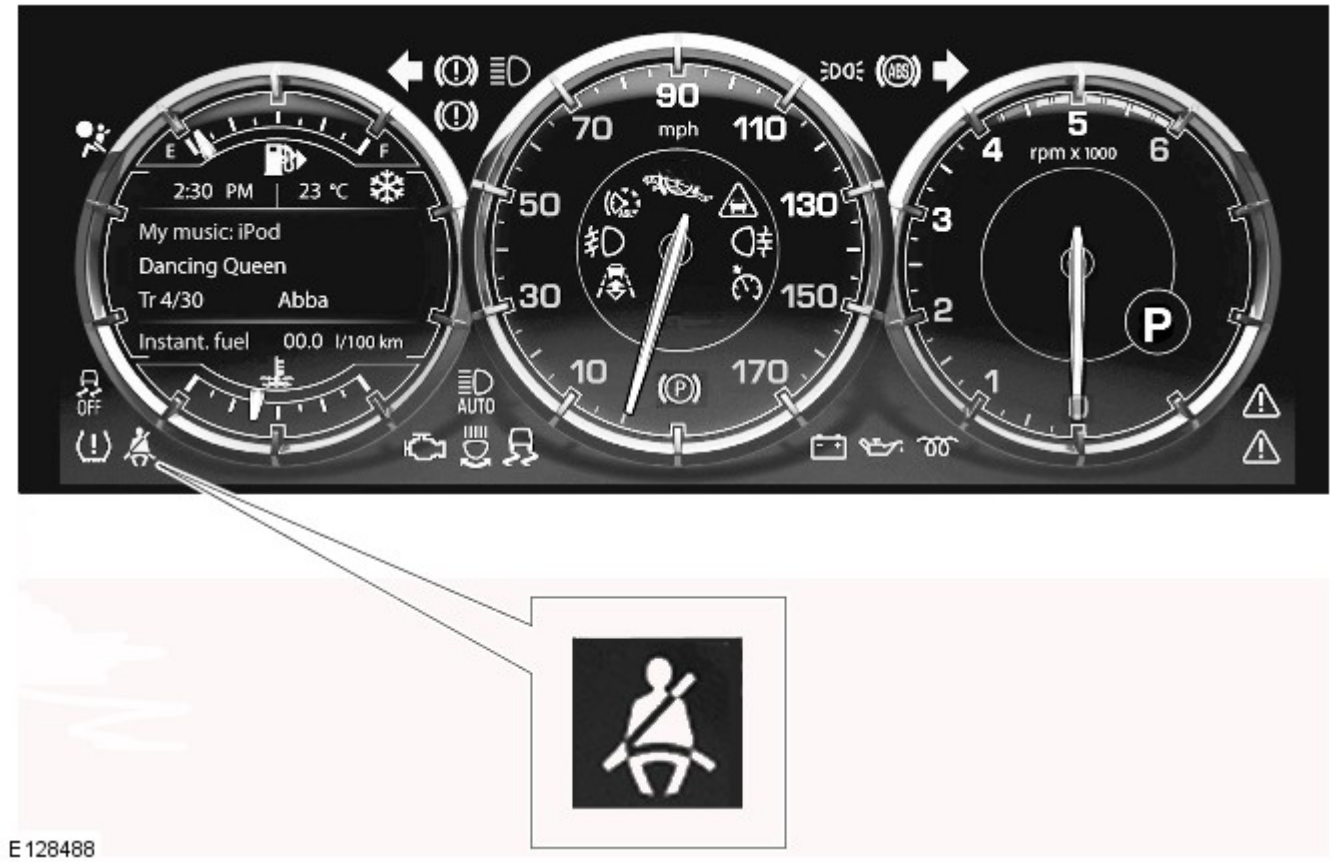
System Operation

SAFETY BELT REMINDER

The safety belt warning indicator comes on if the driver safety belt, or the safety belt of an occupied front passenger seat, is not fastened. The indicator goes off when the offending safety belt is fastened.

The CJB controls the operation of the safety belt warning indicator with a high speed CAN bus message to the instrument cluster. The status of the front safety belts is provided by a high speed CAN bus message from the RCM . Front passenger seat occupancy status is provide by a hardwired input from the occupant detection sensor (all except NAS), or a high speed CAN bus message from the classification module (NAS only).

Safety Belt Warning Indicator

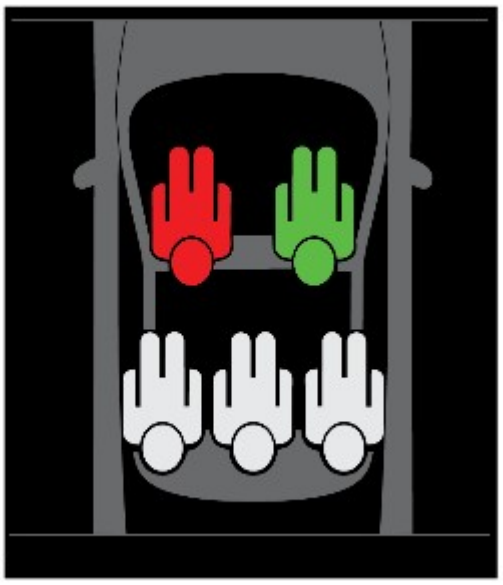


BELTMINDER SYSTEM

The beltminder system augments the safety belt reminder. At vehicle speeds above 10 mph (16 km/h), if the safety belt of the driver seat or an occupied front passenger seat has not been fastened, or if a front or rear safety belt is unfastened, the beltminder system activates an intermittent warning tone, flashes the safety belt warning indicator and displays a warning message indicating which safety belt triggered the warning.

The CJB controls the operation of the beltminder system with a high speed CAN bus message to the instrument cluster. The status of the safety belts is provided by hardwired inputs from each of the rear safety belt buckles, and a high speed CAN bus message from the RCM . Front passenger seat occupancy status is provide by a hardwired input from the occupant detection sensor (all except NAS), or a high speed CAN bus message from the classification module (NAS only).

Message Center Beltminder Graphic



A vehicle graphic in the message center shows the status of the safety belts. Each seating position is represented by a passenger icon, the color of which indicates the safety belt status:

- No color - safety belt not fastened.
- Green - safety belt fastened.
- Red - safety belt status changed from fastened to unfastened.

A beltminder warning triggered by one of the rear safety belts can be cancelled by pressing the information button on the steering wheel.

Although not advisable, it is possible to disable the beltminder system using Jaguar approved diagnostic equipment.

NOTE: If a heavy object is placed on the front passenger seat, it may trigger a beltminder warning.

Component Description

GENERAL

NOTE: Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.

Each safety belt retractor incorporates a pretensioner, a load limiting function and a dual locking function. The safety belt pretensioner are used to tighten the seatbelt during a collision to ensure the occupants are securely held in their seats. The load limiting function progressively releases a small amount of webbing when the belt tension exceeds a certain level, to reduce the loads on an occupant's chest during an impact. The dual locking function locks the retractor if the webbing is pulled out of the retractor too quickly, or the vehicle is subject to unusually high acceleration or tilts beyond a given angle.

Safety Belt System - Safety Belt System - Overview

Description and Operation

OVERVIEW

NOTE: Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.

A three point safety belt is installed at each seat position. The front safety belts have height adjusters installed on the B/C pillars.

As part of the SRS (supplemental restraint system) system, a pyrotechnic pretensioner is integrated into each front safety belt buckle and each front safety belt retractor. A tension sensor is installed on the anchor point of the front passenger safety belt for NAS only vehicles.
Refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).

A safety belt reminder and a belt minder system warn the driver if the safety belt of an occupied front seat is not fastened, or if a front or rear safety belt is unfastened during the journey.

ISOFIX anchor points are provided for the installation of rear child seats. Three anchor points are attached to the parcel tray and two mounting brackets are incorporated into the rear seat hinge brackets.

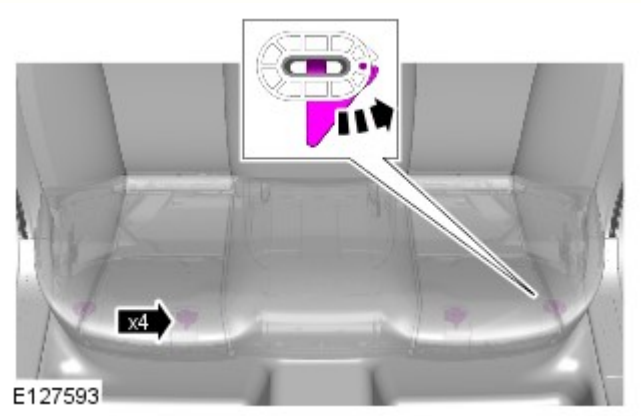
Safety Belt System - Rear Safety Belt Buckle

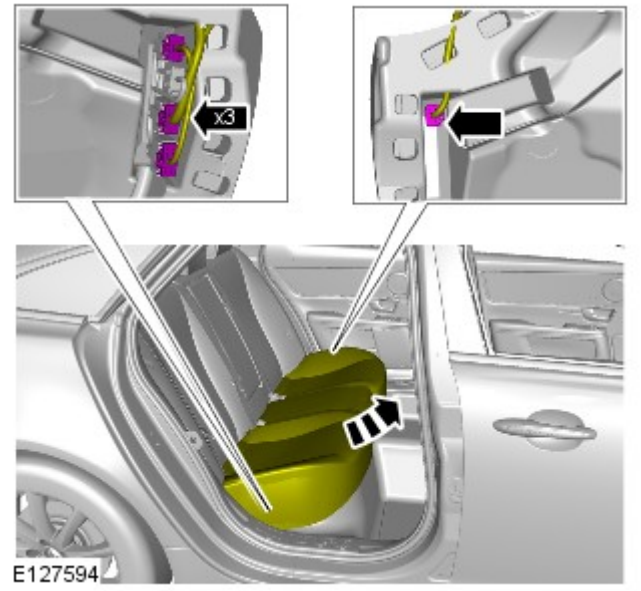
Removal and Installation

Removal

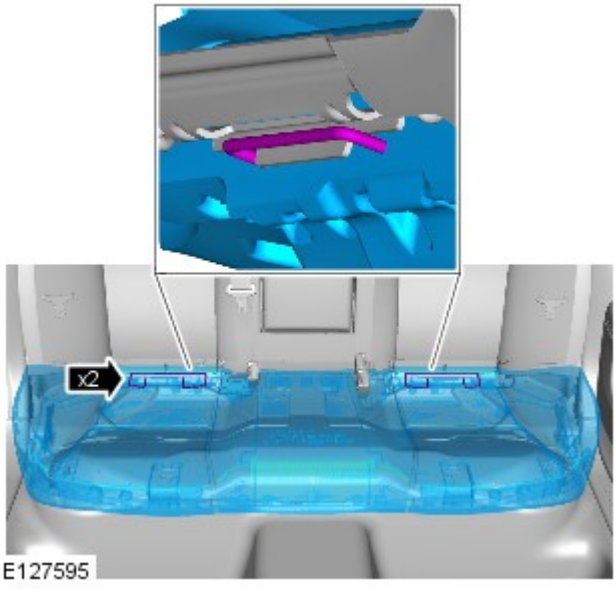
1.

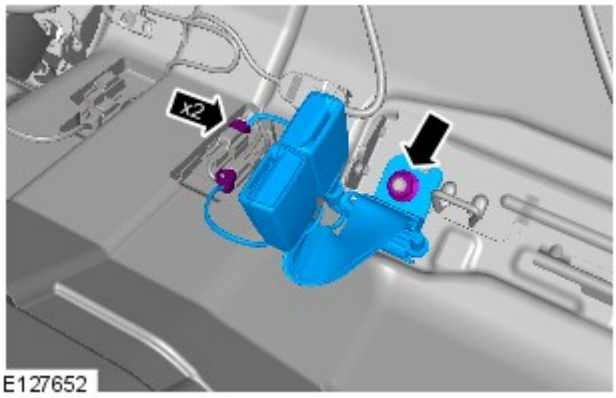


2.



3.





4. CAUTIONS:

Discard the bolt.

Make sure that a new bolt is installed.

Torque: 40 Nm

Installation

1. To install, reverse the removal procedure.

Published: 22-Feb-2016

Safety Belt System - Safety Belt System - Component Location

Description and Operation

NOTE: Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.

COMPONENT LOCATION

Item	Description
1	Belt tension sensor (NAS Vehicles Only)
2	RH (right-hand) front safety belt retractor (if fitted safety belt retractor pretensioner)
3	RH front safety belt
4	RH child seat mounting bracket
5	RH rear safety belt
6	RH rear safety belt retractor
7	Parcel tray child seat anchor (3 off)
8	Center rear safety belt retractor
9	LH (left-hand) rear safety belt retractor
10	LH child seat mounting bracket
11	LH and center rear safety belt buckles
12	RH rear safety belt buckle
13	LH front safety belt
14	LH front safety belt retractor (if fitted safety belt retractor pretensioner)
15	LH front safety belt buckle and pretensioner
16	RH front safety belt buckle and pretensioner

General Information - Diagnostic Trouble Code (DTC) Index DTC: Restraints Control Module (RCM)

Description and Operation

Restraints Control Module (RCM)

WARNINGS:

TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO DEPLETE THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

Do not use a multimeter to probe the restraints control module. It is possible for the power from the meter battery to trigger the activation of the airbags. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

It is advisable not to use a cellular phone or to have a cellular phone in close proximity when working on the restraints control module or associated systems.

Given the legal implications of a restraints system failure, harness repairs to Air Bag module circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Restraints Control Module (RCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual. For additional information, refer to: Air Bag Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Diagnosis and Testing) / Pedestrian Protection System (501-20C Pedestrian Protection System, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B0001-11	Driver Frontal Stage 1 Deployment Control - Circuit short to ground	• Driver airbag (stage 1) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag

B0001-12	Driver Frontal Stage 1 Deployment Control - Circuit short to battery	• Driver airbag (stage 1) circuit short to power	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to power. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-13	Driver Frontal Stage 1 Deployment Control - Circuit open	• Driver airbag (stage 1) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for open circuit, high resistance. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-1A	Driver Frontal Stage 1 Deployment Control - Circuit resistance below threshold	• Driver airbag (stage 1) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit between power and ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-2B	Driver Frontal Stage 1 Deployment Control - Signal cross coupled	• Driver airbag (stage 1) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to another restraints circuit. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-95	Driver Frontal Stage 1 Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0002-11	Driver Frontal Stage 2 Deployment Control - Circuit short to ground	• Driver airbag (stage 2) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit to ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-12	Driver Frontal Stage 2 Deployment Control - Circuit short to battery	• Driver airbag (stage 2) circuit short to power	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit to power. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-13	Driver Frontal Stage 2 Deployment Control - Circuit open	• Driver airbag (stage 2) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for open circuit, high resistance. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag

B0002-1A	Driver Frontal Stage 2 Deployment Control - Circuit resistance below threshold	• Driver airbag (stage 2) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit between power and ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-2B	Driver Frontal Stage 2 Deployment Control - Signal cross coupled	• Driver airbag (stage 2) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit to another restraints circuit. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-95	Driver Frontal Stage 2 Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0010-11	Passenger Frontal Stage 1 Deployment Control - Circuit short to ground	• Passenger airbag (stage 1) circuit short to ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-12	Passenger Frontal Stage 1 Deployment Control - Circuit short to battery	• Passenger airbag (stage 1) circuit short to power	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-13	Passenger Frontal Stage 1 Deployment Control - Circuit open	• Passenger airbag (stage 1) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-1A	Passenger Frontal Stage 1 Deployment Control - Circuit resistance below threshold	• Passenger airbag (stage 1) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-2B	Passenger Frontal Stage 1 Deployment Control - Signal cross coupled	• Passenger airbag (stage 1) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-95	Passenger Frontal Stage 1 Deployment control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0011-11	Passenger Frontal Stage 2 Deployment		• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists,

	Control - Circuit short to ground	• Passenger airbag (stage 2) circuit short to ground	using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-12	Passenger Frontal Stage 2 Deployment Control - Circuit short to battery	• Passenger airbag (stage 2) circuit short to power	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-13	Passenger Frontal Stage 2 Deployment Control - Circuit open	• Passenger airbag (stage 2) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-1A	Passenger Frontal Stage 2 Deployment Control - Circuit resistance below threshold	• Passenger airbag (stage 2) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-2B	Passenger Frontal Stage 2 Deployment Control - Signal cross coupled	• Passenger airbag (stage 2) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-95	Passenger Frontal Stage 2 Deployment control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0020-11	Left Side Air Bag Deployment Control - Circuit short to ground	• Left side airbag (seat) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-12	Left Side Air Bag Deployment Control - Circuit short to battery	• Left side airbag (seat) circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-13	Left Side Airbag Deployment Control - Circuit open	• Left side airbag (seat) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-1A	Left Side Air Bag Deployment Control - Circuit resistance below threshold	• Left side airbag (seat) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)

B0020-2B	Left Side Air Bag Deployment Control - Signal cross coupled	• Left side airbag (seat) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-95	Left Side Airbag Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0021-11	Left Curtain Deployment Control 1 - Circuit short to ground	• Left side air curtain circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-12	Left Curtain Deployment Control 1 - Circuit short to battery	• Left side air curtain circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-13	Left Curtain Deployment Control 1 - Circuit open	• Left side air curtain circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-1A	Left Curtain Deployment Control 1 - Circuit resistance below threshold	• Left side air curtain circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-2B	Left Curtain Deployment Control 1 - Signal cross coupled	• Left side air curtain circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-95	Left Curtain Deployment Control 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0028-11	Right Side Air Bag Deployment Control - Circuit short to ground	• Right side airbag (seat) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-12	Right Side Air Bag Deployment Control - Circuit short to battery	• Right side airbag (seat) circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
	Right Side Airbag Deployment	• Right side airbag (seat) circuit open	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault

B0028-13	Control - Circuit open	circuit, high resistance	exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-1A	Right Side Air Bag Deployment Control - Circuit resistance below threshold	• Right side airbag (seat) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-2B	Right Side Air Bag Deployment Control - Signal cross coupled	• Right side airbag (seat) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-95	Right Side Airbag Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0029-11	Right Curtain Deployment Control 1 - Circuit short to ground	• Right side air curtain circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-12	Right Curtain Deployment Control 1 - Circuit short to battery	• Right side air curtain circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-13	Right Curtain Deployment Control 1 - Circuit open	• Right side air curtain circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-1A	Right Curtain Deployment Control 1 - Circuit resistance below threshold	• Right side air curtain circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-2B	Right Curtain Deployment Control 1 - Signal cross coupled	• Right side air curtain circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-95	Right Curtain Deployment Control 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0050-11	Driver Seatbelt Sensor - Circuit short to ground	• Driver buckle switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to ground

B0050-12	Driver Seatbelt Sensor - Circuit short to battery	• Driver buckle switch circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to power
B0050-13	Driver Seatbelt Sensor - Circuit open	• Driver buckle switch circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for open circuit, high resistance
B0050-1E	Driver Seatbelt Sensor - Circuit resistance out of range	• Driver buckle switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0050-2B	Driver Seatbelt Sensor - Signal cross coupled	• Driver buckle switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to another restraints circuit
B0050-95	Driver Seatbelt Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0052-11	Passenger Seatbelt Sensor - Circuit short to ground	• Passenger buckle switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to ground
B0052-12	Passenger Seatbelt Sensor - Circuit short to battery	• Passenger buckle switch circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to power
B0052-13	Passenger Seatbelt Sensor - Circuit open	• Passenger buckle switch circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for open circuit, high resistance
B0052-1E	Passenger Seatbelt Sensor - Circuit resistance out of range	• Passenger buckle switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0052-2B	Passenger Seatbelt Sensor - Signal cross coupled	• Passenger buckle switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to another restraints circuit
B0052-95	Passenger Seatbelt Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software

B0070-11	Driver Seatbelt Pretensioner Deployment Control - Circuit short to ground	• Driver seatbelt pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-12	Driver Seatbelt Pretensioner Deployment Control - Circuit short to battery	• Driver seatbelt pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-13	Driver Seatbelt Pretensioner Deployment Control - Circuit open	• Driver seatbelt pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-1A	Driver Seatbelt Pretensioner Deployment Control - Circuit resistance below threshold	• Driver seatbelt pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-2B	Driver Seatbelt Pretensioner Deployment Control - Signal cross coupled	• Driver seatbelt pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-95	Driver Seatbelt Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0072-11	Passenger Seatbelt Pretensioner Deployment Control - Circuit short to ground	• Passenger seatbelt pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-12	Passenger Seatbelt Pretensioner Deployment Control - Circuit short to battery	• Passenger seatbelt pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-13	Passenger Seatbelt Pretensioner Deployment Control - Circuit open	• Passenger seatbelt pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-1A	Passenger Seatbelt Pretensioner Deployment Control - Circuit resistance below threshold	• Passenger seatbelt pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner

B0072-2B	Passenger Seatbelt Pretensioner "A" Deployment Control - Signal cross coupled	• Passenger seatbelt pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-95	Passenger Seatbelt Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0090-11	Left Frontal Restraints Sensor - Circuit short to ground	• Front left impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to ground
B0090-12	Left Frontal Restraints Sensor - Circuit short to battery	• Front left impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to power
B0090-2B	Left Frontal Restraints Sensor - Signal cross coupled	• Front left impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to another impact sensor circuit
B0090-4A	Left Frontal Restraints Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0090-87	Left Frontal Restraints Sensor - Missing message	• Front left impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0090-92	Left Frontal Restraints Sensor - Performance or incorrect operation	• Front left impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0090-95	Left Frontal Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0090-96	Left Frontal Restraints Sensor - Component internal failure	• Front left impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0091-11	Left Side Restraints Sensor 1 - Circuit short to ground	• Left C pillar impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to ground
B0091-12	Left Side Restraints Sensor 1 - Circuit short to battery	• Left C pillar impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to power

B0091-2B	Left Side Restraints Sensor 1 - Signal cross coupled	• Left C pillar impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to another impact sensor circuit
B0091-4A	Left Side Restraints Sensor 1 - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0091-87	Left Side Restraints Sensor 1 - Missing message	• Left C pillar impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0091-92	Left Side Restraints Sensor 1 - Performance or incorrect operation	• Left C pillar impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0091-95	Left Side Restraints Sensor 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0091-96	Left Side Restraints Sensor 1 - Component internal failure	• Left C pillar impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0095-11	Right Frontal Restraints Sensor - Circuit short to ground	• Front right impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to ground
B0095-12	Right Frontal Restraints Sensor - Circuit short to battery	• Front right impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to power
B0095-2B	Right Frontal Restraints Sensor - Signal cross coupled	• Front right impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to another impact sensor circuit
B0095-4A	Right Frontal Restraints Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0095-87	Right Frontal Restraints Sensor - Missing message	• Front right impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance

B0095-92	Right Frontal Restraints Sensor - Performance or incorrect operation	• Front right impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0095-95	Right Frontal Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0095-96	Right Frontal Restraints Sensor - Component internal failure	• Front right impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0096-11	Right Side Restraints Sensor 1 - Circuit short to ground	• Right C pillar impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to ground
B0096-12	Right Side Restraints Sensor 1 - Circuit short to battery	• Right C pillar impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to power
B0096-2B	Right Side Restraints Sensor 1 - Signal cross coupled	• Right C pillar impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to another impact sensor circuit
B0096-4A	Right Side Restraints Sensor 1 - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B0096-87	Right Side Restraints Sensor 1 - Missing message	• Right C pillar impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0096-92	Right Side Restraints Sensor 1 - Performance or incorrect operation	• Right C pillar impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B0096-95	Right Side Restraints Sensor 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0096-96	Right Side Restraints Sensor 1 - Component internal failure	• Right C pillar impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B00B5-11	Driver Seat Track Position Restraints Sensor - Circuit short to ground	• Driver seat track position sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to ground
	Driver Seat Track		

B00B5-12	Position Restraints Sensor - Circuit short to battery	• Driver seat track position sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to power
B00B5-13	Driver Seat Track Position Restraints Sensor - Circuit open	• Driver seat track position sensor circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for open circuit, high resistance
B00B5-1E	Driver Seat Track Position Restraints Sensor - Circuit resistance out of range	• Driver seat track position sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B00B5-2B	Driver Seat Track Position Restraints Sensor - Signal cross coupled	• Driver seat track position sensor circuit short circuit to another position sensor circuit	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to another position sensor circuit
B00B5-95	Driver Seat Track Position Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B00C5-11	Passenger Seat Track Position Restraints Sensor - Circuit short to ground	• Passenger seat track position sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to ground
B00C5-12	Passenger Seat Track Position Restraints Sensor - Circuit short to battery	• Passenger seat track position sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to power
B00C5-13	Passenger Seat Track Position Restraints Sensor - Circuit open	• Passenger seat track position sensor circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for open circuit, high resistance
B00C5-1E	Passenger Seat Track Position Restraints Sensor - Circuit resistance out of range	• Passenger seat track position sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B00C5-2B	Passenger Seat Track Position Restraints Sensor - Signal cross coupled	• Passenger seat track position sensor circuit short circuit to another position sensor circuit	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to another position sensor circuit
	Passenger Seat		

B00C5-95	Track Position Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B00D2-68	Restraint System Malfunction Indicator 1 - Event information	• Restraints warning indicator fault reported by the instrument cluster	• Using the manufacturer approved diagnostic system, check the instrument cluster for related DTCs and refer to the relevant DTC index
B00D5-12	Restraint System Passenger Disable Indicator - Circuit short to battery	• Passenger airbag deactivation warning indicator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation warning indicator circuit for short circuit to power
B00D5-14	Restraint System Passenger Disable Indicator - Circuit short to ground or open	• Passenger airbag deactivation warning indicator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation warning indicator circuit for short circuit to ground, open circuit, high resistance
B00D5-95	Restraint System Passenger Disable Indicator - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1001-11	Right Hood Deployment Control - Circuit short to ground	• Right hood deployment control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-12	Right Hood Deployment Control - Circuit short to battery	• Right hood deployment control circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-13	Right Hood Deployment Control - Circuit open	• Right hood deployment control circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-1A	Right Hood Deployment Control - Circuit resistance below threshold	• Right hood deployment control circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-2B	Right Hood Deployment Control - Signal	• Right hood deployment control circuit	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring

	cross coupled	short circuit to another restraints circuit	harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-95	Right Hood Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1003-11	Left Hood Deployment Control - Circuit short to ground	• Left hood deployment control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-12	Left Hood Deployment Control - Circuit short to battery	• Left hood deployment control circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-13	Left Hood Deployment Control - Circuit open	• Left hood deployment control circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-1A	Left Hood Deployment Control - Circuit resistance below threshold	• Left hood deployment control circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-2B	Left Hood Deployment Control - Signal cross coupled	• Left hood deployment control circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-95	Left Hood Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1004-11	Right Frontal Impact Classification Sensor - Circuit short to ground	• Pedestrian right impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to ground
B1004-12	Right Frontal Impact Classification Sensor - Circuit short to battery	• Pedestrian right impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to power
B1004-2B	Right Frontal Impact Classification Sensor - Signal cross coupled	• Pedestrian right impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to another impact sensor circuit
	Right Frontal		

B1004-4A	Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1004-87	Right Frontal Impact Classification Sensor - Missing message	• Pedestrian right impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1004-92	Right Frontal Impact Classification Sensor - Performance or incorrect operation	• Pedestrian right impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1004-95	Right Frontal Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1004-96	Right Frontal Impact Classification Sensor - Component internal failure	• Pedestrian right impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1005-11	Left Frontal Impact Classification Sensor - Circuit short to ground	• Pedestrian left impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to ground
B1005-12	Left Frontal Impact Classification Sensor - Circuit short to battery	• Pedestrian left impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to power
B1005-2B	Left Frontal Impact Classification Sensor - Signal cross coupled	• Pedestrian left impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to another impact sensor circuit
B1005-4A	Left Frontal Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian left impact sensor
B1005-87	Left Frontal Impact Classification Sensor - Missing message	• Pedestrian left impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1005-92	Left Frontal Impact Classification Sensor -		• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and

	Performance or incorrect operation	• Pedestrian left impact sensor signal invalid	retest. If the fault persists, install a new pedestrian left impact sensor
B1005-95	Left Frontal Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1005-96	Left Frontal Impact Classification Sensor - Component internal failure	• Pedestrian left impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian left impact sensor
B1006-11	Center Front Impact Classification Sensor - Circuit short to ground	• Pedestrian center impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to ground
B1006-12	Center Front Impact Classification Sensor - Circuit short to battery	• Pedestrian center impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to power
B1006-2B	Center Front Impact Classification Sensor - Signal cross coupled	• Pedestrian center impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to another impact sensor circuit
B1006-4A	Center Front Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor
B1006-87	Center Front Impact Classification Sensor - Missing message	• Pedestrian center impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1006-92	Center Front Impact Classification Sensor - Performance or incorrect operation	• Pedestrian center impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor
B1006-95	Center Front Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1006-96	Center Front Impact Classification Sensor - Component internal failure	• Pedestrian center impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor

B1193-68	Crash Event Storage Full And Locked - Event information	• Pedestrian protection system deployment events maximum number reached	NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary. Install a new restraints control module
B11A0-11	Left Side Restraints Pressure Sensor - Circuit short to ground	• Left impact pressure sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to ground
B11A0-12	Left Side Restraints Pressure Sensor - Circuit short to battery	• Left impact pressure sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to power
B11A0-2B	Left Side Restraints Pressure Sensor - Signal cross coupled	• Left impact pressure sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to another impact sensor circuit
B11A0-4A	Left Side Restraints Pressure Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A0-87	Left Side Restraints Pressure Sensor - Missing message	• Left impact pressure sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B11A0-92	Left Side Restraints Pressure Sensor - Performance or incorrect operation	• Left impact pressure sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A0-95	Left Side Restraints Pressure Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B11A0-96	Left Side Restraints Pressure Sensor - Component internal failure	• Left impact pressure sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A1-11	Right Side Restraints Pressure Sensor - Circuit short to ground	• Right impact pressure sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to ground
B11A1-12	Right Side Restraints Pressure Sensor - Circuit short to battery	• Right impact pressure sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to power
	Right Side Restraints Pressure Sensor -	• Right impact pressure sensor circuit short	

B11A1-2B	Signal cross coupled	circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to another impact sensor circuit
B11A1-4A	Right Side Restraints Pressure Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor
B11A1-87	Right Side Restraints Pressure Sensor - Missing message	• Right impact pressure sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B11A1-92	Right Side Restraints Pressure Sensor - Performance or incorrect operation	• Right impact pressure sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor
B11A1-95	Right Side Restraints Pressure Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B11A1-96	Right Side Restraints Pressure Sensor - Component internal failure	• Right impact pressure sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor
B11D8-68	Restraint Event Notification - Event information	• Pedestrian protection system has been deployed	NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary
B1206-68	Crash Occurred - Event information	• Crash event recorded	NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary
B1211-11	Driver Seatbelt Retractor Pretensioner Deployment Control - Circuit short to ground	• Driver seatbelt retractor and pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-12	Driver Seatbelt Retractor Pretensioner Deployment Control - Circuit short to battery	• Driver seatbelt retractor and pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-13	Driver Seatbelt Retractor Pretensioner Deployment Control - Circuit open	• Driver seatbelt retractor and pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-1A	Driver Seatbelt Retractor Pretensioner Deployment	• Driver seatbelt retractor and pretensioner circuit short	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the

	Control - Circuit resistance below threshold	circuit between power and ground	manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-2B	Driver Seatbelt Retractor Pretensioner Deployment Control - Signal cross coupled	• Driver seatbelt retractor and pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-95	Driver Seatbelt Retractor Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1214-11	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit short to ground	• Passenger seatbelt retractor and pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-12	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit short to battery	• Passenger seatbelt retractor and pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-13	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit open	• Passenger seatbelt retractor and pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-1A	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit resistance below threshold	• Passenger seatbelt retractor and pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-2B	Passenger Seatbelt Retractor Pretensioner Deployment Control - Signal cross coupled	• Passenger seatbelt retractor and pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-95	Passenger Seatbelt Retractor Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
		NOTE: Circuit reference - E_N_S -	

B1A55-12	Crash Record Output - Circuit short to battery	• Event notification signal circuit short circuit to power	• Refer to the electrical circuit diagrams and check the event notification signal circuit for short circuit to power
B1A55-14	Crash Record Output - Circuit short to ground or open	NOTE: Circuit reference - E_N_S - • Event notification signal circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the event notification signal circuit for short circuit to ground, open circuit, high resistance
B1D74-11	Passenger Airbag Cutoff Enable Switch - Circuit short to ground	• Passenger airbag deactivation switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to ground
B1D74-12	Passenger Airbag Cutoff Enable Switch - Circuit short to battery	• Passenger airbag deactivation switch circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to power
B1D74-13	Passenger Airbag Cutoff Enable Switch - Circuit open	• Passenger airbag deactivation switch circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for open circuit, high resistance
B1D74-1E	Passenger Airbag Cutoff Enable Switch - Circuit resistance out of range	• Passenger airbag deactivation switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1D74-2B	Passenger Airbag Cutoff Enable Switch - Signal cross coupled	• Passenger airbag deactivation switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to another restraints circuit
B1D74-95	Passenger Airbag Cutoff Enable Switch - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
U0001-88	High Speed CAN Communication Bus - Bus off	• High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance

U0100-87	Lost Communication With ECM/PCM "A" - Missing message	• Engine control module power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Engine system fault	• Refer to the electrical circuit diagrams and check the engine control module power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the engine control module for related DTCs and refer to the relevant DTC index
U0121-87	Lost Communication With Anti-Lock Brake System (ABS) Control Module - Missing message	• Anti-lock brake system control module power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Anti-lock brake system fault	• Refer to the electrical circuit diagrams and check the anti-lock brake system control module power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the anti-lock brake system control module for related DTCs and refer to the relevant DTC index
U0140-87	Lost Communication With Body Control Module - Missing message	• Central junction box power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Central junction box system fault	• Refer to the electrical circuit diagrams and check the central junction box power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the central junction box for related DTCs and refer to the relevant DTC index
U0154-87	Lost Communication With Restraints Occupant Classification System Module - Missing message	• Occupant classification sensor control module power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Occupant classification system fault	• Refer to the electrical circuit diagrams and check the occupant classification sensor control module power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the occupant classification sensor control module for related DTCs and refer to the relevant DTC index
U0155-87	Lost Communication With Instrument Panel Cluster (IPC) Control	• Instrument cluster power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short	• Refer to the electrical circuit diagrams and check the instrument cluster power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit

	Module - Missing message	circuit to power, open circuit, high resistance • Instrument cluster system fault	diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the instrument cluster for related DTCs and refer to the relevant DTC index
U0300-00	Internal Control Module Software Incompatibility - No sub type information	• Car configuration file mismatch with vehicle specification • Incorrect restraints control module installed	• Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary • Install a new restraints control module as necessary
U0415-29	Invalid Data Received From Anti-Lock Brake System (ABS) Control Module - Signal invalid	• Missing/invalid data from the anti-lock brake system control module	• Using the manufacturer approved diagnostic system, check the anti-lock brake system control module for related DTCs and refer to the relevant DTC index
U0455-55	Invalid Data Received From Restraints Occupant Classification System Module - Not configured	• Car configuration file mismatch with vehicle specification • Incorrect passenger seat installed	• Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary • Install a new passenger seat as necessary
U0455-92	Invalid Data Received From Restraints Occupant Classification System Module - Performance or incorrect operation	• Missing/invalid data from the occupant classification sensor control module	• Using the manufacturer approved diagnostic system, check the occupant classification sensor control module for related DTCs and refer to the relevant DTC index
U0455-93	Invalid Data Received From Restraints Occupant Classification System Module - No operation	• Missing/invalid data from the occupant classification sensor control module	• Using the manufacturer approved diagnostic system, check the occupant classification sensor control module for related DTCs and refer to the relevant DTC index
U0455-95	Invalid Data Received From Restraints Occupant Classification System Module - Incorrect assembly	• Mismatch between restraints control module and occupant classification sensor control module software	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software. If the fault persists, re-configure the occupant classification sensor control module with the latest level software
U1A14-55	CAN Initialisation Failure - Not configured	• Restraints control module internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new restraints control module
U2100-00	Initial Configuration Not Complete - No sub type information	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
U2101-00	Control Module Configuration	• Car configuration file mismatch with	

	Incompatible - No sub type information	vehicle specification	• Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary
U2101-4A	Control Module Configuration Incompatible - Incorrect component installed	• Incorrect restraints control module installed	• Install the original or a new restraints control module as necessary
U3000-49	Control Module - Internal electronic failure	• Restraints control module internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new restraints control module
U3006-17	Control Module Input Power "A" - Circuit voltage above threshold	• Battery/charging system fault	• Using the manufacturer approved diagnostic system, check datalogger signal - ECU Power Supply Voltage (0xD112). Refer to the relevant section of the workshop manual and test the battery and charging system
U3006-68	Control Module Input Power "A" - Event information	• Restraints control module power or ground circuit open circuit, high resistance • Battery/charging system fault	• Using the manufacturer approved diagnostic system, check datalogger signal - ECU Power Supply Voltage (0xD112). Refer to the electrical circuit diagrams and check the restraints control module power and ground circuits for open circuit, high resistance • Refer to the relevant section of the workshop manual and test the battery and charging system

Published: 20-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Active Safety Belt Module (SPMA/SPMB)

Description and Operation

Active Safety Belt Module (SPMA/SPMB)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Active Safety Belt Module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.
For additional information, refer to: Safety Belt System (501-20A Safety Belt System, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
U1A14-00	CAN Initialization Failure - No sub type information	• Power distribution fault to control module • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network. After installing a new control module, updating software or repairing a wiring harness perform an On Demand Self Test and Retract and Release Self Test using the manufacturers approved diagnostic system
U2001-68	Reduced System Function - Event information	• Seat belt retractor mechanism has exceeded the design limit for the durability	NOTE: If required, it is only necessary to install a new component on the side affected by the DTC. • Confirm the Safety belt retractor mechanism has exceeded the design limit for durability by interrogating the Active Safety Belt Module. Using the manufacturer approved diagnostic system check the Dynamic Safety belt Health Status at PID5824, if the Safety belt status is confirmed as 'not healthy' (01) install a new retractor mechanism as required. If the Safety belt status is 'healthy' (00) clear the DTC and Refer to the workshop manual section 501-20A and perform the Retract and Release Self Test using the manufacturers approved diagnostic system. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
U2101-00	Control Module Configuration Incompatible - No sub type information	• The control module is not compatible with the vehicle	• Check the vehicle configuration file to ensure the vehicle configuration is correct for the installed hardware. The Active Safety Belt Control Modules are handed (connector shell is different between LH and RH sides) and cannot be installed on another vehicle as they store VIN data. Using the manufacturer approved diagnostic system run the routine RID 0402h to clear self learnt data (except VIN). Cycle the ignition and the module should re-learn the correct configuration. clear the DTC and Refer to the workshop manual section 501-20A and perform the Retract and Release Self Test using the manufacturers approved diagnostic system. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
U3000-45	Control Module - Program memory failure	• Component internal memory failure	• Install a new control module, refer to the Warranty Policy and Procedures manual if a module/component is suspect. After installing a new control module, updating software or repairing a wiring harness perform an On Demand Self Test and Retract and Release Self Test using the manufacturers approved diagnostic system
U3000-49	Control Module - Internal electronic failure	• Component internal electronic failure	• Install a new control module, refer to the Warranty Policy and Procedures manual if a module/component is suspect. After installing a new control module, updating software or repairing a wiring harness perform an On Demand Self Test and Retract and Release Self Test using the manufacturers approved diagnostic system
U3000-4B	Control Module - Over temperature	• Belt retraction motor has exceeded the design operating temperature	• During 'aggressive' cornering or braking the belt mechanism will operate to ensure the occupant is correctly positioned in the seat. This DTC is set when the belt retraction motor has exceeded the temperature threshold and functionality is inhibited until the motor has cooled. Allow the motor to cool and then clear the DTC. If the DTC resets refer to the Warranty Policy and Procedures manual if a module/component is suspect. After installing a new control module, updating software or repairing a wiring harness perform an On Demand Self Test and Retract and Release Self Test using the manufacturers approved diagnostic system
U3002-81	Vehicle Identification Number -	• Vehicle identification number not stored	

	Invalid serial data received	• New module configuration routine not completed	• Using the manufacturer approved diagnostic system carry out the new module configuration routine
U3003-62	Battery Voltage - Signal compare failure	• Power distribution fault to control module • CAN network fault	• This DTC is set when the control module registers a difference of more than 2 volts between the CAN reference battery voltage and the module supply voltage. Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network. After installing a new control module, updating software or repairing a wiring harness perform an On Demand Self Test and Retract and Release Self Test using the manufacturers approved diagnostic system
U3006-16	Control Module Input Power "A" - Circuit voltage below threshold	• Vehicle battery discharged • Power distribution fault to control module causing volt drop on supply circuits • Internal control module fault	• This DTC is set when the measured supply voltage is below 9 volts. Refer to the battery care manual and confirm vehicle battery is fully charged and serviceable. Refer to the relevant section in the workshop manual and check the charging system is performing correctly. Refer to the electrical circuit diagrams and check the power and ground connections to the module. If no faults are found suspect the control module, refer to the Warranty Policy and Procedures manual if a module/component is suspect
U3006-17	Control Module Input Power "A" - Circuit voltage above threshold	• Vehicle charging system fault • Internal control module fault	• This DTC is set when the measured supply voltage is above 16 volts. Refer to the battery care manual and confirm vehicle battery is fully charged and serviceable. Refer to the relevant section in the workshop manual and check the charging system is performing correctly. Refer to the electrical circuit diagrams and check the power and ground connections to the module. If no faults are found suspect the control module, refer to the Warranty Policy and Procedures manual if a module/component is suspect
U0452-29	Invalid Data Received From Restraints Control Module - Signal invalid	• Supplementary Restraints System fault • Restraints Control Module fault	• Check the Restraints Control Module for related DTCs and refer to the relevant DTC index
U0452-31	Invalid Data Received From Restraints Control Module - No signal	• Supplementary Restraints System fault • Restraints Control Module fault	• Check the Restraints Control Module for related DTCs and refer to the relevant DTC index
U0415-29	Invalid Data Received From Anti-Lock Braking System (ABS) Control Module - Signal invalid	• Anti-Lock Braking System fault • Anti-Lock Braking System control module fault	• Check the Anti-Lock Braking System Control Module for related DTCs and refer to the relevant DTC index
U0415-31	Invalid Data Received From Anti-Lock Braking System (ABS) Control Module - No signal	• Anti-Lock Braking System fault • Anti-Lock Braking System control module fault	• Check the Anti-Lock Braking System Control Module for related DTCs and refer to the relevant DTC index
	Invalid Data Received From		

U0422-29	Body Control Module - Signal invalid	• Central Junction Box system fault	• Check the Central Junction Box for related DTCs and refer to the relevant DTC index
U0422-31	Invalid Data Received From Body Control Module - No signal	• Central Junction Box system fault	• Check the Central Junction Box for related DTCs and refer to the relevant DTC index
U0423-29	Invalid Data Received From Instrument Panel Control Module - Signal invalid	• Instrument Panel Control Module system fault	• Check the Instrument Panel Control Module for related DTCs and refer to the relevant DTC index
U0423-31	Invalid Data Received From Instrument Panel Control Module - No signal	• Instrument Panel Control Module system fault	• Check the Instrument Panel Control Module for related DTCs and refer to the relevant DTC index
U0001-88	High Speed CAN Communication Bus - Bus off	• Power distribution fault to control module • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network. After installing a new control module, updating software or repairing a wiring harness perform an On Demand Self Test and Retract and Release Self Test using the manufacturers approved diagnostic system
U0104-00	Lost Communication With Cruise Control Module - No sub type information	• Power distribution fault to control module • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Active Safety Belt Module and Speed Control Module
U0405-29	Invalid Data Received From Cruise Control Module - Signal invalid	• Speed control system related fault	• Check the Speed Control Module for related DTCs and refer to the relevant DTC index
U0103-00	Lost Communication With Gear Shift Control Module A - No sub type information	• Power distribution fault to control module • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Active Safety Belt Module and Transmission Shift Control Module

Safety Belt System - Safety Belt System - Overview

Description and Operation

OVERVIEW

NOTE: Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.

A three point safety belt is installed at each seat position. The front safety belts have height adjusters installed on the B/C pillars.

As part of the SRS (supplemental restraint system) system, a pyrotechnic pretensioner is integrated into each front safety belt buckle and each front safety belt retractor. A tension sensor is installed on the anchor point of the front passenger safety belt for NAS only vehicles.
Refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).

A safety belt reminder and a belt minder system warn the driver if the safety belt of an occupied front seat is not fastened, or if a front or rear safety belt is unfastened during the journey.

ISOFIX anchor points are provided for the installation of rear child seats. Three anchor points are attached to the parcel tray and two mounting brackets are incorporated into the rear seat hinge brackets.

Supplemental Restraint System - Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) - Component Location

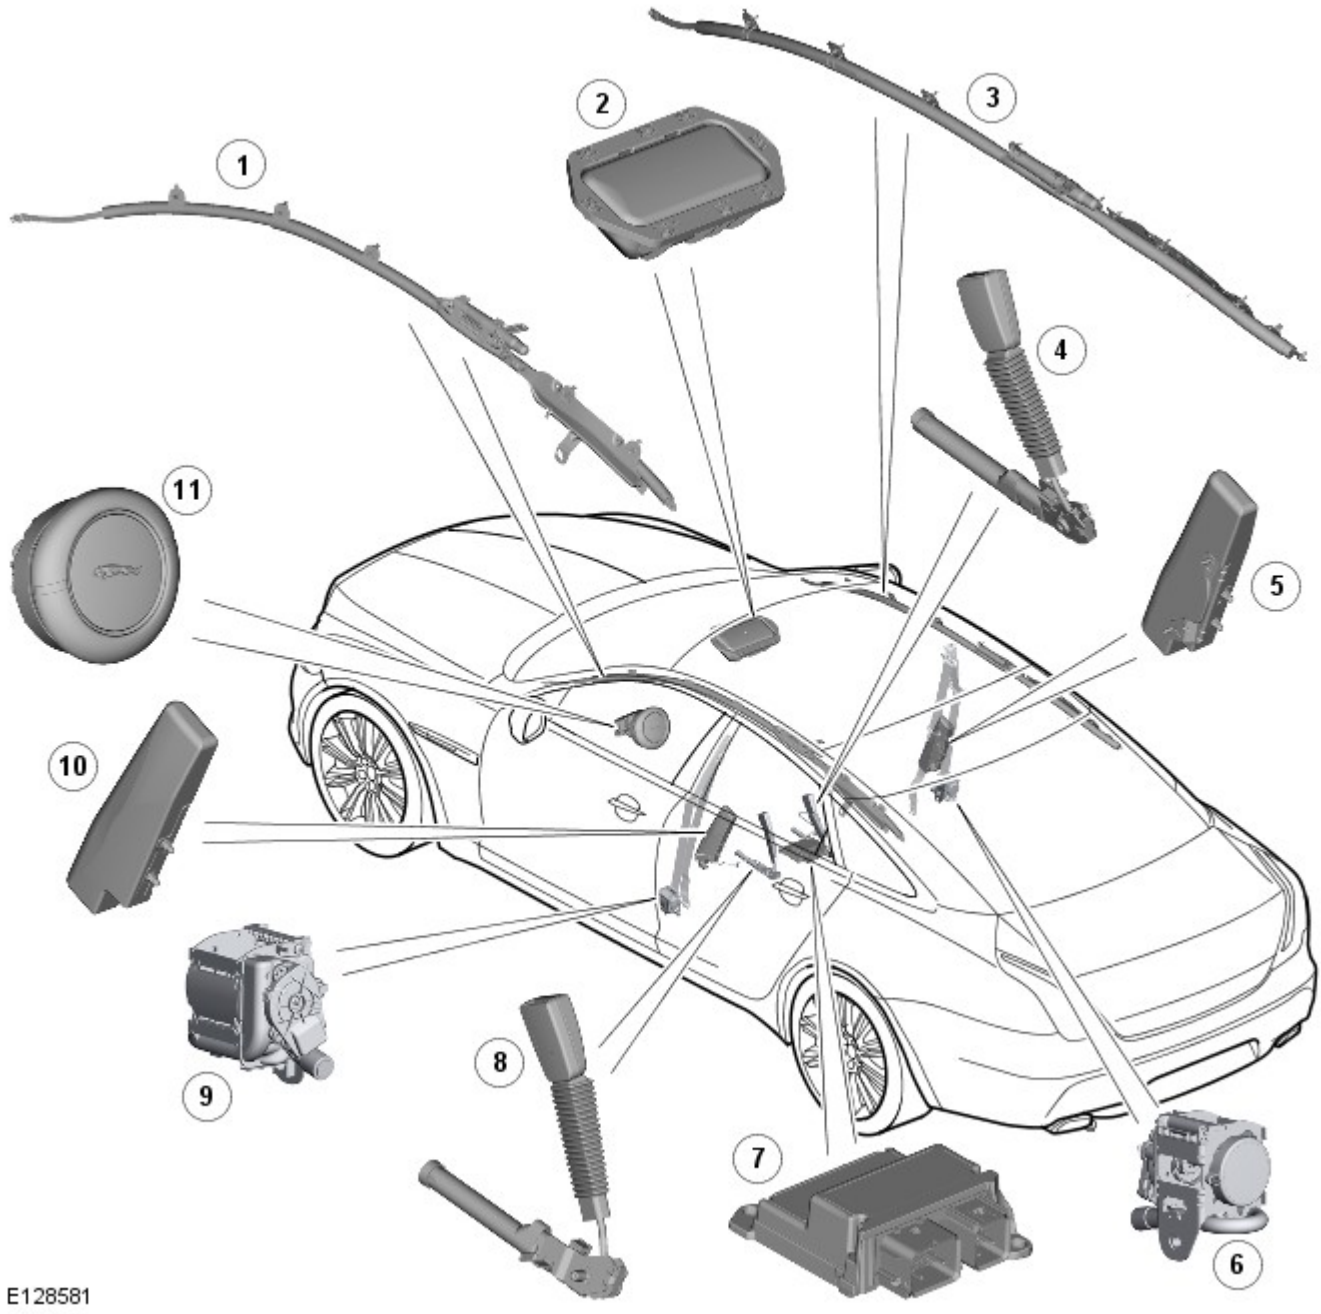
Description and Operation

NOTES:

LHD (left-hand drive) installations shown; RHD (right-hand drive) installations similar.

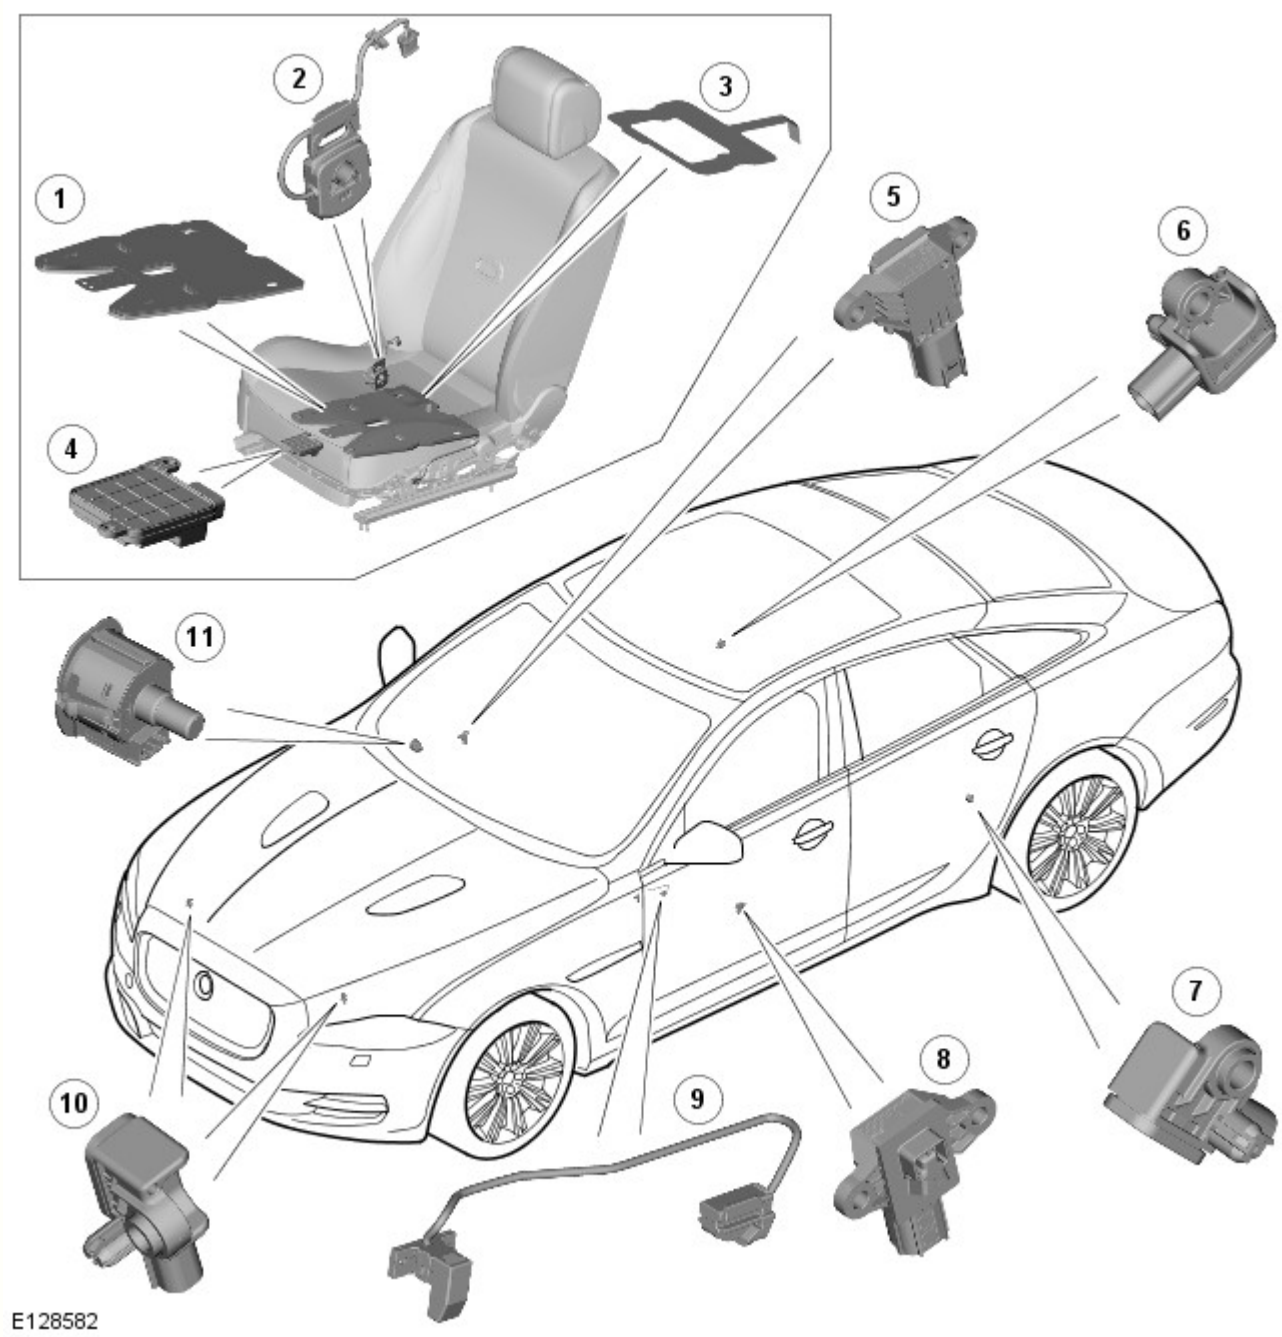
Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.

COMPONENT LOCATION - SHEET 1 OF 2



Item	Description
1	LH (left-hand) side air curtain
2	Passenger air bag
3	RH (right-hand) side air curtain
4	Passenger pretensioner
5	Passenger side airbag
6	RH safety belt retractor pretensioner (if fitted)
7	RCM (restraints control module)
8	Driver pretensioner
9	LH safety belt retractor pretensioner (if fiited)
10	Driver side air bag
11	Driver air bag

COMPONENT LOCATION - SHEET 2 OF 2



Item	Description
1	Bladder and pressure sensor (NAS only)
2	Safety belt tension sensor (NAS only)
3	Occupant detection sensor (all except NAS)
4	Control module (NAS only)
5	RH pressure sensor
6	RH rear impact sensor
7	LH rear impact sensor
8	LH pressure sensor
9	Driver seat position sensor
10	Front impact sensor (2 off)
11	PAD (passenger air bag deactivation) switch (where fitted)

Safety Belt System - Safety Belt System Armoured

Description and Operation

COMPONENT LOCATION

E131387

OVERVIEW

All armored vehicles are configured for four seats, so the rear seat row only has safety belts installed at the outer seat positions.

The rear seat row has lower ISOfix anchor points as on non-armored vehicles, but there are no upper tether points.

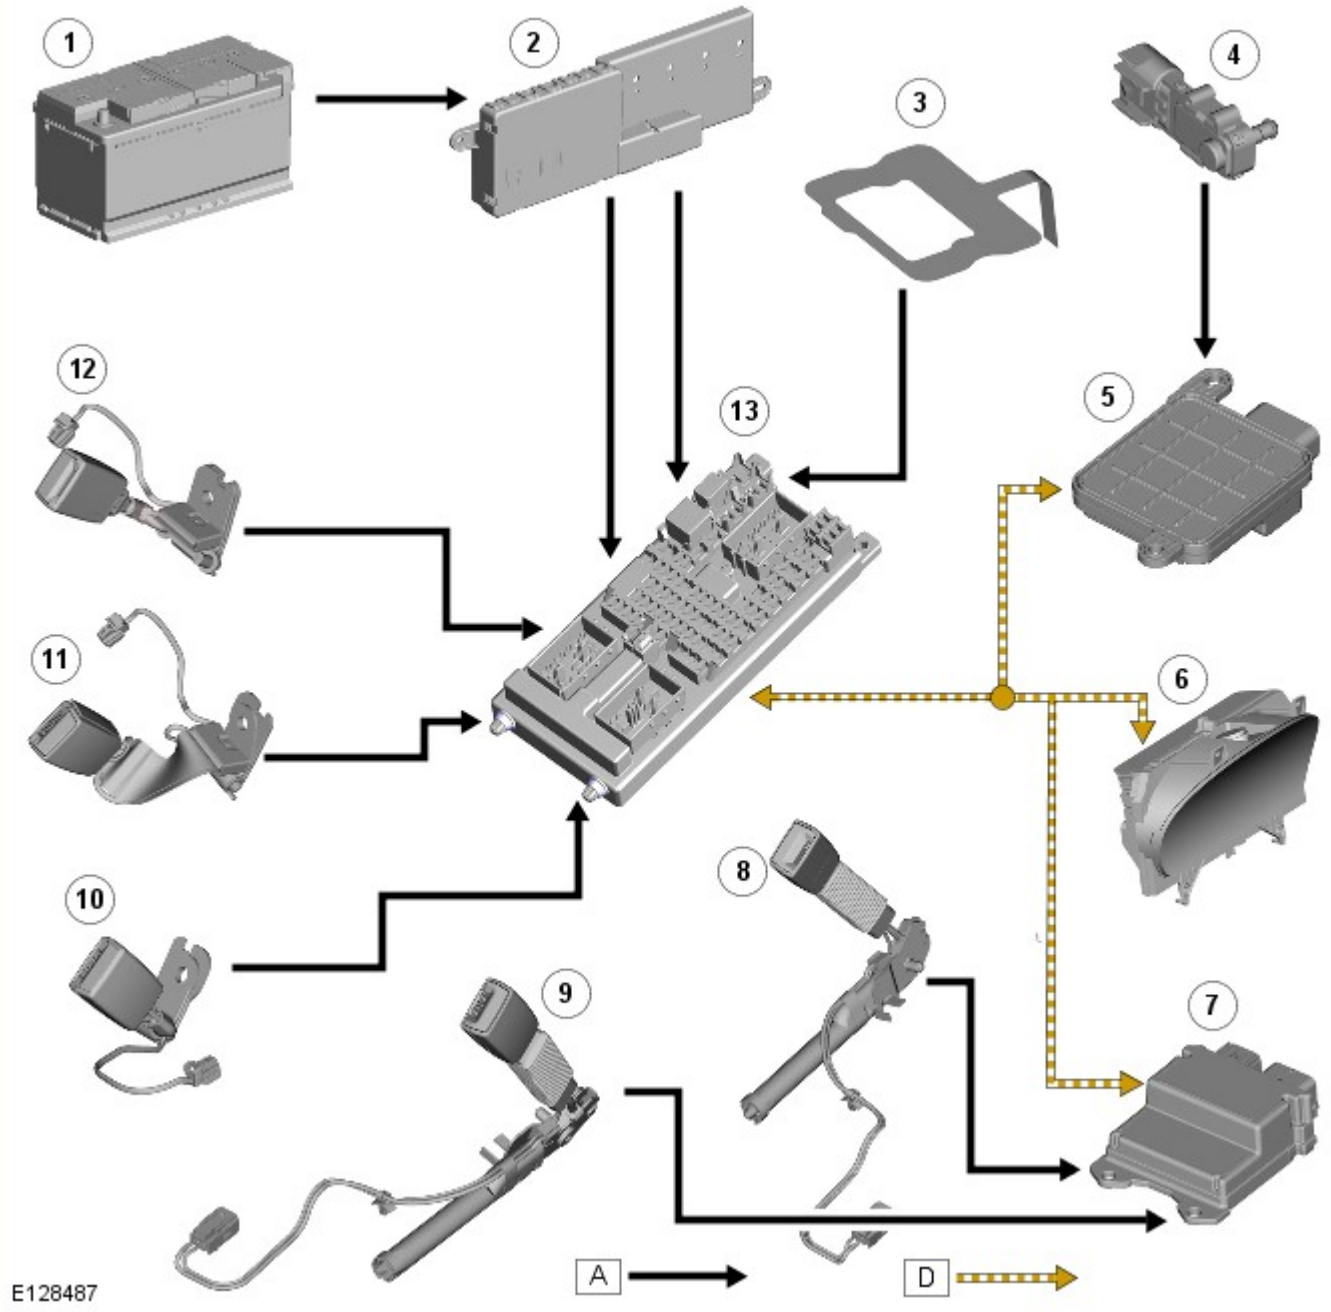
Safety Belt System - Safety Belt System - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: A = Hardwired; D = High speed CAN (controller area network) bus.

SAFETY BELT REMINDER/BELTMINDER SYSTEM



Item	Description
1	Battery
2	BJB (battery junction box) (40 A midi fuse (2 off))
3	Occupant detection sensor (where fitted)
4	Pressure sensor (where fitted)
5	Occupant classification module (where fitted)
6	Instrument cluster
7	RCM (restraints control module)

8	LH (left-hand) front buckle switch
9	RH (right-hand) front buckle switch
10	RH rear buckle switch
11	Center rear buckle switch
12	LH rear buckle switch
13	CJB (central junction box)

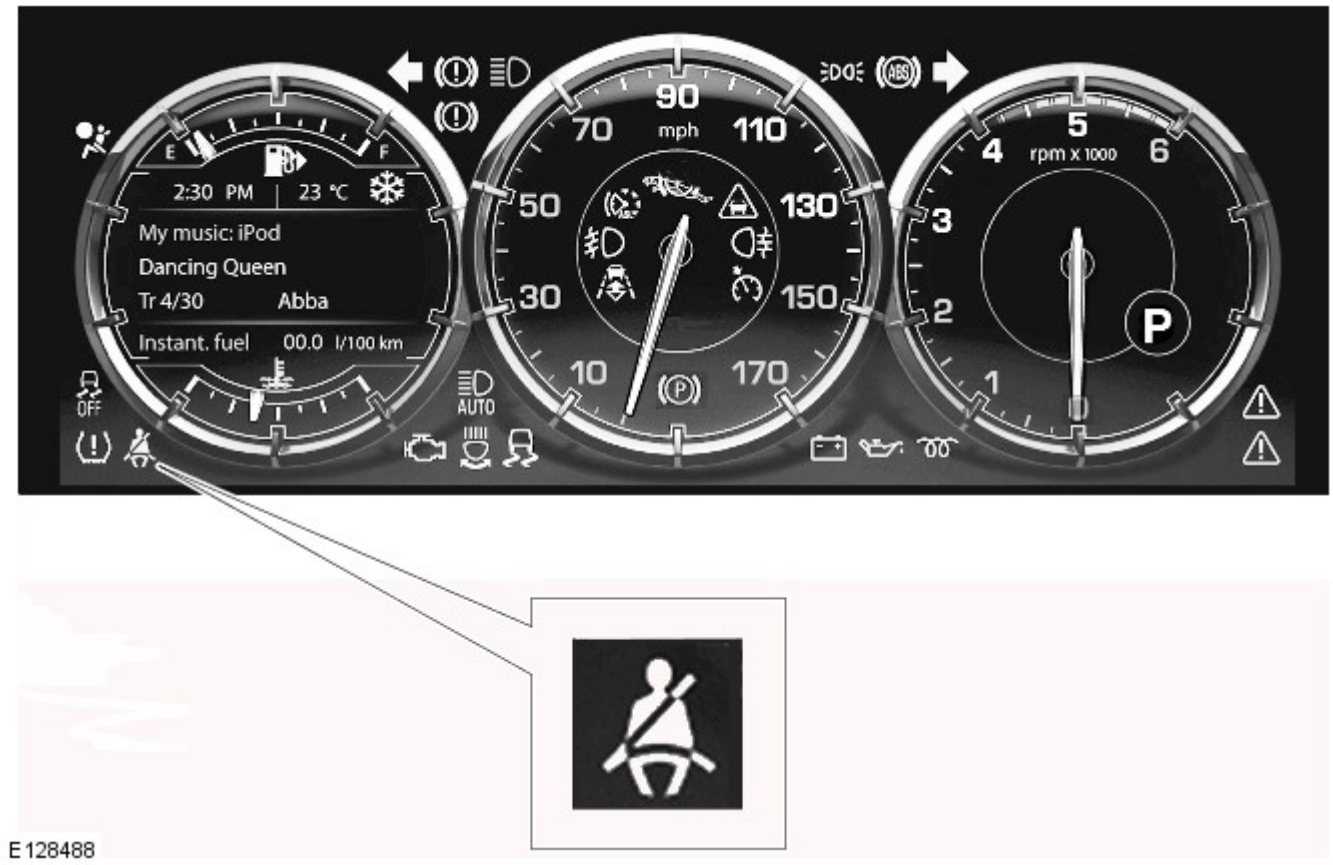
System Operation

SAFETY BELT REMINDER

The safety belt warning indicator comes on if the driver safety belt, or the safety belt of an occupied front passenger seat, is not fastened. The indicator goes off when the offending safety belt is fastened.

The CJB controls the operation of the safety belt warning indicator with a high speed CAN bus message to the instrument cluster. The status of the front safety belts is provided by a high speed CAN bus message from the RCM . Front passenger seat occupancy status is provide by a hardwired input from the occupant detection sensor (all except NAS), or a high speed CAN bus message from the classification module (NAS only).

Safety Belt Warning Indicator

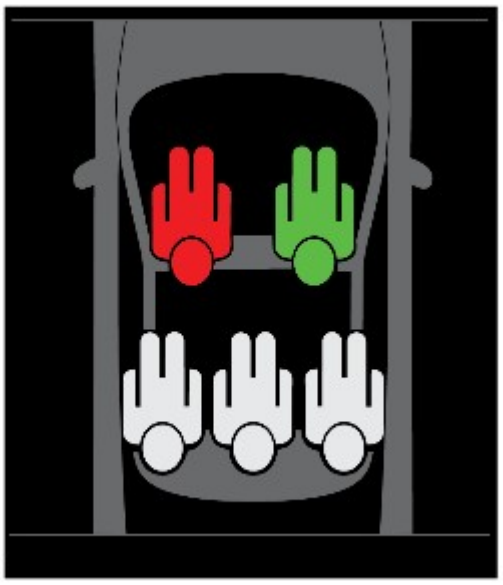


BELTMINDER SYSTEM

The beltminder system augments the safety belt reminder. At vehicle speeds above 10 mph (16 km/h), if the safety belt of the driver seat or an occupied front passenger seat has not been fastened, or if a front or rear safety belt is unfastened, the beltminder system activates an intermittent warning tone, flashes the safety belt warning indicator and displays a warning message indicating which safety belt triggered the warning.

The CJB controls the operation of the beltminder system with a high speed CAN bus message to the instrument cluster. The status of the safety belts is provided by hardwired inputs from each of the rear safety belt buckles, and a high speed CAN bus message from the RCM . Front passenger seat occupancy status is provide by a hardwired input from the occupant detection sensor (all except NAS), or a high speed CAN bus message from the classification module (NAS only).

Message Center Beltminder Graphic



A vehicle graphic in the message center shows the status of the safety belts. Each seating position is represented by a passenger icon, the color of which indicates the safety belt status:

- No color - safety belt not fastened.
- Green - safety belt fastened.
- Red - safety belt status changed from fastened to unfastened.

A beltminder warning triggered by one of the rear safety belts can be cancelled by pressing the information button on the steering wheel.

Although not advisable, it is possible to disable the beltminder system using Jaguar approved diagnostic equipment.

NOTE: If a heavy object is placed on the front passenger seat, it may trigger a beltminder warning.

Component Description

GENERAL

NOTE: Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.

Each safety belt retractor incorporates a pretensioner, a load limiting function and a dual locking function. The safety belt pretensioner are used to tighten the seatbelt during a collision to ensure the occupants are securely held in their seats. The load limiting function progressively releases a small amount of webbing when the belt tension exceeds a certain level, to reduce the loads on an occupant's chest during an impact. The dual locking function locks the retractor if the webbing is pulled out of the retractor too quickly, or the vehicle is subject to unusually high acceleration or tilts beyond a given angle.

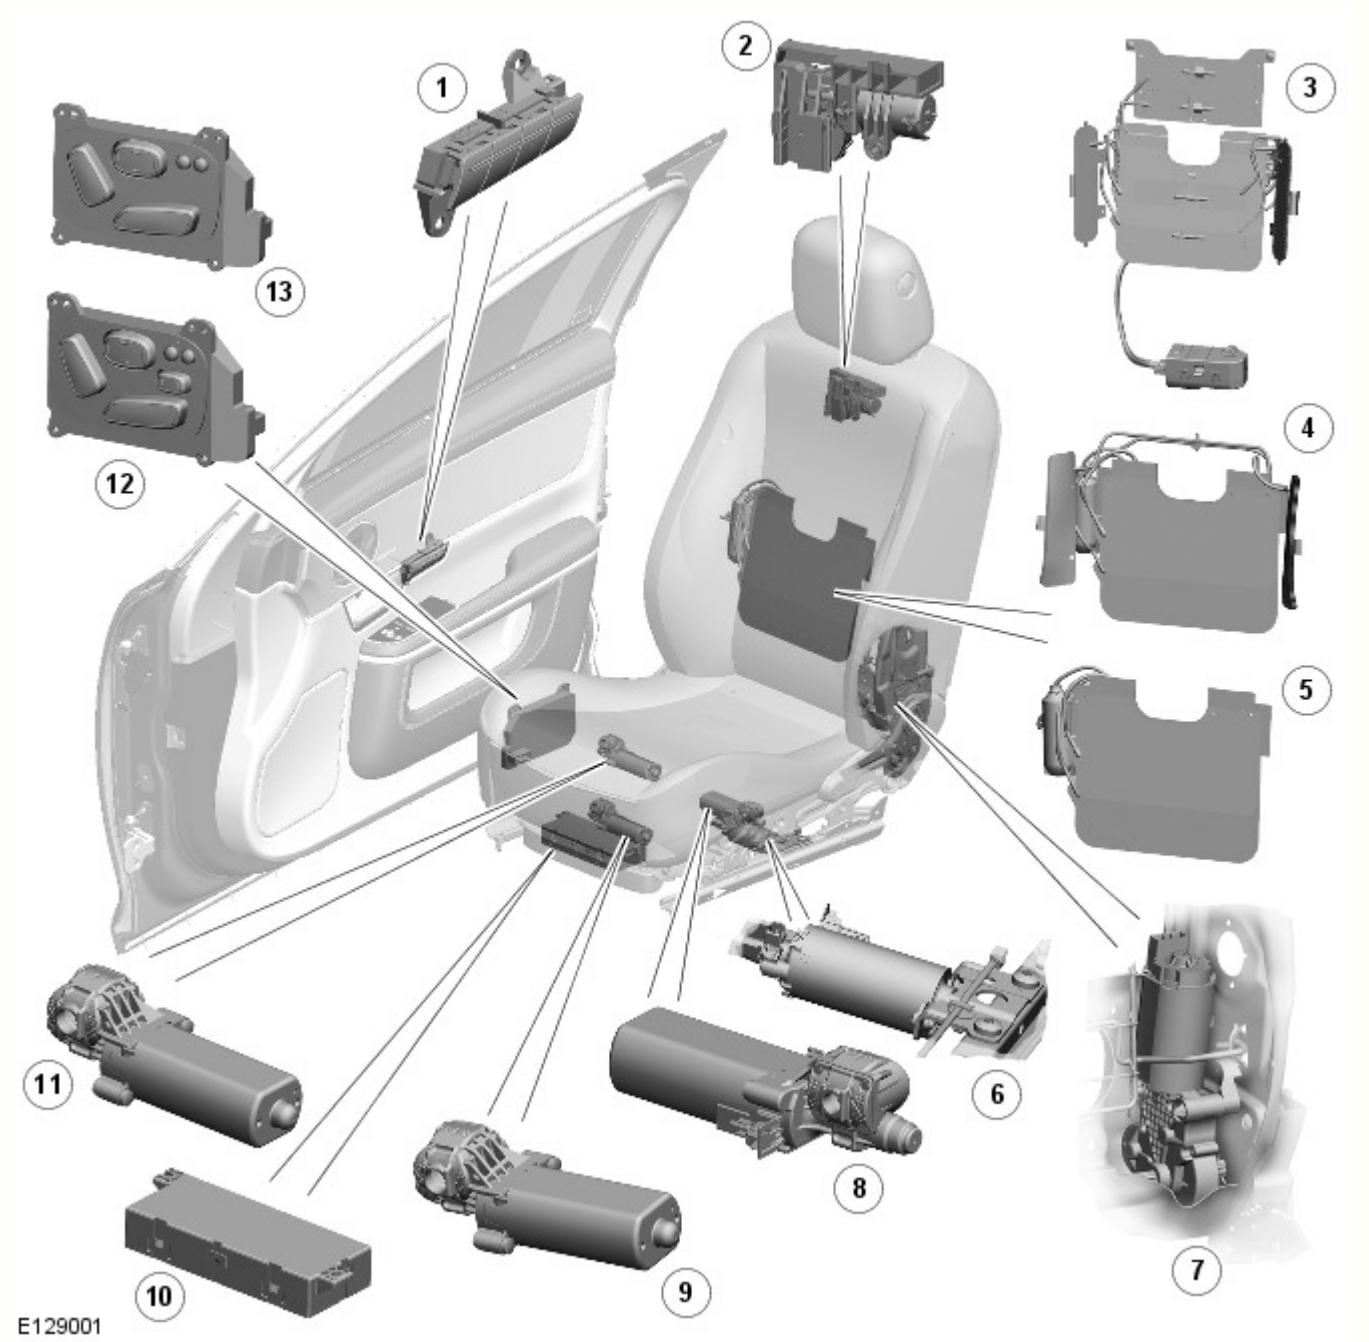
Seating - Seats - Component Location

Description and Operation

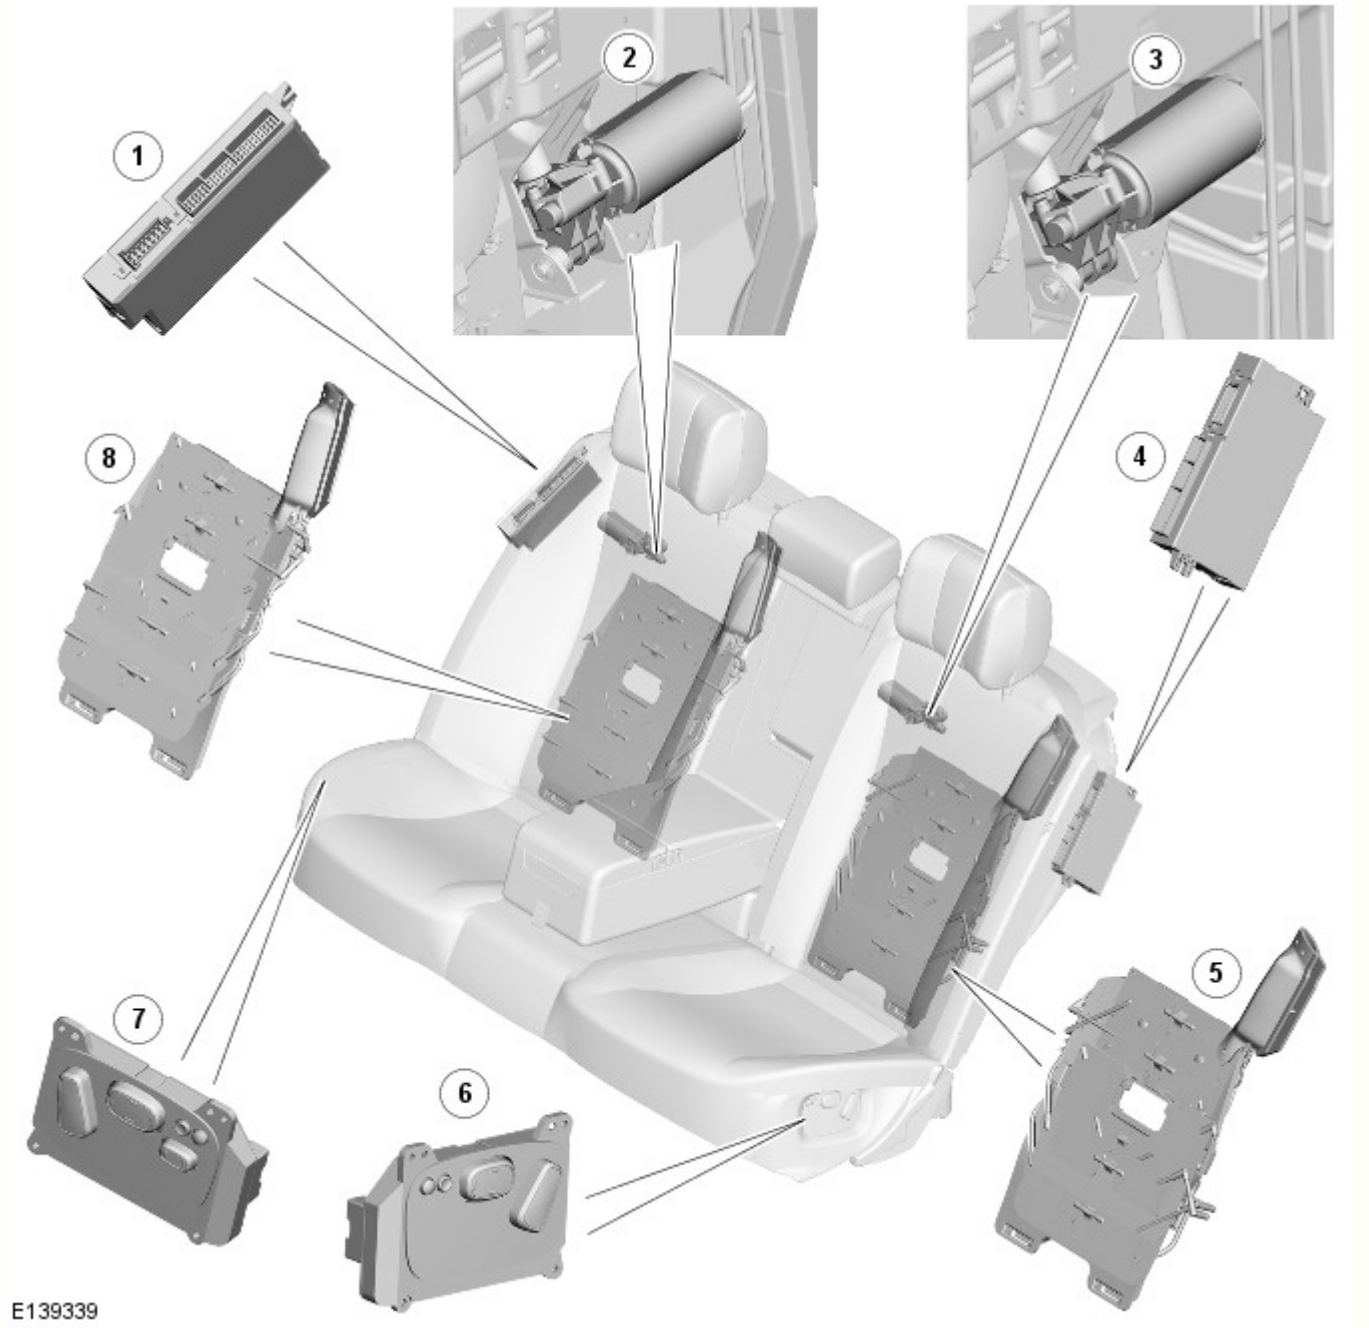
COMPONENT LOCATION - FRONT SEAT ADJUSTMENT



Item	Description
1	Memory switch pack
2	Head restraint motor
3	Pump, lumbar support, squab bolster supports and back massage cells
4	Pump, lumbar support and squab bolster supports
5	Pump and lumbar support (4-way support shown, 2-way similar)
6	Seat slide motor
7	Squab recline motor
8	Cushion tilt motor
9	Cushion extension motor
10	Seat control module
11	Seat height motor

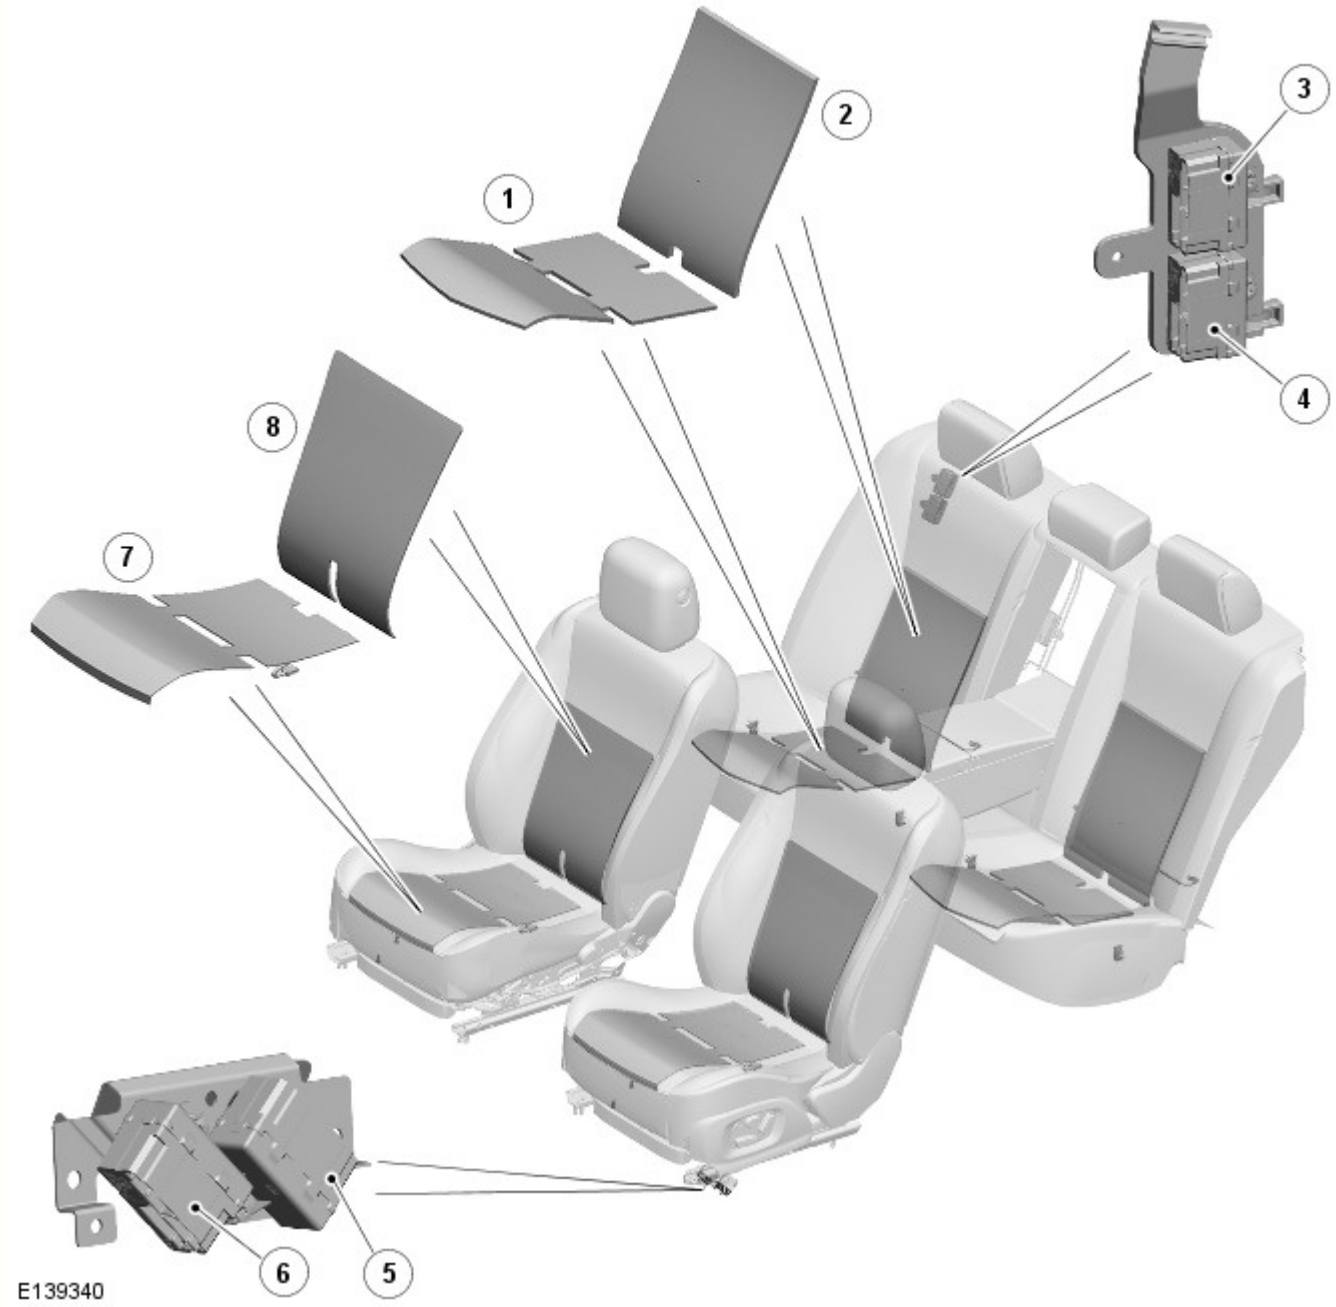
12	Seat switch pack (16 and 18 way)
13	Seat switch pack (8, 10 and 12 way)

COMPONENT LOCATION - REAR SEAT ADJUSTMENT



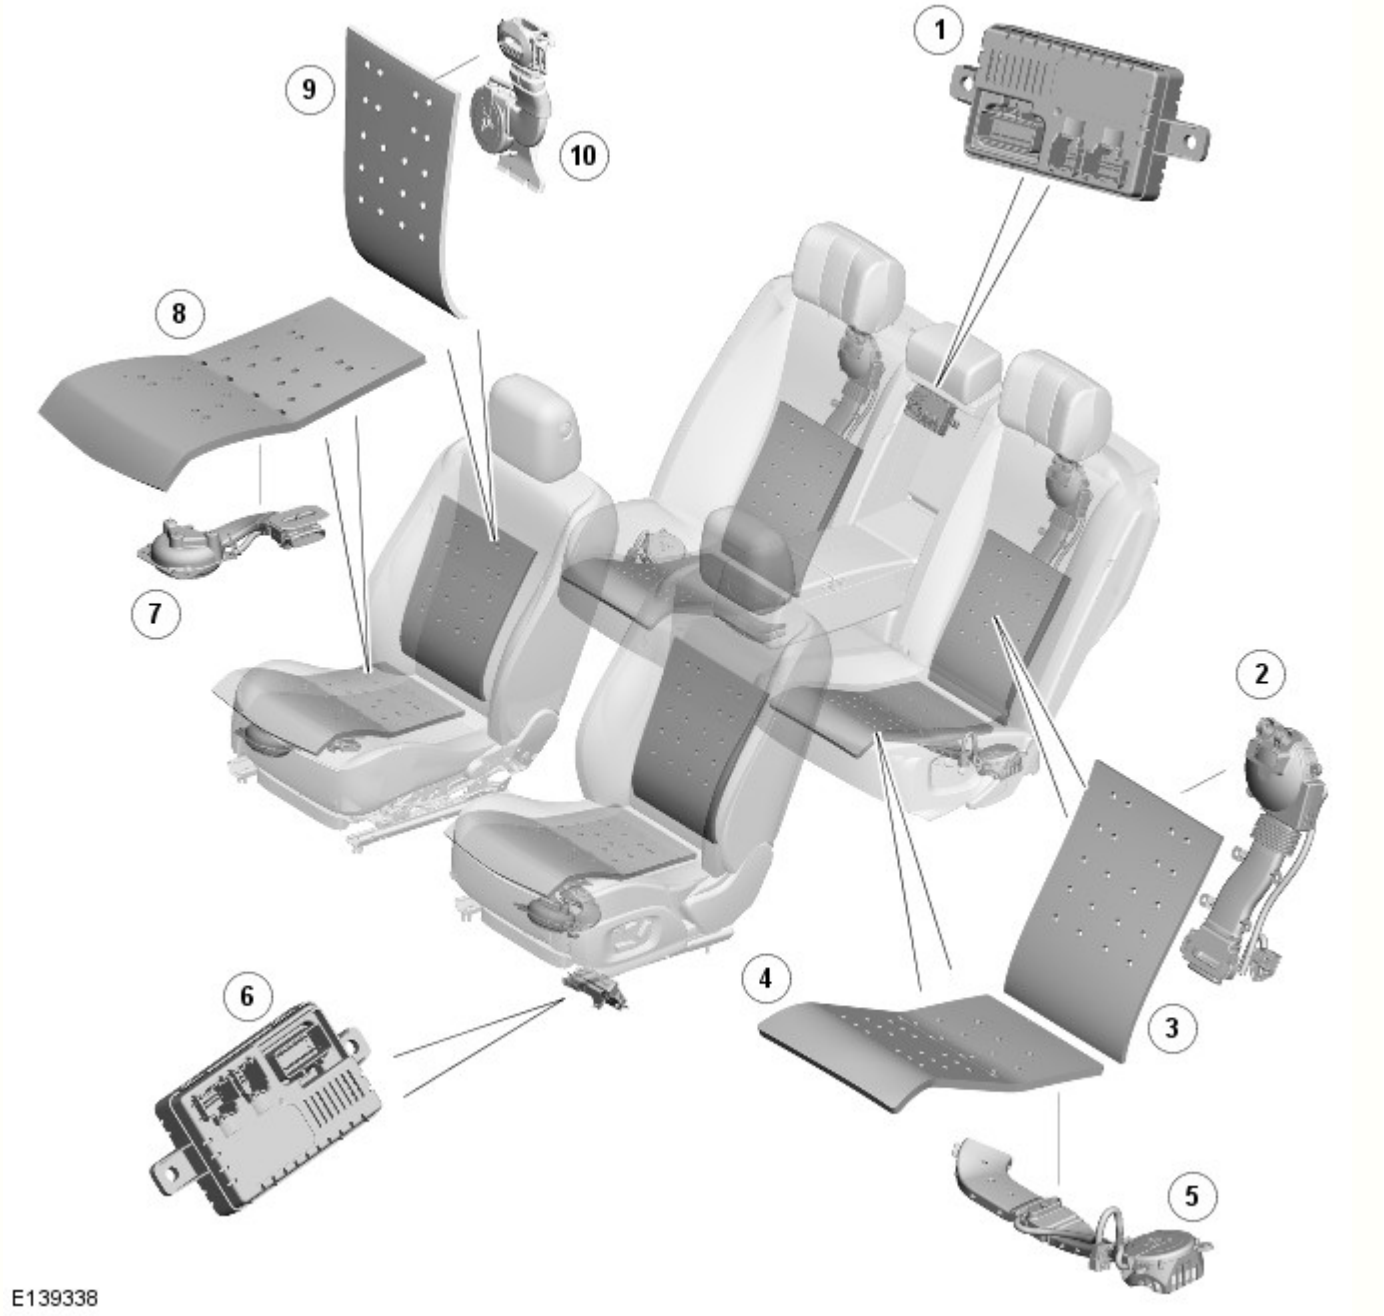
Item	Description
1	Right Hand (RH) rear seat module
2	RH rear seat recline motor
3	Left Hand (LH) rear seat recline motor
4	LH rear seat module
5	LH 4-way lumbar adjustment and massage
6	LH Rear seat adjustment switchpack (Left Hand Drive version shown)
7	RH Rear seat adjustment switchpack (Left Hand Drive version shown)
8	RH 4-way lumbar adjustment massage

COMPONENT LOCATION - HEATED FRONT AND REAR SEATS



Item	Description
1	Rear seat cushion heater element
2	Rear seat squab heater element
3	Rear RH seat heater module
4	Rear LH seat heater module
5	Front passenger seat heater module
6	Driver seat heater module
7	Front seat cushion heater element
8	Front seat squab heater element

COMPONENT LOCATION - FRONT AND REAR CLIMATE SEATS



Item	Description
1	Rear seats climate control module
2	Rear seat squab climate module
3	Rear seat squab pad assembly
4	Rear seat cushion pad assembly
5	Rear seat cushion climate module
6	Front seats climate control module
7	Front seat cushion climate module
8	Front seat cushion pad assembly
9	Front seat squab pad assembly
10	Front seat squab climate module

Seating - Seats

Diagnosis and Testing

Principles of Operation

For a detailed description of the Seating system, refer to the relevant Description and Operation section in the workshop manual. REFER to: (501-10 Seating)

Seats (Description and Operation),
Seats (Description and Operation),
Seats (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern

2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
• Seat runners • Seat frames	• Fuses • Wiring harnesses and connectors • Driver seat module • Passenger seat module • Central junction box • Touch screen • Seat movement switch(es) • Seat heater switch(es) • Seat motor(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index

5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required

Symptom Charts

Adjustment - Front Seats

Symptom	Possible Causes	Action
No seat movement from switch pack (including no memory recall)	• Seat module has gone into sleep mode • Seat switch pack LIN, power or ground circuit - open circuit	Set ignition ON. Re-check seat function from switch pack. Check for DTC B1A9887 and refer to DTC Index. Check for DTC B1A9888 and refer to DTC Index

	• Seat switch pack LIN circuit - short to power, ground	
No seat movement or lumbar movement from switch pack (including no memory recall)	NOTE: Seat module does not control the seat lumbar function • Seat switch pack power or ground supply circuits - open circuit	Refer to the electrical circuit diagrams and check seat switch pack power and ground supply circuits for open circuit
Seat movement and lumbar movement from switch pack is ok, however, no recall from memory switch pack	• Seat switch pack to memory switch pack circuits - short, open circuit	NOTE: Memory switch pack is separate switch hardwired to seat adjust switch Refer to the electrical circuit diagrams and check seat switch pack to memory switch pack circuits for short, open circuit
Seat movement from switch pack occurs in delayed inch mode (seat axis moves short distance when switch pressed for longer than 2 seconds and then stops). This behaviour could occur on any seat axis (slide, height, squab, tilt, headrest or cushion) when requested	• Motor Hall sensor on affected axis is not connected or not receiving expected signals	Check for DTCs, B1B8731, B1B9131, B1B8931, B1B9331, B106331, B106431. If present then check Hall sensor feedback circuits between seat motor and seat module and also check Hall sensor ground circuits for affected axis. These DTCs are only logged if the axis is attempted to be moved in both directions. When hall sensor connection issue fixed press switch on affected axis for longer than 2 seconds. By keeping the switch pressed the axis movement should now operate for the duration of switch-press. Re-calibrate affected seat
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	• MS CAN fault	Carry out CAN network integrity test using manufacturer approved diagnostic system
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	• Seat module is disconnected from the CAN Bus	Check for Instrument Cluster DTC U020800 'Lost Communication With Seat Module'. If this DTC is present, refer to the electrical circuit diagrams and check seat module power and ground supplies for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	• Instrument cluster is disconnected from the CAN Bus	Check for seat module DTC U015500 'Lost Communication With Instrument Cluster'. If this DTC is present, refer to the electrical circuit diagrams and check instrument cluster power and ground supplies for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	• Driver Door Module is disconnected from the CAN Bus	Check for seat module DTC U019900 'Lost Communication With Driver Door Module'. If this DTC is present, refer to the electrical circuit diagrams and check driver door module power and ground supplies for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the		Check for seat module DTC U014200 'Lost Communication With RJB'. If this DTC is present, refer to the electrical

requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	• Rear Junction Box (RJB) is disconnected from the CAN Bus	circuit diagrams and check RJB power and ground supplies for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	• Central Junction Box (CJB) is disconnected from the CAN Bus	Refer to the electrical circuit diagrams and check CJB power and ground supplies for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system
NOTE: Electric passenger seat can always be activated – there is no passenger seat module installed to this vehicle Seat module does not go to sleep. Seat movement is always active from driver seat switch pack	• Seat module is in manufacturing mode	NOTE: A new module is NOT required to be installed, only the module replacement routine needs to be performed. This will set the PID required to disable manufacturing mode Seat module needs to be configured for customer mode. Check for DTC U1A4C68 'Build/End of Line mode Active'. If this DTC is present then configure for customer mode by running 'New Seat Module Replacement' application for the affected seat using the manufacturer approved diagnostic system
Front seat fore/aft movement not functioning	• Carry out the pinpoint test associated to this symptom	• GO to Pinpoint Test A.
Front seat excessive fore/aft free play	• Carry out the pinpoint test associated to this symptom	• GO to Pinpoint Test B.
Front seat fore/aft movement noisy	• Carry out the pinpoint test associated to this symptom	• GO to Pinpoint Test C.
Front seat height, tilt and/or seat extension motor movement not functioning	• Carry out the pinpoint test associated to this symptom	• GO to Pinpoint Test D.
Front seat height, tilt and/or extension movement noisy	• Carry out the pinpoint test associated to this symptom	• GO to Pinpoint Test E.

DTC Index

For a complete list of all diagnostic trouble codes that could be logged on this vehicle, please refer to Section 100-00. REFER to: (100-00 General Information)

Diagnostic Trouble Code (DTC) Index - DTC: Driver/Passenger Seat Module (DSM/PSM) (Description and Operation), Diagnostic Trouble Code (DTC) Index - DTC: Climate Controlled Seat Module - Front/Rear (SCME/SCMF) (Description and Operation).

Pinpoint Tests

PINPOINT TEST A : FRONT SEAT FORE/AFT MOVEMENT NOT FUNCTIONING	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CHECK FOR FRONT SEAT FORWARD-REARWARD SEAT MOTOR OPERATION	

	WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual. 1 Set ignition status to ' ON'.
	2 From the switch pack, operate the front seat forward-rearward seat motor switch and listen for evidence of the motor operating.
	Does the motor operate? **Yes** GO to A2 . **No** GO to A3 .
A2: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR DRIVE BAR	
	1 Check front seat drive bar for correct installation and condition
	Is the front seat drive bar correctly installed and in a serviceable condition? **Yes** Re-check for correct front seat forward-rearward movement. Remove seat to allow for further investigation if required. **No** Correctly install front seat forward-rearward seat motor drive bar, or replace if required.
A3: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR	
WARNING: When carrying out the following steps, stand clear of all moving parts and ensure link harness is routed accordingly.	
	1 Set ignition status to 'OFF'.
	2 Disconnect front seat forward-rearward seat motor connector.
	NOTE: It may be that the seat has been driven to the limit of travel along the relevant axis, and when the link harness is connected, the seat will remain in the same position. If this is the case, a jolt may be felt from the motor. To confirm the motor operation, swap the link harness to alternate motor pin connections and the seat should travel in the opposite direction. 3 Using a locally made fused link harness and power supply, connect power and ground to forward-rearward seat motor.

Battery positive terminal	Battery negative terminal
forward-rearward seat motor pin 1	forward-rearward seat motor pin 2

	Does the motor operate? **Yes** Using manufacturer approved diagnostic system, check for related Diagnostic Trouble Codes (DTCs) and carry out the repair operations specified. Alternatively, refer to the electrical circuit diagrams and check front seat forward-rearward seat motor circuits. **No** Replace front seat forward-rearward seat motor. Refer to relevant section of workshop manual.
PINPOINT TEST B : FRONT SEAT EXCESSIVE FORWARD-REARWARD FREE PLAY	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
B1: CHECK FRONT SEAT FOR EXCESSIVE FORWARD-REARWARD FREE PLAY	
	WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual. 1 Check all accessible front seat frame fixings are installed and to the correct torque.
	Are all accessible front seat frame fixings installed and to the correct torque? **Yes** GO to B2 . **No** Install and tighten all accessible front seat frame fixings to correct torque and re-check for excessive free play.
B2: COMPARE THE FRONT SEAT FORWARD-REARWARD FREE PLAY AGAINST A SIMILAR SEAT	
	1 Compare the front seat forward-rearward free play against a similar seat.
	Is the front seat forward-rearward free play excessive when compared to a similar seat? **Yes** GO to B3 . **No** The front seat frame is operating correctly. Submit Electronic Product Quality Report (EPQR) with any further query.
B3: CHECK REMAINING FRONT SEAT FRAME FIXINGS	
	1 Remove front seat and/or any seat covers/trim to allow access to check remaining front seat frame fixings are all installed and to the correct torque.

	Are all remaining front seat frame fixings installed and to the correct torque? **Yes** Replace front seat frame. Refer to the relevant section of the workshop manual. **No** Install and tighten all remaining front seat frame fixings to correct torque and re-check for excessive free play.

PINPOINT TEST C : FRONT SEAT FORWARD-REARWARD MOVEMENT NOISY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: COMPARE FRONT SEAT FORWARD-REARWARD MOVEMENT NOISE TO OTHER FRONT SEAT	
	WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual. 1 Compare the front seat forward-rearward movement noise to other front seat.
	Is the front seat forward-rearward movement noise excessive when compared to other front seat? **Yes** GO to C2 . **No** GO to C3 .
C2: COMPARE FRONT SEAT FORWARD-REARWARD MOVEMENT NOISE TO FRONT SEAT IN OTHER VEHICLE	
	1 Compare the front seat forward-rearward movement noise to front seat in other vehicle.
	Is the front seat forward-rearward movement noise excessive when compared to front seat in other vehicle? **Yes** GO to C3 . **No** The front seat frame is operating correctly. Submit Electronic Product Quality Report (EPQR) with any further query.
C3: CHECK FOR DEBRIS OBSTRUCTING SEAT MOVEMENT	
	1 Check for debris obstructing seat movement.
	Is the front seat forward-rearward movement obstructed by debris? **Yes** Remove obstruction and re-check for noisy forward-rearward seat movement. **No** GO to C4 .
C4: RE-ALIGN FRONT SEAT FRAME	
	1 Loosen front seat frame fixings.
	2 Set ignition status to 'ON'.
	3 Using the front seat switch pack drive the front seat fully forward then fully rearward.
	4 Tighten front seat frame fixings to the correct torque.
	5 Re-check for noisy seat movement.
	Is the front seat forward-rearward movement still noisy? **Yes** GO to C5 . **No** The front seat frame is now operating correctly.
C5: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR DRIVE BAR	
	1 Check front seat drive bar for correct installation and condition.
	Is the front seat drive bar correctly installed and in a serviceable condition? **Yes** Replace front seat forward-rearward seat motor. Refer to relevant section of workshop manual. **No** Correctly install front seat forward-rearward seat motor drive bar, or replace if required.

PINPOINT TEST D : FRONT SEAT HEIGHT, TILT AND/OR SEAT EXTENSION MOTOR MOVEMENT NOT FUNCTIONING

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: CHECK FRONT SEAT HEIGHT, TILT OR EXTENSION MOTOR	
	WARNINGS: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.
	When carrying out the following steps, stand clear of all moving parts and ensure link harness is routed accordingly.
	1 Set ignition status to ' OFF'.
	2 Disconnect front seat height, tilt or extension motor connector.

	NOTE: It may be that the seat has been driven to the limit of travel along the relevant axis, and when the link harness is connected, the seat will remain in the same position. If this is the case, a jolt may be felt from the motor. To confirm the motor operation, swap the link harness to alternate motor pin connections and the seat should travel in the opposite direction. 3 Using a locally made fused link harness and power supply, connect power and ground to relevant motor.

Battery positive terminal	Battery negative terminal
motor pin 1	motor pin 2

	Does the motor operate? **Yes** Using manufacturer approved diagnostic system, check for related Diagnostic Trouble Codes (DTCs) and carry out the repair operations specified. Alternatively, refer to the electrical circuit diagrams and check relevant motor circuits. **No** Replace the relevant motor. Refer to relevant section of workshop manual.

PINPOINT TEST E : FRONT SEAT HEIGHT, TILT AND/OR EXTENSION MOVEMENT NOISY	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
E1: COMPARE THE HEIGHT, TILT OR EXTENSION MOVEMENT NOISE WITH THE OTHER FRONT SEAT	
	WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual. 1 Compare the front seat movement noise to other front seat.
	Is the front seat height, tilt or extension movement noise excessive when compared to other front seat? **Yes** GO to E2 . **No** GO to E3 .
E2: COMPARE FRONT SEAT HEIGHT, TILT OR EXTENSION MOVEMENT NOISE TO FRONT SEAT IN OTHER VEHICLE	
	1 Compare the front seat height, tilt or extension movement noise to front seat in other vehicle.
	Is the front seat height, tilt or extension movement noise excessive when compared to front seat in other vehicle? **Yes** GO to E3 . **No** The front seat frame is operating correctly. Submit Electronic Product Quality Report (EPQR) with any further query.
E3: CHECK FOR DEBRIS OBSTRUCTING SEAT MOVEMENT	
	1 Check for debris obstructing seat movement.
	Is the front seat height, tilt or extension movement obstructed by debris? **Yes** Remove obstruction and re-check for noisy height, tilt or extension seat movement. **No** GO to E4 .
E4: CHECK FOR HEIGHT, TILT OR EXTENSION MOVEMENT MECHANISM LUBRICATION	
	1 Check and apply manufacturer approved lubrication to seat height, tilt or extension movement mechanism and re-test for noise.
	Is the front seat height, tilt or extension noise still apparent? **Yes** Replace the relevant motor. Refer to relevant section of workshop manual. **No** The front seat height, tilt or extension motor is operating correctly.

Published: 11-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Climate Controlled Seat Module - Front/Rear (SCME/SCMF)

Description and Operation

Climate Controlled Seat Module - Front/Rear (SCME/SCMF)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If a control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Climate Controlled Seat Module - Front/Rear (SCME/SCMF), for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: Seats (501-10 Seating, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B10B9-13	Blower Control - Circuit open	• LH seat blower + circuit, open circuit • LH seat blower - circuit, open circuit • Connectors disconnected • Connector pin damage • Blower motor assembly open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check LH seat blower + circuit for open circuit. Check LH seat blower - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check blower motor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B10B9-4B	Blower Control - Over temperature	• Mechanical restriction in blower motor assembly • LH seat blower + circuit, short to ground • LH seat blower - circuit, short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Check for mechanical restriction or debris in blower motor assembly. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check LH seat blower + circuit for short to ground. Check LH seat blower - circuit for short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• RH seat blower + circuit, open circuit	

B1157-13	Blower Control B - Circuit open	• RH seat blower - circuit, open circuit • Connectors disconnected • Connector pin damage • Blower motor assembly open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check RH seat blower + circuit for open circuit. Check RH seat blower - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check blower motor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1157-4B	Blower Control B - Over temperature	• Mechanical restriction in blower motor assembly • RH seat blower + circuit, short to ground • RH seat blower - circuit, short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Check for mechanical restriction or debris in blower motor assembly. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check RH seat blower + circuit for short to ground. Check RH seat blower - circuit for short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B120E-13	Right Thermal Electric Device Control - Circuit open	• RH seat back thermal electric device + circuit, open circuit • RH seat back thermal electric device - circuit, open circuit • RH seat cushion thermal electric device + circuit, open circuit • RH seat cushion thermal electric device - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat backrest thermal electric device assembly, open circuit • Climate seat cushion thermal electric device assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for open circuit. Check RH seat back thermal electric device - circuit for open circuit. Check RH seat cushion thermal electric device + circuit for open circuit. Check RH seat cushion thermal electric device - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check climate seat backrest thermal electric device assembly for open circuit. Check climate seat cushion thermal electric device assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• RH seat back thermal electric device + circuit, short to ground • RH seat back thermal electric device - circuit, short to ground	Carry out On Demand Self Test (ODST) using manufacturer approved

B120E-19	Right Thermal Electric Device Control - Circuit current above threshold	• RH seat cushion thermal electric device + circuit, short to ground • RH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for short to ground. Check RH seat back thermal electric device - circuit for short to ground. Check RH seat cushion thermal electric device + circuit for short to ground. Check RH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B120E-4B	Right Thermal Electric Device Control - Over temperature	• Restriction in thermal electric device air path • RH seat back thermal electric device + circuit, short to ground • RH seat back thermal electric device - circuit, short to ground • RH seat cushion thermal electric device + circuit, short to ground • RH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Check for blockage or restriction in thermal electric device air path. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for short to ground. Check RH seat back thermal electric device - circuit for short to ground. Check RH seat cushion thermal electric device + circuit for short to ground. Check RH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B120F-98	Left Seat Cushion - Component or system over temperature	• The Climate Control Seat Module LH cushion sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module LH cushion sensor input circuit temperature is greater than 110 Degrees C for	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	
B1223-13	Right Seat Cushion Temperature Sensor - Circuit open	• RH seat cushion sensor circuit, open circuit • RH seat cushion sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat cushion temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat cushion sensor circuit for open circuit. Check RH seat cushion sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat cushion temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1224-13	Left Seat Cushion Temperature Sensor - Circuit open	• LH seat back thermal electric device + circuit, open circuit • LH seat back thermal electric device - circuit, open circuit • LH seat cushion thermal electric device + circuit, open circuit • LH seat cushion thermal electric device - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat backrest thermal electric device assembly, open circuit • Climate seat cushion thermal electric device assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for open circuit. Check LH seat back thermal electric device - circuit for open circuit. Check LH seat cushion thermal electric device + circuit for open circuit. Check LH seat cushion thermal electric device - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check climate seat backrest thermal electric device assembly for open circuit. Check climate seat cushion thermal electric device assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• LH seat back thermal electric device + circuit, short to ground • LH seat back thermal electric device - circuit, short to ground • LH seat cushion thermal electric	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device +

B1224-19	Left Thermal Electric Device Control - Circuit current above threshold	device + circuit, short to ground • LH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	circuit for short to ground. Check LH seat back thermal electric device - circuit for short to ground. Check LH seat cushion thermal electric device + circuit for short to ground. Check LH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1224-4B	Left Thermal Electric Device Control - Over temperature	• Restriction in thermal electric device air path • LH seat back thermal electric device + circuit, short to ground • LH seat back thermal electric device - circuit, short to ground • LH seat cushion thermal electric device + circuit, short to ground • LH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Check for blockage or restriction in thermal electric device air path. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for short to ground. Check LH seat back thermal electric device - circuit for short to ground. Check LH seat cushion thermal electric device + circuit for short to ground. Check LH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1225-13	Right Seat Back Temperature Sensor - Circuit open	• RH seat back sensor circuit, open circuit • RH seat back sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat back temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back sensor circuit for open circuit. Check RH seat back sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat back temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• LH seat back sensor circuit, open circuit	

B1229-13	Left Seat Back Temperature Sensor - Circuit open	• LH seat back sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat back temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back sensor circuit for open circuit. Check LH seat back sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat back temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122A-11	Right Seat Cushion Blower Speed Sensor - Circuit short to ground	• RH cushion fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH cushion fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122A-12	Right Seat Cushion Blower Speed Sensor - Circuit short to battery	• RH cushion fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH cushion fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122B-11	Right Seat Back Blower Speed Sensor - Circuit short to ground	• RH seat back fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122B-12	Right Seat Back Blower Speed Sensor - Circuit short to battery	• RH seat back fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122C-11	Left Seat Cushion Blower Speed Sensor - Circuit short to ground	• LH cushion fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH cushion fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122C-12	Left Seat Cushion Blower	• LH cushion fan speed, circuit short to power • Blower motor assembly, short to power	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH cushion fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using

	Speed Sensor - Circuit short to battery	• Climate Control Seat Module failure	manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122D-11	Left Seat Back Blower Speed Sensor - Circuit short to ground	• LH seat back fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122D-12	Left Seat Back Blower Speed Sensor - Circuit short to battery	• LH seat back fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122E-98	Right Seat Cushion - Component or system over temperature	• The Climate Control Seat Module RH cushion sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module RH cushion sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122F-98	Right Seat Back - Component or system over temperature	• The Climate Control Seat Module RH seat back sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module RH seat back sensor input circuit temperature is	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	
B1230-98	Left Seat Back - Component or system over temperature	• The Climate Control Seat Module LH seat back sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module LH seat back sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1231-7A	Right Seat - Fluid leak or seal failure	• The Climate Control Seat Module has detected an input temperature difference greater than expected between RH seat back sensor and RH cushion sensor • Climate seat back assembly air path leaking • Climate seat cushion assembly air path leaking • Seat assembly damaged	Check for blockage or restriction in seat back thermal electric device fan ducts. Check seat back thermal electric device fan exhaust vent is clear. Check for blockage or restriction in seat cushion thermal electric device fan ducts. Check seat cushion thermal electric device fan exhaust vent is clear. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1232-7A	Left Seat - Fluid leak or seal failure	• The Climate Control Seat Module has detected an input temperature difference greater than expected between LH seat back sensor and LH cushion sensor	Check for blockage or restriction in seat back thermal electric device fan ducts. Check seat back thermal electric device fan exhaust vent is clear. Check for blockage or restriction in seat cushion thermal electric device fan ducts. Check seat cushion thermal electric device fan exhaust vent is clear. Carry out On Demand Self Test (ODST) using manufacturer

		• Climate seat back assembly air path leaking • Climate seat cushion assembly air path leaking • Seat assembly damaged	approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1235-13	Left Seat Cushion Temperature Sensor - Circuit open	• LH seat cushion sensor circuit, open circuit • LH seat cushion sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat cushion temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat cushion sensor circuit for open circuit. Check LH seat cushion sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat cushion temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
U0010-88	Medium Speed CAN Communication Bus - Bus off	• Medium Speed CAN communication bus off	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network.
U0140-00	Lost Communication With Body Control Module - No sub type information	• CAN harness link between Climate Control Seat Module and Central Junction Box malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Central Junction Box within the specified time interval	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a climate seat concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis Using the manufacturer approved diagnostic system, check Central Junction Box for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Central Junction Box power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Central Junction Box, repair as necessary.
U0142-00	Lost Communication With Body Control Module "B" - No sub type information	• CAN harness link between Climate Control Seat Module and Rear Junction Box malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Rear Junction Box within the specified time interval	Using the manufacturer approved diagnostic system, check Rear Junction Box for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Rear Junction Box power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Rear Junction Box, repair as necessary.
		• CAN harness link between Climate Control Seat Module and Instrument Panel	

U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• Cluster (IPC) network malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Instrument Panel Cluster (IPC) within the specified time interval	Using the manufacturer approved diagnostic system, check Instrument Panel Cluster (IPC) for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Instrument Panel Cluster (IPC) power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Instrument Panel Cluster (IPC), repair as necessary.
U0156-00	Lost Communication With Information Center "A" - No sub type information	• CAN harness link between Climate Control Seat Module and Information and Entertainment Control Module network malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Information and Entertainment Control Module within the specified time interval	Using the manufacturer approved diagnostic system, check Information and Entertainment Control Module for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Information and Entertainment Control Module power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Information and Entertainment Control Module, repair as necessary.
U0300-00	Internal Control Module Software Incompatibility - No sub type information	• Incorrect or invalid software has been installed	Using the manufacturer approved diagnostic system, re-configure the Climate Control Seat Module and the Rear Junction Box. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect.
U0401-00	Invalid Data Received from ECM/PCM A - No sub type information	• The Engine Control Module (ECM) has transmitted engine speed quality factor CAN signal at a specific value for a greater than expected time period	Using the manufacturer approved diagnostic system, check Engine Control Module for DTCs and refer to the relevant DTC Index.
U2101-00	Control module Configuration Incompatible - No sub type information	• Calibration incomplete/corrupt	Using the manufacturer approved diagnostic system, re-configure the Climate Control Seat Module and the Rear Junction Box. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
U3000-04	Control Module - System internal failures	• Climate Control Seat Module failure • Climate Control Seat Module microprocessor failed internal ROM and/or RAM checksum test	Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect.
		• Mismatch in battery voltage of 2 volts or more between the	

U3003-62	Battery Voltage - Signal compare failure		measured battery voltage at the Climate Control Seat Module and the battery voltage signal sent from the Rear Junction Box	Refer to the electrical circuit diagrams and check that power supply voltage at Climate Control Seat Module and Rear Junction Box is not different by more than 2 volts. Rectify as required. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.

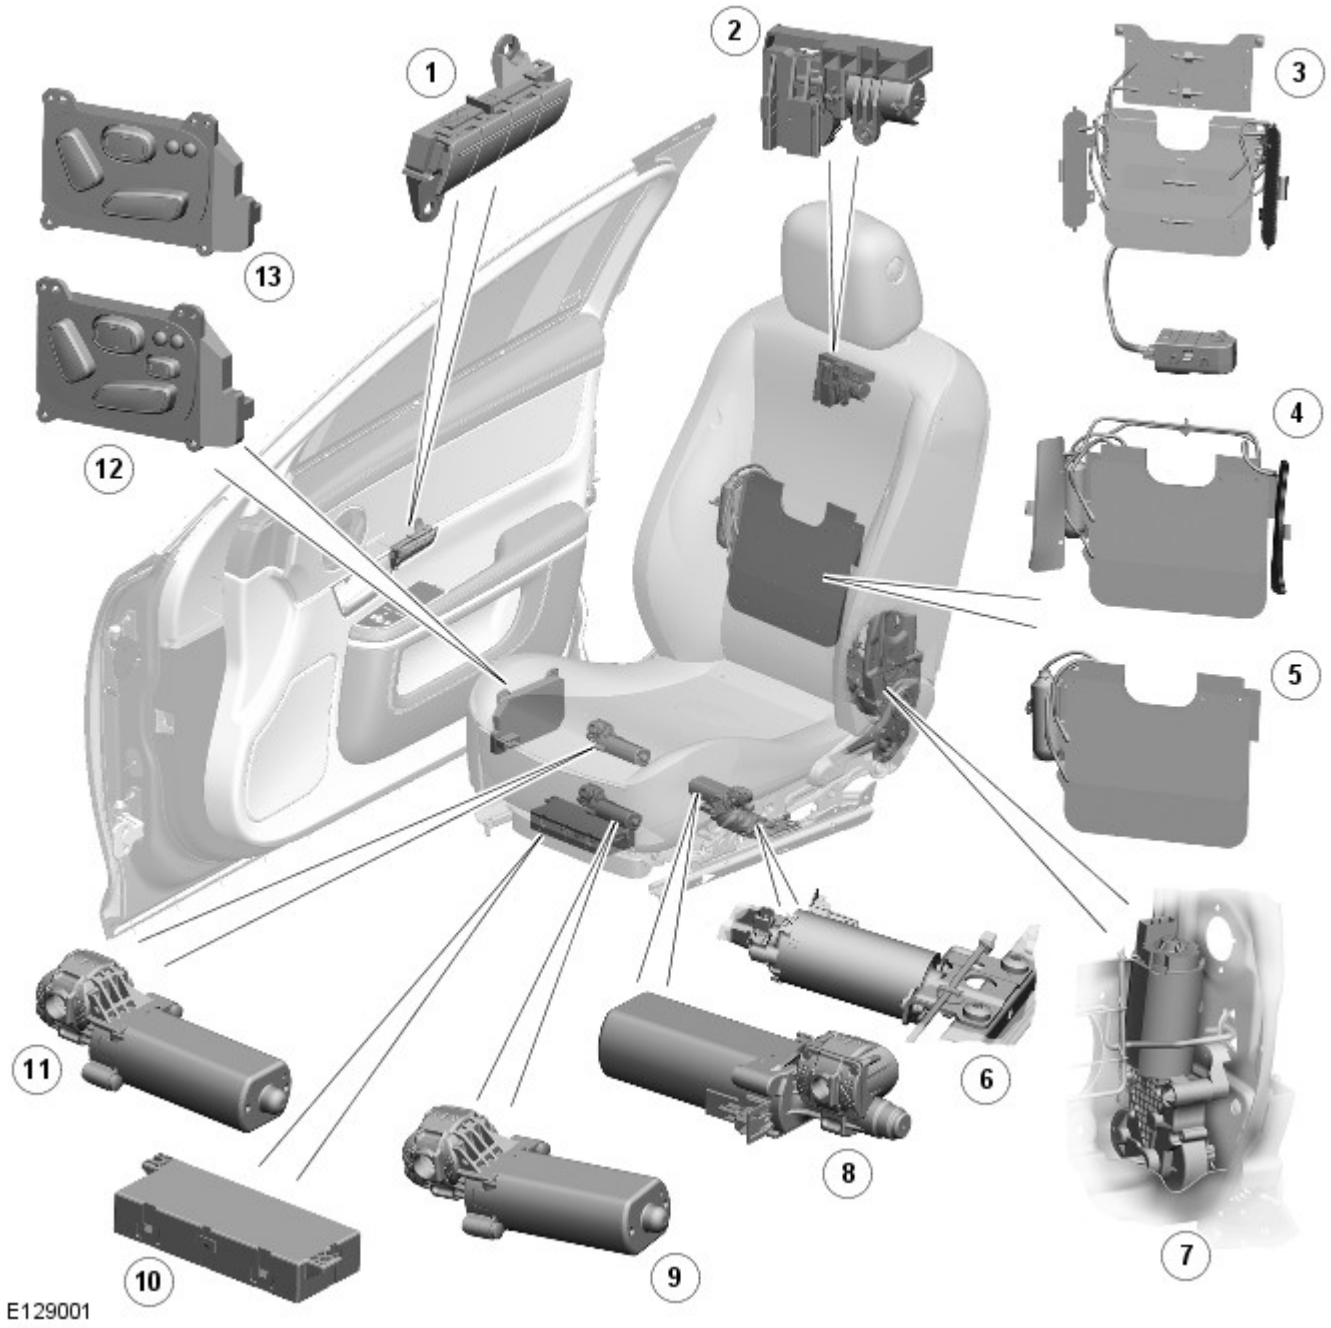
Seating - Seats - Component Location

Description and Operation

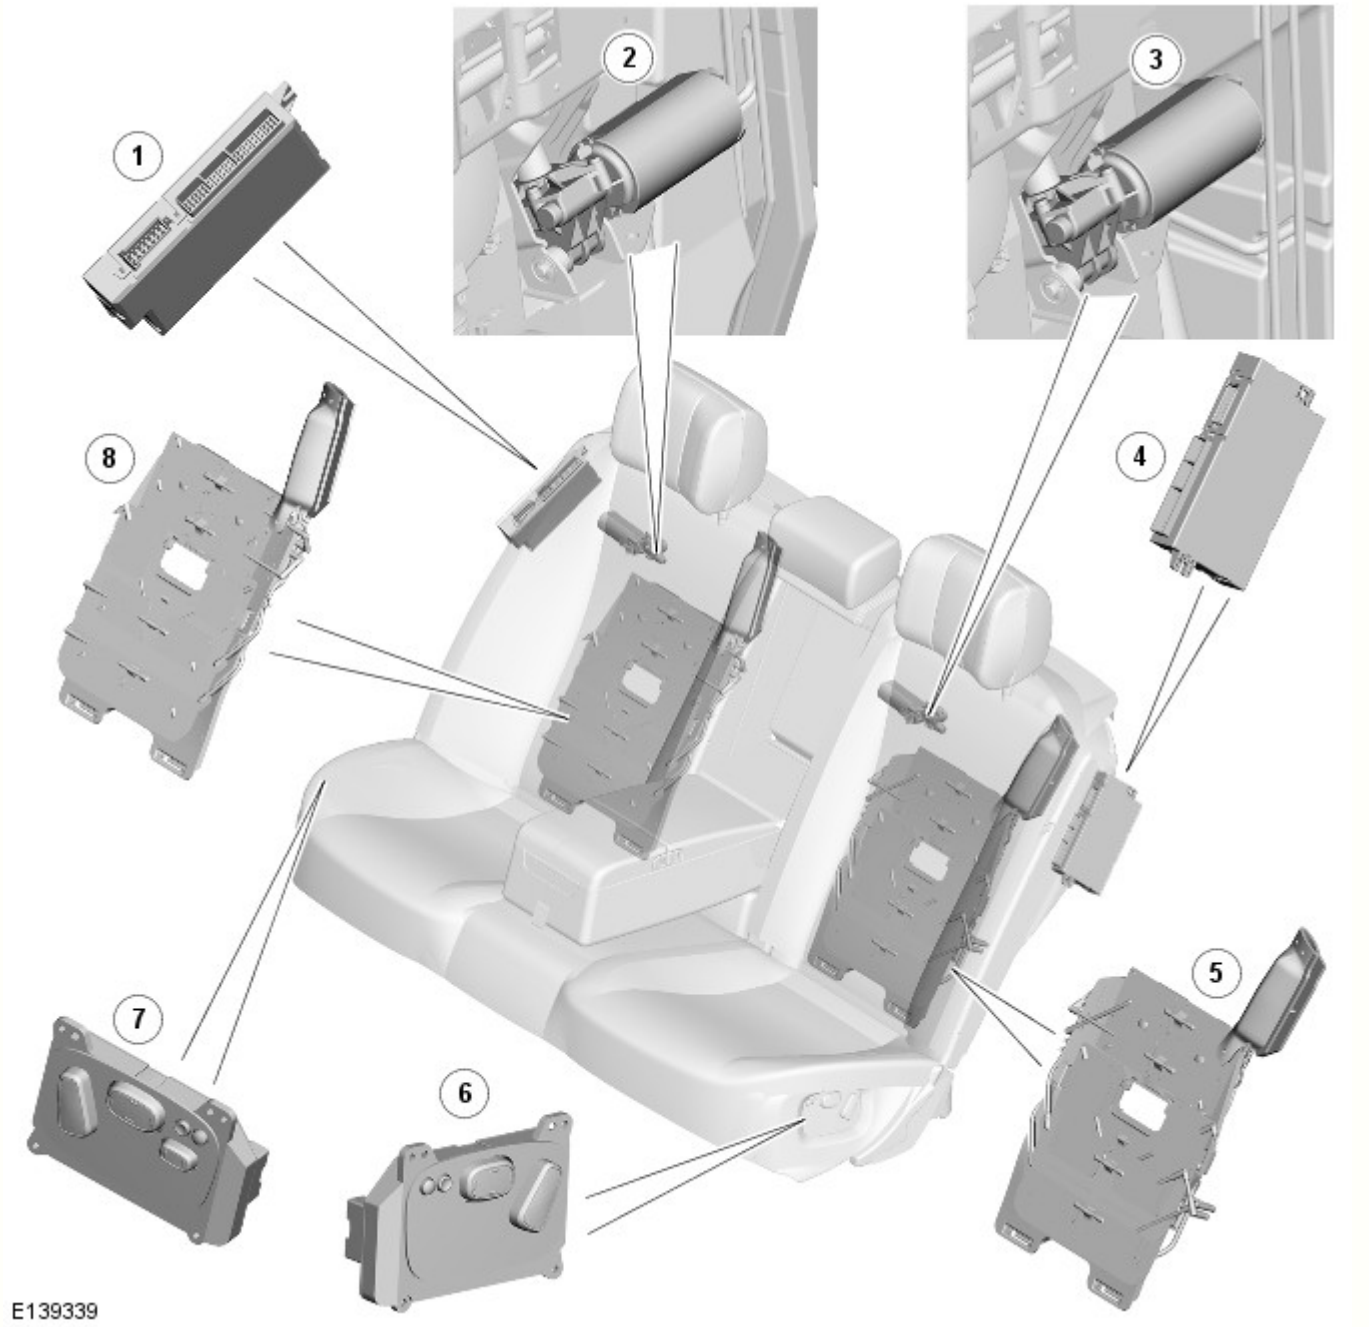
COMPONENT LOCATION - FRONT SEAT ADJUSTMENT



Item	Description
1	Memory switch pack
2	Head restraint motor
3	Pump, lumbar support, squab bolster supports and back massage cells
4	Pump, lumbar support and squab bolster supports

5	Pump and lumbar support (4-way support shown, 2-way similar)
6	Seat slide motor
7	Squab recline motor
8	Cushion tilt motor
9	Cushion extension motor
10	Seat control module
11	Seat height motor
12	Seat switch pack (16 and 18 way)
13	Seat switch pack (8, 10 and 12 way)

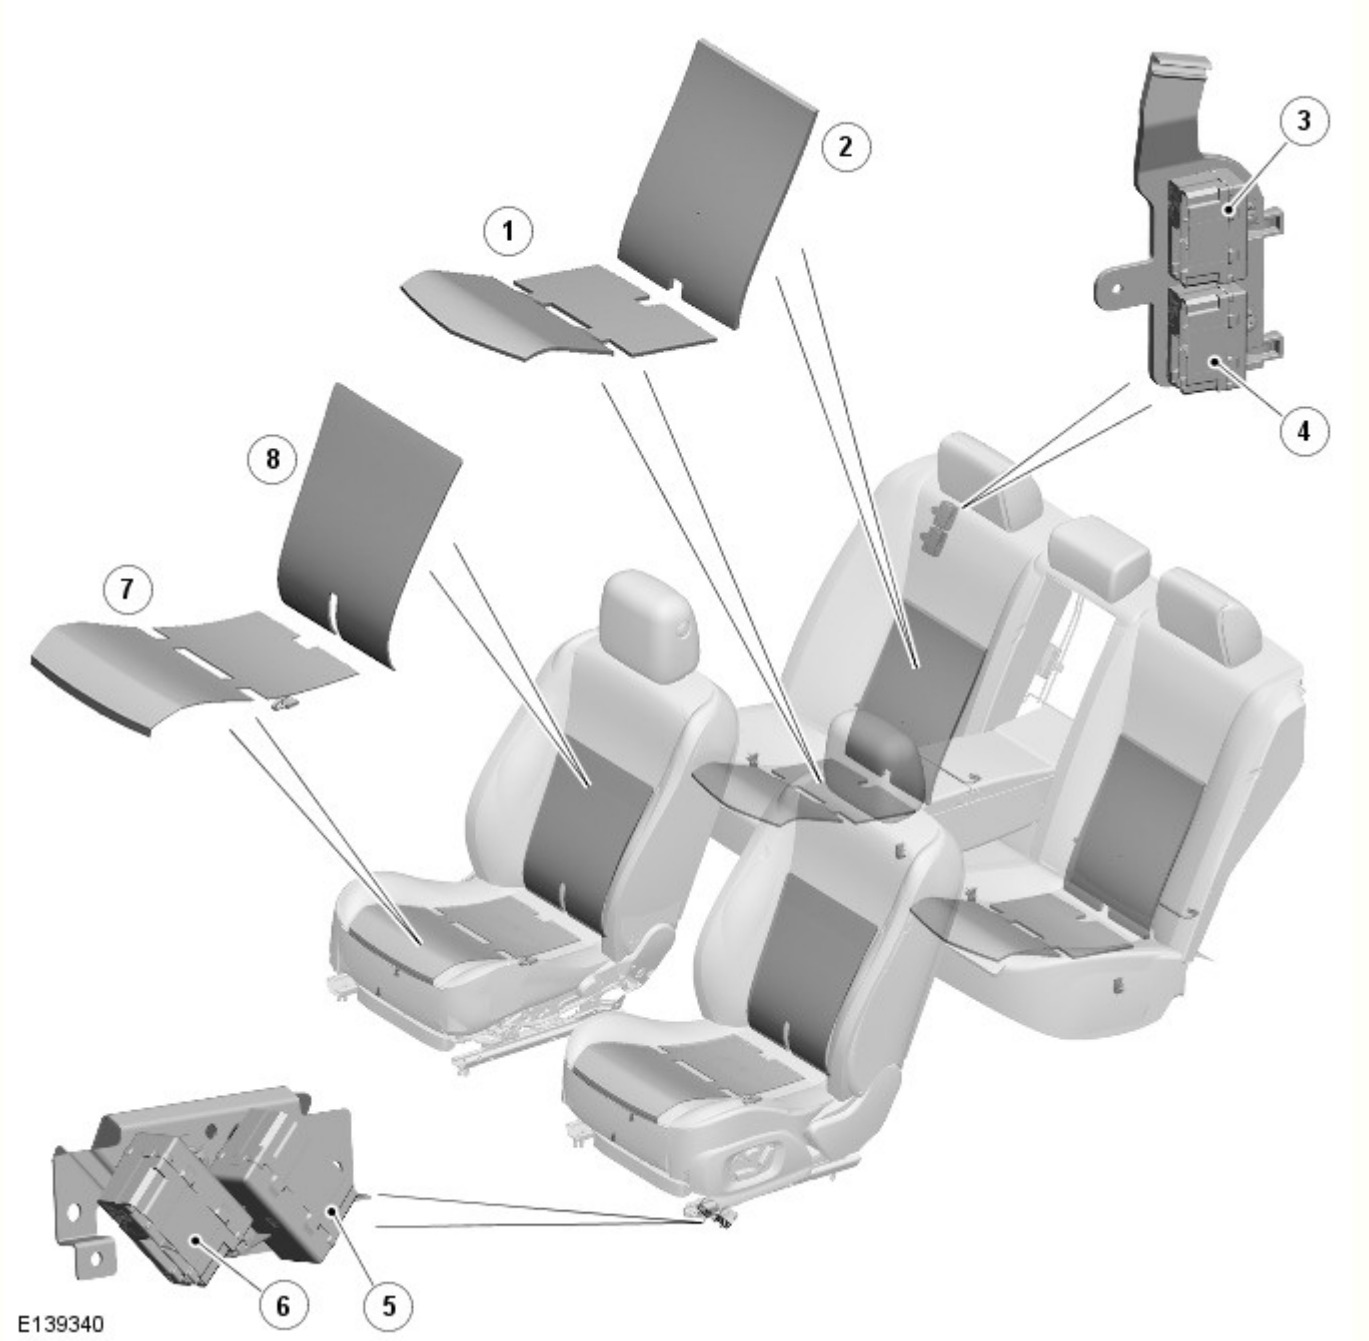
COMPONENT LOCATION - REAR SEAT ADJUSTMENT



Item	Description
1	Right Hand (RH) rear seat module
2	RH rear seat recline motor
3	Left Hand (LH) rear seat recline motor
4	LH rear seat module
5	LH 4-way lumbar adjustment and massage

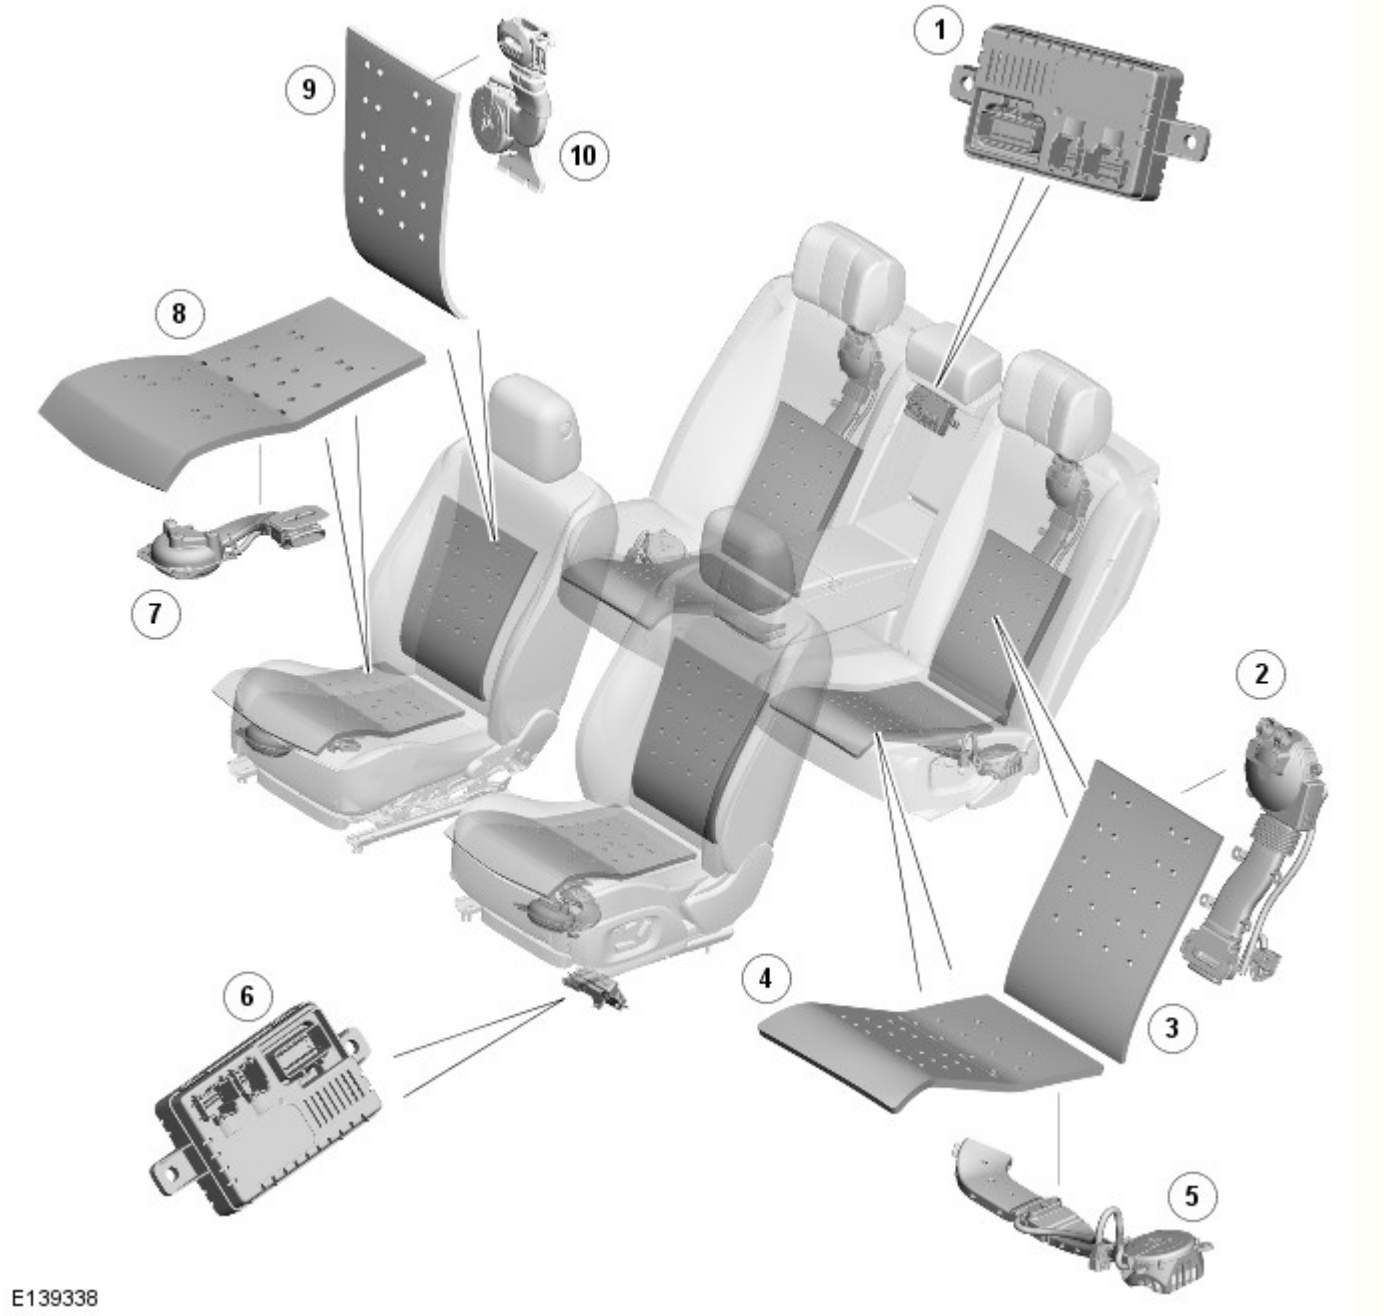
6	LH Rear seat adjustment switchpack (Left Hand Drive version shown)
7	RH Rear seat adjustment switchpack (Left Hand Drive version shown)
8	RH 4-way lumbar adjustment massage

COMPONENT LOCATION - HEATED FRONT AND REAR SEATS



Item	Description
1	Rear seat cushion heater element
2	Rear seat squab heater element
3	Rear RH seat heater module
4	Rear LH seat heater module
5	Front passenger seat heater module
6	Driver seat heater module
7	Front seat cushion heater element
8	Front seat squab heater element

COMPONENT LOCATION - FRONT AND REAR CLIMATE SEATS



Item	Description
1	Rear seats climate control module
2	Rear seat squab climate module
3	Rear seat squab pad assembly
4	Rear seat cushion pad assembly
5	Rear seat cushion climate module
6	Front seats climate control module
7	Front seat cushion climate module
8	Front seat cushion pad assembly
9	Front seat squab pad assembly
10	Front seat squab climate module

Published: 04-Oct-2011

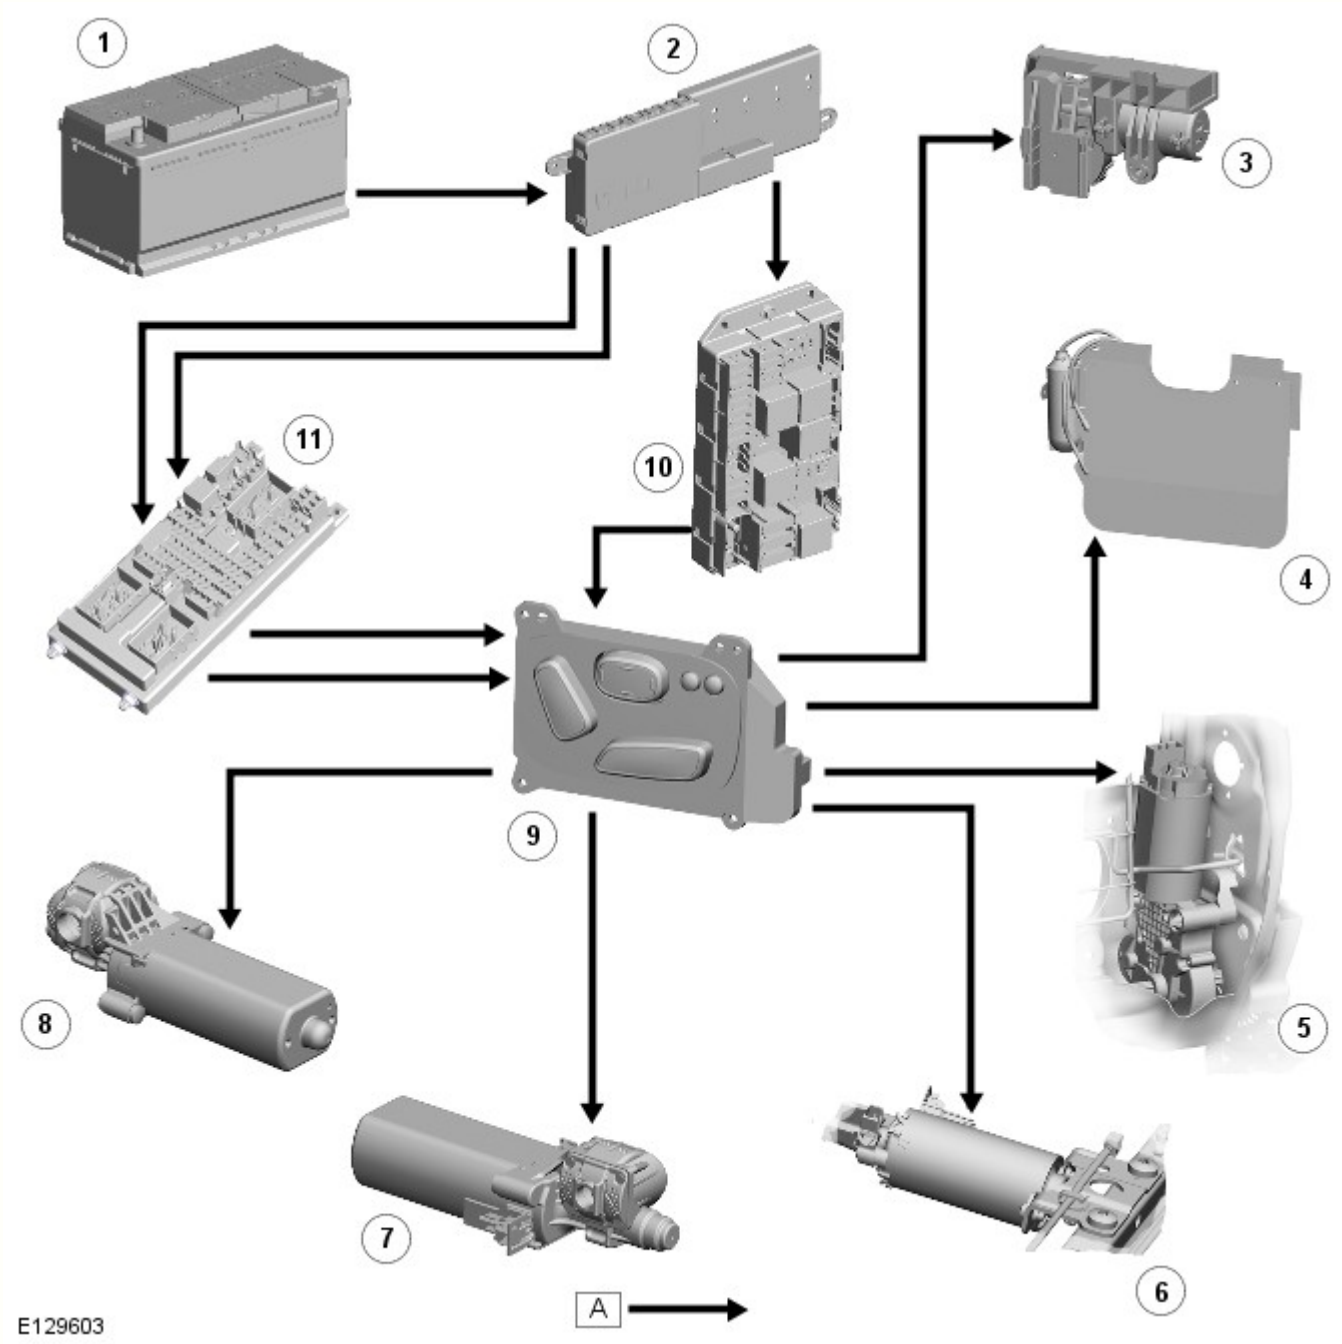
Seating - Seats - System Operation and Component Description

Description and Operation

Control Diagram

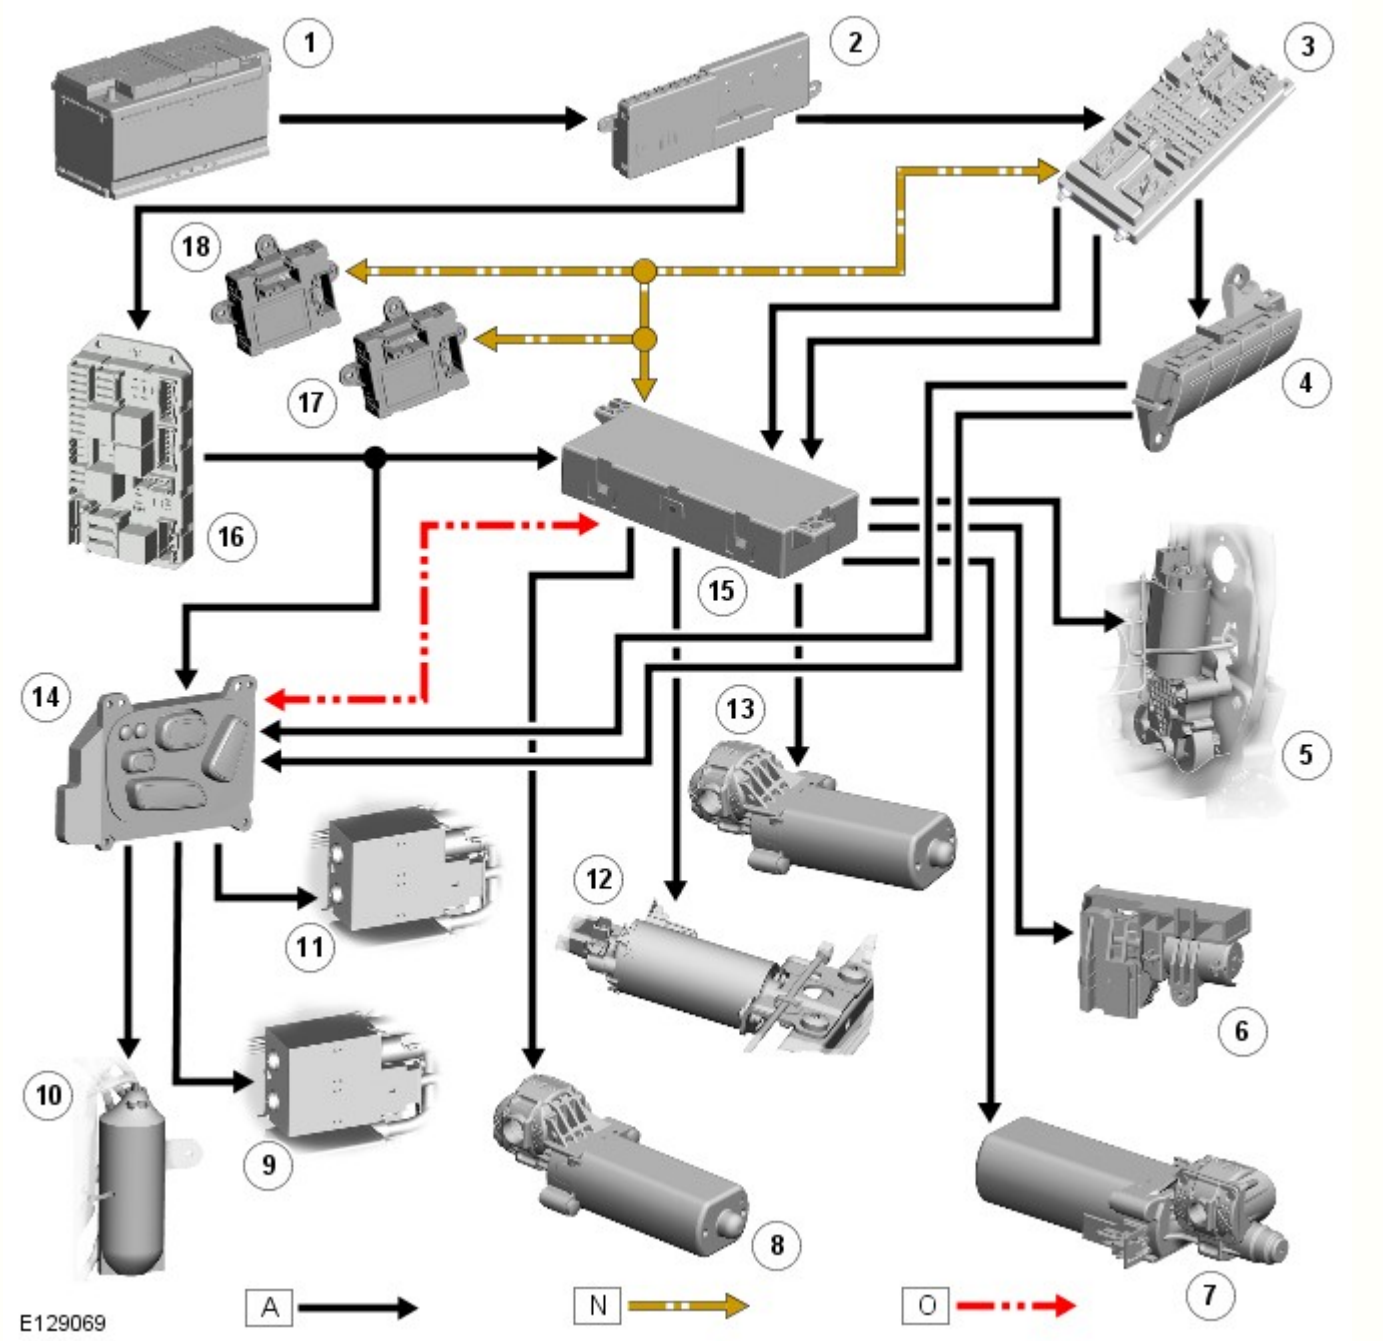
NOTE: **A** = Hardwired; **N** = Medium Speed CAN bus; **O** = LIN Bus

ADJUSTMENT - NON-MEMORY FRONT SEAT



Item	Description
1	Battery
2	BJB (battery junction box)
3	Head restraint motor
4	2-way lumbar adjustment
5	Squab recline motor
6	Seat slide motor
7	Cushion tilt motor
8	Seat height motor
9	Seat switch pack
10	RJB (rear junction box)
11	CJB (central junction box)

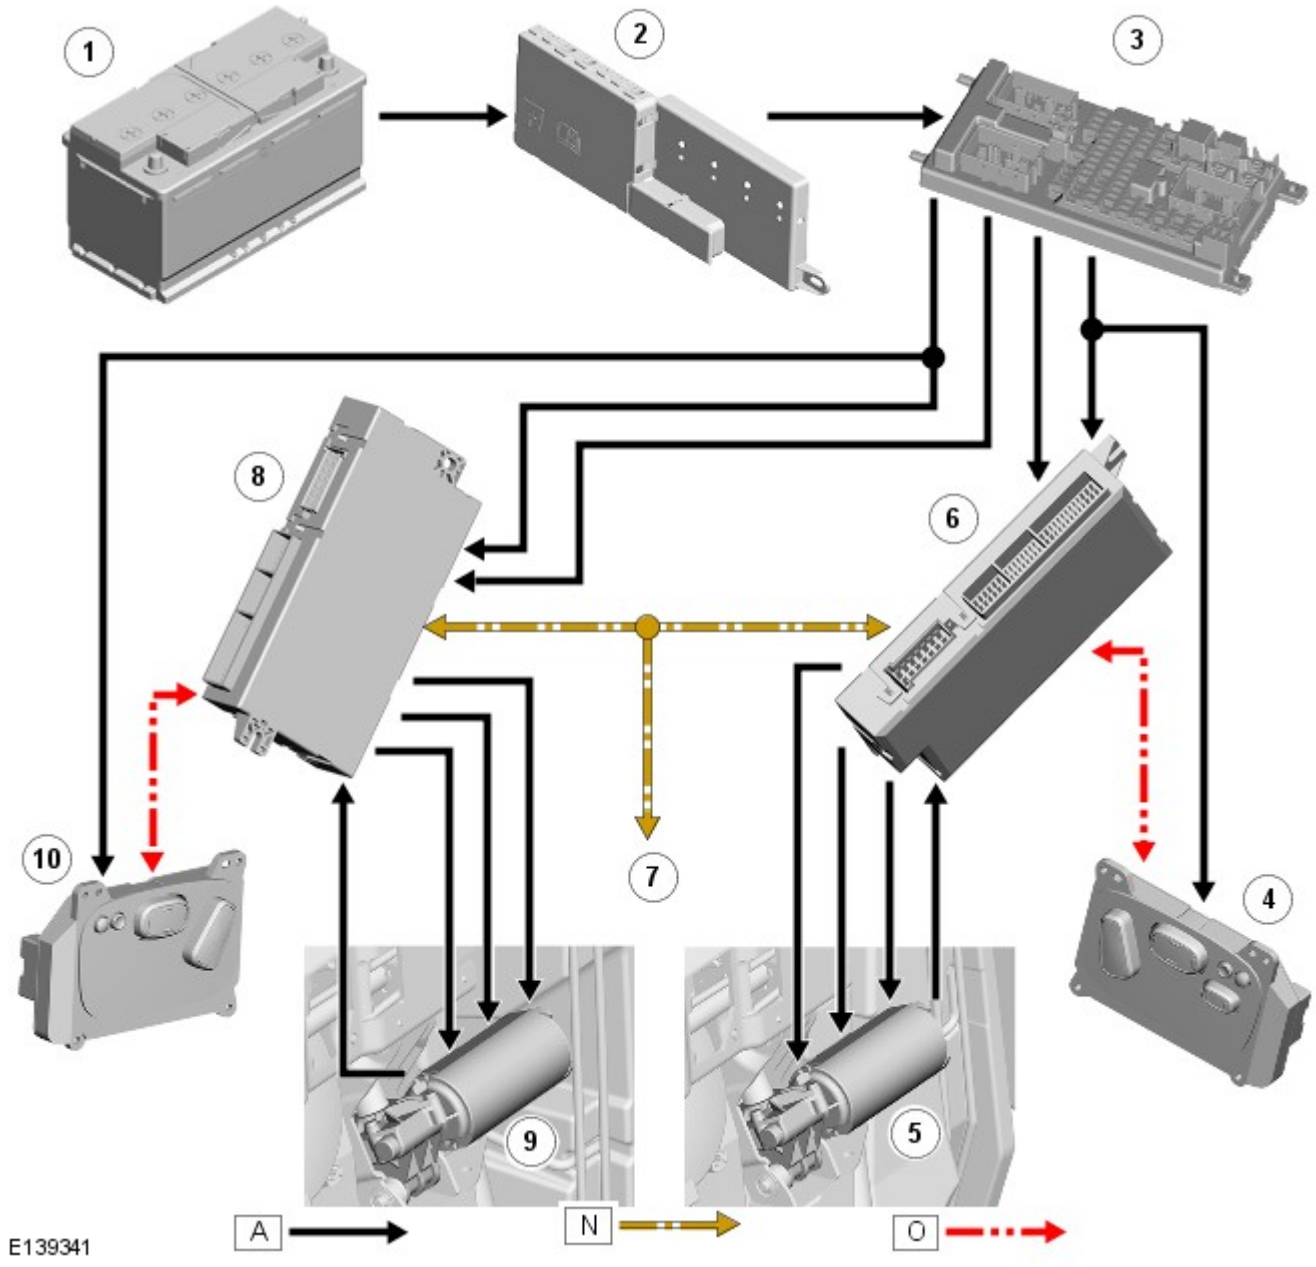
ADJUSTMENT - MEMORY FRONT SEAT



Item	Description
1	Battery
2	BJB
3	CJB
4	Seat memory switches
5	Squab recline motor
6	Head restraint motor
7	Cushion tilt motor
8	Seat height motor
9	Lumbar adjustment solenoids
10	Air pump
11	Squab bolster adjustment solenoids
12	Seat slide motor
13	Cushion extension motor
14	Seat switch pack
15	Driver seat module
16	RJB

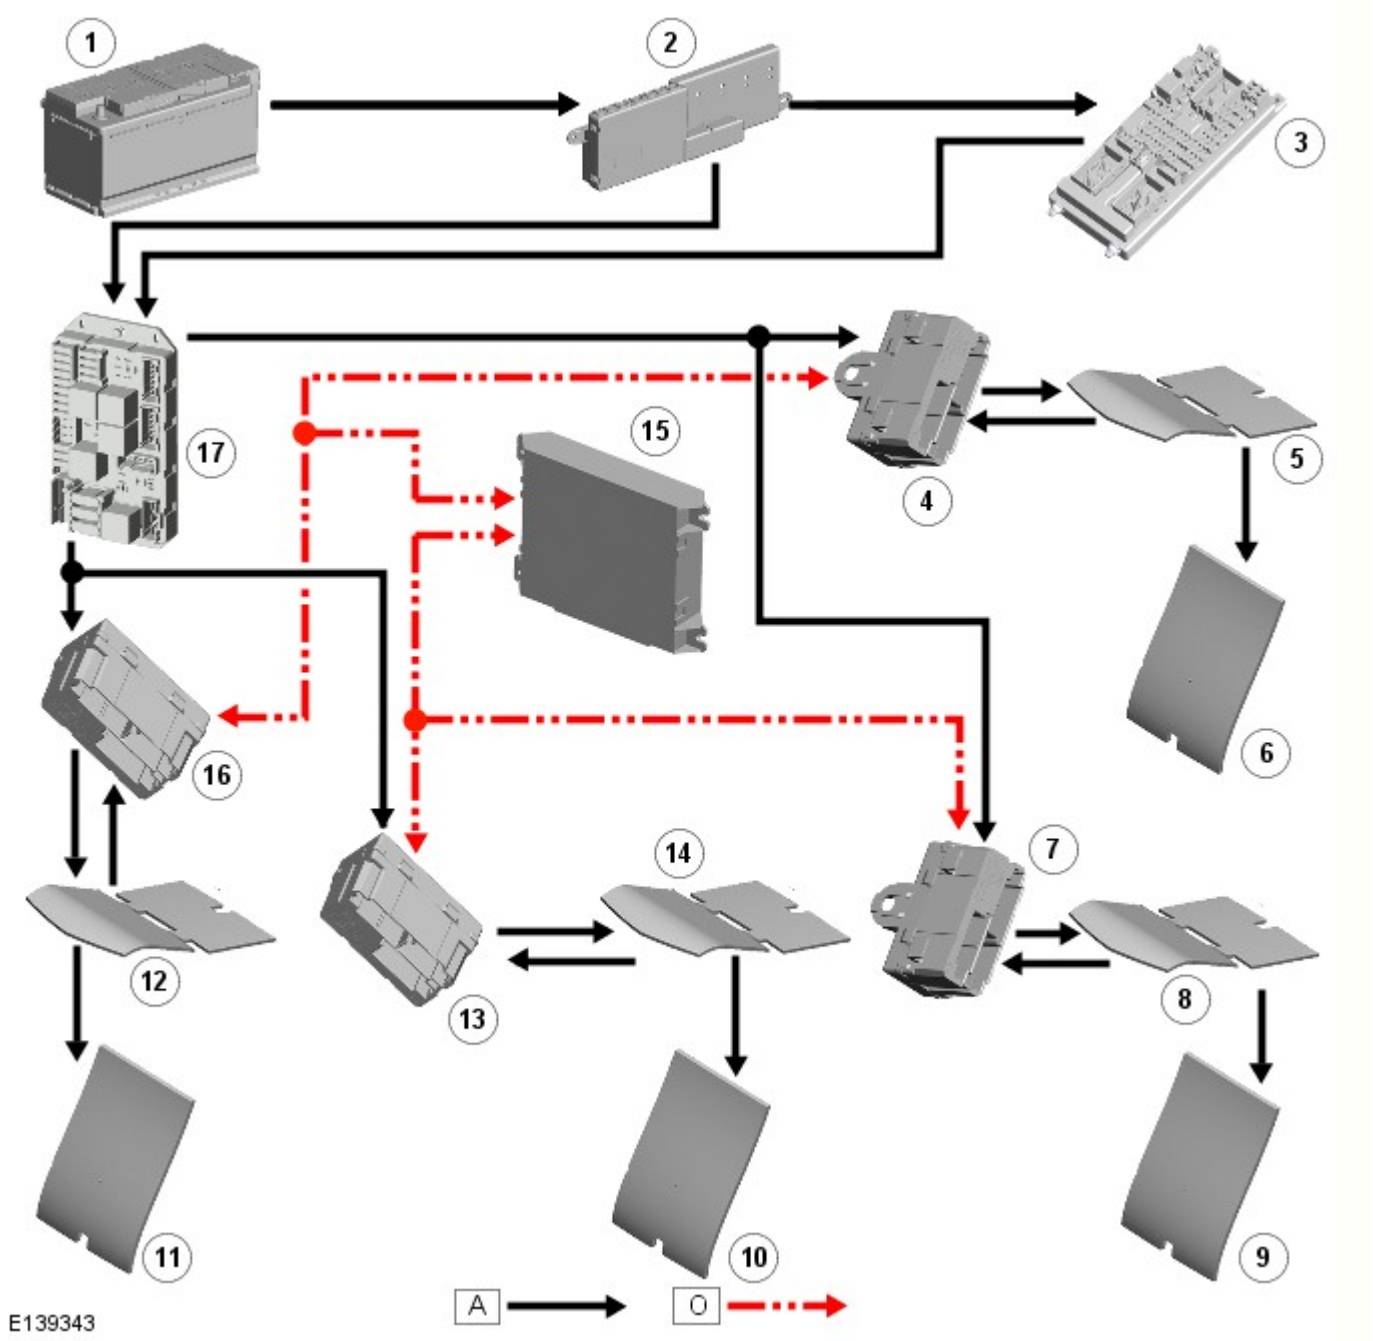
17	LH (left-hand) door module
18	RH (right-hand) door module

ADJUSTMENT - REAR SEATS



Item	Description
1	Battery
2	Battery Junction Box (BJB)
3	Central Junction Box (CJB)
4	Rear RH seat switchpack
5	RH recline motor
6	RH rear seat module
7	Medium speed CAN (controller area network) to other vehicle systems
8	LH rear seat module
9	LH recline motor
10	Rear LH seat switchpack

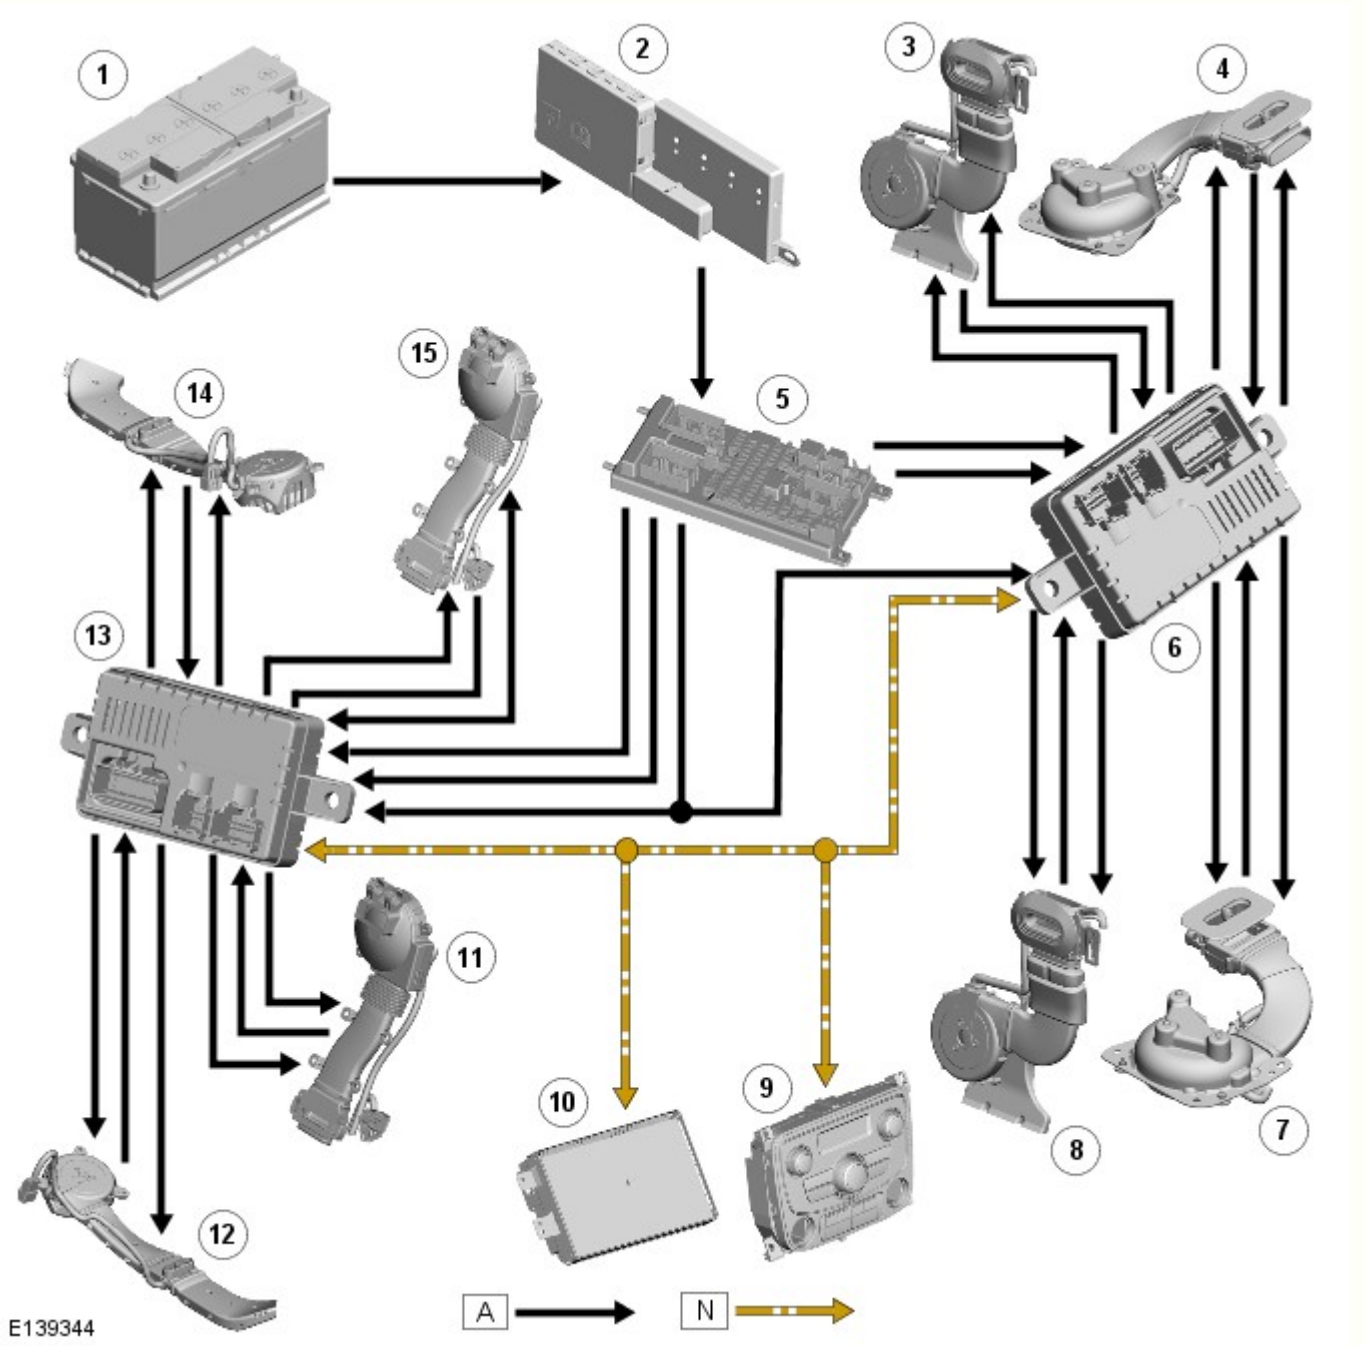
HEATED SEATS - FRONT AND REAR



Item	Description
1	Battery
2	BJB
3	CJB
4	Rear RH seat heater module
5	Rear RH cushion heater
6	Rear RH squab heater
7	Rear LH seat heater module
8	Rear LH cushion heater
9	Rear LH squab heater
10	Front LH squab heater
11	Front RH squab heater
12	Front RH cushion heater
13	Front LH seat heater module
14	Front LH cushion heater
15	ATC (automatic temperature control) module
16	Front RH seat heater module

17	RJB

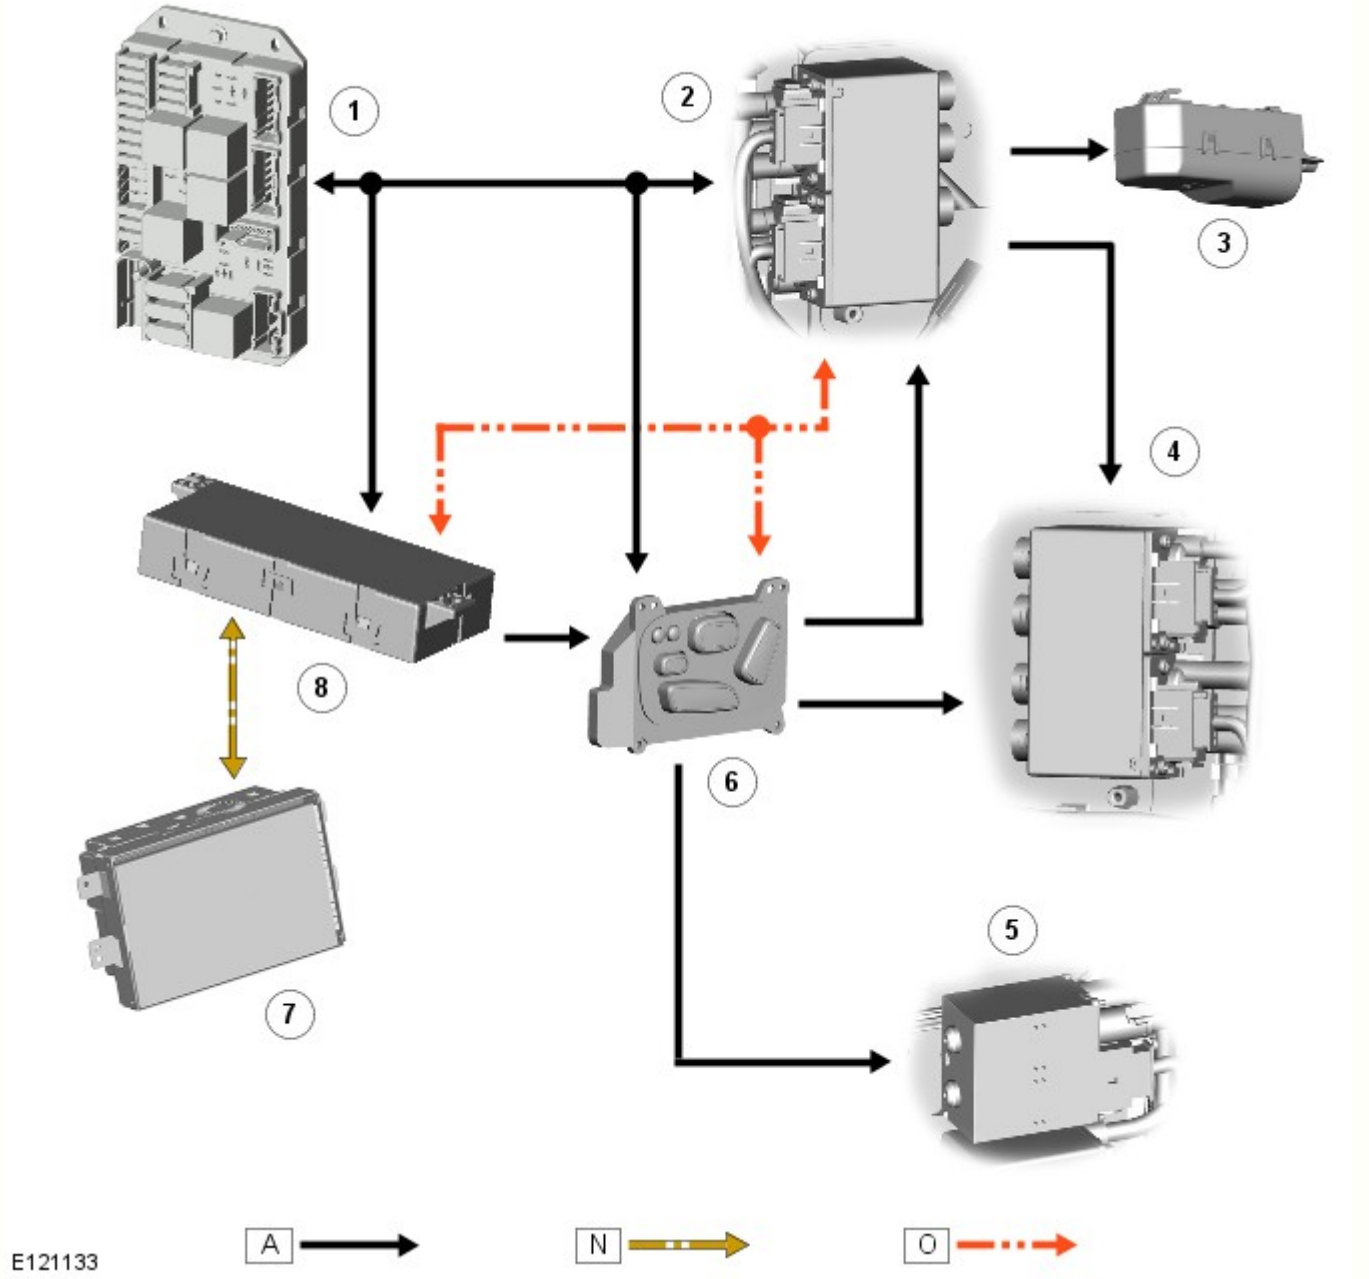
CLIMATE SEATS - FRONT AND REAR



Item	Description
1	Battery
2	BJB
3	Front RH seat squab climate module
4	Front RH seat cushion climate module
5	CJB
6	Front seat climate control module
7	Front LH seat cushion climate module
8	Front LH seat squab climate module
9	Rear climate control panel
10	Touch Screen Display (TSD)
11	Rear RH seat squab climate module
12	Rear RH seat cushion climate module
13	Rear seat climate control module

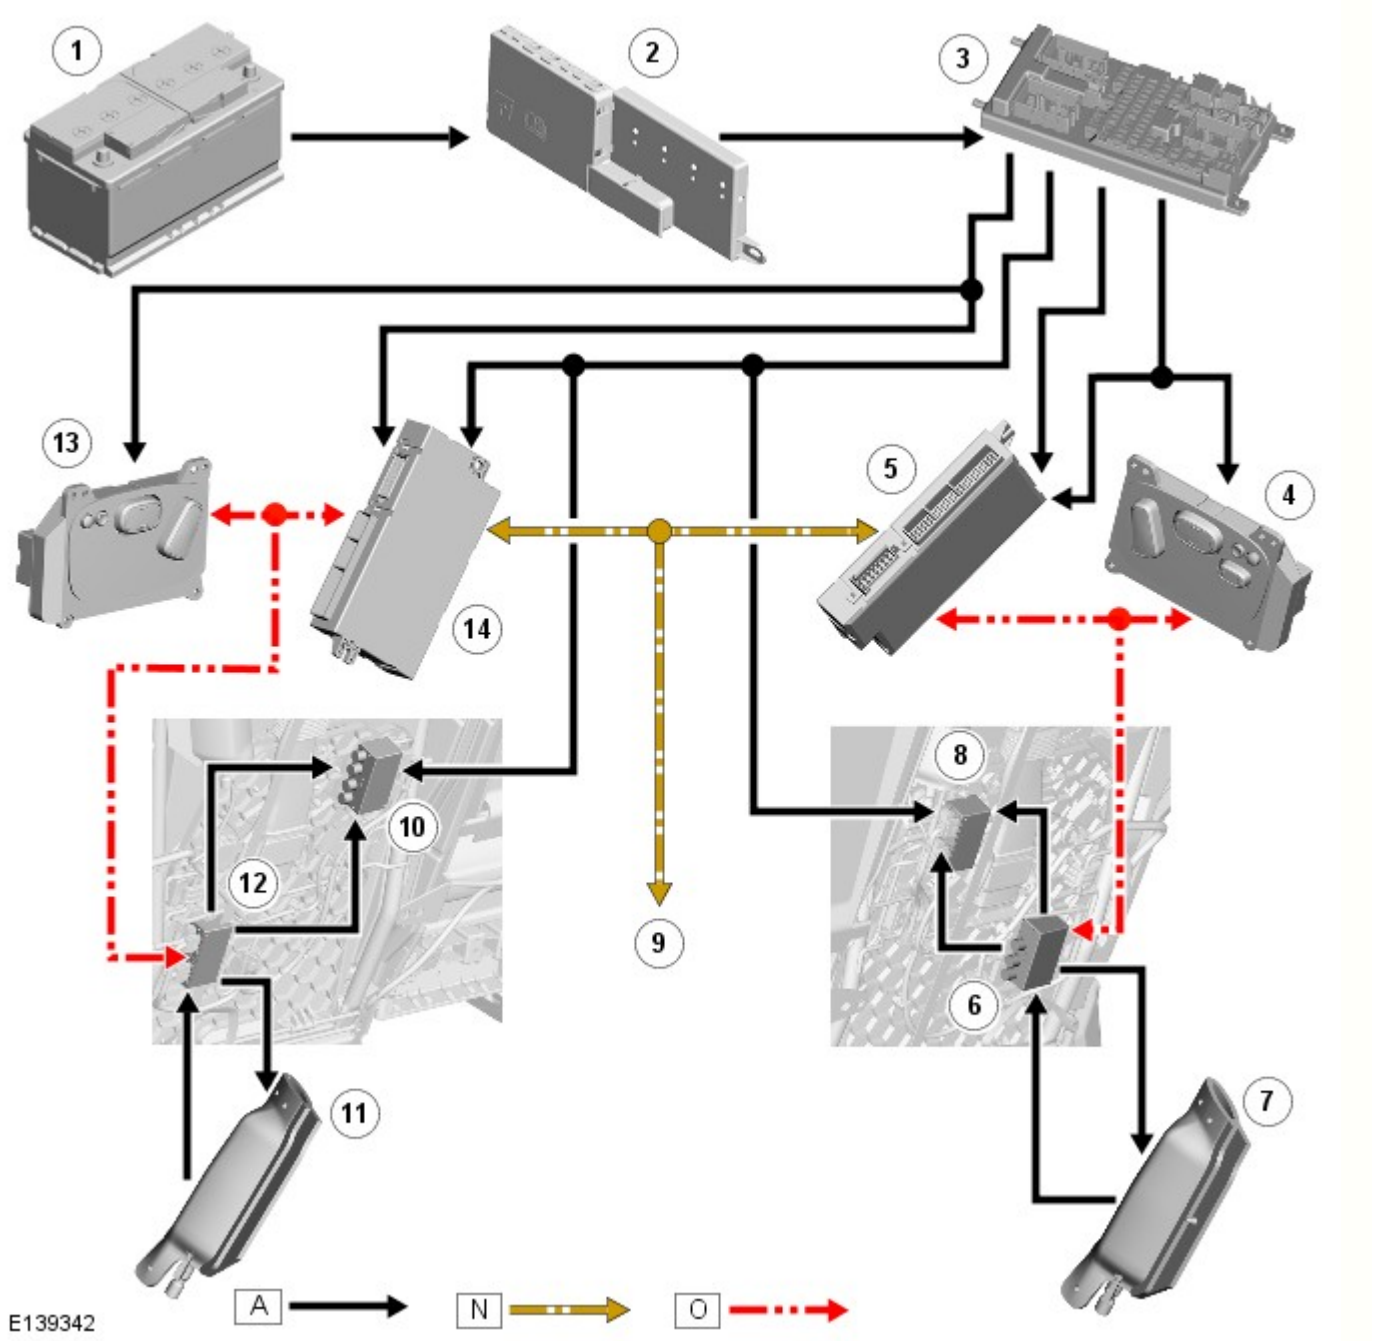
14	Rear LH seat cushion climate module
15	Rear LH seat squab climate module

SEAT MASSAGE - FRONT SEATS



Item	Description
1	RJB
2	Master massage solenoid
3	Air pump
4	Slave massage and adjustable bolster solenoid
5	Lumbar solenoid
6	Seat switch pack
7	Touch-screen
8	Seat module

SEAT MASSAGE - REAR SEATS



Item	Description
1	Battery
2	Battery Junction Box (BJB)
3	Central Junction Box (CJB)
4	Rear RH seat switch pack
5	RH rear seat module
6	RH slave massage solenoid
7	RH seat air pump
8	RH master massage solenoid
9	Medium speed CAN to other vehicle systems
10	LH master massage solenoid
11	LH seat air pump
12	LH slave massage solenoid
13	Rear LH seat switch pack
14	LH rear seat module

System Operation

PRINCIPLES OF OPERATION

FRONT SEATS

Adjustment - Non-memory Seats

On non-memory front seats, each seat switch pack receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the air pump and associated solenoid valves.

For the adjustment motors, when a switch is operated power is connected to the applicable side of the related motor and a ground is connected to the opposite side of the motor, which then runs in the required direction. To move the motor in the opposite direction the polarity is reversed.

When the lumbar inflate switch is pressed, power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

Adjustment - Memory Seats

On memory front seats, the seat module receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the seat module.

Permanent power supplies are also connected from the CJB to the memory switch pack and from the RJB to the seat switch pack.

The seat switch pack is connected to the seat module by a LIN (local interconnect network) bus for the seat adjustment switches. Any selection for seat adjustment generates a message which is passed via the LIN bus to the seat module. The seat module processes the request and operates the applicable seat motor as required using the power supplies from the CJB .

The seat module on the driver seat is also connected to the medium speed CAN bus. This allows the driver seat module to monitor the position of the door mirrors and the steering column, using signals from the door modules and CJB respectively, when storing and recalling memory settings.

The memory switch pack has two hardwired connections with the related seat switch pack. One is for the three channel switches and one is for the memory switch. Operation of the any of the memory switches is relayed from the seat switch pack to the seat module on the LIN bus.

Memory settings are stored in the seat module by pressing the memory switch and then, within 5 seconds, one of the channel switches. When the memory switch is pressed the LED (light emitting diode) in the switch comes on. After the channel switch is pressed, the LED goes off and a chime sounds to confirm that the settings have been memorized. If the ignition is on, the message center will display a confirmation message. Any previously stored settings on the selected channel will be over-written.

Memory settings are recalled by pressing the applicable channel switch. If the ignition is on, the message center will display a confirmation message.

On seats with 2-way lumbar adjustment, when the inflate switch is pressed power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

On seats with 4-way lumbar adjustment and bolster adjustment, when an inflate switch is pressed, power is simultaneously connected to the air pump and the related inflate solenoid valve. When a deflate switch is pressed, power is connected to the related deflate solenoid valve, which opens to deflate the support. On vehicles with massage seats, power is connected to the inflate and deflate solenoid valves in the same way, but when an inflate selection is made the air pump is activated by a LIN bus message to the master solenoid valve, which then operates the air pump.

Stall Detection

A seat adjustment motor is deemed to have stalled if there is no change in the input from the feedback sensor of the motor for 200 ms. If a stall condition is detected then the drive to that motor is cancelled for the remainder of the memory recall operation or until the switch is re-selected (manual movement). The motor may be activated again, to move past the stall position, by pressing the appropriate switch for more than 2 seconds. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again, when a further 0.5 second of activation is permitted. This is known as inch mode, which allows seat adjustment to be maintained if sensor feedback is lost.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the adjustment motors.

Battery Monitor

If the battery voltage drops below 10.5 V, then the driver seat module ignores all requests for a memory recall until the battery voltage has reached 11.5 V. This will conserve as much power in the vehicle battery as possible to enable engine cranking.

Massage Seats

Seat massage requests from the START / STOP buttons on the TSD are sent via the medium speed CAN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on the LIN bus connection.

When a START button is pressed, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When a STOP button is pressed, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

Anti-Whiplash System (AWS)

Depending on the weight of the occupant and the severity of the collision, the mechanisms begin to operate at a relative impact speed of between approximately 8.7 and 11.2 mph (13.9 and 17.9 km/h). At the point of a rear impact, the forward energy of the impact and the inertia of the occupant combine to push the backrest against the occupant's back. That causes the AWS mechanism to begin a controlled sequence of movements. First, while remaining in an upright position, the backrest moves rearwards by approximately 50 mm. Next, the backrest reclines through an angle dependant upon the direction and relative speed of the collision, up to a maximum of approximately 15 degrees.

The combined effect of these movements is to absorb some of the energy of the impact and reduce the relative acceleration of head and body, thereby helping to reduce the possibility of whiplash injury.

HEATED SEATS

The heater elements only operate when the engine is running. Power for the heater elements is supplied to the seat heater modules from the heated seat relay in the RJB , which is controlled by a hardwired ignition signal from the CJB .

Seat heating selections made on the TSD and the rear climate control panel are transmitted to the ATC module.
Refer to: Heating and Ventilation (412-01 Climate Control, Description and Operation).

When the ATC module receives a seat heating request, it sends a LIN bus message to the appropriate seat heater module to energize the heater elements in the cushion and the squab. The seat heater module relays the temperature signal, from the thermal sensor in the cushion heater element, back to the ATC module. The ATC module uses the temperature signal to regulate the heater elements at the selected heat setting.

CLIMATE SEATS

The heating/cooling of the climate seats only operates when the engine is running. Power for the climate modules is supplied to the climate seat control modules by two permanent power supplies from the CJB . The climate seat control modules also receive a power supply from the ignition relay in the CJB .

Heating/Cooling selections on the TSD and the rear climate control panel are transmitted to the appropriate climate seat control module on the medium speed CAN bus. The climate seat control module then energizes the Peltier cell and the blower of the climate module(s) in the appropriate seat. The climate seat control module uses the signals from the temperature sensors in the squab and the cushion climate modules to regulate the seat at the selected temperature. If full seat heating/cooling is selected, both the squab and the cushion climate modules are activated. If partial seat heating/cooling is selected, only the squab climate module is activated.

REAR SEATS

Adjustment

The rear seat adjustment is only active when the smart key is in the vehicle and the ignition is on.

Each rear seat switchpack receives a logic power supply from the CJB via fuse F47. Each switchpack is connected to its respective rear seat control module by a LIN bus connection.

Each rear seat module receives two power supplies from the CJB to operate the recline motor, the lumbar pump and the solenoids.

Operation of the rear seat switchpack switches for seat recline produces a LIN bus message to the respective rear seat control module. The seat control module then provides a power supply to the applicable seat recline motor. Each recline motor has a Hall effect sensor to determine the position of the seat.

A seat recline motor is deemed to have stalled if there is no change in the input from the Hall sensor of the motor for 200 ms. If a stall condition is detected then the power supply to the motor is removed until the switch is re-selected. The motor may be activated again. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If Hall sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the recline motors.

Massage Seats

Seat massage requests from the seat switchpack are passed on a LIN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on a LIN bus connection.

When the ON button is pressed on the seat switchpack, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When the OFF button is pressed on the seat switchpack, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

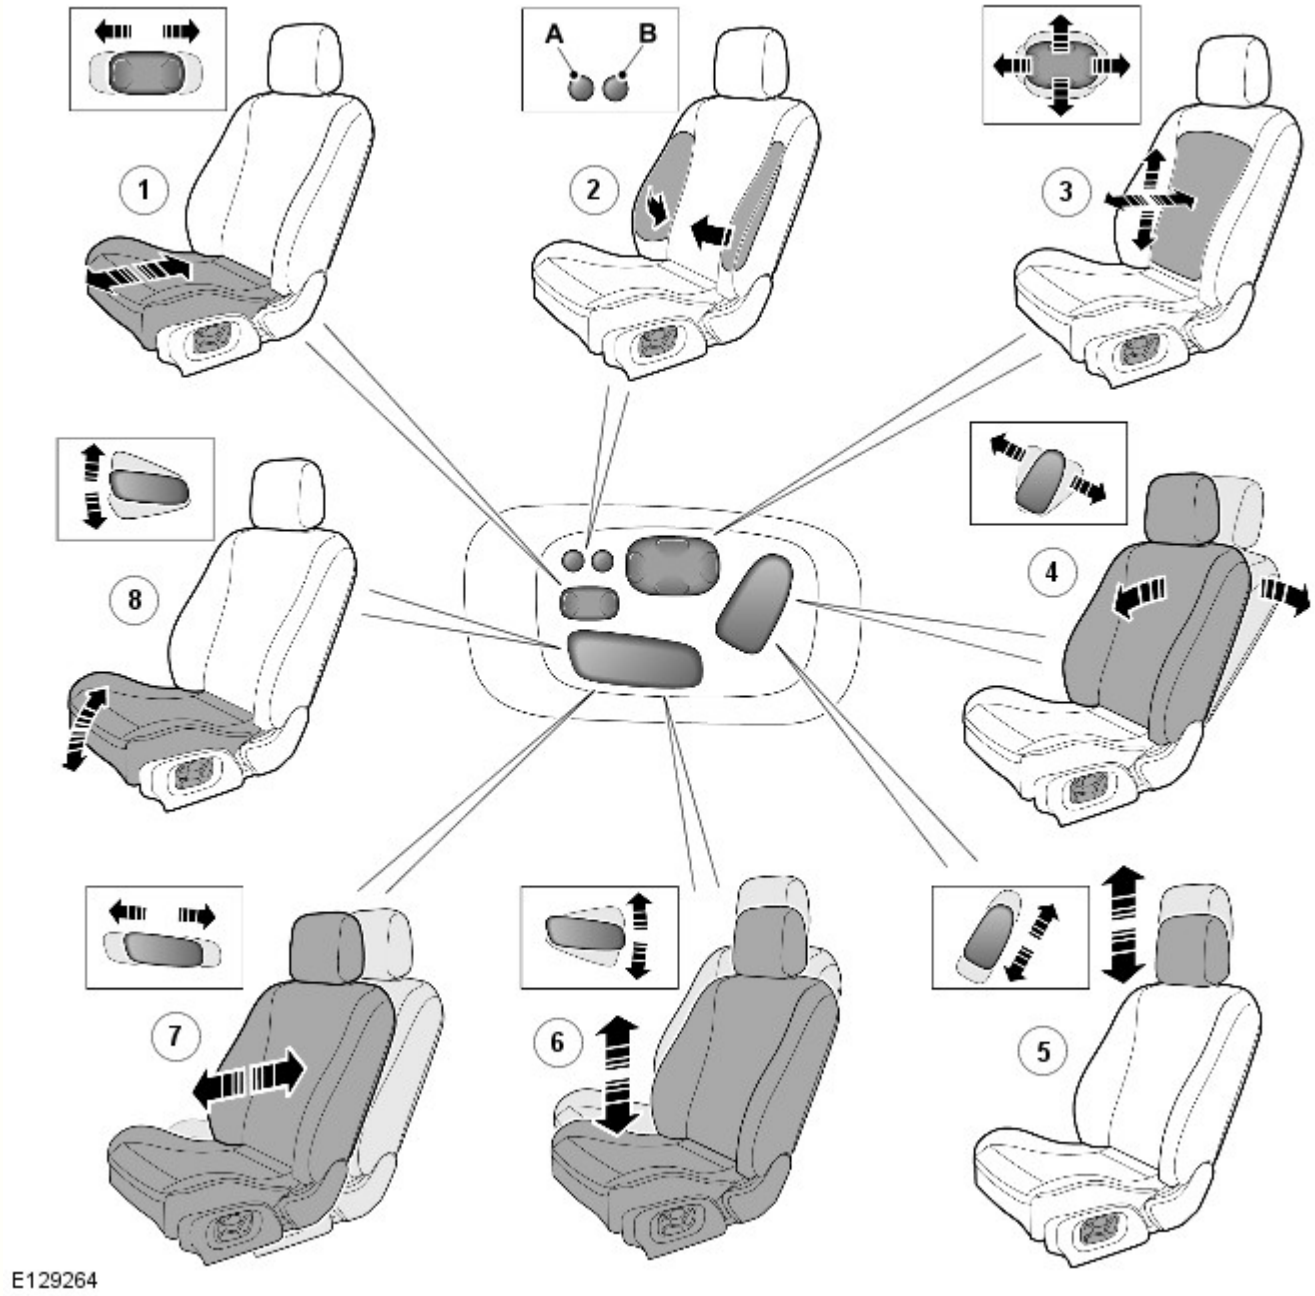
Component Description

FRONT SEATS ADJUSTMENT

Electric motors are used to provide adjustment of seat slide, seat height, squab recline and, where fitted, cushion tilt, head restraint and cushion extension. An air pump and inflatable cushions are used to provide adjustment of the lumbar support and the squab bolster supports (where fitted).

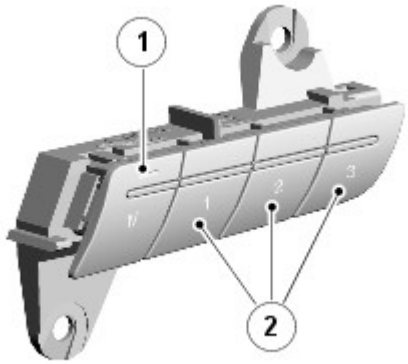
All of the seat adjustments are controlled from the seat switch pack on the outside of the seat cushion. On non memory seats, the control switches are connected directly to the adjustment motors. On memory seats, the switches are connected to the adjustment motors via a seat control module. Memory seats also have a memory switch pack in the related door panel.

Adjustment Switches



Item	Description
1	Cushion extension
2A	Bolster inflate
2B	Bolster deflate
3	Lumbar support (4-way shown; 2-way uses only fore/aft positions for inflate/deflate)
4	Squab recline
5	Head restraint
6	Seat height
7	Seat slide
8	Cushion tilt

Memory Switch Pack



Item	Description
1	Channel switches
2	Memory switch

Seat Motors

Each adjustment motor contains a Hall position sensor. The sensors provide position feedback signals which, on seats with a memory function, are used for memory store and recall operation.

The seat slide motor is an integral component of the cushion frame. The motor drives a gear on a worm drive lead screw, which is integral with the floor rail. The lead screw has a stop at each end to limit the fore and aft seat movement.

The seat height motor is located below the seat. The motor drives a gear on a lead screw. The lead screw moves a lever mechanism, which raises or lowers the seat cushion.

The squab recline motor is located in the squab frame. The recline motor rotates a shaft connected to the squab frame, which changes the angle of the squab.

The tilt motor is located below the seat. The tilt motor drives a gear on a lead screw to raise the front of the seat cushion.

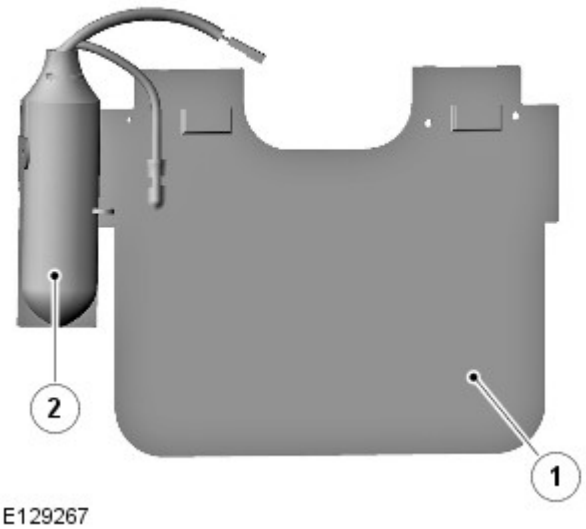
The head restraint motor is located in the upper section of the squab frame and is accessible by removal of the seat back. The motor moves a cradle by a rack and pinion arrangement. The cradle has two head restraint stems, which raise and lower the head restraint as the motor moves the cradle.

The cushion extend motor is located below the seat. The motor drives a gear on a lead screw, which extends or retracts the front of the seat cushion.

Lumbar Adjustment

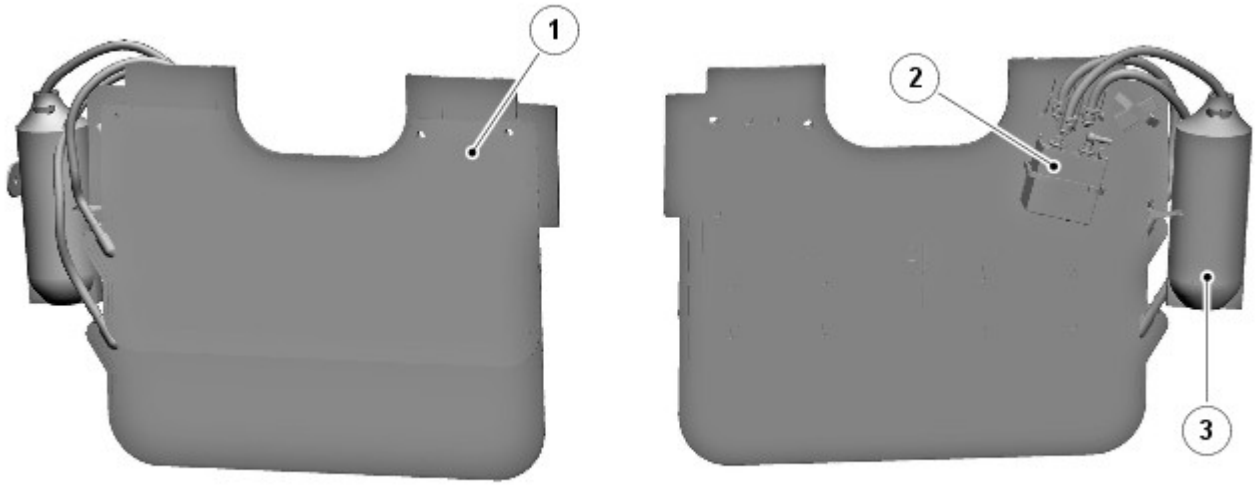
Lumbar adjustment is provided by a lumbar support and air pump installed in the squab. The lumbar support consists of an inflatable cushion with either a single air cell (2-way lumbar support) or dual air cells (4-way lumbar support), depending on vehicle specification. On vehicles with massage seats, the dual cell lumbar support is operated by the air pump of the massage system.

2-way Lumbar Support



Item	Description
1	Lumbar support
2	Air pump

4-way Lumbar Support



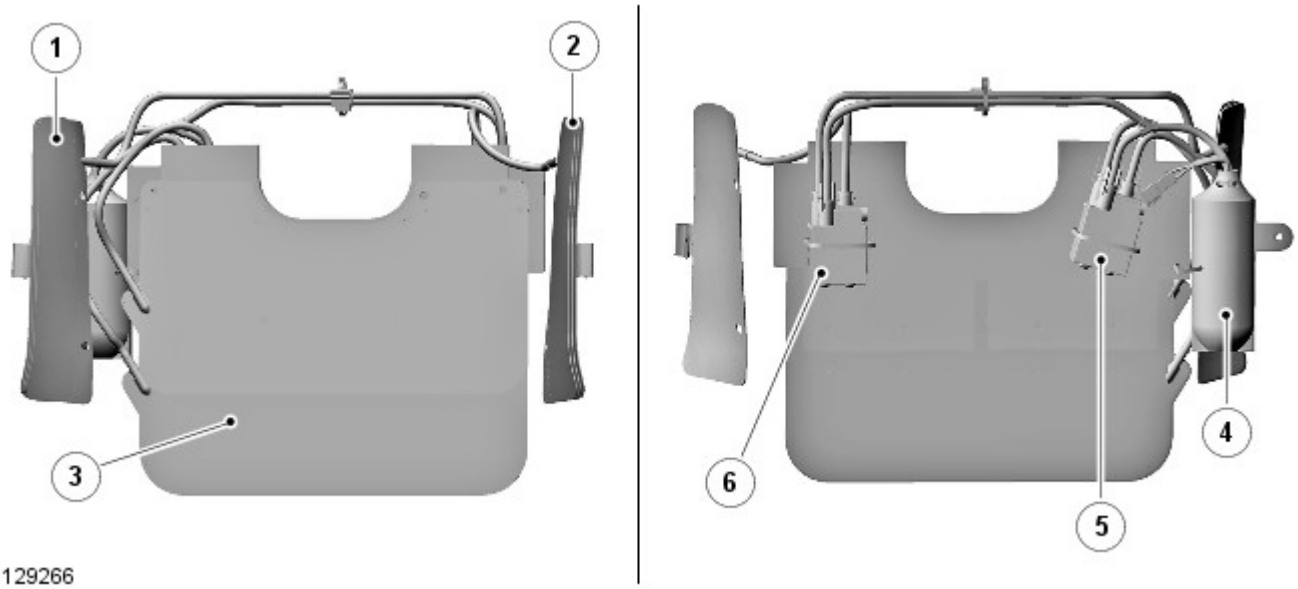
E129268

Item	Description
1	Lumbar support
2	Solenoid valves
3	Air pump

Squab Bolster Adjustment

Squab bolster adjustment is provided by inflatable cushions on the inside faces of the squab bolsters. The inflatable cushions are operated simultaneously by a solenoid valve block and the air pump of the lumbar support or the massage seat system. On vehicles with massage seats, the squab bolster solenoid valves are incorporated into the valve block containing the slave massage solenoid valves.

Squab and Lumbar Support



E129266

Item	Description
1	RH squab bolster support
2	LH squab bolster support
3	4-way lumbar support

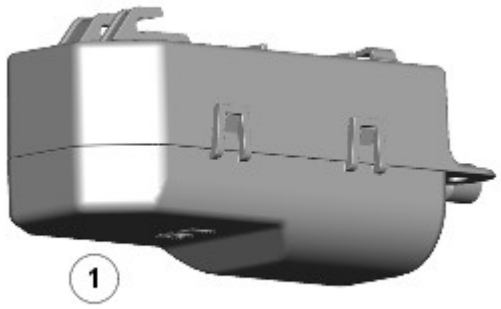
4	Air pump
5	Lumbar support solenoid valves
6	Squab support solenoid valves

MASSAGE FRONT SEATS

Where fitted, the massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar and squab bolster supports. The slave solenoid block also incorporates the solenoid valves used to control the squab bolster supports.

Operation of the massage system is controlled with START and STOP buttons on the climate menu of the TSD and is independent of the lumbar and squab bolster adjustments.

Air Pump



E121128

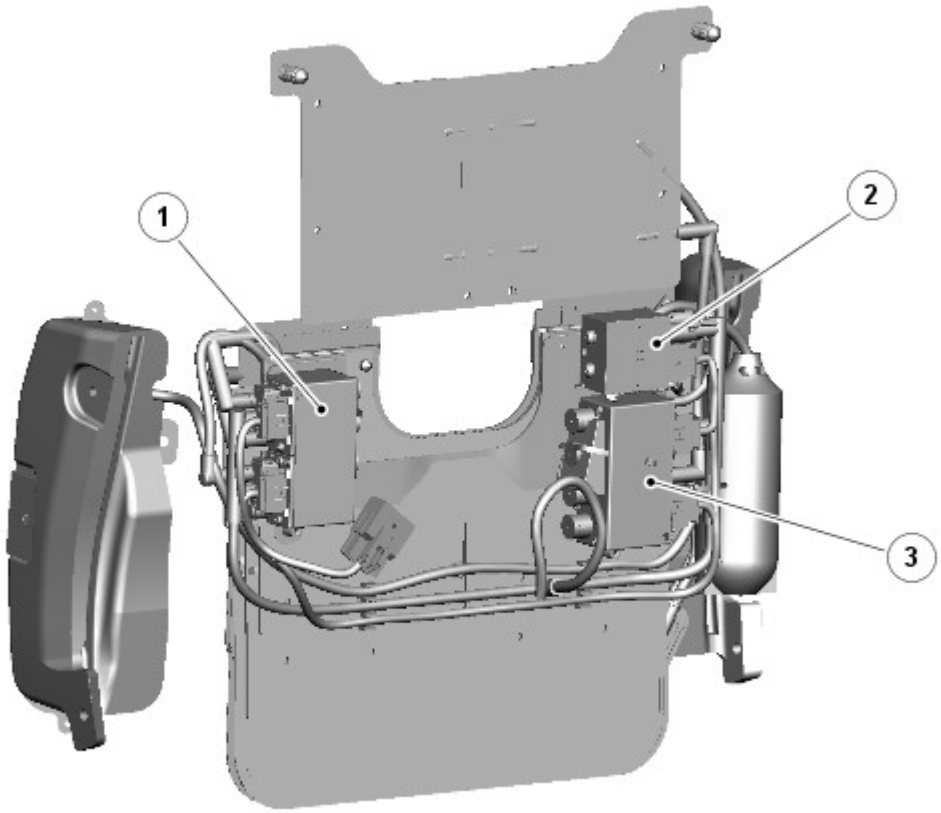
Item	Description
1	Air pump

The air pump is located underneath the seat at the rear of the squab. The pump is housed inside a NVH (noise, vibration and harshness) casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the lumbar solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in ^{2} .).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves

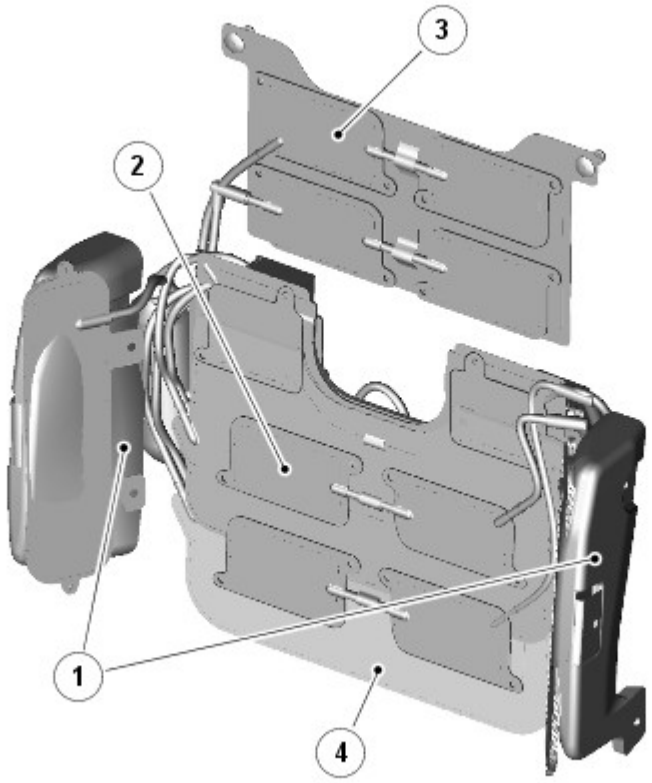


E121129

Item	Description
1	Master massage solenoid valves
2	Lumbar solenoid valves
3	Slave massage and adjustable bolster solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

Air Cell Pads



E121130

Item	Description
1	Squab bolster cells (2 off)
2	Lower massage cells (3 pairs)
3	Upper massage cells (2 pairs)
4	Lumber cells (2 off)

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in ^{2} .). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

HEATED FRONT AND REAR SEATS

Heated seats incorporate heater elements in the cushion and the squab of the seat. Power to the heater elements of the front seats is controlled by two seat heater modules attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Power to the heater elements of the two outside rear seats is controlled by two seat heater modules attached to a bracket on the back of the rear seat squab.

Each cushion heater element has a thermal sensor, which supplies a feedback temperature signal to the related seat heater module. The squab heater elements do not have a thermal sensor, and are regulated at the same temperature as the cushion heater elements.

Seat heating for the front and rear seats can be selected on the climate menu of the TSD. Seat heating for the rear seats can also be selected on the rear climate control panel. Three levels of heating are available. Heating can also be selected for either the cushion and the squab or just the squab.

CLIMATE FRONT AND REAR SEATS

Climate seats incorporate climate modules in the cushion and the squab of the seat. Operation of the climate modules of the front seats is controlled by a climate seat control module attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Operation of the climate modules of the two outside rear seats is controlled by a climate seat control module attached to the body, behind the of the rear seat squab.

The climate modules contain Peltier cells, which heat up or cool down depending on the voltage provided by the climate seat control module. Each climate module also contains a blower, which blows air over the Peltier cell to distribute the heated or cooled air through liners in the related cushion or squab. The blower is also controlled by the climate seat control module.

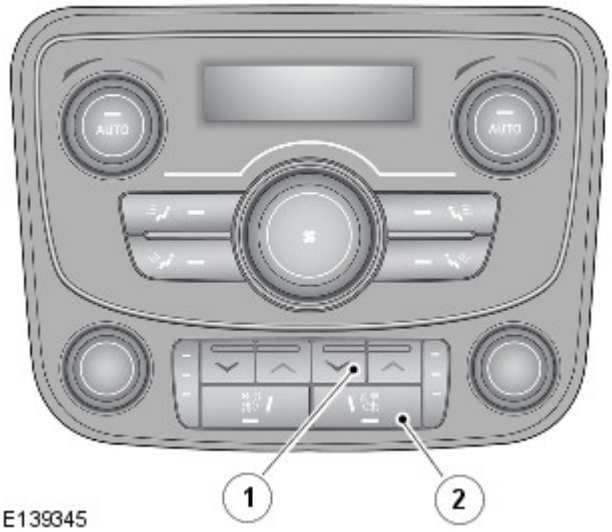
Seat heating and cooling for the front and rear seats can be selected on the climate menu of the TSD. Seat heating and cooling for the rear seats can also be selected on the rear climate control panel. Three levels of heating and three levels of cooling are available. Heating and cooling can also be selected for either the cushion and the squab, or just the squab.

Touch Screen Display

E129269

Item	Description
1	Temperature control buttons
2	Zone control button
3	Massage control buttons

Rear Climate Control Panel



E139345

Item	Description
1	Temperature control switch
2	Zone control switch

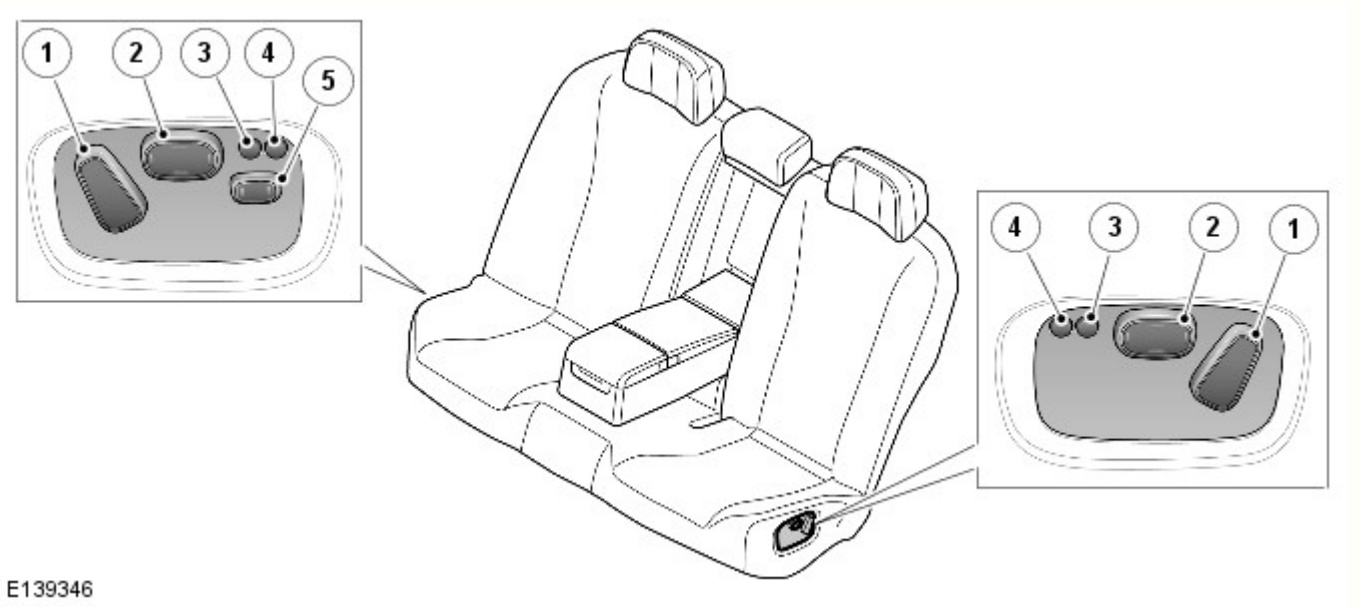
REAR SEATS ADJUSTMENT

An electric recline motor is used to provide adjustment of seat squab recline. An air pump and inflatable cushions are used to provide adjustment of the lumbar support.

All of the seat adjustments are controlled from the seat switchpack on the outside of the seat cushion. The control switches are connected via a LIN bus to the seat control module to the adjustment motors via a seat control module.

Rear seat switchpack functions are disabled if the rear window isolation switch has been activated.

Adjustment Switches (LHD (left-hand drive) version shown



Item	Description
1	Seat squab recline control
2	Lumbar support adjustment
3	Massage OFF
4	Massage ON
5	Front passenger seat away - forward or rearward adjustment

The rear seat control switchpack on the passenger side of the vehicle also has a front passenger seat away switch. This switch when pressed will move the front passenger seat forwards or backwards to allow more room for the rear seat passenger on that side. A second switch for this function is located on the inside face of the front passenger seat back to allow the driver to operate the function.

Front Passenger Seat Away Switch

E139347

The front passenger seat way function allows the driver to adjust the position of the front passenger seat using a switch located on the passenger seat bolster.

The two-way rocker switch allows the driver to move the front passenger seat forward or rearwards to adjust leg room for the rear seat passenger.

The rear seat adjustment switchpack for the rear seat behind the front passenger seat, has an additional two-way switch to move the front passenger seat forwards or rearwards, allowing the passenger to adjust the available leg room.

MASSAGE REAR SEATS

Where fitted, the rear seat massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar supports.

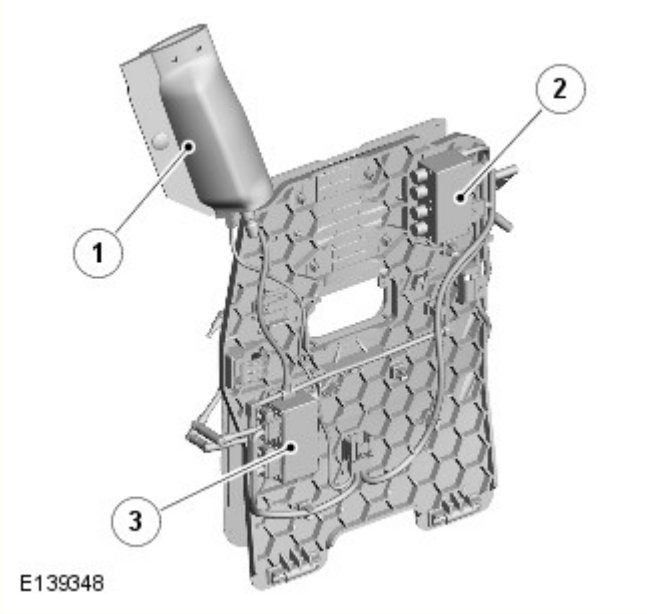
Operation of the massage system is controlled with START and STOP buttons on the rear seat adjustment switches.

The air pump is located at the rear of the squab. The pump is housed inside a NVH casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the slave solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in2.).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves



Item	Description
1	Air pump
2	Slave massage solenoid valves
3	Master massage solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in2.). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

General Information - Diagnostic Trouble Code (DTC) Index DTC: Driver/Passenger Seat Module (DSM/PSM)

Description and Operation

Driver/Passenger Seat Module (DSM/PSM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system)

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the digital multimeter leads into account

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion

If diagnostic trouble codes are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

Where an 'on demand self-test' is referred to, this can be accessed via the 'diagnostic trouble code monitor' tab on the manufacturers approved diagnostic system

Check DDW for open campaigns. Refer to the corresponding bulletins and SSM's which may be valid for the specific customer complaint and carry out the recommendations as needed.

The table below lists all diagnostic trouble codes (DTCs) that could be logged in the driver/passenger seat module, for additional diagnosis and testing information refer to the relevant diagnosis and testing section.
For additional information, refer to: Seats (501-10 Seating, Diagnosis and Testing).

B1139-12	Lumbar Control D - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1139-13	Lumbar Control D - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B113A-00	General Failure on Seat Lumbar - No sub type information	• No sub type information	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B113B-00	Lumbar Control Multiple Failures - No sub type information	• No sub type information	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit

B12CC-00	Driver Seat Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B12D9-00	Driver Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B12DB-00	Passenger Seat Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B12E6-00	Passenger Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B13F6-11	Passenger Seat Away Switch - Circuit short to ground	• Passenger seat away switch circuit - short circuit to ground • Faulty switch	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the passenger seat away switch circuit for short circuit to ground • If no circuit faults are present, check and install new passenger seat away switch as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B13F7-00	Right Rear Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B13F8-00	Left Rear Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B13F9-00	Right Rear Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect

B13FA-00	Left Rear Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B1B86-11	Seat Height Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat height motor circuit
B1B86-15	Seat Height Motor Relay - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat height motor circuit
B1B87-31	Seat Height Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat height motor sensor circuit. Repair circuit as required. Clear DTC and retest
B1B88-11	Seat Slide Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat slide motor relay circuit
B1B88-15	Seat Slide Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat slide motor relay circuit
B1B89-31	Seat Slide Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat slide motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B90-11	Seat Tilt Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat tilt motor relay circuit
B1B90-15	Seat Tilt Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat tilt motor relay circuit
B1B91-31	Seat Tilt Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat tilt motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B92-11	Seat Recline Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat recline motor relay circuit
	Seat Recline Motor		

B1B92-15	Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat recline motor relay circuit
B1B93-31	Seat Recline Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat recline motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B94-24	Seat Height Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B95-24	Seat Height Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B96-24	Seat Slide Forward Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B97-24	Seat Slide Backward Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B98-24	Seat Tilt Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B99-24	Seat Tilt Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C00-24	Seat Recline Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C01-24	Seat Recline Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C02-24	Memory Store Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C03-24	Memory #1 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C04-24	Memory #2 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit

B1C05-24	Memory #3 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1D94-11	Lumbar Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat lumbar motor relay circuit
B1D94-15	Lumbar Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat lumbar motor relay circuit
U0010-88	Medium speed CAN Communication Bus - Bus off	• CAN signal fault. • Possible open circuit. • Faulty Control module.	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0140-00	Lost Communication With Central Junction Box - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Central Junction Box and Seat Module
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Instrument Cluster and Seat Module
U0199-00	Lost Communication With "Door Control Module A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Driver Door Module and Seat Module
U0246-00	Lost Communication With Seat Control Module "E" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Rear Right Massage Seat Module and Rear Right Seat Module
U0247-00	Lost Communication With Seat Control Module "F" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Rear Left Massage Seat Module and Rear Left Seat Module
U024B-00	Lost Communication With Seat Control Module "G" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Passenger Front Massage Seat Module and Drivers Seat Module

U024C-00	Lost Communication With Seat Control Module "H" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Drivers Front Massage Seat Module and Drivers Seat Module
U0300-00	Software Incompatibility - No sub type information	• No sub type information	• Check the module configuration using the approved diagnostic system. Check that the module software versions are the latest release and update as necessary
U1A14-49	CAN Initialization Failure - Internal electronic failure	• Internal electronic failure	• Suspect the driver seat module, check and install a new module as required, refer to the Warranty Policy and Procedures manual if a module is suspect
U1A4C-00	Build / End of Line mode Active - No sub type information	• Vehicle configuration incorrect	• Check the module configuration using the approved diagnostic system
U2100-00	Initial Configuration Not Complete - No sub type information	• Car Configuration Data not loaded (Central Junction Box installed to vehicle and not initialized) • Internal Central Junction Box failure	• Install car config to Central Junction Box. Clear DTC and retest systems
U2101-00	Control Module Configuration Incompatible - No sub type information	• Car Configuration Data transmitted over CAN does not match seat control module internal config	• Carry out the new module software installation procedure
U3000-49	Control Module - Internal electronic failure	• Internal electronic failure - Internal RAM/ROM error	• Renew the Control module. Refer to the Warranty Policy and Procedures manual if a module is suspect
U3001-46	Control Module Improper Shutdown - Calibration/parameter memory failure	• Event information	• DTC for information only. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a control module
U3002-81	Vehicle Identification Number - Invalid serial data received	• Invalid serial data received	• Configure the module using the manufacturers approved diagnostic system
U3003-16	Battery Voltage - Circuit voltage below threshold	• Battery voltage below threshold (8 volts)	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module
U3003-17	Battery Voltage - Circuit voltage above threshold	• Battery voltage above threshold	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

Seating - Seats - Overview

Description and Operation

OVERVIEW

Leather Seat Covers

Leather is a natural product, therefore it bears natural characteristics, such as grain variations, growth & bush marks. These non-weakening marks show the true nature of the hide and are the hallmarks of Leather. In order to maintain the beauty of the vehicles natural Leather upholstery it requires regular cleaning, which if neglected, may cause deterioration. Where dust and dirt are allowed to accumulate and become ingrained in the surface of the Leather, the upholstery may become permanently damaged.

Light coloured upholstery can be particularly susceptible to soiling and staining and care should be taken to ensure that where there is evidence of any soiling or staining on the upholstery then this should be cleaned immediately using the Jaguar/Land Rover approved products, failure to do this could lead to the stain becoming permanent, this applies to all leather upholstery and is not colour specific.

Leather trimmed seats will naturally exhibit areas of creasing and wrinkling over a period of time and is a normal characteristic as the Leather ages.

Particular care should be taken where there is evidence of soiling or staining on the leather, this should be cleaned immediately. Failure to do this could lead to the stain becoming permanent.

Particular care should be taken to prevent damage from studs, zips and buckles.

NOTES:

Please refer to Leather care label attached to seats for more information.

Creasing and wrinkling does not represent a manufacturing defect.

Damage from studs, zips and buckles do not represent manufacturing defects.

Use only Jaguar/Land Rover approved products in accordance with the instructions for use.

Front Seats

Various options are available for the front seats with regard to temperature control and electrical adjustment. Seats are non-heated, heated or heated and cooled (climate), with the following adjustment options:

- 10-way adjustment on the driver seat and 8-way adjustment on the passenger seat.
- 16-way adjustment on the driver seat and 12-way adjustment on the passenger seat.
- 18-way adjustment on the driver and passenger seats.

8-way adjustments consist of seat slide, seat height, squab recline and 2-way lumbar adjustment. 10-way adjustment adds cushion tilt. 12-way adjustment adds head restraint. 16-way adjustment adds cushion extension and replaces 2-way lumbar adjustment with 4-way. 18-way adjustment adds squab bolster adjustment. The controls for seat adjustment are installed in the outboard side shield of the related seat cushion.

The driver seat on all options has a 3-channel memory for easy recall of stored position settings for the seat, steering column and door mirrors. Passenger seats with 18-way adjustment also have a 3-channel memory. The controls for memory operation are in the related front door casing. Lumbar and squab bolster settings are not included in the memory function.

Some climate seats with 18-way adjustment also incorporate a massage function. The massage function is produced using additional lumbar cells. Operation of the massage function is controlled from the Climate / Front Climate / Front Seats menu of the Touch Screen Display (TSD).

Operation of the temperature settings for heated and climate seats is controlled from the Climate / Front Climate / Front Seats menu of the TSD.

Both front seats incorporate an Anti-Whiplash System (AWS) consisting of active, energy absorbent backrest mechanisms. Together with correctly positioned head rests, the AWS helps reduce the likelihood of neck and spinal injury in the event of a rear impact. In a low speed rear impact, AWS automatically moves and reclines the backrest by a small amount, to change the posture of the seat occupant and reduce the relative front to rear motion between body and head.

A map pocket is installed on the rear of each front seat squab. Depending on trim level, some vehicles also have a folding tray attached to the rear of the squabs.

Rear Seats

The following options are available for the two outer rear seats:

- Non-heated seats.
- Heated seats.
- Climate seats
- Recline function
- Front passenger seat away function
- Massage seats.

Operation of the temperature settings for heated and climate seats is controlled from the rear climate control panel and/or the Climate / Rear Climate / Rear Seats menu of the TSD.

ISOFIX fastening points are attached to the vehicle floor to provide secure fastening for compatible child seats in the rear seats.

From 12MY rear seat recline, massage and front passenger seat away functions are introduced. The functions are controlled by a switch pack on each end of the rear seat cushion and an additional seat control module for each seat. A chauffeur switch is fitted to the front passenger seat to allow the front passenger seat away function to be operated by the driver.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

1. Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

Seating - Heater Mats

Diagnosis and Testing

Principles of Operation

Heated seats incorporate heater elements in the cushion and the backrest of the seat. Each cushion heater element has a thermal sensor, which supplies a feedback temperature signal to the related seat heater module. The backrest heater elements do not have a thermal sensor, and are regulated at the same temperature as the cushion heater elements.

For a detailed description of the seat heater mat, refer to the relevant Description and Operation section in the workshop manual. REFER to: (501-10 Seating)

Seats (Description and Operation),
Seats (Description and Operation),
Seats (Description and Operation).

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual inspection

Mechanical	Electrical
• Seat heater switches condition and installation	• Fuses • Harnesses and connectors • Seat heater module • Seat heater switches • Seat heater mat

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTC's) and refer to the DTC Index.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

DTC Index

For a complete list of all diagnostic trouble codes that could be logged on this vehicle, please refer to section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Driver/Passenger Seat Module (DSM/PSM) (100-00 General Information, Description and Operation) /
Diagnostic Trouble Code (DTC) Index - DTC: Climate Controlled Seat Module - Front/Rear (SCME/SCMF) (100-00 General Information, Description and Operation).

PINPOINT TEST A : SEAT HEATER MAT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CHECK FOR DTC'S	
	1 Where possible use the manufacturer approved diagnostic system to review any logged seat heater mat DTC's
	Were any seat heater mat DTC's logged? **Yes** Carry out the help text action for any logged DTC's. Clear the DTC and retest. If DTC's return follow the tests listed below GO to A2 . **No** GO to A2 .
A2: MANUAL CHECK	
NOTES: The manual check should be carried out by someone familiar with correct seat heat operation	
On full power the seat should be hot to touch	
	1 If required operate the vehicle air conditioning on full for 10 minutes to reduce the in vehicle ambient temperature
	2 Operate the seat heater on full power
	Does the seat heater operate correctly? **Yes** Clear any stored DTC's and retest. If seat heater operation is correct no further action required **No** GO to A3 .
A3: SHORT CIRCUIT TO GROUND	

	1	Refer to the electrical circuit diagrams and the seat heater mat application chart (see above) to identify the connector
	2	Disconnect the connector
	3	Refer to the electrical circuit diagrams and check the seat heater mat **heater circuit** and the **NTC resistor circuit** for short circuit to ground
	Are either of the circuits short circuit to ground? **Yes** Repair the circuit or replace the seat heater mat as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component. Clear any stored DTC's and retest **No** GO to A4 .	
A4: CIRCUIT CONTINUITY TEST		
	1	Refer to the electrical circuit diagrams and check the seat heater mat (heater circuit) for circuit continuity
	Does the seat heater mat **heater circuit** pass the continuity test? **Yes** GO to A5 . **No** Repair the circuit or replace the seat heater mat as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component. Clear any stored DTC's and retest	
A5: POWER CONSUMPTION		
NOTE: The seat heater power supply cycles on and off dependant on the seat and cabin temperature and may only switch on for 5 seconds in 30 seconds		
	1	Reconnect the connector
	2	Operate the vehicle air conditioning on full for 10 minutes to reduce the in vehicle ambient temperature
	3	Refer to the electrical circuit diagrams and check the seat heater mat (heater circuit) using a **current clamp**
	4	Operate the seat heater on full power
	5	Use the chart above to calculate typical value (V/R=I) (**Volts** divided by **Resistance** equals **Current in Amps**)
	6	Examples (12 volts / 0.5 ohms =24 amps) (12 volts / 1 ohms = 12 amps) (12 volts / 2 ohms = 6 amps)
	Does the seat heater mat consume the correct level of current? **Yes** Clear any stored DTC's and retest. If operation correct, no further action required **No** GO to A6 .	
A6: RESISTANCE CHECK		
NOTES: Ensure the multimeter used is calibrated and a resistance reading of **0** ohms is shown when the test leads are connected together, alternately subtract any resistance shown from the result		
The seat heater mat circuits should be checked at the seat heater module connector		
Refer to the electrical circuit diagrams and to confirm the total resistance of the circuit the cushion and backrest are connected in series		
	1	Refer to the electrical circuit diagrams and the seat heater mat application chart (see above) to identify the terminals
	2	Disconnect the connector
	3	Using a multimeter, carry out a resistance check of the seat heater mat **heater circuit** and the **NTC resistor circuit** . Record the results
	4	Compare the results to the chart (see above)
	Are the results within specification at the given ambient temperature? (tolerance +/- **0.5** Ohms) **Yes** Reconnect the connector. Clear any stored DTC's and retest. If customer concern or DTC's return refer to electrical circuit diagrams and investigate the power and ground supply circuits **No** Replace the seat heater mat as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component. Clear any stored DTC's and retest	

Published: 11-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Climate Controlled Seat Module - Front/Rear (SCME/SCMF)

Description and Operation

Climate Controlled Seat Module - Front/Rear (SCME/SCMF)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If a control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Climate Controlled Seat Module - Front/Rear (SCME/SCMF), for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: Seats (501-10 Seating, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B10B9-13	Blower Control - Circuit open	• LH seat blower + circuit, open circuit • LH seat blower - circuit, open circuit • Connectors disconnected • Connector pin damage • Blower motor assembly open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check LH seat blower + circuit for open circuit. Check LH seat blower - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check blower motor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• Mechanical restriction in blower motor assembly • LH seat blower + circuit, short to ground	Check for mechanical restriction or debris in blower motor assembly. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check LH seat blower + circuit for short to ground. Check LH seat blower - circuit for short to ground. Check blower motor

B10B9-4B	Blower Control - Over temperature	• LH seat blower - circuit, short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1157-13	Blower Control B - Circuit open	• RH seat blower + circuit, open circuit • RH seat blower - circuit, open circuit • Connectors disconnected • Connector pin damage • Blower motor assembly open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check RH seat blower + circuit for open circuit. Check RH seat blower - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check blower motor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1157-4B	Blower Control B - Over temperature	• Mechanical restriction in blower motor assembly • RH seat blower + circuit, short to ground • RH seat blower - circuit, short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Check for mechanical restriction or debris in blower motor assembly. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check RH seat blower + circuit for short to ground. Check RH seat blower - circuit for short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B120E-13	Right Thermal Electric Device Control - Circuit open	• RH seat back thermal electric device + circuit, open circuit • RH seat back thermal electric device - circuit, open circuit • RH seat cushion thermal electric device + circuit, open circuit • RH seat cushion thermal electric device - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat backrest thermal electric device assembly, open circuit • Climate seat cushion thermal electric device assembly, open circuit	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for open circuit. Check RH seat back thermal electric device - circuit for open circuit. Check RH seat cushion thermal electric device + circuit for open circuit. Check RH seat cushion thermal electric device - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check climate seat backrest thermal electric device assembly for open circuit. Check climate seat cushion thermal electric device assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		• Climate Control Seat Module failure	
B120E-19	Right Thermal Electric Device Control - Circuit current above threshold	• RH seat back thermal electric device + circuit, short to ground • RH seat back thermal electric device - circuit, short to ground • RH seat cushion thermal electric device + circuit, short to ground • RH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for short to ground. Check RH seat back thermal electric device - circuit for short to ground. Check RH seat cushion thermal electric device + circuit for short to ground. Check RH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B120E-4B	Right Thermal Electric Device Control - Over temperature	• Restriction in thermal electric device air path • RH seat back thermal electric device + circuit, short to ground • RH seat back thermal electric device - circuit, short to ground • RH seat cushion thermal electric device + circuit, short to ground • RH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Check for blockage or restriction in thermal electric device air path. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for short to ground. Check RH seat back thermal electric device - circuit for short to ground. Check RH seat cushion thermal electric device + circuit for short to ground. Check RH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• The Climate Control Seat Module LH cushion sensor input circuit temperature exceeds 65	

B120F-98	Left Seat Cushion - Component or system over temperature	Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module LH cushion sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1223-13	Right Seat Cushion Temperature Sensor - Circuit open	• RH seat cushion sensor circuit, open circuit • RH seat cushion sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat cushion temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat cushion sensor circuit for open circuit. Check RH seat cushion sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat cushion temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1224-13	Left Seat Cushion Temperature Sensor - Circuit open	• LH seat back thermal electric device + circuit, open circuit • LH seat back thermal electric device - circuit, open circuit • LH seat cushion thermal electric device + circuit, open circuit • LH seat cushion thermal electric device - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat backrest thermal electric device assembly, open circuit • Climate seat cushion thermal electric device assembly, open circuit	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for open circuit. Check LH seat back thermal electric device - circuit for open circuit. Check LH seat cushion thermal electric device + circuit for open circuit. Check LH seat cushion thermal electric device - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check climate seat backrest thermal electric device assembly for open circuit. Check climate seat cushion thermal electric device assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		• Climate Control Seat Module failure	
B1224-19	Left Thermal Electric Device Control - Circuit current above threshold	• LH seat back thermal electric device + circuit, short to ground • LH seat back thermal electric device - circuit, short to ground • LH seat cushion thermal electric device + circuit, short to ground • LH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for short to ground. Check LH seat back thermal electric device - circuit for short to ground. Check LH seat cushion thermal electric device + circuit for short to ground. Check LH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1224-4B	Left Thermal Electric Device Control - Over temperature	• Restriction in thermal electric device air path • LH seat back thermal electric device + circuit, short to ground • LH seat back thermal electric device - circuit, short to ground • LH seat cushion thermal electric device + circuit, short to ground • LH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Check for blockage or restriction in thermal electric device air path. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for short to ground. Check LH seat back thermal electric device - circuit for short to ground. Check LH seat cushion thermal electric device + circuit for short to ground. Check LH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• RH seat back sensor circuit, open circuit • RH seat back sensor - circuit, open circuit	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back sensor circuit for open circuit. Check RH seat back sensor - circuit for open circuit. Check for any

B1225-13	Right Seat Back Temperature Sensor - Circuit open	• Connectors disconnected • Connector pin damage • Climate seat back temperature sensor assembly, open circuit • Climate Control Seat Module failure	disconnected connectors or damaged connector pins. Check Climate seat back temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1229-13	Left Seat Back Temperature Sensor - Circuit open	• LH seat back sensor circuit, open circuit • LH seat back sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat back temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back sensor circuit for open circuit. Check LH seat back sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat back temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122A-11	Right Seat Cushion Blower Speed Sensor - Circuit short to ground	• RH cushion fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH cushion fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122A-12	Right Seat Cushion Blower Speed Sensor - Circuit short to battery	• RH cushion fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH cushion fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122B-11	Right Seat Back Blower Speed Sensor - Circuit short to ground	• RH seat back fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122B-12	Right Seat Back Blower Speed Sensor - Circuit short to battery	• RH seat back fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
			Carry out On Demand Self Test (ODST) using manufacturer approved

B122C-11	Left Seat Cushion Blower Speed Sensor - Circuit short to ground	• LH cushion fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH cushion fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122C-12	Left Seat Cushion Blower Speed Sensor - Circuit short to battery	• LH cushion fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH cushion fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122D-11	Left Seat Back Blower Speed Sensor - Circuit short to ground	• LH seat back fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122D-12	Left Seat Back Blower Speed Sensor - Circuit short to battery	• LH seat back fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122E-98	Right Seat Cushion - Component or system over temperature	• The Climate Control Seat Module RH cushion sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module RH cushion sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

B122F-98	Right Seat Back - Component or system over temperature	• The Climate Control Seat Module RH seat back sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module RH seat back sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1230-98	Left Seat Back - Component or system over temperature	• The Climate Control Seat Module LH seat back sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module LH seat back sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1231-7A	Right Seat - Fluid leak or seal failure	• The Climate Control Seat Module has detected an input temperature difference greater than expected between RH seat back sensor and RH cushion sensor • Climate seat back assembly air path leaking	Check for blockage or restriction in seat back thermal electric device fan ducts. Check seat back thermal electric device fan exhaust vent is clear. Check for blockage or restriction in seat cushion thermal electric device fan ducts. Check seat cushion thermal electric device fan exhaust vent is clear. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		• Climate seat cushion assembly air path leaking • Seat assembly damaged	
B1232-7A	Left Seat - Fluid leak or seal failure	• The Climate Control Seat Module has detected an input temperature difference greater than expected between LH seat back sensor and LH cushion sensor • Climate seat back assembly air path leaking • Climate seat cushion assembly air path leaking • Seat assembly damaged	Check for blockage or restriction in seat back thermal electric device fan ducts. Check seat back thermal electric device fan exhaust vent is clear. Check for blockage or restriction in seat cushion thermal electric device fan ducts. Check seat cushion thermal electric device fan exhaust vent is clear. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1235-13	Left Seat Cushion Temperature Sensor - Circuit open	• LH seat cushion sensor circuit, open circuit • LH seat cushion sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat cushion temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat cushion sensor circuit for open circuit. Check LH seat cushion sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat cushion temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
U0010-88	Medium Speed CAN Communication Bus - Bus off	• Medium Speed CAN communication bus off	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network.
U0140-00	Lost Communication With Body Control Module - No sub type information	• CAN harness link between Climate Control Seat Module and Central Junction Box malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Central Junction Box within the specified time interval	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a climate seat concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis Using the manufacturer approved diagnostic system, check Central Junction Box for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Central Junction Box power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Central Junction Box, repair as necessary.
	Lost	• CAN harness link between Climate Control Seat Module and Rear Junction Box malfunction	Using the manufacturer approved diagnostic system, check Rear

U0142-00	Communication With Body Control Module "B" - No sub type information	• The Climate Control Seat Module has not received the expected CAN signal from the Rear Junction Box within the specified time interval	Junction Box for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Rear Junction Box power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Rear Junction Box, repair as necessary.
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• CAN harness link between Climate Control Seat Module and Instrument Panel Cluster (IPC) network malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Instrument Panel Cluster (IPC) within the specified time interval	Using the manufacturer approved diagnostic system, check Instrument Panel Cluster (IPC) for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Instrument Panel Cluster (IPC) power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Instrument Panel Cluster (IPC), repair as necessary.
U0156-00	Lost Communication With Information Center "A" - No sub type information	• CAN harness link between Climate Control Seat Module and Information and Entertainment Control Module network malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Information and Entertainment Control Module within the specified time interval	Using the manufacturer approved diagnostic system, check Information and Entertainment Control Module for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Information and Entertainment Control Module power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Information and Entertainment Control Module, repair as necessary.
U0300-00	Internal Control Module Software Incompatibility - No sub type information	• Incorrect or invalid software has been installed	Using the manufacturer approved diagnostic system, re-configure the Climate Control Seat Module and the Rear Junction Box. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect.
U0401-00	Invalid Data Received from ECM/PCM A - No sub type information	• The Engine Control Module (ECM) has transmitted engine speed quality factor CAN signal at a specific value for a greater than expected time period	Using the manufacturer approved diagnostic system, check Engine Control Module for DTCs and refer to the relevant DTC Index.
U2101-00	Control module Configuration		Using the manufacturer approved diagnostic system, re-configure the Climate Control Seat Module and the Rear Junction Box. Carry out On

	Incompatible - No sub type information	• Calibration incomplete/corrupt	Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
U3000-04	Control Module - System internal failures	• Climate Control Seat Module failure • Climate Control Seat Module microprocessor failed internal ROM and/or RAM checksum test	Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect.
U3003-62	Battery Voltage - Signal compare failure	• Mismatch in battery voltage of 2 volts or more between the measured battery voltage at the Climate Control Seat Module and the battery voltage signal sent from the Rear Junction Box	Refer to the electrical circuit diagrams and check that power supply voltage at Climate Control Seat Module and Rear Junction Box is not different by more than 2 volts. Rectify as required. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.

System Operation

PRINCIPLES OF OPERATION

FRONT SEATS

Adjustment - Non-memory Seats

On non-memory front seats, each seat switch pack receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the air pump and associated solenoid valves.

For the adjustment motors, when a switch is operated power is connected to the applicable side of the related motor and a ground is connected to the opposite side of the motor, which then runs in the required direction. To move the motor in the opposite direction the polarity is reversed.

When the lumbar inflate switch is pressed, power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

Adjustment - Memory Seats

On memory front seats, the seat module receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the seat module.

Permanent power supplies are also connected from the CJB to the memory switch pack and from the RJB to the seat switch pack.

The seat switch pack is connected to the seat module by a LIN (local interconnect network) bus for the seat adjustment switches. Any selection for seat adjustment generates a message which is passed via the LIN bus to the seat module. The seat module processes the request and operates the applicable seat motor as required using the power supplies from the CJB .

The seat module on the driver seat is also connected to the medium speed CAN bus. This allows the driver seat module to monitor the position of the door mirrors and the steering column, using signals from the door modules and CJB respectively, when storing and recalling memory settings.

The memory switch pack has two hardwired connections with the related seat switch pack. One is for the three channel switches and one is for the memory switch. Operation of the any of the memory switches is relayed from the seat switch pack to the seat module on the LIN bus.

Memory settings are stored in the seat module by pressing the memory switch and then, within 5 seconds, one of the channel switches. When the memory switch is pressed the LED (light emitting diode) in the switch comes on. After the channel switch is pressed, the LED goes off and a chime sounds to confirm that the settings have been memorized. If the ignition is on, the message center will display a confirmation message. Any previously stored settings on the selected channel will be over-written.

Memory settings are recalled by pressing the applicable channel switch. If the ignition is on, the message center will display a confirmation message.

On seats with 2-way lumbar adjustment, when the inflate switch is pressed power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

On seats with 4-way lumbar adjustment and bolster adjustment, when an inflate switch is pressed, power is simultaneously connected to the air pump and the related inflate solenoid valve. When a deflate switch is pressed, power is connected to the related deflate solenoid valve, which opens to deflate the support. On vehicles with massage seats, power is connected to the inflate and deflate solenoid valves in the same way, but when an inflate selection is made the air pump is activated by a LIN bus message to the master solenoid valve, which then operates the air pump.

Stall Detection

A seat adjustment motor is deemed to have stalled if there is no change in the input from the feedback sensor of the motor for 200 ms. If a stall condition is detected then the drive to that motor is cancelled for the remainder of the memory recall operation or until the switch is re-selected (manual movement). The motor may be activated again, to move past the stall position, by pressing the appropriate switch for more than 2 seconds. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again, when a further 0.5 second of activation is permitted. This is known as inch mode, which allows seat adjustment to be maintained if sensor feedback is lost.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the adjustment motors.

Battery Monitor

If the battery voltage drops below 10.5 V, then the driver seat module ignores all requests for a memory recall until the battery voltage has reached 11.5 V. This will conserve as much power in the vehicle battery as possible to enable engine cranking.

Massage Seats

Seat massage requests from the START / STOP buttons on the TSD are sent via the medium speed CAN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on the LIN bus connection.

When a START button is pressed, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When a STOP button is pressed, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

Anti-Whiplash System (AWS)

Depending on the weight of the occupant and the severity of the collision, the mechanisms begin to operate at a relative impact speed of between approximately 8.7 and 11.2 mph (13.9 and 17.9 km/h). At the point of a rear impact, the forward energy of the impact and the inertia of the occupant combine to push the backrest against the occupant's back. That causes the AWS mechanism to begin a controlled sequence of movements. First, while remaining in an upright position, the backrest moves rearwards by approximately 50 mm. Next, the backrest reclines through an angle dependant upon the direction and relative speed of the collision, up to a maximum of approximately 15 degrees.

The combined effect of these movements is to absorb some of the energy of the impact and reduce the relative acceleration of head and body, thereby helping to reduce the possibility of whiplash injury.

HEATED SEATS

The heater elements only operate when the engine is running. Power for the heater elements is supplied to the seat heater modules from the heated seat relay in the RJB , which is controlled by a hardwired ignition signal from the CJB .

Seat heating selections made on the TSD and the rear climate control panel are transmitted to the ATC module.
Refer to: Heating and Ventilation (412-01 Climate Control, Description and Operation).

When the ATC module receives a seat heating request, it sends a LIN bus message to the appropriate seat heater module to energize the heater elements in the cushion and the squab. The seat heater module relays the temperature signal, from the thermal sensor in the cushion heater element, back to the ATC module. The ATC module uses the temperature signal to regulate the heater elements at the selected heat setting.

CLIMATE SEATS

The heating/cooling of the climate seats only operates when the engine is running. Power for the climate modules is supplied to the climate seat control modules by two permanent power supplies from the CJB . The climate seat control modules also receive a power supply from the ignition relay in the CJB .

Heating/Cooling selections on the TSD and the rear climate control panel are transmitted to the appropriate climate seat control module on the medium speed CAN bus. The climate seat control module then energizes the Peltier cell and the blower of the climate module(s) in the appropriate seat. The climate seat control module uses the signals from the temperature sensors in the squab and the cushion climate modules to regulate the seat at the selected temperature. If full seat heating/cooling is selected, both the squab and the cushion climate modules are activated. If partial seat heating/cooling is selected, only the squab climate module is activated.

REAR SEATS

Adjustment

The rear seat adjustment is only active when the smart key is in the vehicle and the ignition is on.

Each rear seat switchpack receives a logic power supply from the CJB via fuse F47. Each switchpack is connected to its respective rear seat control module by a LIN bus connection.

Each rear seat module receives two power supplies from the CJB to operate the recline motor, the lumbar pump and the solenoids.

Operation of the rear seat switchpack switches for seat recline produces a LIN bus message to the respective rear seat control module. The seat control module then provides a power supply to the applicable seat recline motor. Each recline motor has a Hall effect sensor to determine the position of the seat.

A seat recline motor is deemed to have stalled if there is no change in the input from the Hall sensor of the motor for 200 ms. If a stall condition is detected then the power supply to the motor is removed until the switch is re-selected. The motor may be activated again. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If Hall sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the recline motors.

Massage Seats

Seat massage requests from the seat switchpack are passed on a LIN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on a LIN bus connection.

When the ON button is pressed on the seat switchpack, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When the OFF button is pressed on the seat switchpack, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

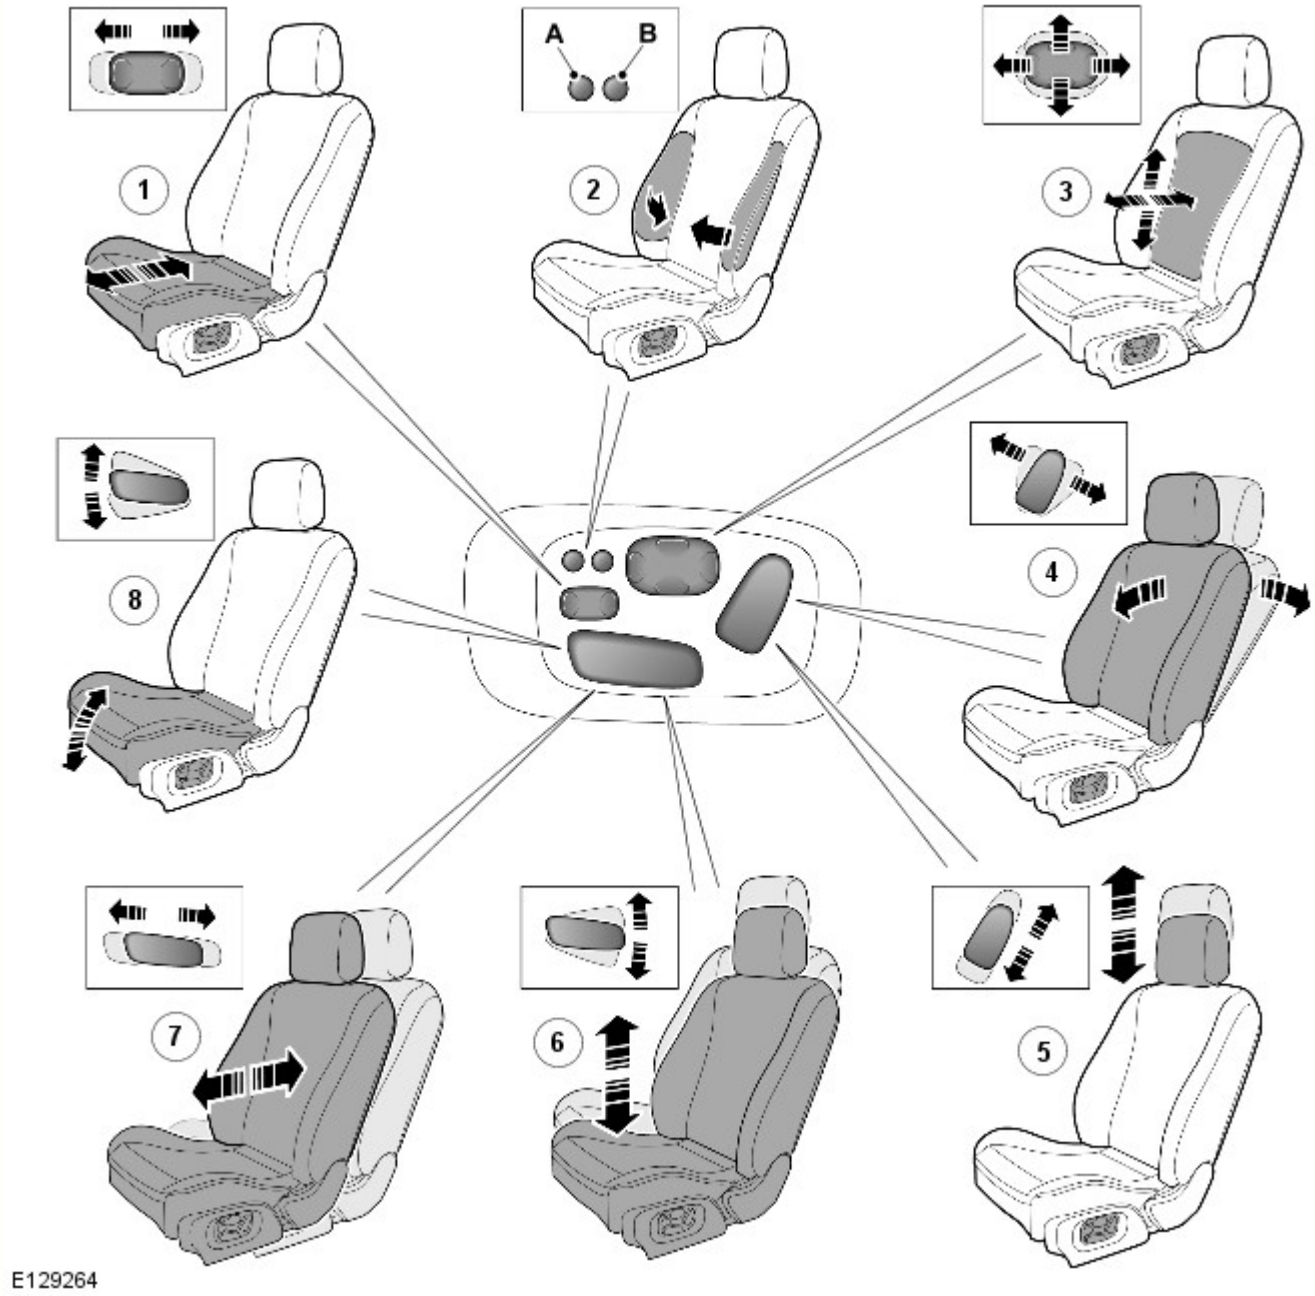
Component Description

FRONT SEATS ADJUSTMENT

Electric motors are used to provide adjustment of seat slide, seat height, squab recline and, where fitted, cushion tilt, head restraint and cushion extension. An air pump and inflatable cushions are used to provide adjustment of the lumbar support and the squab bolster supports (where fitted).

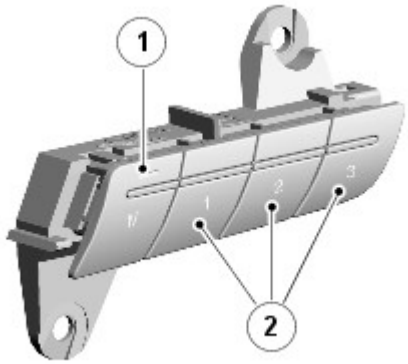
All of the seat adjustments are controlled from the seat switch pack on the outside of the seat cushion. On non memory seats, the control switches are connected directly to the adjustment motors. On memory seats, the switches are connected to the adjustment motors via a seat control module. Memory seats also have a memory switch pack in the related door panel.

Adjustment Switches



Item	Description
1	Cushion extension
2A	Bolster inflate
2B	Bolster deflate
3	Lumbar support (4-way shown; 2-way uses only fore/aft positions for inflate/deflate)
4	Squab recline
5	Head restraint
6	Seat height
7	Seat slide
8	Cushion tilt

Memory Switch Pack



Item	Description
1	Channel switches
2	Memory switch

Seat Motors

Each adjustment motor contains a Hall position sensor. The sensors provide position feedback signals which, on seats with a memory function, are used for memory store and recall operation.

The seat slide motor is an integral component of the cushion frame. The motor drives a gear on a worm drive lead screw, which is integral with the floor rail. The lead screw has a stop at each end to limit the fore and aft seat movement.

The seat height motor is located below the seat. The motor drives a gear on a lead screw. The lead screw moves a lever mechanism, which raises or lowers the seat cushion.

The squab recline motor is located in the squab frame. The recline motor rotates a shaft connected to the squab frame, which changes the angle of the squab.

The tilt motor is located below the seat. The tilt motor drives a gear on a lead screw to raise the front of the seat cushion.

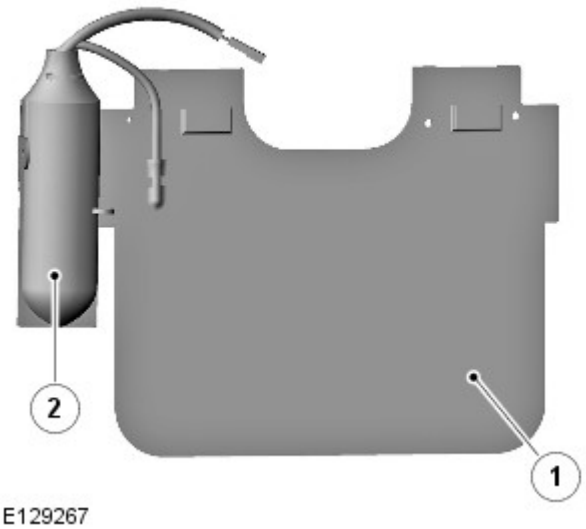
The head restraint motor is located in the upper section of the squab frame and is accessible by removal of the seat back. The motor moves a cradle by a rack and pinion arrangement. The cradle has two head restraint stems, which raise and lower the head restraint as the motor moves the cradle.

The cushion extend motor is located below the seat. The motor drives a gear on a lead screw, which extends or retracts the front of the seat cushion.

Lumbar Adjustment

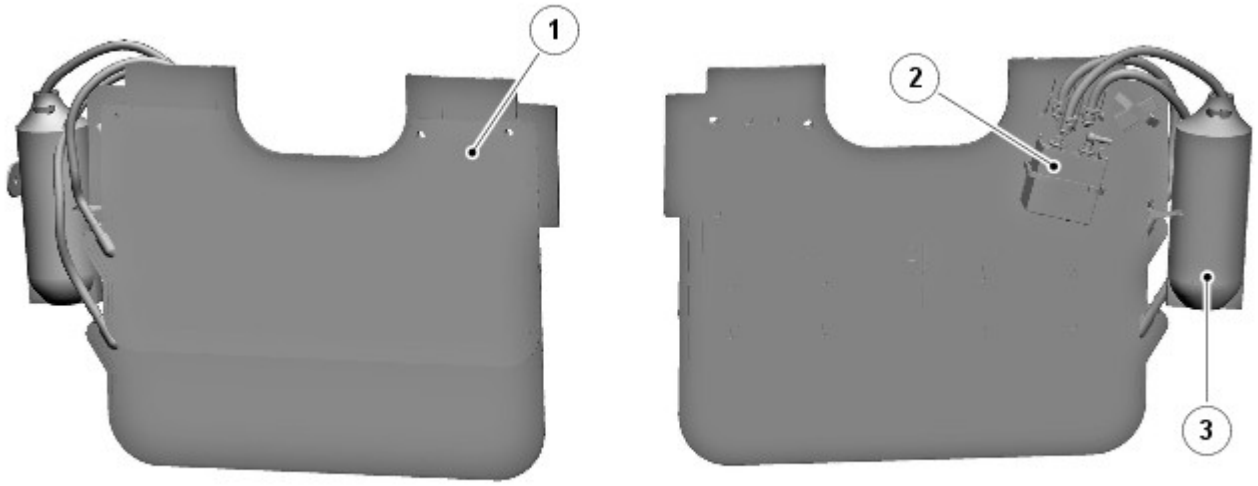
Lumbar adjustment is provided by a lumbar support and air pump installed in the squab. The lumbar support consists of an inflatable cushion with either a single air cell (2-way lumbar support) or dual air cells (4-way lumbar support), depending on vehicle specification. On vehicles with massage seats, the dual cell lumbar support is operated by the air pump of the massage system.

2-way Lumbar Support



Item	Description
1	Lumbar support
2	Air pump

4-way Lumbar Support



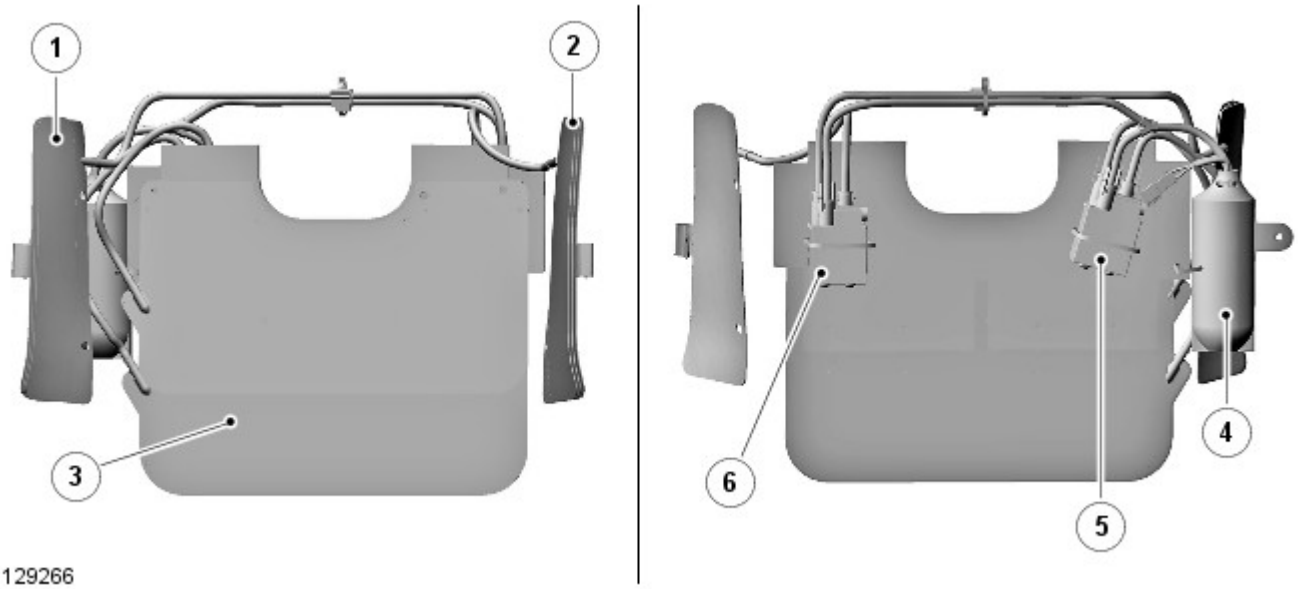
E129268

Item	Description
1	Lumbar support
2	Solenoid valves
3	Air pump

Squab Bolster Adjustment

Squab bolster adjustment is provided by inflatable cushions on the inside faces of the squab bolsters. The inflatable cushions are operated simultaneously by a solenoid valve block and the air pump of the lumbar support or the massage seat system. On vehicles with massage seats, the squab bolster solenoid valves are incorporated into the valve block containing the slave massage solenoid valves.

Squab and Lumbar Support



E129266

Item	Description
1	RH squab bolster support
2	LH squab bolster support
3	4-way lumbar support

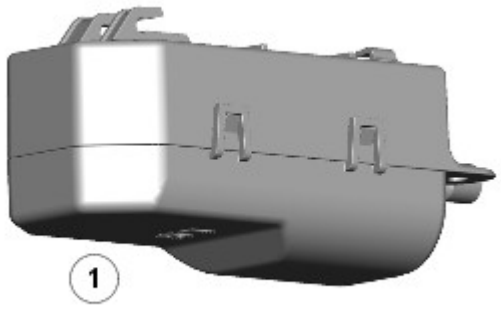
4	Air pump
5	Lumbar support solenoid valves
6	Squab support solenoid valves

MASSAGE FRONT SEATS

Where fitted, the massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar and squab bolster supports. The slave solenoid block also incorporates the solenoid valves used to control the squab bolster supports.

Operation of the massage system is controlled with START and STOP buttons on the climate menu of the TSD and is independent of the lumbar and squab bolster adjustments.

Air Pump



E121128

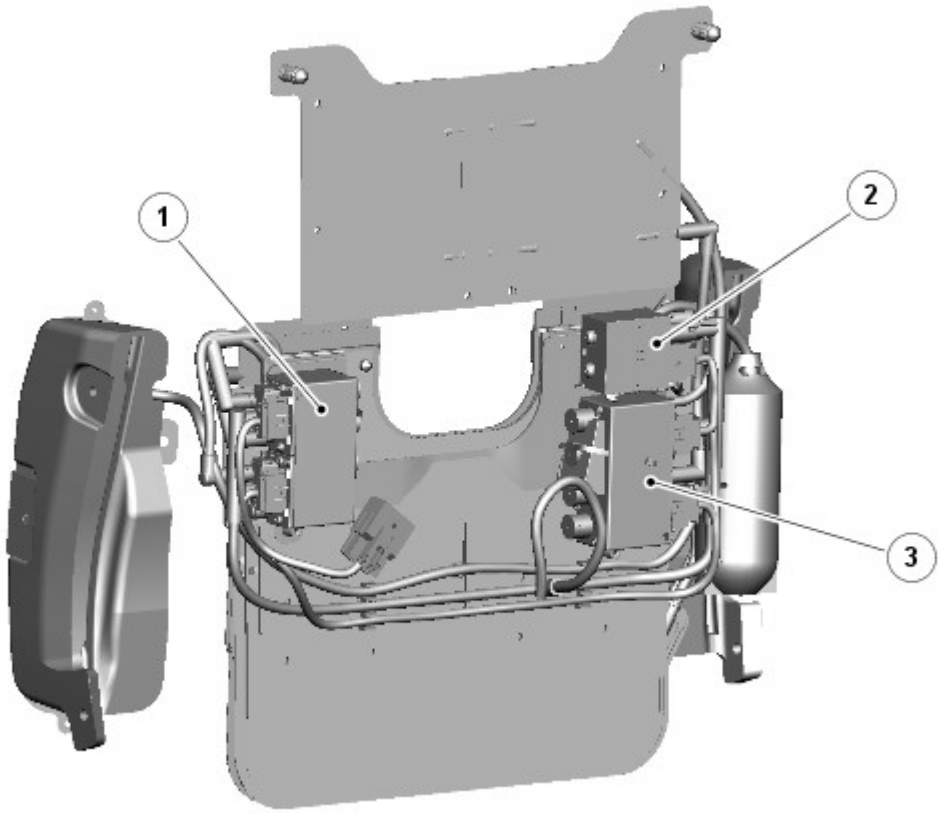
Item	Description
1	Air pump

The air pump is located underneath the seat at the rear of the squab. The pump is housed inside a NVH (noise, vibration and harshness) casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the lumbar solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in ^{2} .).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves

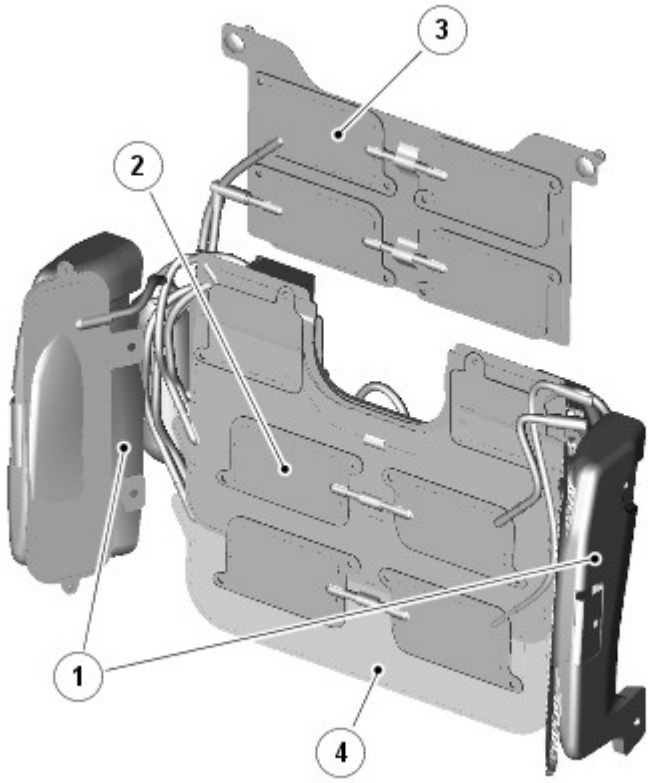


E121129

Item	Description
1	Master massage solenoid valves
2	Lumbar solenoid valves
3	Slave massage and adjustable bolster solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

Air Cell Pads



E121130

Item	Description
1	Squab bolster cells (2 off)
2	Lower massage cells (3 pairs)
3	Upper massage cells (2 pairs)
4	Lumber cells (2 off)

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in ^{2} .). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

HEATED FRONT AND REAR SEATS

Heated seats incorporate heater elements in the cushion and the squab of the seat. Power to the heater elements of the front seats is controlled by two seat heater modules attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Power to the heater elements of the two outside rear seats is controlled by two seat heater modules attached to a bracket on the back of the rear seat squab.

Each cushion heater element has a thermal sensor, which supplies a feedback temperature signal to the related seat heater module. The squab heater elements do not have a thermal sensor, and are regulated at the same temperature as the cushion heater elements.

Seat heating for the front and rear seats can be selected on the climate menu of the TSD. Seat heating for the rear seats can also be selected on the rear climate control panel. Three levels of heating are available. Heating can also be selected for either the cushion and the squab or just the squab.

CLIMATE FRONT AND REAR SEATS

Climate seats incorporate climate modules in the cushion and the squab of the seat. Operation of the climate modules of the front seats is controlled by a climate seat control module attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Operation of the climate modules of the two outside rear seats is controlled by a climate seat control module attached to the body, behind the of the rear seat squab.

The climate modules contain Peltier cells, which heat up or cool down depending on the voltage provided by the climate seat control module. Each climate module also contains a blower, which blows air over the Peltier cell to distribute the heated or cooled air through liners in the related cushion or squab. The blower is also controlled by the climate seat control module.

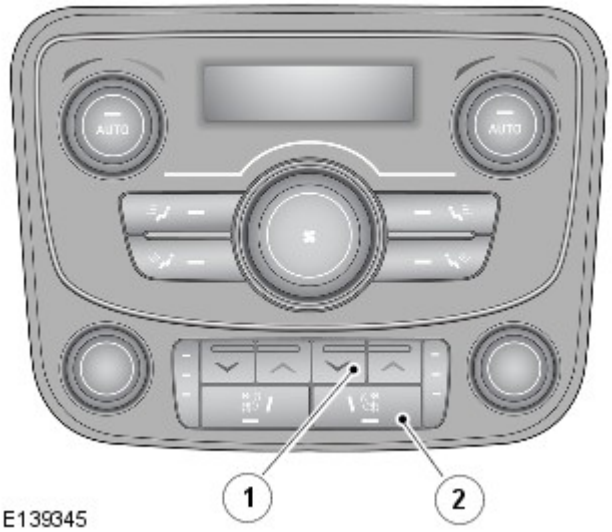
Seat heating and cooling for the front and rear seats can be selected on the climate menu of the TSD. Seat heating and cooling for the rear seats can also be selected on the rear climate control panel. Three levels of heating and three levels of cooling are available. Heating and cooling can also be selected for either the cushion and the squab, or just the squab.

Touch Screen Display

E129269

Item	Description
1	Temperature control buttons
2	Zone control button
3	Massage control buttons

Rear Climate Control Panel



E139345

Item	Description
1	Temperature control switch
2	Zone control switch

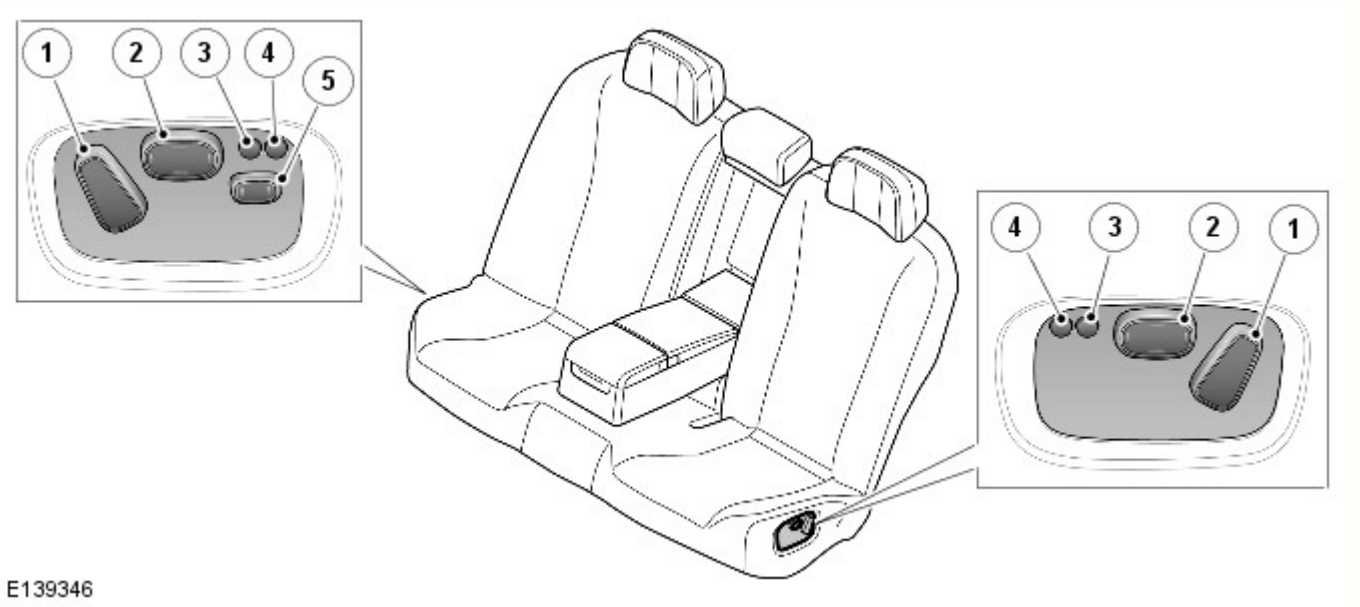
REAR SEATS ADJUSTMENT

An electric recline motor is used to provide adjustment of seat squab recline. An air pump and inflatable cushions are used to provide adjustment of the lumbar support.

All of the seat adjustments are controlled from the seat switchpack on the outside of the seat cushion. The control switches are connected via a LIN bus to the seat control module to the adjustment motors via a seat control module.

Rear seat switchpack functions are disabled if the rear window isolation switch has been activated.

Adjustment Switches (LHD (left-hand drive) version shown



Item	Description
1	Seat squab recline control
2	Lumbar support adjustment
3	Massage OFF
4	Massage ON
5	Front passenger seat away - forward or rearward adjustment

The rear seat control switchpack on the passenger side of the vehicle also has a front passenger seat away switch. This switch when pressed will move the front passenger seat forwards or backwards to allow more room for the rear seat passenger on that side. A second switch for this function is located on the inside face of the front passenger seat back to allow the driver to operate the function.

Front Passenger Seat Away Switch

E139347

The front passenger seat way function allows the driver to adjust the position of the front passenger seat using a switch located on the passenger seat bolster.

The two-way rocker switch allows the driver to move the front passenger seat forward or rearwards to adjust leg room for the rear seat passenger.

The rear seat adjustment switchpack for the rear seat behind the front passenger seat, has an additional two-way switch to move the front passenger seat forwards or rearwards, allowing the passenger to adjust the available leg room.

MASSAGE REAR SEATS

Where fitted, the rear seat massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar supports.

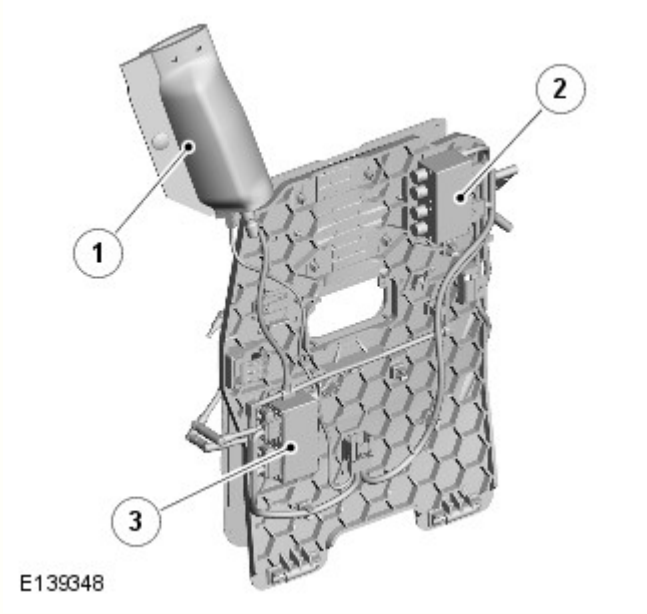
Operation of the massage system is controlled with START and STOP buttons on the rear seat adjustment switches.

The air pump is located at the rear of the squab. The pump is housed inside a NVH casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the slave solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in2.).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves



Item	Description
1	Air pump
2	Slave massage solenoid valves
3	Master massage solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in2.). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

Published: 21-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Driver/Passenger Seat Module (DSM/PSM)

Description and Operation

Driver/Passenger Seat Module (DSM/PSM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system)

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the digital multimeter leads into account

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion

If diagnostic trouble codes are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

Where an 'on demand self-test' is referred to, this can be accessed via the 'diagnostic trouble code monitor' tab on the manufacturers approved diagnostic system

Check DDW for open campaigns. Refer to the corresponding bulletins and SSM's which may be valid for the specific customer complaint and carry out the recommendations as needed.

The table below lists all diagnostic trouble codes (DTCs) that could be logged in the driver/passenger seat module, for additional diagnosis and testing information refer to the relevant diagnosis and testing section.
For additional information, refer to: Seats (501-10 Seating, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B105D-11	Seat Bolster Inflate Output - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105D-15	Seat Bolster Inflate Output - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105E-11	Seat Bolster Deflate Output - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105E-15	Seat Bolster Deflate Output - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105F-11	Seat Cushion Extension Motor Output - Circuit short to ground	• Seat cushion extend motor circuit - Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat cushion extend motor circuit for circuit short to ground. Repair circuit as required, clear DTC and retest
B105F-15	Seat Cushion Extension Motor Output - Circuit short to battery or open	• Seat cushion extend motor circuit - Circuit short to power, open circuit, high resistance	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat cushion extend motor circuit for circuit short to power, open circuit, high resistance. Repair circuit as required, clear DTC and retest
B1060-11	Seat Headrest Motor Output - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat headrest motor circuit
B1060-15	Seat Headrest Motor Output - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat headrest motor circuit
B1063-31	Seat Cushion Extension Motor Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat cushion motor sensor circuit. Repair circuit as required. Clear DTC and retest
B1064-31	Seat Headrest Motor	• Harness/connector problem • No signal from sensor	• Check the seat wiring harness/connectors for security/integrity

	Sensor - No signal	• Sensor/motor malfunction	• Refer to the electrical circuit diagrams and check the seat headrest motor sensor circuit. Repair circuit as required. Clear DTC and retest
B1065-24	Cushion Extend Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1066-24	Cushion Retract Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1067-24	Lumbar In Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1068-24	Lumbar Out Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1069-24	Lumbar Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106A-24	Lumbar Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106B-24	Bolster Inflate Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106C-24	Bolster Deflate Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106D-24	Headrest Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106E-24	Headrest Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1087-83	LIN Bus "A" - Value of signal protection calculation incorrect	• LIN bus checksum error - Value of signal protection calculation incorrect • Generic LIN bus failure	• Check for other LIN Bus related DTCs. Refer to the electrical circuit diagrams and check the LIN Bus circuit
B1087-86	LIN Bus "A" - Signal invalid	• Generic LIN bus failure • Signal invalid - LIN bus Bit error / Parity Error /Synch Error	• Check for other LIN Bus related DTCs. Refer to the electrical circuit diagrams and check the LIN Bus circuit

B1087-87	LIN Bus "A" - Missing message	• Generic LIN bus failure • Missing message - Slave not responding or LIN bus short circuit to ground or power	• Check for other LIN Bus related DTCs. Refer to the electrical circuit diagrams and check the LIN Bus circuit
B1136-11	Lumbar Control A - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1136-12	Lumbar Control A - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1136-13	Lumbar Control A - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1137-11	Lumbar Control B - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1137-12	Lumbar Control B - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1137-13	Lumbar Control B - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1138-11	Lumbar Control C - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1138-12	Lumbar Control C - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1138-13	Lumbar Control C - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1139-11	Lumbar Control D - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1139-12	Lumbar Control D - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1139-13	Lumbar Control D - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B113A-00	General Failure on Seat Lumbar - No sub type information	• No sub type information	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B113B-00	Lumbar Control Multiple Failures - No sub type information	• No sub type information	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit

B12CC-00	Driver Seat Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B12D9-00	Driver Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B12DB-00	Passenger Seat Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B12E6-00	Passenger Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B13F6-11	Passenger Seat Away Switch - Circuit short to ground	• Passenger seat away switch circuit - short circuit to ground • Faulty switch	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the passenger seat away switch circuit for short circuit to ground • If no circuit faults are present, check and install new passenger seat away switch as required. Refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B13F7-00	Right Rear Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B13F8-00	Left Rear Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B13F9-00	Right Rear Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect

B13FA-00	Left Rear Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B1B86-11	Seat Height Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat height motor circuit
B1B86-15	Seat Height Motor Relay - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat height motor circuit
B1B87-31	Seat Height Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat height motor sensor circuit. Repair circuit as required. Clear DTC and retest
B1B88-11	Seat Slide Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat slide motor relay circuit
B1B88-15	Seat Slide Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat slide motor relay circuit
B1B89-31	Seat Slide Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat slide motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B90-11	Seat Tilt Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat tilt motor relay circuit
B1B90-15	Seat Tilt Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat tilt motor relay circuit
B1B91-31	Seat Tilt Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat tilt motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B92-11	Seat Recline Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat recline motor relay circuit
	Seat Recline Motor		

B1B92-15	Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat recline motor relay circuit
B1B93-31	Seat Recline Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat recline motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B94-24	Seat Height Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B95-24	Seat Height Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B96-24	Seat Slide Forward Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B97-24	Seat Slide Backward Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B98-24	Seat Tilt Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B99-24	Seat Tilt Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C00-24	Seat Recline Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C01-24	Seat Recline Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C02-24	Memory Store Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C03-24	Memory #1 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C04-24	Memory #2 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit

B1C05-24	Memory #3 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1D94-11	Lumbar Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat lumbar motor relay circuit
B1D94-15	Lumbar Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat lumbar motor relay circuit
U0010-88	Medium speed CAN Communication Bus - Bus off	• CAN signal fault. • Possible open circuit. • Faulty Control module.	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0140-00	Lost Communication With Central Junction Box - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Central Junction Box and Seat Module
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Instrument Cluster and Seat Module
U0199-00	Lost Communication With "Door Control Module A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Driver Door Module and Seat Module
U0246-00	Lost Communication With Seat Control Module "E" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Rear Right Massage Seat Module and Rear Right Seat Module
U0247-00	Lost Communication With Seat Control Module "F" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Rear Left Massage Seat Module and Rear Left Seat Module
U024B-00	Lost Communication With Seat Control Module "G" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Passenger Front Massage Seat Module and Drivers Seat Module

U024C-00	Lost Communication With Seat Control Module "H" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Drivers Front Massage Seat Module and Drivers Seat Module
U0300-00	Software Incompatibility - No sub type information	• No sub type information	• Check the module configuration using the approved diagnostic system. Check that the module software versions are the latest release and update as necessary
U1A14-49	CAN Initialization Failure - Internal electronic failure	• Internal electronic failure	• Suspect the driver seat module, check and install a new module as required, refer to the Warranty Policy and Procedures manual if a module is suspect
U1A4C-00	Build / End of Line mode Active - No sub type information	• Vehicle configuration incorrect	• Check the module configuration using the approved diagnostic system
U2100-00	Initial Configuration Not Complete - No sub type information	• Car Configuration Data not loaded (Central Junction Box installed to vehicle and not initialized) • Internal Central Junction Box failure	• Install car config to Central Junction Box. Clear DTC and retest systems
U2101-00	Control Module Configuration Incompatible - No sub type information	• Car Configuration Data transmitted over CAN does not match seat control module internal config	• Carry out the new module software installation procedure
U3000-49	Control Module - Internal electronic failure	• Internal electronic failure - Internal RAM/ROM error	• Renew the Control module. Refer to the Warranty Policy and Procedures manual if a module is suspect
U3001-46	Control Module Improper Shutdown - Calibration/parameter memory failure	• Event information	• DTC for information only. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a control module
U3002-81	Vehicle Identification Number - Invalid serial data received	• Invalid serial data received	• Configure the module using the manufacturers approved diagnostic system
U3003-16	Battery Voltage - Circuit voltage below threshold	• Battery voltage below threshold (8 volts)	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module
U3003-17	Battery Voltage - Circuit voltage above threshold	• Battery voltage above threshold	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

Seating - Seats - Overview

Description and Operation

OVERVIEW

Leather Seat Covers

Leather is a natural product, therefore it bears natural characteristics, such as grain variations, growth & bush marks. These non-weakening marks show the true nature of the hide and are the hallmarks of Leather. In order to maintain the beauty of the vehicles natural Leather upholstery it requires regular cleaning, which if neglected, may cause deterioration. Where dust and dirt are allowed to accumulate and become ingrained in the surface of the Leather, the upholstery may become permanently damaged.

Light coloured upholstery can be particularly susceptible to soiling and staining and care should be taken to ensure that where there is evidence of any soiling or staining on the upholstery then this should be cleaned immediately using the Jaguar/Land Rover approved products, failure to do this could lead to the stain becoming permanent, this applies to all leather upholstery and is not colour specific.

Leather trimmed seats will naturally exhibit areas of creasing and wrinkling over a period of time and is a normal characteristic as the Leather ages.

Particular care should be taken where there is evidence of soiling or staining on the leather, this should be cleaned immediately. Failure to do this could lead to the stain becoming permanent.

Particular care should be taken to prevent damage from studs, zips and buckles.

NOTES:

Please refer to Leather care label attached to seats for more information.

Creasing and wrinkling does not represent a manufacturing defect.

Damage from studs, zips and buckles do not represent manufacturing defects.

Use only Jaguar/Land Rover approved products in accordance with the instructions for use.

Front Seats

Various options are available for the front seats with regard to temperature control and electrical adjustment. Seats are non-heated, heated or heated and cooled (climate), with the following adjustment options:

- 10-way adjustment on the driver seat and 8-way adjustment on the passenger seat.
- 16-way adjustment on the driver seat and 12-way adjustment on the passenger seat.
- 18-way adjustment on the driver and passenger seats.

8-way adjustments consist of seat slide, seat height, squab recline and 2-way lumbar adjustment. 10-way adjustment adds cushion tilt. 12-way adjustment adds head restraint. 16-way adjustment adds cushion extension and replaces 2-way lumbar adjustment with 4-way. 18-way adjustment adds squab bolster adjustment. The controls for seat adjustment are installed in the outboard side shield of the related seat cushion.

The driver seat on all options has a 3-channel memory for easy recall of stored position settings for the seat, steering column and door mirrors. Passenger seats with 18-way adjustment also have a 3-channel memory. The controls for memory operation are in the related front door casing. Lumbar and squab bolster settings are not included in the memory function.

Some climate seats with 18-way adjustment also incorporate a massage function. The massage function is produced using additional lumbar cells. Operation of the massage function is controlled from the Climate / Front Climate / Front Seats menu of the Touch Screen Display (TSD).

Operation of the temperature settings for heated and climate seats is controlled from the Climate / Front Climate / Front Seats menu of the TSD.

Both front seats incorporate an Anti-Whiplash System (AWS) consisting of active, energy absorbent backrest mechanisms. Together with correctly positioned head rests, the AWS helps reduce the likelihood of neck and spinal injury in the event of a rear impact. In a low speed rear impact, AWS automatically moves and reclines the backrest by a small amount, to change the posture of the seat occupant and reduce the relative front to rear motion between body and head.

A map pocket is installed on the rear of each front seat squab. Depending on trim level, some vehicles also have a folding tray attached to the rear of the squabs.

Rear Seats

The following options are available for the two outer rear seats:

- Non-heated seats.
- Heated seats.
- Climate seats
- Recline function
- Front passenger seat away function
- Massage seats.

Operation of the temperature settings for heated and climate seats is controlled from the rear climate control panel and/or the Climate / Rear Climate / Rear Seats menu of the TSD.

ISOFIX fastening points are attached to the vehicle floor to provide secure fastening for compatible child seats in the rear seats.

From 12MY rear seat recline, massage and front passenger seat away functions are introduced. The functions are controlled by a switch pack on each end of the rear seat cushion and an additional seat control module for each seat. A chauffeur switch is fitted to the front passenger seat to allow the front passenger seat away function to be operated by the driver.

Seating - Lumbar Assembly

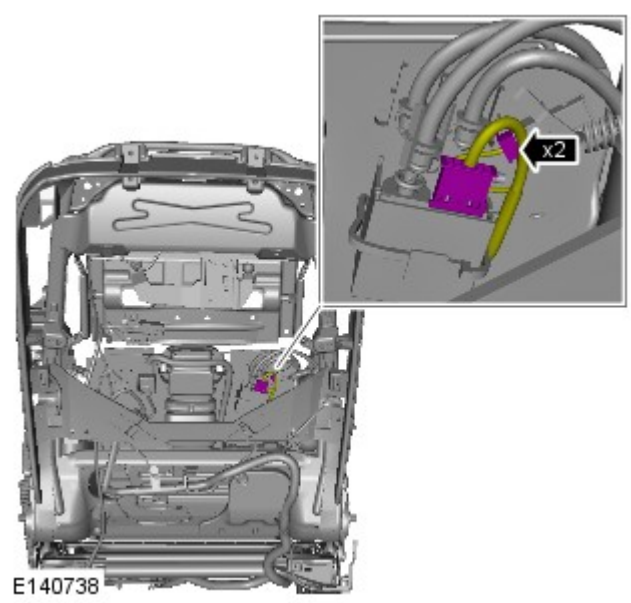
Removal and Installation

Removal

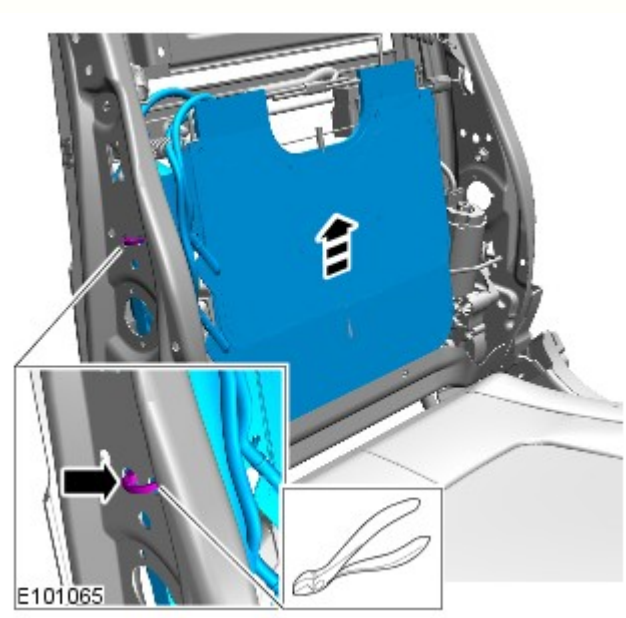
1. Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Refer to: Front Seat Backrest Cushion (501-10 Seating, Removal and Installation).

3.



4.



Installation

1. To install, reverse the removal procedure.

2. If a new component has been installed, configure using Jaguar approved diagnostic equipment.

Published: 07-Oct-2015

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

NOTES:

Some variation in the illustrations may occur, but the essential information is always correct.

Removal steps in this procedure may contain installation details.

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

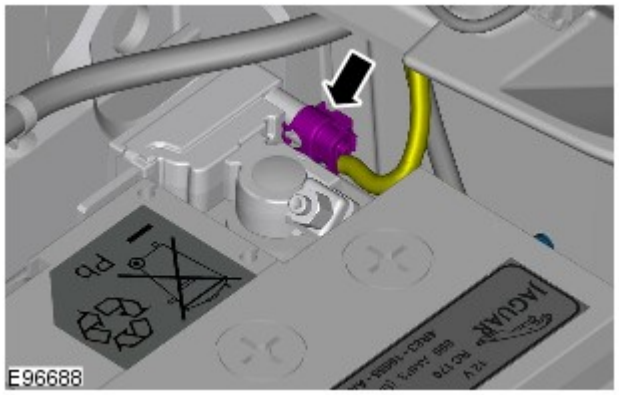
General Procedures

Disconnect

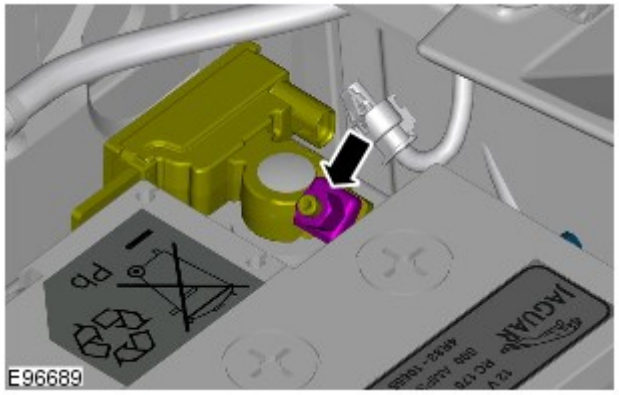
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

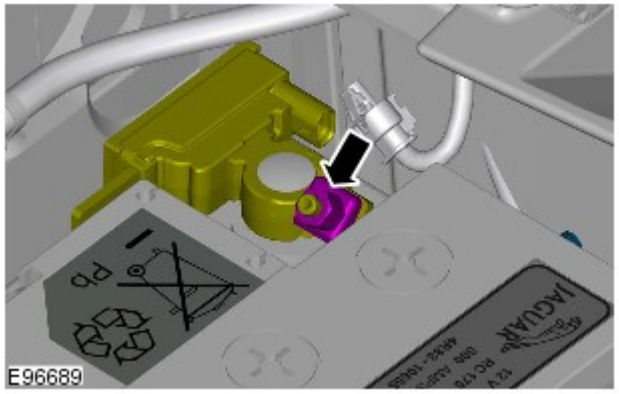


4. CAUTION: Take extra care not to damage the wiring harness.



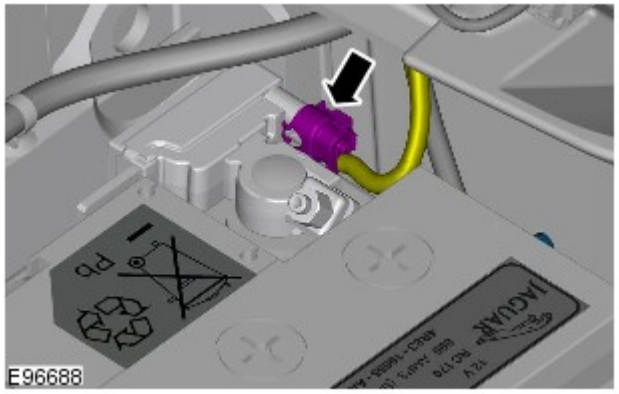
5.

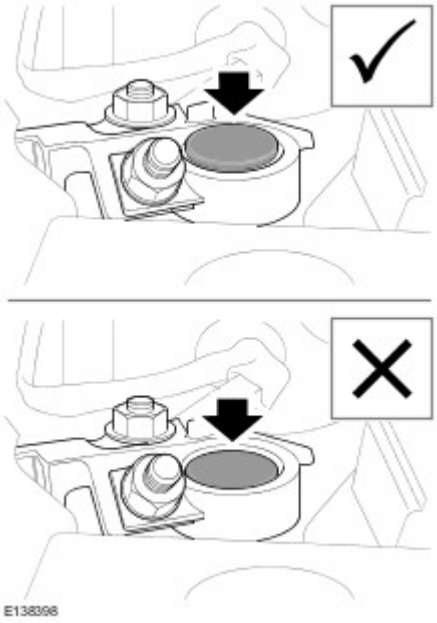
Connect



1. *Torque:* 6 Nm

2.





3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

CAUTIONS:

The front passenger seat occupant classification sensor is available only as a service kit. No attempt should be made to replace individual components. Failure to follow this instruction may result in personal injury.

Check for correct operation of the front seat after completion of the procedure to make sure that the wiring harness has not become trapped or stretched.

NOTES:

Note the routing of the seat harness.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Make the air bag supplemental restraint system (SRS) safe.

   Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Refer to: Front Seat (501-10 Seating, Removal and Installation).

4. Refer to: Front Seat Control Switch (501-10 Seating, Removal and Installation).

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

Battery, Mounting and Cables - Battery Disconnect and Connect

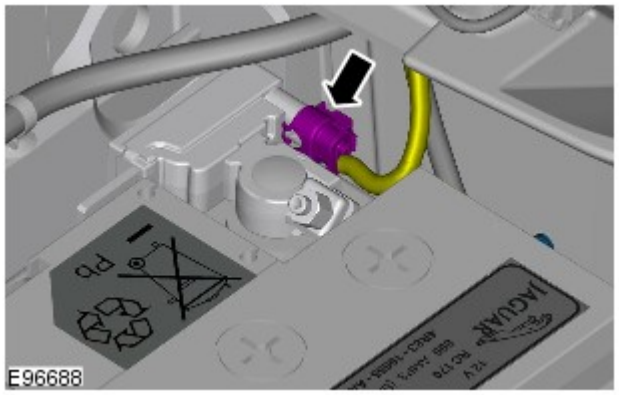
General Procedures

Disconnect

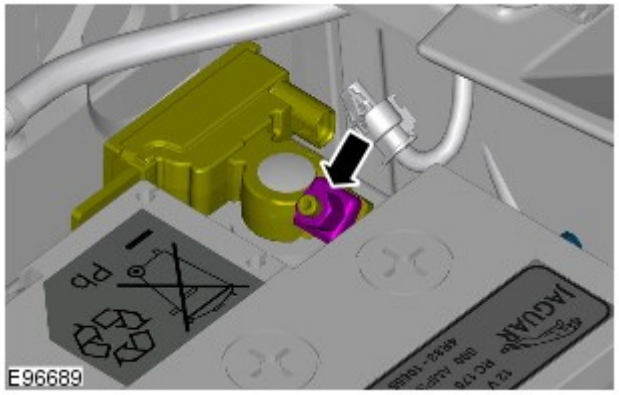
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

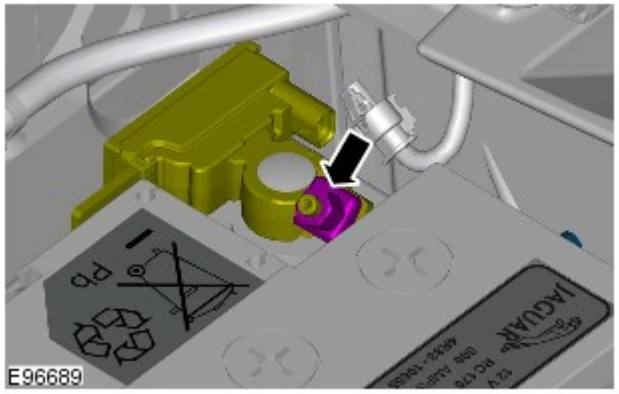


4. CAUTION: Take extra care not to damage the wiring harness.



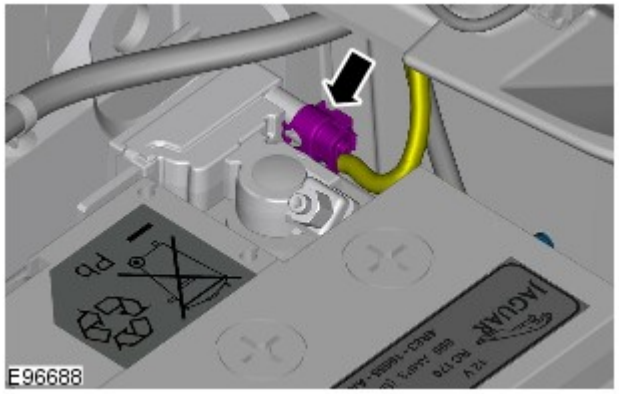
5.

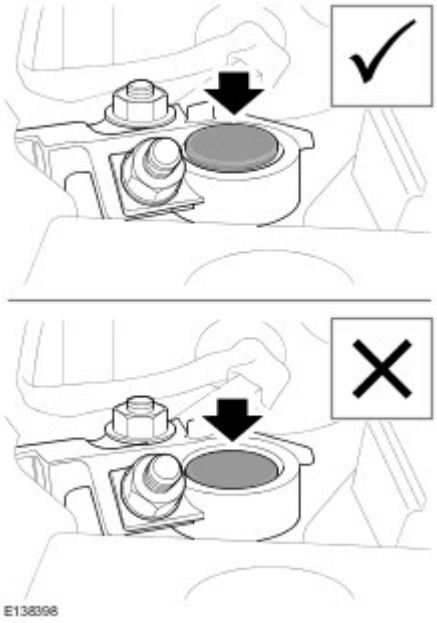
Connect



1. *Torque:* 6 Nm

2.





3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.
