WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

Seating - Seat Cover Inspection

Description and Operation

Leather Seat Covers

Leather is a natural product, therefore it bears natural characteristics, such as grain variations, growth & bush marks. These non-weakening marks show the true nature of the hide and are the hallmarks of Leather. In order to maintain the beauty of the vehicles natural leather upholstery it requires regular cleaning, which if neglected, may cause deterioration. Where dust and dirt are allowed to accumulate and become ingrained in the surface of the leather, the upholstery may become permanently damaged.

Light coloured upholstery can be particularly susceptible to soiling and staining and care should be taken to ensure that where there is evidence of any soiling or staining on the upholstery then this should be cleaned immediately using the Jaguar/Land Rover approved products, failure to do this could lead to the stain becoming permanent, this applies to all leather upholstery and is not colour specific.

Leather trimmed seats will naturally exhibit areas of creasing and wrinkling over a period of time and is a normal characteristic as the leather ages.

Particular care should be taken where there is evidence of soiling or staining on the leather, this should be cleaned immediately. Failure to do this could lead to the stain becoming permanent.

Particular care should be taken to prevent damage from studs, zips and buckles.

Seat Cover Replacement

Rest of World Vehicles

Refererence should be made to the list of documents below before any seat cover is replaced in Jaguar Land Rover warranty.

- Global Warranty Policy and Procedure Manual on TOPIx.
- Leather Seat Cover Finessing Process on the Excellence Academy.
- Seat Smoothing Procedure in the workshop manual.

All seat covers that are replaced should be done using all available TOPIx guides. Any damage that has been done to other components during the seat cover replacement process will not be paid under warranty.

NAS vehicles

Refererence should be made to the list of documents below before any seat cover is replaced in Jaguar Land Rover warranty.

Seating - Seats - Overview

Description and Operation

OVERVIEW

Leather Seat Covers

Leather is a natural product, therefore it bears natural characteristics, such as grain variations, growth & bush marks. These non-weakening marks show the true nature of the hide and are the hallmarks of Leather. In order to maintain the beauty of the vehicles natural Leather upholstery it requires regular cleaning, which if neglected, may cause deterioration. Where dust and dirt are allowed to accumulate and become ingrained in the surface of the Leather, the upholstery may become permanently damaged.

Light coloured upholstery can be particularly susceptible to soiling and staining and care should be taken to ensure that where there is evidence of any soiling or staining on the upholstery then this should be cleaned immediately using the Jaguar/Land Rover approved products, failure to do this could lead to the stain becoming permanent, this applies to all leather upholstery and is not colour specific.

Leather trimmed seats will naturally exhibit areas of creasing and wrinkling over a period of time and is a normal characteristic as the Leather ages.

Particular care should be taken where there is evidence of soiling or staining on the leather, this should be cleaned immediately. Failure to do this could lead to the stain becoming permanent.

Particular care should be taken to prevent damage from studs, zips and buckles.

NOTES:

Please refer to Leather care label attached to seats for more information.

Creasing and wrinkling does not represent a manufacturing defect.

Damage from studs, zips and buckles do not represent manufacturing defects.

Use only Jaguar/Land Rover approved products in accordance with the instructions for use.

Front Seats

Various options are available for the front seats with regard to temperature control and electrical adjustment. Seats are non-heated, heated or heated and cooled (climate), with the following adjustment options:

- 10-way adjustment on the driver seat and 8-way adjustment on the passenger seat.
- 16-way adjustment on the driver seat and 12-way adjustment on the passenger seat.
- 18-way adjustment on the driver and passenger seats.

8-way adjustments consist of seat slide, seat height, squab recline and 2-way lumbar adjustment. 10-way adjustment adds cushion tilt. 12-way adjustment adds head restraint. 16-way adjustment adds cushion extension and replaces 2-way lumbar adjustment with 4-way. 18-way adjustment adds squab bolster adjustment. The controls for seat adjustment are installed in the outboard side shield of the related seat cushion.

The driver seat on all options has a 3-channel memory for easy recall of stored position settings for the seat, steering column and door mirrors. Passenger seats with 18-way adjustment also have a 3-channel memory. The controls for memory operation are in the related front door casing. Lumbar and squab bolster settings are not included in the memory function.

Some climate seats with 18-way adjustment also incorporate a massage function. The massage function is produced using additional lumbar cells. Operation of the massage function is controlled from the Climate / Front Climate / Front Seats menu of the Touch Screen Display (TSD).

Operation of the temperature settings for heated and climate seats is controlled from the Climate / Front Climate / Front Seats menu of the TSD.

Both front seats incorporate an Anti-Whiplash System (AWS) consisting of active, energy absorbent backrest mechanisms. Together with correctly positioned head rests, the AWS helps reduce the likelihood of neck and spinal injury in the event of a rear impact. In a low speed rear impact, AWS automatically moves and reclines the backrest by a small amount, to change the posture of the seat occupant and reduce the relative front to rear motion between body and head.

A map pocket is installed on the rear of each front seat squab. Depending on trim level, some vehicles also have a folding tray attached to the rear of the squabs.

Rear Seats

The following options are available for the two outer rear seats:

- Non-heated seats.
- Heated seats.
- Climate seats
- Recline function
- Front passenger seat away function
- Massage seats.

Operation of the temperature settings for heated and climate seats is controlled from the rear climate control panel and/or the Climate / Rear Climate / Rear Seats menu of the TSD.

ISOFIX fastening points are attached to the vehicle floor to provide secure fastening for compatible child seats in the rear seats.

From 12MY rear seat recline, massage and front passenger seat away functions are introduced. The functions are controlled by a switch pack on each end of the rear seat cushion and an additional seat control module for each seat. A chauffeur switch is fitted to the front passenger seat to allow the front passenger seat away function to be operated by the driver.

Seating - Seats Armoured

Description and Operation

COMPONENT LOCATION

E131388

OVERVIEW

All armored vehicles are configured as four seat vehicles. The rear seat row is a two seat layout, without a center head restraint.

Published: 16-Apr-2014

Seating - Seats Vehicles With: Climate Controlled Seats

Diagnosis and Testing

Principle of Operation

For a detailed description of the seating systems and operation, refer to the relevant description and operation section of the workshop manual. REFER to: (501-10 Seating)

Seats (Description and Operation),
Seats (Description and Operation),
Seats (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

The DTC index containing an actions list is for guidance only any reference to “check and install new blower unit” should only be carried out following failure confirmation using the pin out diagnostics and/or the over temperature and fluid/air leak diagnostics contained below. The recording of a DTC does NOT signify a permanently failed unit

The climate system functions in a manner that means any detected error state either intermittent or permanent will shut down the complete seat climate system until the next ignition cycle, this does not mean that both climate units within the one seat have failed. This shut down is design intent to protect the system to ensure that the fault detected does not damage the units, it is possible that both units are functioning correctly and that the fault lies elsewhere within the system. The following process can be carried out without removing either the seats or the climate units from the vehicle and should correctly identify any failed units, this should ensure that only failed units are changed under warranty. Any units exhibiting the correct reading as per process below, should NOT be changed under warranty. If all units have a correct reading then re-confirm customer symptom, if customer symptom is still present then carry out further system checks

1. Verify the customer concern

2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection

Mechanical	Electrical
• Seat heater switch condition and installation	• Battery condition and state of charge • Fuses • Harnesses and connectors • Seat heater switch(es) • Seat heater elements • Seat module(s) • Ignition switch • Battery junction box • Central junction box • LIN circuit

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

4. If the cause is not visually evident, carry out normal dealer warranty process, perform on-demand self test, check for DTCs and refer to the relevant DTC index

5. Allow 30 mins since the last seat/cooled operation prior to carrying out pin testing detailed below in the section "Connector and Pin Information"

6. Locate climate seat module, (refer to Electrical Information - Electrical Reference Library, contained in TOPIx) for guidance on how to gain access to the connector(s)

7. Locate and disconnect relevant connector prior to pin test

8. Using ohm-meter to probe each heat/cooled unit pins (at rear of connector), reading should achieve no greater than 10 ohms after 1 minute (initial fluctuations in readings may occur using ohm-meter, post 1 minute readings will have stabilized)

1. If any unit reads greater than 10 ohms, replace only that defective unit

2. If all units read less than 10 ohms but faults are still suspected, do not replace any units. Refer to step 4 below

3. As a final check, when a faulty unit has been identified strip the seat to access unit connector, REFER to: Seats (501-10, Removal & Installation) and re-check ohm reading to confirm greater than 10 ohms prior to removing unit

4. In cases where the above diagnostic routine does NOT identify a failed unit, please refer to "Over Temperature and Fluid/Air Leak Diagnostics" below. Also check for any live technical service bulletins referring to the seat climate system

Seat Climate Control Module/Seat Climate Assembly - Further Diagnostics

In the event of suspected climate seat faults use the pinpoint tests detailed below

Connector Checks

First, check the integrity of the three seat climate control module harness connectors:

1. Disconnect each connector

2. Inspect each connector for cracks and breaks, replace as required

3. Check the integrity of connector terminals for bent terminals, backed-out or badly crimped wires. Rectify as required

4. Reconnect all connectors and retest. If seat climate functions are still faulty, note any DTCs that have been logged by the seat climate control module(s) and refer to the table and pinpoint tests below:

DTC Logged	Pinpoint Test Required
NOTE: Where DTCs are marked in bold, this means that there are two possible diagnostic processes that may be applied to resolve these faults. Check the listings below to reference an alternative set of pinpoint tests for these DTCs • B10B9-13 Blower Control - Circuit open • B10B9-4B Blower Control - Over temperature • B1157-13 Blower Control B - Circuit open • B1157-4B Blower Control B - Over temperature • **B120E-4B** Right Thermal Electric Device Control - Over temperature • **B1224-4B** Left Thermal Electric Device Control - Over temperature • B122A-11 Right Seat Cushion Blower Speed Sensor - Circuit short to ground • B122A-12 Right Seat Cushion Blower Speed Sensor - Circuit short to battery • B122B-11 Right Seat Back Blower Speed Sensor - Circuit short to ground • B122B-12 Right Seat Back Blower Speed Sensor - Circuit short to battery • B122C-11 Left Seat Cushion Blower Speed Sensor - Circuit short to ground • B122C-12 Left Seat Cushion Blower Speed Sensor - Circuit short to battery • B122D-11 Left Seat Back Blower Speed Sensor - Circuit short to ground • B122D-12 Left Seat Back Blower Speed Sensor - Circuit short to battery	GO to Pinpoint Test A.

NOTE: Where DTCs are marked in bold, this means that there are two possible diagnostic processes that may be applied to resolve these faults. Check the listings below to reference an alternative set of pinpoint tests for these DTCs • **B120E-13** Right Thermal Electric Device Control - Circuit open • **B120E-19** Right Thermal Electric Device Control - Circuit current above threshold • **B1223-13** Right Seat Cushion Temperature Sensor - Circuit open • **B1224-13** Left Thermal Electric Device Control - Circuit open • **B1224-19** Left Thermal Electric Device Control - Circuit current above threshold • **B1225-13** Right Seat Back Temperature Sensor - Circuit open • **B1229-13** Left Seat Back Temperature Sensor - Circuit open • **B1235-13** Left Seat Cushion Temperature Sensor - Circuit open	GO to Pinpoint Test B.
• B120F-98 Left Seat Cushion - Component or system over temperature • B122E-98 Right Seat Cushion - Component or system over temperature • B122F-98 Right Seat Back - Component or system over temperature • B1230-98 Left Seat Back - Component or system over temperature • B1231-7A Right Seat - Fluid leak or seal failure • B1232-7A Left Seat - Fluid leak or seal failure	GO to Pinpoint Test C.
NOTE: Where DTCs are marked in bold, this means that there are two possible diagnostic processes that may be applied to resolve these faults. Check the listings above to reference an alternative set of pinpoint tests for these DTCs • **B120E-4B** Right Thermal Electric Device Control - Over temperature • **B120E-13** Right Thermal Electric Device Control - Circuit open • **B120E-19** Right Thermal Electric Device Control - Circuit current above threshold • **B1223-13** Right Seat Cushion Temperature Sensor - Circuit open • **B1224-4B** Left Thermal Electric Device Control - Over temperature • **B1224-13** Left Thermal Electric Device Control - Circuit open • **B1224-19** Left Thermal Electric Device Control - Circuit current above threshold • **B1225-13** Right Seat Back Temperature Sensor - Circuit open • **B1229-13** Left Seat Back Temperature Sensor - Circuit open • **B1235-13** Left Seat Cushion Temperature Sensor - Circuit open	GO to Pinpoint Test D.

PINPOINT TEST A : CLIMATE SEATS ASSEMBLY - BLOWER DIAGNOSTICS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: CLIMATE SEATS ASSEMBLY - BLOWER SPEED CONTROL CIRCUIT RESISTANCE CHECKS AT SEAT TO VEHICLE CONNECTOR	
	1 Uncouple seat harness connector from the seat climate control module (Front seats connector C3HS03C/Rear seats connector C3HS41C (static seats)or rear seats connector C3HS41F (moveable seats)
	2 Check the resistance of the climate seats blower speed control circuits at the connector • For right-side seat cushion blower, check resistance at pins 3 and 7 • For right-side seat backrest blower, check resistance at pins 4 and 7 • For left-side seat cushion blower, check resistance at pins 11 and 15 • For left-side seat backrest blower, check resistance at pins 12 and 15
	Is the resistance between 290 and 420 kilo-ohms? **Yes** No circuit faults present. No further action **No** GO to A2 .
A2: CLIMATE SEATS ASSEMBLY - BLOWER POWER CIRCUIT RESISTANCE CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR	
	1 Locate the appropriate seat backrest/seat cushion climate assembly connector
	2 Disconnect connector
	3 Check the integrity of connector terminals for bent terminals, backed-out or badly crimped wires. Rectify as required
	4 Check the resistance of the climate seats blower power circuits at the climate assembly connector, pins 2 and 4
	Is the resistance between 290 and 420 kilo-ohms? **Yes** GO to A3 . **No** Replace the seat climate assembly
A3: CLIMATE SEATS ASSEMBLY - BLOWER SPEED CONTROL CIRCUIT RESISTANCE CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR	

	1 Check the resistance of the climate seats blower control circuits at the climate assembly connector, pins 4 and 7
	Is the resistance between 290 and 420 kilo-ohms? **Yes** No internal circuit faults present. Check for circuit faults in wiring harness between seat climate control module and climate seat assembly and replace as required **No** Replace the seat climate assembly

PINPOINT TEST B : CLIMATE SEATS ASSEMBLY - THERMAL ELECTRIC DEVICE (TED) DIAGNOSTICS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CLIMATE SEATS ASSEMBLY - TED SENSOR CIRCUIT RESISTANCE CHECKS AT SEAT TO VEHICLE CONNECTOR	
	1 Uncouple seat harness connector from the seat climate control module (Front seats connector C3HS03B/Rear seats connector C3HS41B (static seats)or rear seats connector C3HS41E (moveable seats)
	2 Check the resistance of the climate seats TED sensor circuits at the connector • For right-side seat cushion TED sensor circuits, check resistance at pins 2 and 3 • For right-side seat backrest TED sensor circuits, check resistance at pins 4 and 5 • For left-side seat cushion TED sensor circuits, check resistance at pins 7 and 8 • For left-side seat backrest TED sensor circuits, check resistance at pins 9 and 10
	Is the resistance between 0.9 and 1.1 kilo-ohms? (Note: these values are based on an ambient temperature of 22°C/72°F) **Yes** No circuit faults present. No further action **No** GO to B2 .
B2: CLIMATE SEATS ASSEMBLY - TED SENSOR CIRCUIT RESISTANCE CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR	
	1 Locate the appropriate seat backrest/seat cushion climate assembly connector
	2 Disconnect connector
	3 Check the integrity of connector terminals for bent terminals, backed-out or badly crimped wires. Rectify as required
	4 Check the resistance of the climate seats TED sensor circuits at the climate assembly connector, pins 5 and 8 (Green and Green wires)
	Is the resistance between 0.9 and 1.1 kilo-ohms? (Note: these values are based on an ambient temperature of 22°C/72°F) **Yes** GO to B3 . **No** Replace the seat climate assembly
B3: CLIMATE SEATS ASSEMBLY - TED SUPPLY CIRCUIT OPEN CIRCUIT CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR	
	1 Check the TED supply circuits at the climate assembly connector, pins 1 and 3 (Blue and Yellow wires) for open circuit faults
	Is an open-circuit fault present? **Yes** Replace the seat climate assembly **No** No internal circuit faults present. Check for circuit faults in wiring harness between seat climate control module and climate seat assembly and replace as required

PINPOINT TEST C : CLIMATE SEATS ASSEMBLY - BLOWER AND DUCTING DIAGNOSTICS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: CLIMATE SEATS ASSEMBLY - BLOWER SPEED CONTROL CIRCUIT RESISTANCE CHECKS AT SEAT TO VEHICLE CONNECTOR	
	1 Uncouple seat harness connector from the seat climate control module (Front seats connector C3HS03C/Rear seats connector C3HS41C (static seats)or rear seats connector C3HS41F (moveable seats)
	2 Check the resistance of the climate seats blower speed control circuits at the connector • For right-side seat cushion blower, check resistance at pins 3 and 7 • For right-side seat backrest blower, check resistance at pins 4 and 7 • For left-side seat cushion blower, check resistance at pins 11 and 15 • For left-side seat backrest blower, check resistance at pins 12 and 15
	Is the resistance between 290 and 420 kilo-ohms? **Yes** No circuit faults present. No further action

	No GO to C2 .
C2: CLIMATE SEATS ASSEMBLY - BLOWER CIRCUIT RESISTANCE CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR	
	1 Locate the appropriate seat backrest/seat cushion climate assembly connector
	2 Disconnect connector
	3 Check the integrity of connector terminals for bent terminals, backed-out or badly crimped wires. Rectify as required
	4 Check the resistance of the climate seats blower circuits at the climate assembly connector, pins 2 and 4 (Violet and Black wires)
	Is the resistance between 290 and 420 kilo-ohms? **Yes** GO to C3 . **No** Replace the seat climate assembly
C3: CLIMATE SEATS ASSEMBLY - BLOWER CONTROL CIRCUIT RESISTANCE CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR	
	1 Check the resistance of the climate seats blower control circuits at the climate assembly connector, pins 4 and 7 (Black and Purple wires)
	Is the resistance between 290 and 420 kilo-ohms? **Yes** No internal circuit faults present. Check for circuit faults in wiring harness between seat climate control module and climate seat assembly and replace as required. If no harness faults are found, GO to C4 . **No** Replace the seat climate assembly
C4: CLIMATE SEATS ASSEMBLY - BLOWER DUCTING INSPECTION	
	1 Check that the ducting is securely attached to the blower and thermal electric device
	2 Check the ducting for holes, cuts or tears
	Is the ducting undamaged and securely attached to the blower and thermal electric device? **Yes** GO to C5 . **No** Replace the seat climate assembly
C5: CLIMATE SEATS ASSEMBLY - EXHAUST AIRFLOW CHECKS	
	1 Check for blockages or restrictions at the thermal electric device exhaust vent
	Are blockages or restrictions present? **Yes** Rectify as required **No** GO to C6 .
C6: CLIMATE SEATS ASSEMBLY - BLOWER AIRFLOW CHECKS	
	1 Check for blockages or restrictions at the blower air intake
	2 Check that the blower fan movement is not restricted
	Are there any air intake blockages or restrictions to the blower fan movement? **Yes** Rectify as required **No** No further action

PINPOINT TEST D : CLIMATE SEATS ASSEMBLY - THERMAL ELECTRIC DEVICE (TED) AND DUCTING DIAGNOSTICS

TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
D1: CLIMATE SEATS ASSEMBLY - TED SENSOR CIRCUIT RESISTANCE CHECKS AT SEAT TO VEHICLE CONNECTOR	
	1 Uncouple seat harness connector from the seat climate control module (Front seats connector C3HS03B/Rear seats connector C3HS41B (static seats)or rear seats connector C3HS41E (moveable seats)
	2 Check the resistance of the climate seats TED sensor circuits at the connector • For right-side seat cushion TED sensor circuits, check resistance at pins 2 and 3 • For right-side seat backrest TED sensor circuits, check resistance at pins 4 and 5 • For left-side seat cushion TED sensor circuits, check resistance at pins 7 and 8 • For left-side seat backrest TED sensor circuits, check resistance at pins 9 and 10
	Is the resistance between 0.9 and 1.1 kilo-ohms? (Note: these values are based on an ambient temperature of 22°C/72°F) **Yes** No circuit faults present. No further action **No** GO to D2 .
D2: CLIMATE SEATS ASSEMBLY - TED SENSOR CIRCUIT RESISTANCE CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR	
	1

	1	Locate the appropriate seat backrest/seat cushion climate assembly connector
	2	Disconnect connector
	3	Check the integrity of connector terminals for bent terminals, backed-out or badly crimped wires. Rectify as required
	4	Check the resistance of the climate seats TED sensor circuits at the climate assembly connector, pins 5 and 8 (Green and Green wires)
	Is the resistance between 0.9 and 1.1 kilo-ohms? (Note: these values are based on an ambient temperature of 22°C/72°F) **Yes** GO to D3 . **No** Replace the seat climate assembly	
D3: CLIMATE SEATS ASSEMBLY - TED SUPPLY CIRCUIT OPEN CIRCUIT CHECKS AT SEAT CLIMATE ASSEMBLY CONNECTOR		
	1	Check the TED supply circuits at the climate assembly connector, pins 1 and 3 (Blue and Yellow wires) for open circuit faults
	Is an open-circuit fault present? **Yes** Replace the seat climate assembly **No** No internal circuit faults present. Check for circuit faults in wiring harness between seat climate control module and climate seat assembly and replace as required. If no harness faults are found, GO to D4 .	
D4: CLIMATE SEATS ASSEMBLY - TED DUCTING INSPECTION		
	1	Check that the ducting is securely attached to the blower and thermal electric device
	2	Check the ducting for holes, cuts or tears
	Is the ducting undamaged and securely attached to the blower and thermal electric device? **Yes** GO to D5 . **No** Replace the seat climate assembly	
D5: CLIMATE SEATS ASSEMBLY - EXHAUST AIRFLOW CHECKS		
	1	Check for blockages or restrictions at the thermal electric device exhaust vent
	Are blockages or restrictions present? **Yes** Rectify as required **No** GO to D6 .	
D6: CLIMATE SEATS ASSEMBLY - BLOWER AIRFLOW CHECKS		
	1	Check for blockages or restrictions at the blower air intake
	2	Check that the blower fan movement is not restricted
	Are there any air intake blockages or restrictions to the blower fan movement? **Yes** Rectify as required **No** No further action	

Over Temperature and Fluid/Air Leak Diagnostics

Check For Air Flow Specific DTCs	Diagnostic Guidance Notes
• B120F-98 • B122E-98 • B122F-98 • B1230-98 • B1231-7A • B1232-7A	• Once the diagnostic process detailed above has been carried out and it has been identified that there has not been a failure of any of the climate units, then refer back to the relevant climate system DTC codes that have been recorded • DTC codes listed that end in 7A or 98 indicate a possible air leak or air flow restriction within the system • In these circumstances, starting with the seat base check all ducting connections for correct engagement and inspect ducting for signs of damage which could result in an air leak (for connection issues re-connect and test system). Only in the event of finding damage to the ducting of one of the units should the unit be replaced. Note that only the specific unit should be replaced • Due to the design function of the system, both climate units in any one seat operate integrally. Therefore, if an issue is detected in one of the units then **both** units are shut down to protect the system until next ignition cycle. Under these circumstances, only replace the damaged unit and DO NOT replace both units

DTC Index

For a complete list of all diagnostic trouble codes that could be logged on this vehicle, please refer to Section 100-00. REFER to: (100-00 General Information)

Diagnostic Trouble Code (DTC) Index - DTC: Climate Controlled Seat Module - Front/Rear (SCME/SCMF) (Description and Operation),

Diagnostic Trouble Code (DTC) Index - DTC: Climate Controlled Seat Module - Front/Rear (SCME/SCMF) (Description and Operation).

Published: 11-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Climate Controlled Seat Module - Front/Rear (SCME/SCMF)

Description and Operation

Climate Controlled Seat Module - Front/Rear (SCME/SCMF)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If a control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Climate Controlled Seat Module - Front/Rear (SCME/SCMF), for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: Seats (501-10 Seating, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B10B9-13	Blower Control - Circuit open	• LH seat blower + circuit, open circuit • LH seat blower - circuit, open circuit • Connectors disconnected • Connector pin damage • Blower motor assembly open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check LH seat blower + circuit for open circuit. Check LH seat blower - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check blower motor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• Mechanical restriction in	

B10B9-4B	Blower Control - Over temperature	blower motor assembly • LH seat blower + circuit, short to ground • LH seat blower - circuit, short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Check for mechanical restriction or debris in blower motor assembly. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check LH seat blower + circuit for short to ground. Check LH seat blower - circuit for short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1157-13	Blower Control B - Circuit open	• RH seat blower + circuit, open circuit • RH seat blower - circuit, open circuit • Connectors disconnected • Connector pin damage • Blower motor assembly open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check RH seat blower + circuit for open circuit. Check RH seat blower - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check blower motor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1157-4B	Blower Control B - Over temperature	• Mechanical restriction in blower motor assembly • RH seat blower + circuit, short to ground • RH seat blower - circuit, short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Check for mechanical restriction or debris in blower motor assembly. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check RH seat blower + circuit for short to ground. Check RH seat blower - circuit for short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B120E-13	Right Thermal Electric Device Control - Circuit open	• RH seat back thermal electric device + circuit, open circuit • RH seat back thermal electric device - circuit, open circuit • RH seat cushion thermal electric device + circuit, open circuit • RH seat cushion thermal electric device - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat backrest thermal electric device assembly, open circuit	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for open circuit. Check RH seat back thermal electric device - circuit for open circuit. Check RH seat cushion thermal electric device + circuit for open circuit. Check RH seat cushion thermal electric device - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check climate seat backrest thermal electric device assembly for open circuit. Check climate seat cushion thermal electric device assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		• Climate seat cushion thermal electric device assembly, open circuit • Climate Control Seat Module failure	
B120E-19	Right Thermal Electric Device Control - Circuit current above threshold	• RH seat back thermal electric device + circuit, short to ground • RH seat back thermal electric device - circuit, short to ground • RH seat cushion thermal electric device + circuit, short to ground • RH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for short to ground. Check RH seat back thermal electric device - circuit for short to ground. Check RH seat cushion thermal electric device + circuit for short to ground. Check RH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B120E-4B	Right Thermal Electric Device Control - Over temperature	• Restriction in thermal electric device air path • RH seat back thermal electric device + circuit, short to ground • RH seat back thermal electric device - circuit, short to ground • RH seat cushion thermal electric device + circuit, short to ground • RH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Check for blockage or restriction in thermal electric device air path. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back thermal electric device + circuit for short to ground. Check RH seat back thermal electric device - circuit for short to ground. Check RH seat cushion thermal electric device + circuit for short to ground. Check RH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• The Climate Control Seat	

B120F-98	Left Seat Cushion - Component or system over temperature	Module LH cushion sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module LH cushion sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1223-13	Right Seat Cushion Temperature Sensor - Circuit open	• RH seat cushion sensor circuit, open circuit • RH seat cushion sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat cushion temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat cushion sensor circuit for open circuit. Check RH seat cushion sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat cushion temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1224-13	Left Seat Cushion Temperature Sensor - Circuit open	• LH seat back thermal electric device + circuit, open circuit • LH seat back thermal electric device - circuit, open circuit • LH seat cushion thermal electric device + circuit, open circuit • LH seat cushion thermal electric device - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat backrest thermal electric device assembly, open circuit • Climate seat cushion thermal	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for open circuit. Check LH seat back thermal electric device - circuit for open circuit. Check LH seat cushion thermal electric device + circuit for open circuit. Check LH seat cushion thermal electric device - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check climate seat backrest thermal electric device assembly for open circuit. Check climate seat cushion thermal electric device assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		electric device assembly, open circuit • Climate Control Seat Module failure	
B1224-19	Left Thermal Electric Device Control - Circuit current above threshold	• LH seat back thermal electric device + circuit, short to ground • LH seat back thermal electric device - circuit, short to ground • LH seat cushion thermal electric device + circuit, short to ground • LH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for short to ground. Check LH seat back thermal electric device - circuit for short to ground. Check LH seat cushion thermal electric device + circuit for short to ground. Check LH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1224-4B	Left Thermal Electric Device Control - Over temperature	• Restriction in thermal electric device air path • LH seat back thermal electric device + circuit, short to ground • LH seat back thermal electric device - circuit, short to ground • LH seat cushion thermal electric device + circuit, short to ground • LH seat cushion thermal electric device - circuit, short to ground • Climate seat backrest thermal electric device assembly, short to ground • Climate seat cushion thermal electric device assembly, short to ground • Climate Control Seat Module failure	Check for blockage or restriction in thermal electric device air path. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back thermal electric device + circuit for short to ground. Check LH seat back thermal electric device - circuit for short to ground. Check LH seat cushion thermal electric device + circuit for short to ground. Check LH seat cushion thermal electric device - circuit for short to ground. Check climate seat backrest thermal electric device assembly for short to ground. Check climate seat cushion thermal electric device assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
		• RH seat back sensor circuit, open circuit	Carry out On Demand Self Test (ODST) using manufacturer approved

B1225-13	Right Seat Back Temperature Sensor - Circuit open	• RH seat back sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat back temperature sensor assembly, open circuit • Climate Control Seat Module failure	diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back sensor circuit for open circuit. Check RH seat back sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat back temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1229-13	Left Seat Back Temperature Sensor - Circuit open	• LH seat back sensor circuit, open circuit • LH seat back sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat back temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back sensor circuit for open circuit. Check LH seat back sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat back temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122A-11	Right Seat Cushion Blower Speed Sensor - Circuit short to ground	• RH cushion fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH cushion fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122A-12	Right Seat Cushion Blower Speed Sensor - Circuit short to battery	• RH cushion fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH cushion fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122B-11	Right Seat Back Blower Speed Sensor - Circuit short to ground	• RH seat back fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122B-12	Right Seat Back Blower Speed Sensor - Circuit short to battery	• RH seat back fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, RH seat back fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

B122C-11	Left Seat Cushion Blower Speed Sensor - Circuit short to ground	• LH cushion fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH cushion fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122C-12	Left Seat Cushion Blower Speed Sensor - Circuit short to battery	• LH cushion fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH cushion fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122D-11	Left Seat Back Blower Speed Sensor - Circuit short to ground	• LH seat back fan speed, circuit short to ground • Blower motor assembly, short to ground • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back fan speed for circuit short to ground. Check blower motor assembly for short to ground. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122D-12	Left Seat Back Blower Speed Sensor - Circuit short to battery	• LH seat back fan speed, circuit short to power • Blower motor assembly, short to power • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat back fan speed for circuit short to power. Check blower motor assembly for short to power. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B122E-98	Right Seat Cushion - Component or system over temperature	• The Climate Control Seat Module RH cushion sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module RH cushion sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

B122F-98	Right Seat Back - Component or system over temperature	• The Climate Control Seat Module RH seat back sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module RH seat back sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1230-98	Left Seat Back - Component or system over temperature	• The Climate Control Seat Module LH seat back sensor input circuit temperature exceeds 65 Degrees C continuously for more than 4 seconds during cooling • The Climate Control Seat Module LH seat back sensor input circuit temperature is greater than 110 Degrees C for more than 4 seconds during heating • Blocked or restricted thermal electric device fan exhaust vent • Restricted thermal electric fan movement	Check for blockage or restriction in thermal electric device fan exhaust vent. Check for restricted thermal electric fan movement. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1231-7A	Right Seat - Fluid leak or seal failure	• The Climate Control Seat Module has detected an input temperature difference greater than expected between RH seat back sensor and RH cushion sensor • Climate seat back assembly air path leaking	Check for blockage or restriction in seat back thermal electric device fan ducts. Check seat back thermal electric device fan exhaust vent is clear. Check for blockage or restriction in seat cushion thermal electric device fan ducts. Check seat cushion thermal electric device fan exhaust vent is clear. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

		• Climate seat cushion assembly air path leaking • Seat assembly damaged	
B1232-7A	Left Seat - Fluid leak or seal failure	• The Climate Control Seat Module has detected an input temperature difference greater than expected between LH seat back sensor and LH cushion sensor • Climate seat back assembly air path leaking • Climate seat cushion assembly air path leaking • Seat assembly damaged	Check for blockage or restriction in seat back thermal electric device fan ducts. Check seat back thermal electric device fan exhaust vent is clear. Check for blockage or restriction in seat cushion thermal electric device fan ducts. Check seat cushion thermal electric device fan exhaust vent is clear. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
B1235-13	Left Seat Cushion Temperature Sensor - Circuit open	• LH seat cushion sensor circuit, open circuit • LH seat cushion sensor - circuit, open circuit • Connectors disconnected • Connector pin damage • Climate seat cushion temperature sensor assembly, open circuit • Climate Control Seat Module failure	Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm the fault is present. Refer to the electrical circuit diagrams and check, LH seat cushion sensor circuit for open circuit. Check LH seat cushion sensor - circuit for open circuit. Check for any disconnected connectors or damaged connector pins. Check Climate seat cushion temperature sensor assembly for open circuit. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Alternatively carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
U0010-88	Medium Speed CAN Communication Bus - Bus off	• Medium Speed CAN communication bus off	Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network.
U0140-00	Lost Communication With Body Control Module - No sub type information	• CAN harness link between Climate Control Seat Module and Central Junction Box malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Central Junction Box within the specified time interval	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a climate seat concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis Using the manufacturer approved diagnostic system, check Central Junction Box for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Central Junction Box power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Central Junction Box, repair as necessary.
	Lost	• CAN harness link between Climate Control Seat Module and Rear Junction Box malfunction	Using the manufacturer approved diagnostic system, check Rear

U0142-00	Communication With Body Control Module "B" - No sub type information	• The Climate Control Seat Module has not received the expected CAN signal from the Rear Junction Box within the specified time interval	Junction Box for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Rear Junction Box power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Rear Junction Box, repair as necessary.
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• CAN harness link between Climate Control Seat Module and Instrument Panel Cluster (IPC) network malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Instrument Panel Cluster (IPC) within the specified time interval	Using the manufacturer approved diagnostic system, check Instrument Panel Cluster (IPC) for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Instrument Panel Cluster (IPC) power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Instrument Panel Cluster (IPC), repair as necessary.
U0156-00	Lost Communication With Information Center "A" - No sub type information	• CAN harness link between Climate Control Seat Module and Information and Entertainment Control Module network malfunction • The Climate Control Seat Module has not received the expected CAN signal from the Information and Entertainment Control Module within the specified time interval	Using the manufacturer approved diagnostic system, check Information and Entertainment Control Module for DTCs and refer to the relevant DTC Index. Using the manufacturer approved diagnostic system, carry out network integrity test. Refer to the electrical circuit diagrams and check Information and Entertainment Control Module power and ground circuits for open circuit. Check CAN harness between Climate Control Seat Module and Information and Entertainment Control Module, repair as necessary.
U0300-00	Internal Control Module Software Incompatibility - No sub type information	• Incorrect or invalid software has been installed	Using the manufacturer approved diagnostic system, re-configure the Climate Control Seat Module and the Rear Junction Box. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification. Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect.
U0401-00	Invalid Data Received from ECM/PCM A - No sub type information	• The Engine Control Module (ECM) has transmitted engine speed quality factor CAN signal at a specific value for a greater than expected time period	Using the manufacturer approved diagnostic system, check Engine Control Module for DTCs and refer to the relevant DTC Index.
U2101-00	Control module Configuration		Using the manufacturer approved diagnostic system, re-configure the Climate Control Seat Module and the Rear Junction Box. Carry out On

	Incompatible - No sub type information	• Calibration incomplete/corrupt	Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
U3000-04	Control Module - System internal failures	• Climate Control Seat Module failure • Climate Control Seat Module microprocessor failed internal ROM and/or RAM checksum test	Refer to the warranty policy and procedures manual if the Climate Control Seat Module is suspect.
U3003-62	Battery Voltage - Signal compare failure	• Mismatch in battery voltage of 2 volts or more between the measured battery voltage at the Climate Control Seat Module and the battery voltage signal sent from the Rear Junction Box	Refer to the electrical circuit diagrams and check that power supply voltage at Climate Control Seat Module and Rear Junction Box is not different by more than 2 volts. Rectify as required. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.

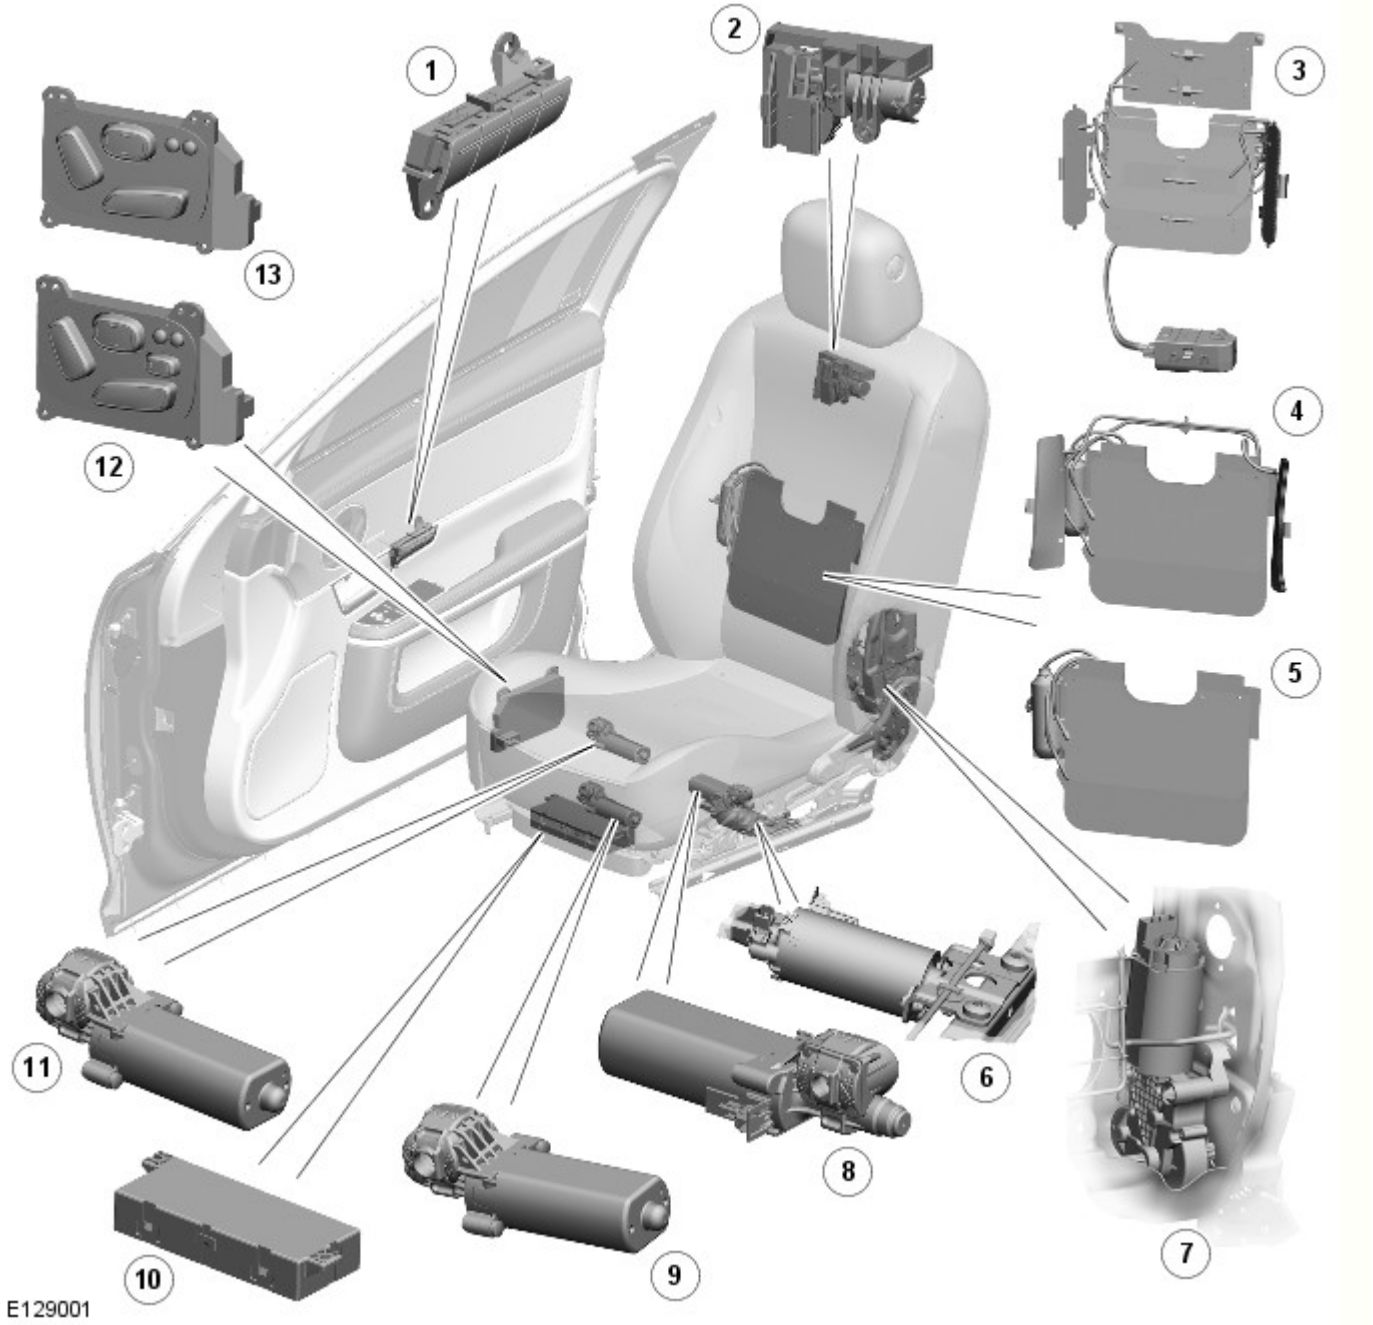
Seating - Seats - Component Location

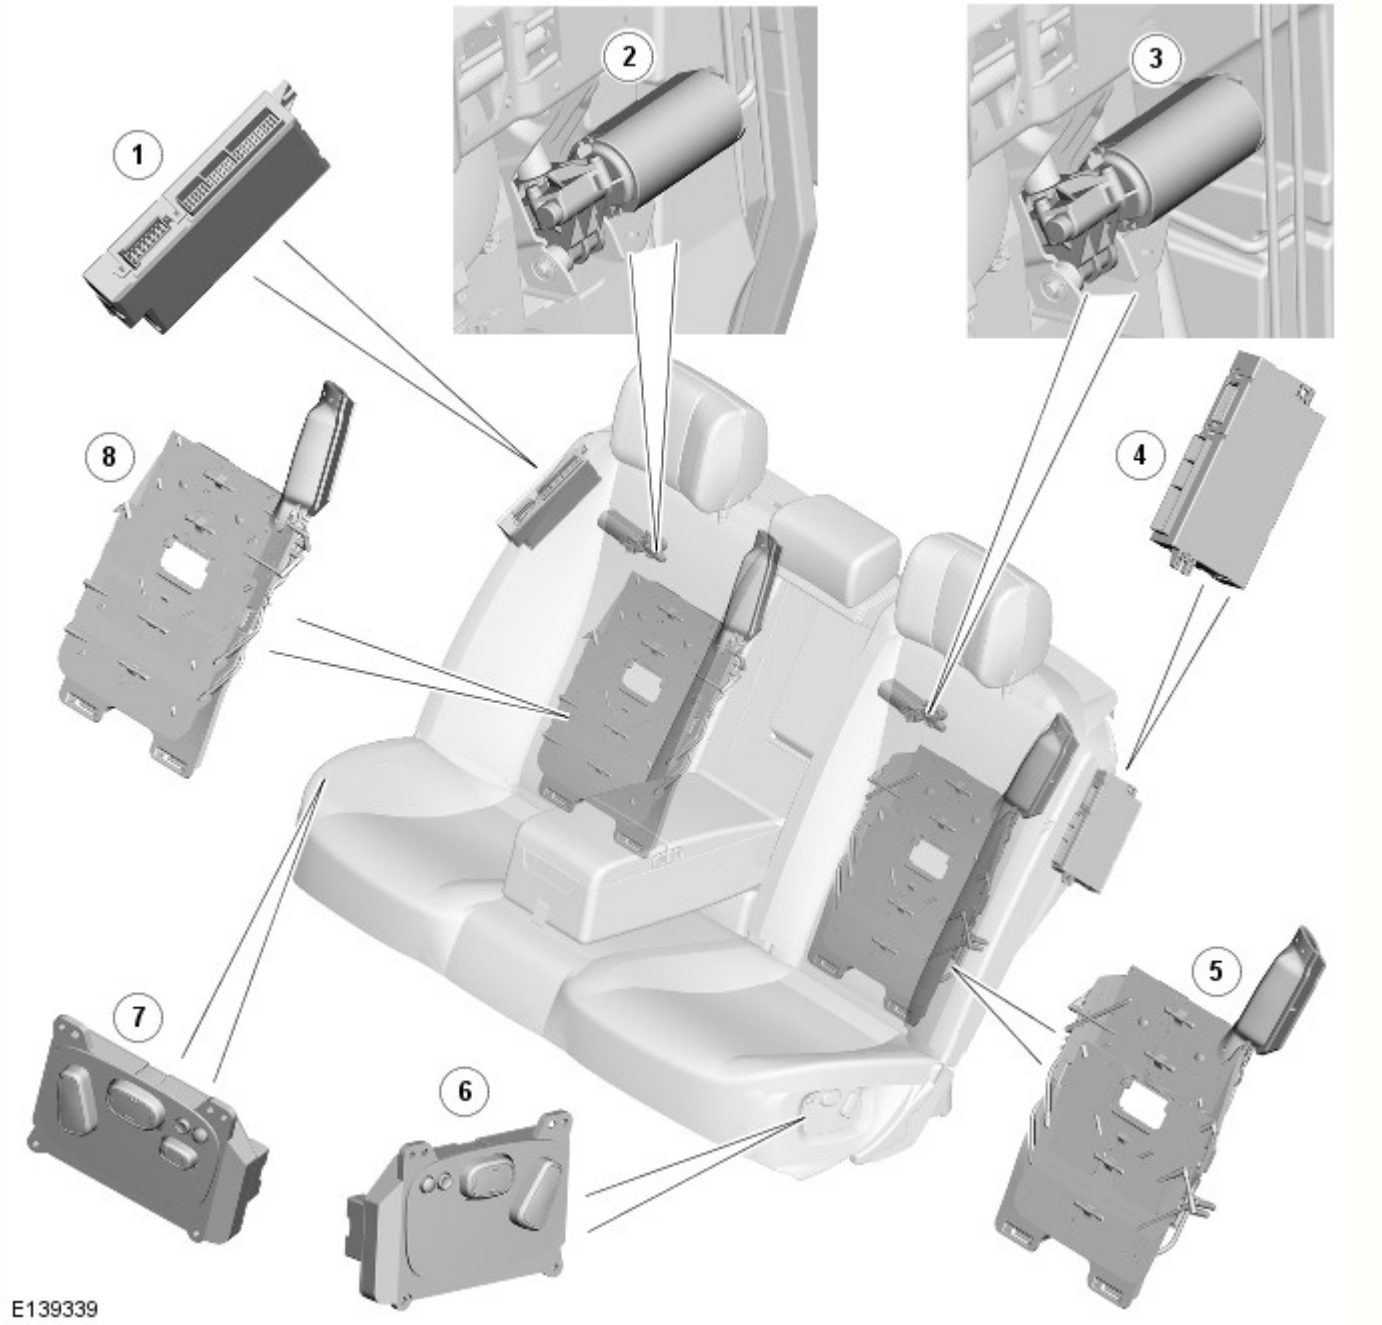
Description and Operation

COMPONENT LOCATION - FRONT SEAT ADJUSTMENT



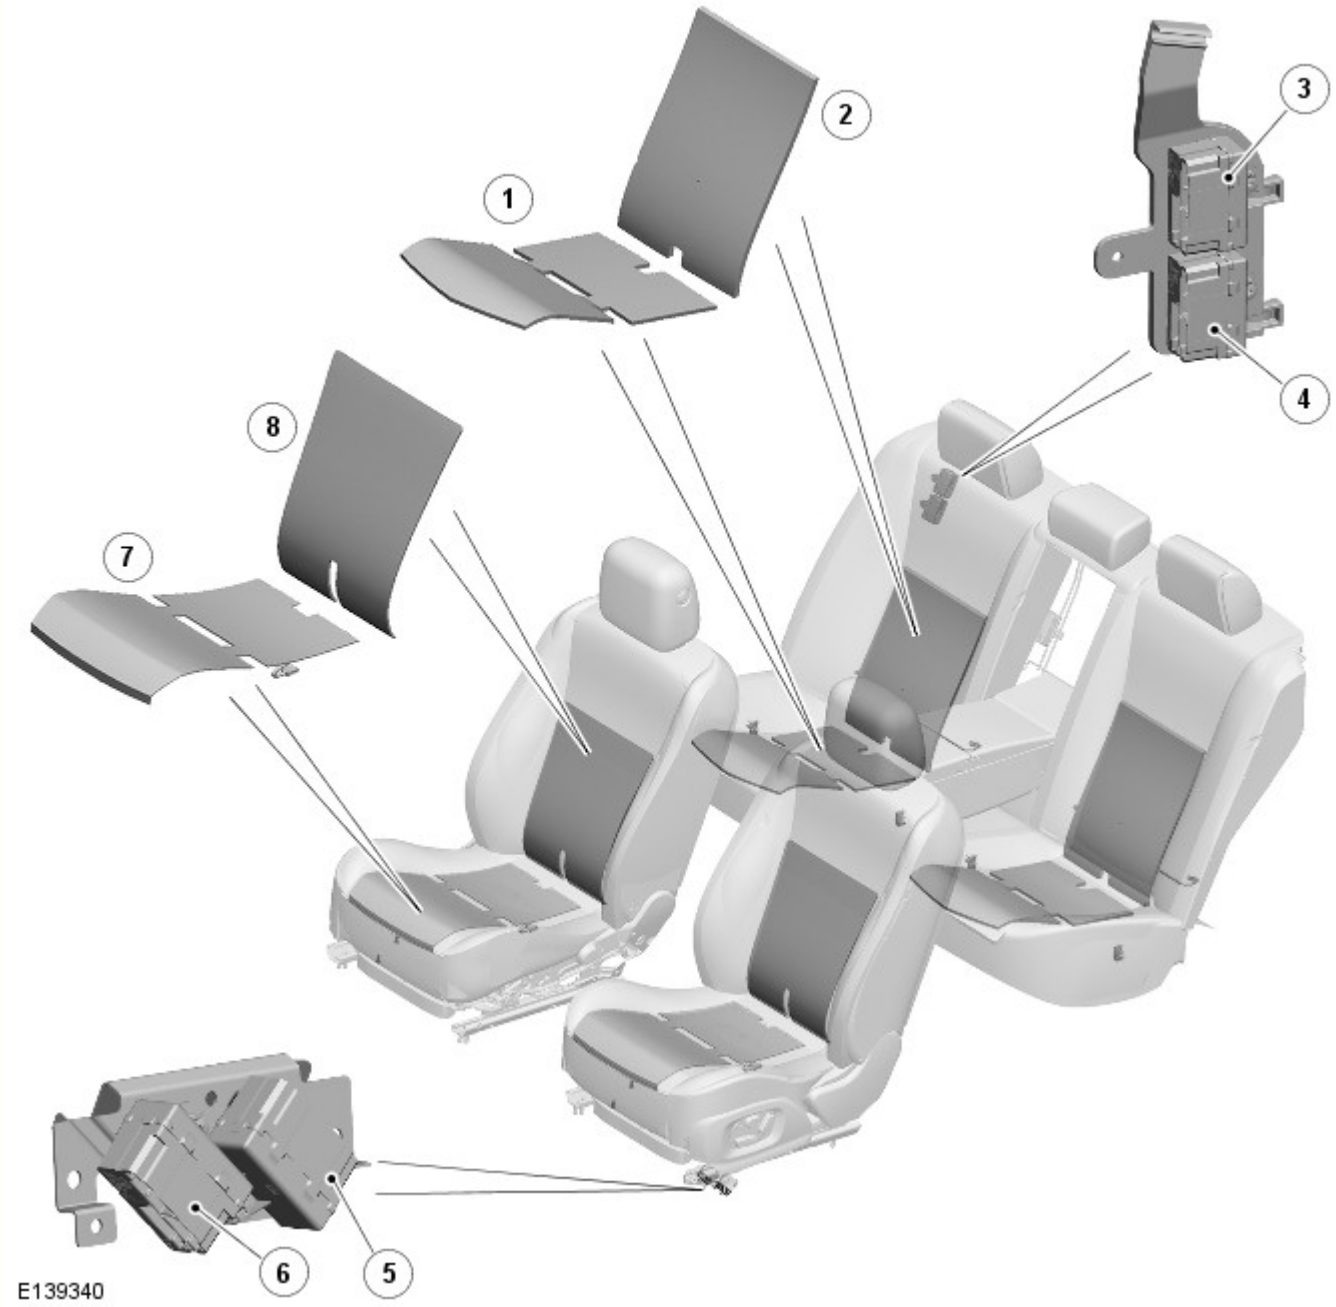
Item	Description
1	Memory switch pack
2	Head restraint motor
3	Pump, lumbar support, squab bolster supports and back massage cells
4	Pump, lumbar support and squab bolster supports
5	Pump and lumbar support (4-way support shown, 2-way similar)
6	Seat slide motor
7	Squab recline motor
8	Cushion tilt motor
9	Cushion extension motor
10	Seat control module
11	Seat height motor
12	Seat switch pack (16 and 18 way)
13	Seat switch pack (8, 10 and 12 way)

COMPONENT LOCATION - REAR SEAT ADJUSTMENT



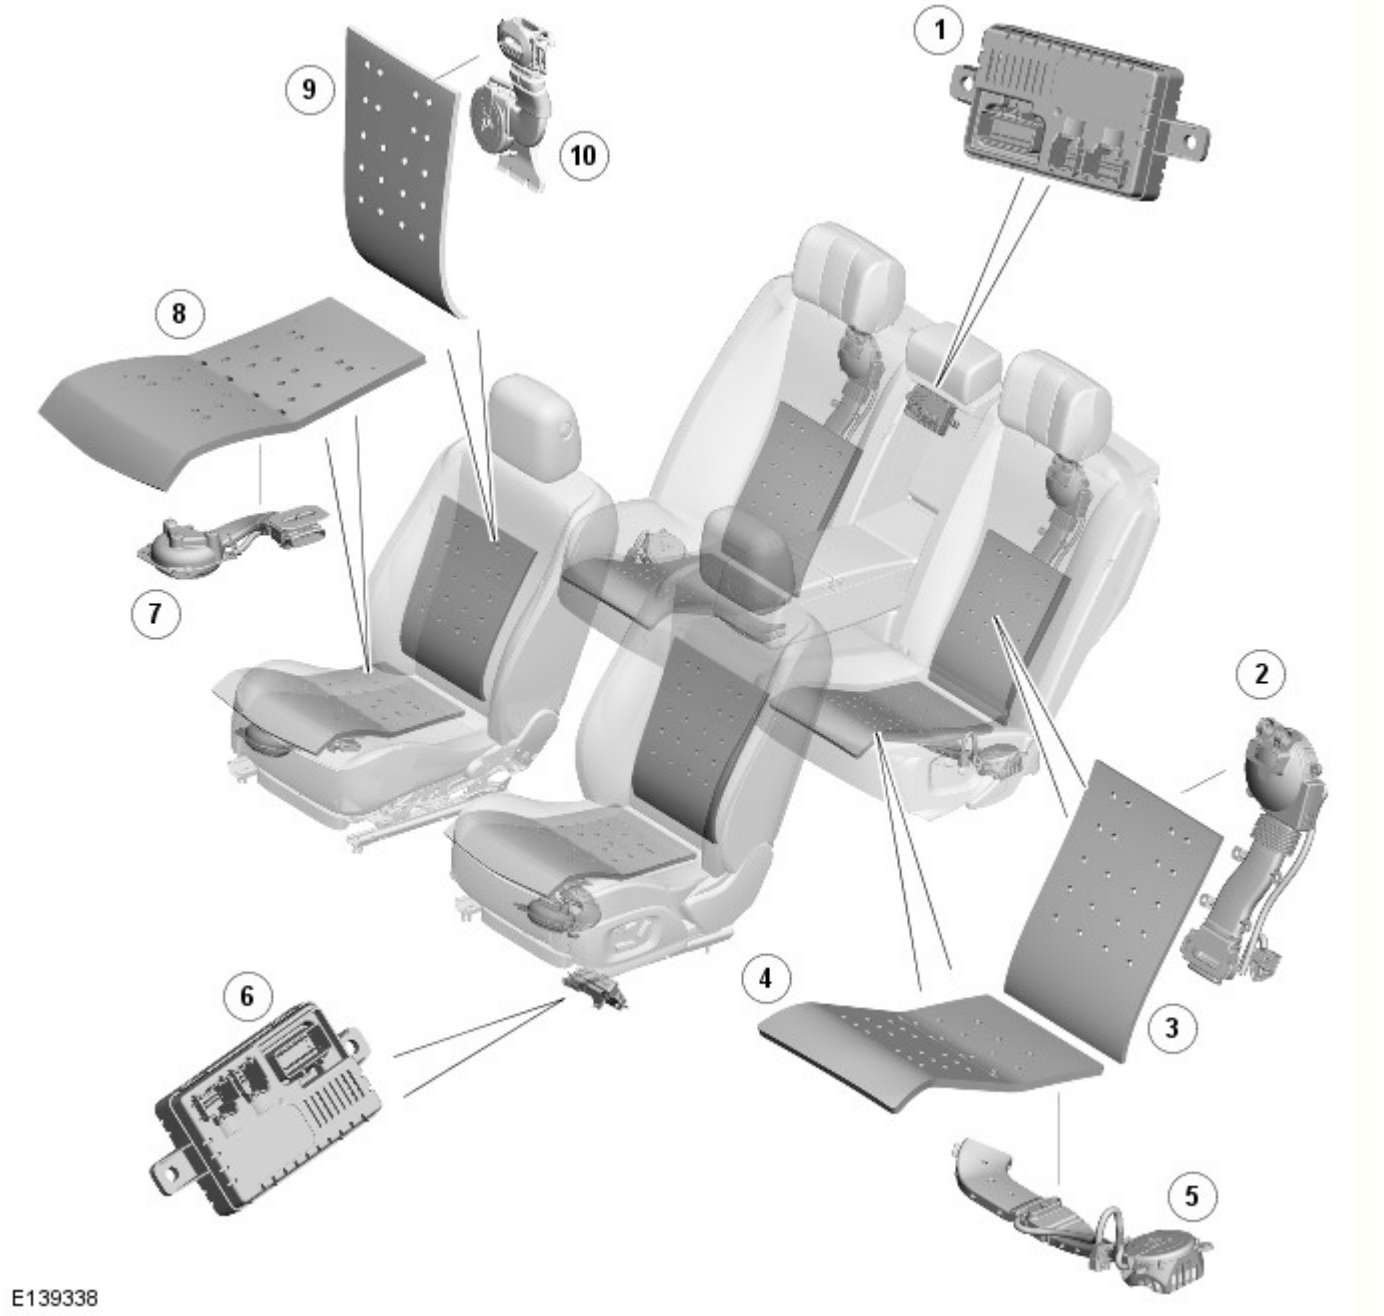
Item	Description
1	Right Hand (RH) rear seat module
2	RH rear seat recline motor
3	Left Hand (LH) rear seat recline motor
4	LH rear seat module
5	LH 4-way lumbar adjustment and massage
6	LH Rear seat adjustment switchpack (Left Hand Drive version shown)
7	RH Rear seat adjustment switchpack (Left Hand Drive version shown)
8	RH 4-way lumbar adjustment massage

COMPONENT LOCATION - HEATED FRONT AND REAR SEATS



Item	Description
1	Rear seat cushion heater element
2	Rear seat squab heater element
3	Rear RH seat heater module
4	Rear LH seat heater module
5	Front passenger seat heater module
6	Driver seat heater module
7	Front seat cushion heater element
8	Front seat squab heater element

COMPONENT LOCATION - FRONT AND REAR CLIMATE SEATS



Item	Description
1	Rear seats climate control module
2	Rear seat squab climate module
3	Rear seat squab pad assembly
4	Rear seat cushion pad assembly
5	Rear seat cushion climate module
6	Front seats climate control module
7	Front seat cushion climate module
8	Front seat cushion pad assembly
9	Front seat squab pad assembly
10	Front seat squab climate module

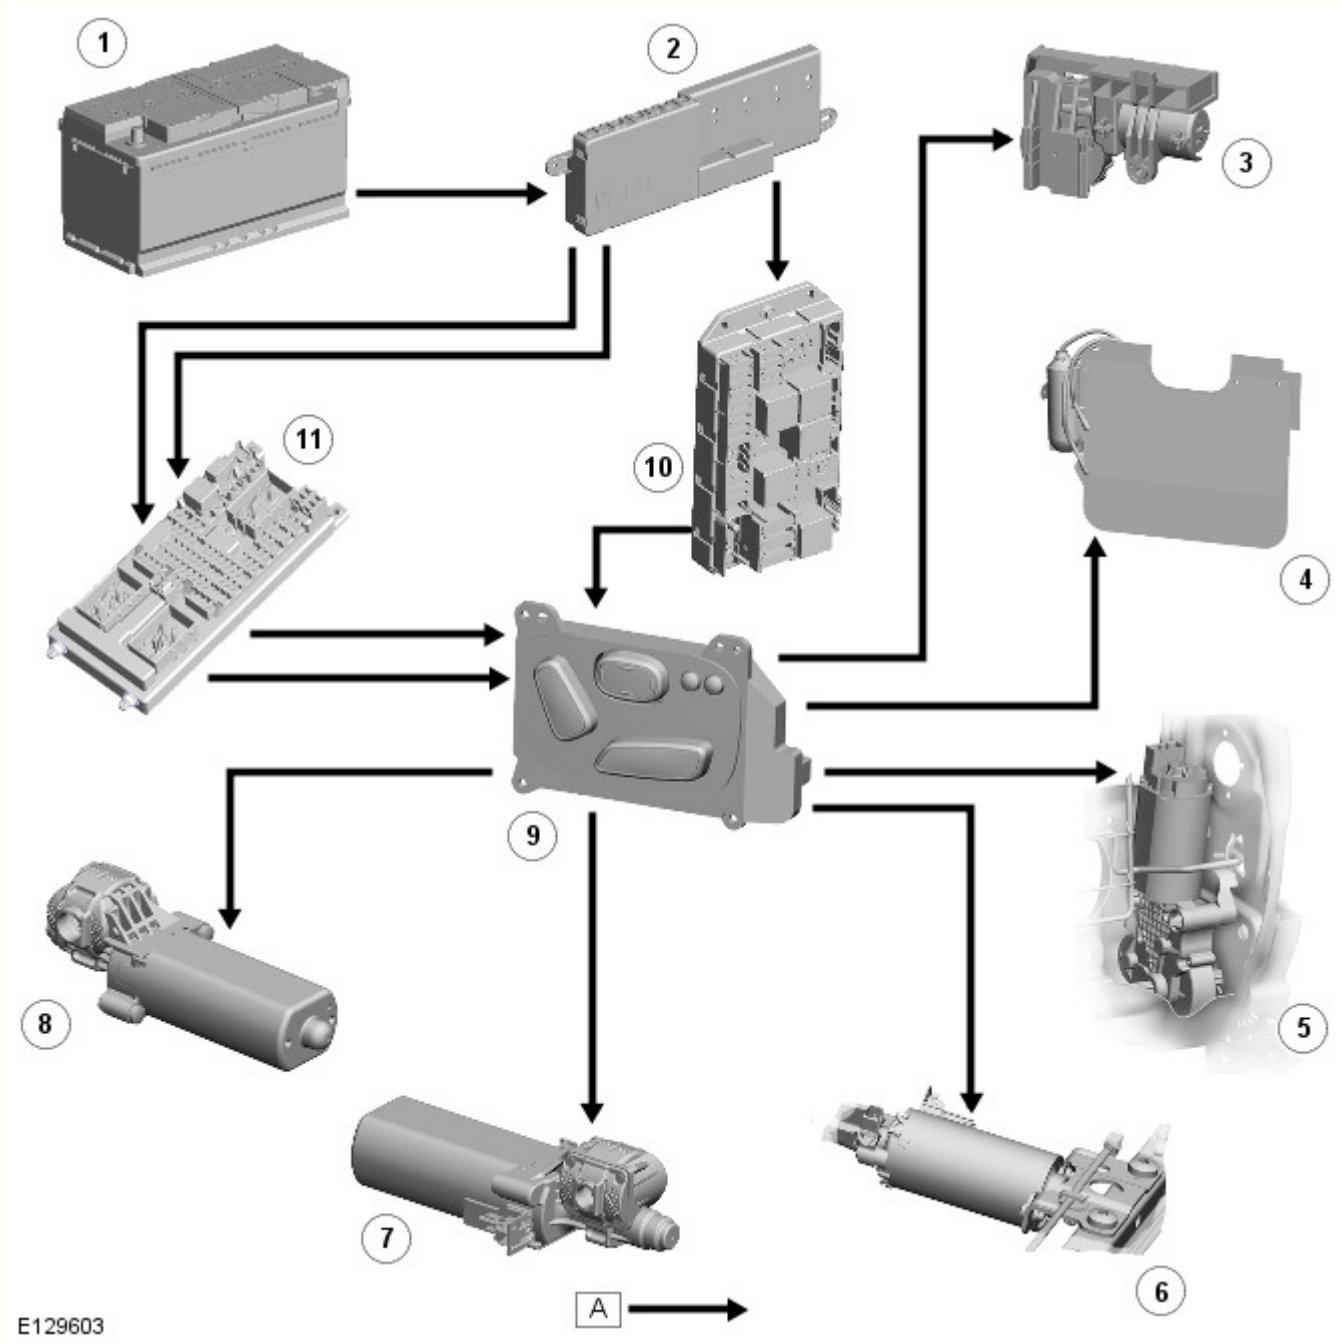
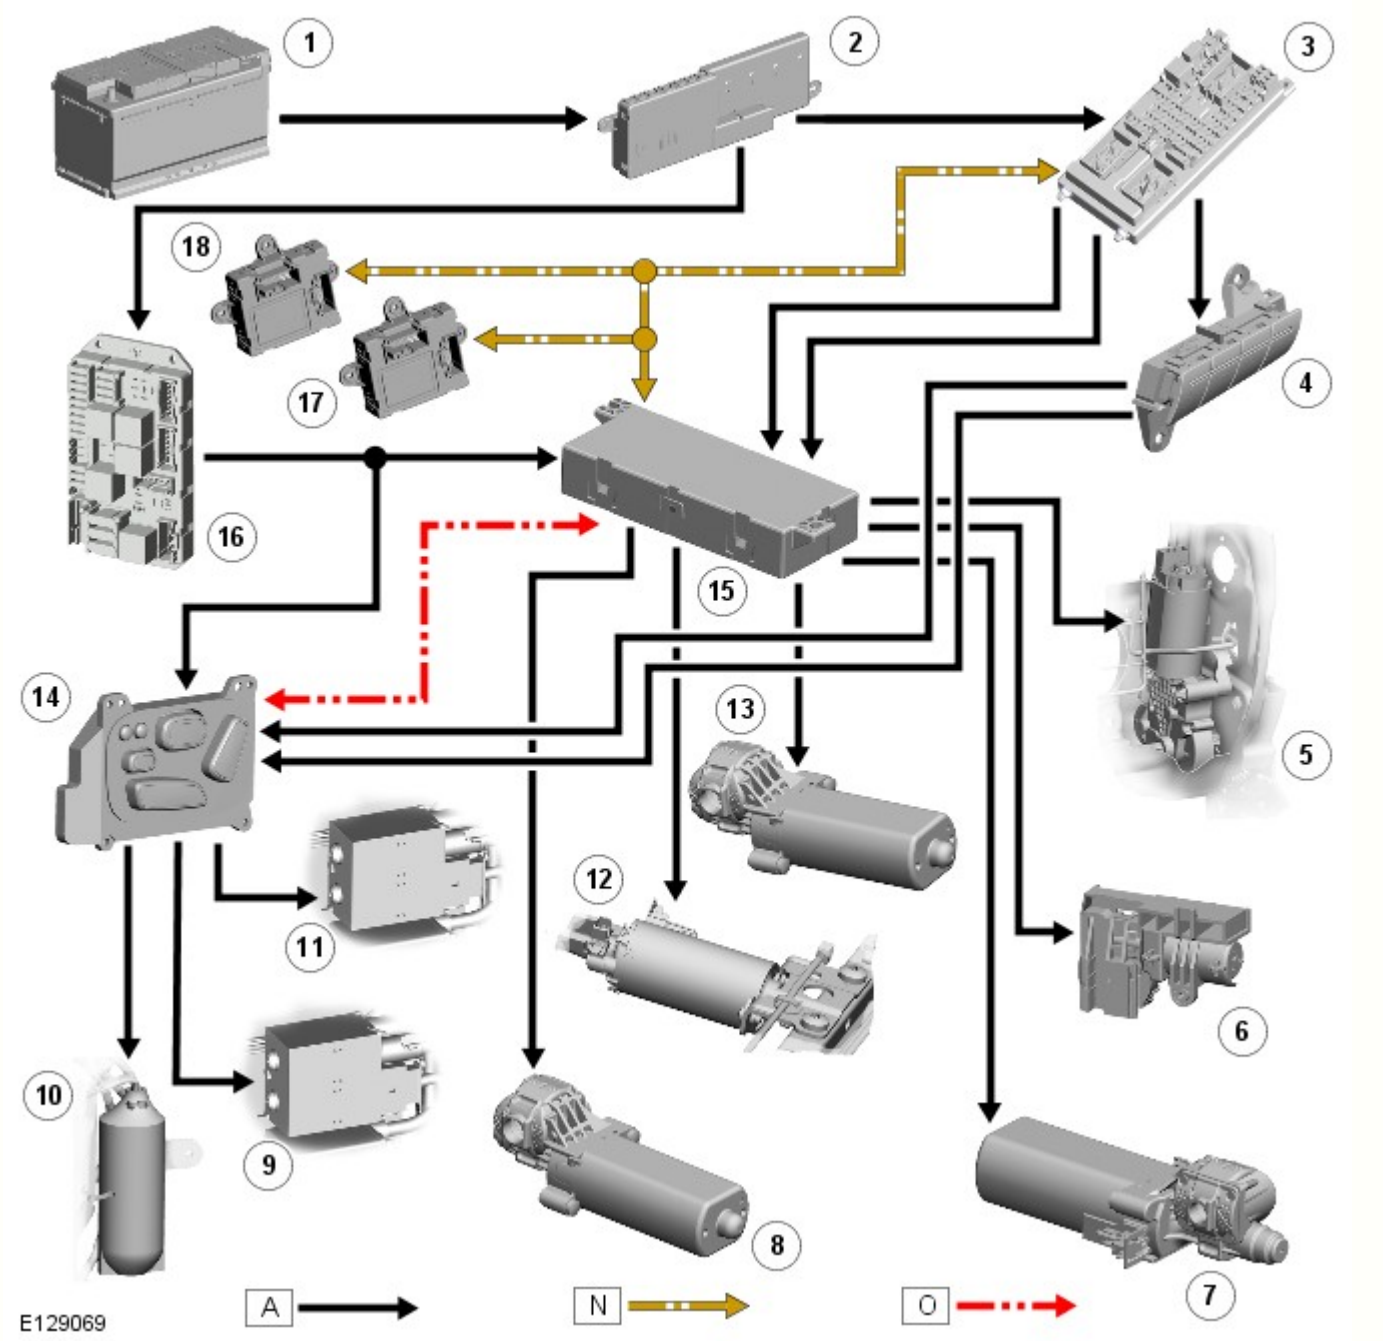
ADJUSTMENT - NON-MEMORY FRONT SEAT



Item	Description
1	Battery
2	BJB (battery junction box)
3	Head restraint motor
4	2-way lumbar adjustment
5	Squab recline motor
6	Seat slide motor
7	Cushion tilt motor
8	Seat height motor
9	Seat switch pack
10	RJB (rear junction box)
11	CJB (central junction box)

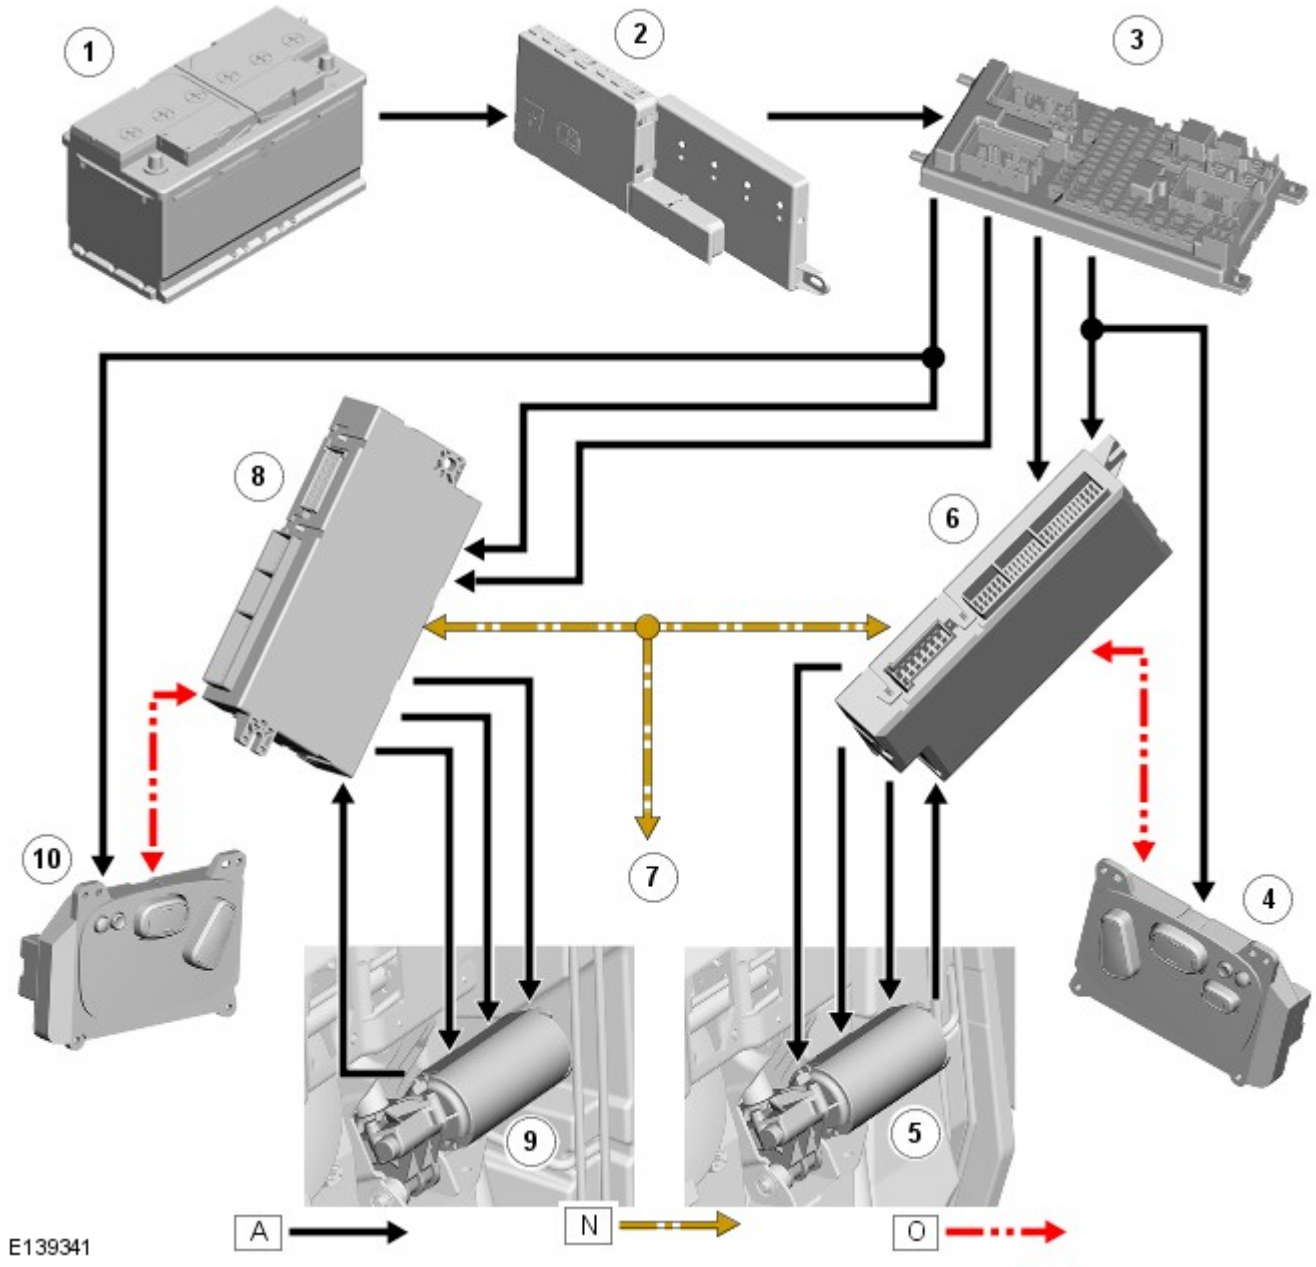
ADJUSTMENT - MEMORY FRONT SEAT



Item	Description
1	Battery
2	BJB
3	CJB
4	Seat memory switches
5	Squab recline motor
6	Head restraint motor
7	Cushion tilt motor
8	Seat height motor
9	Lumbar adjustment solenoids
10	Air pump
11	Squab bolster adjustment solenoids
12	Seat slide motor
13	Cushion extension motor
14	Seat switch pack
15	Driver seat module
16	RJB

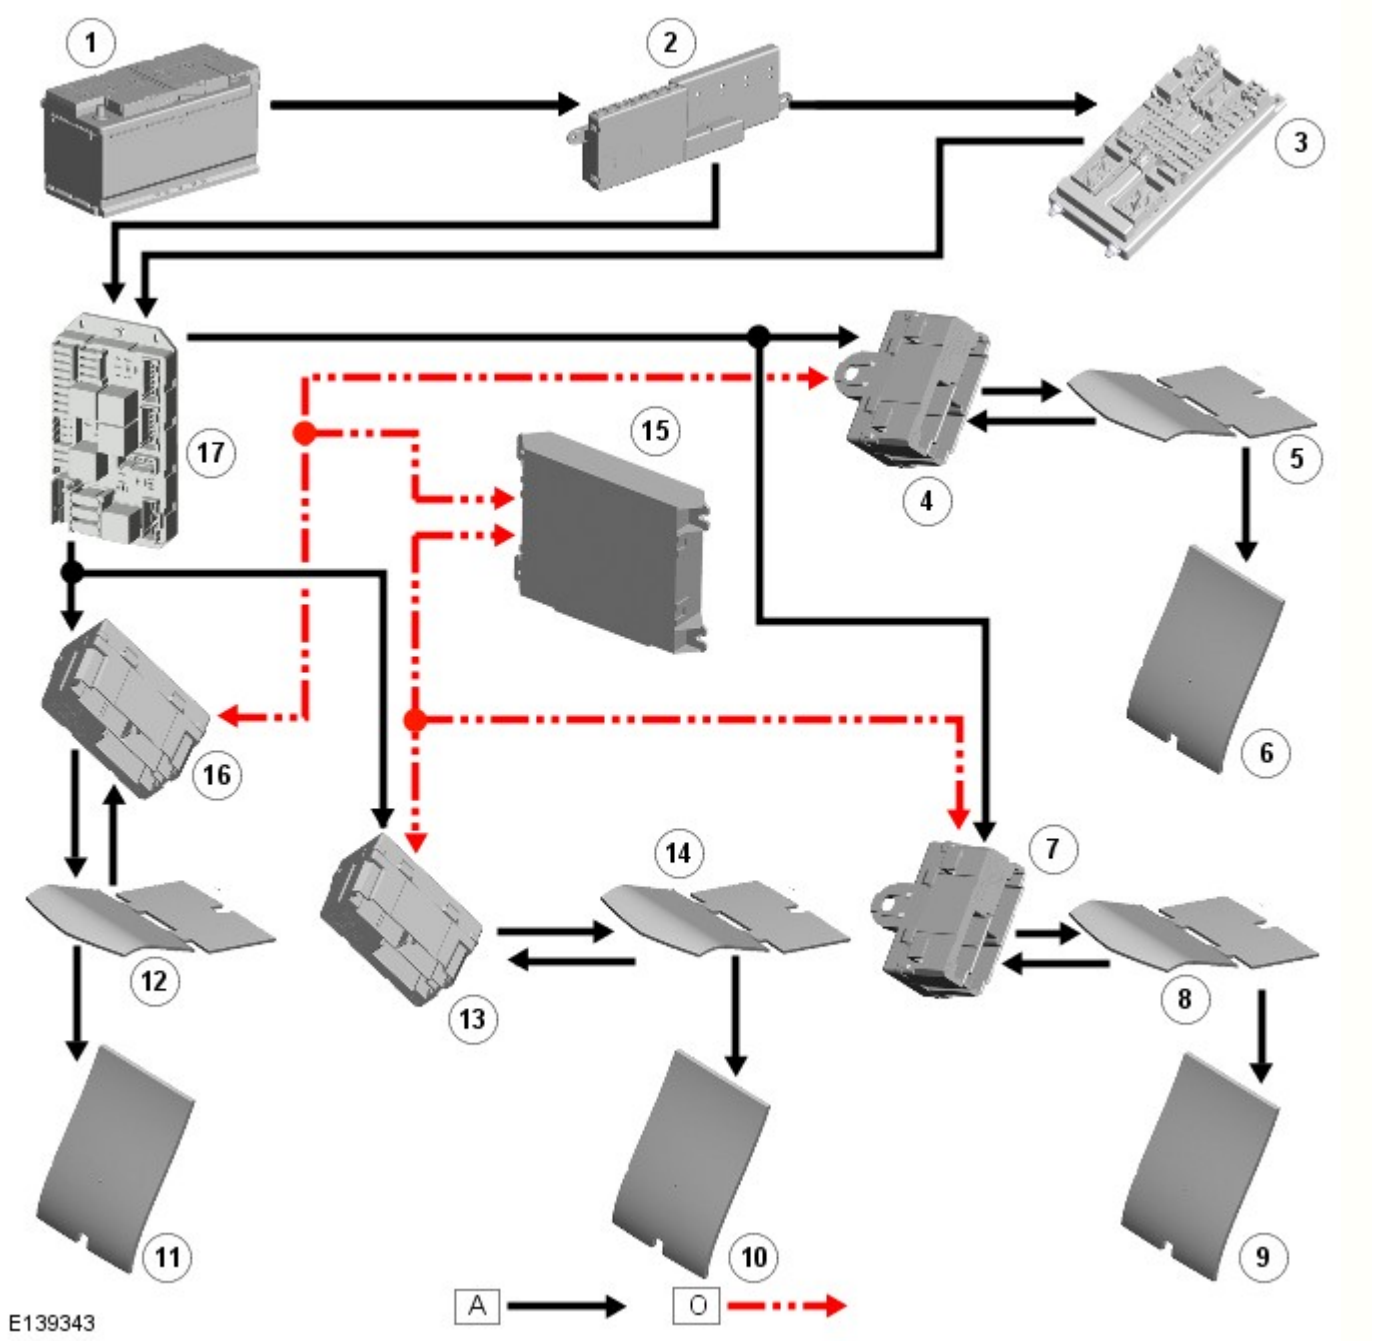
17	LH (left-hand) door module
18	RH (right-hand) door module

ADJUSTMENT - REAR SEATS



Item	Description
1	Battery
2	Battery Junction Box (BJB)
3	Central Junction Box (CJB)
4	Rear RH seat switchpack
5	RH recline motor
6	RH rear seat module
7	Medium speed CAN (controller area network) to other vehicle systems
8	LH rear seat module
9	LH recline motor
10	Rear LH seat switchpack

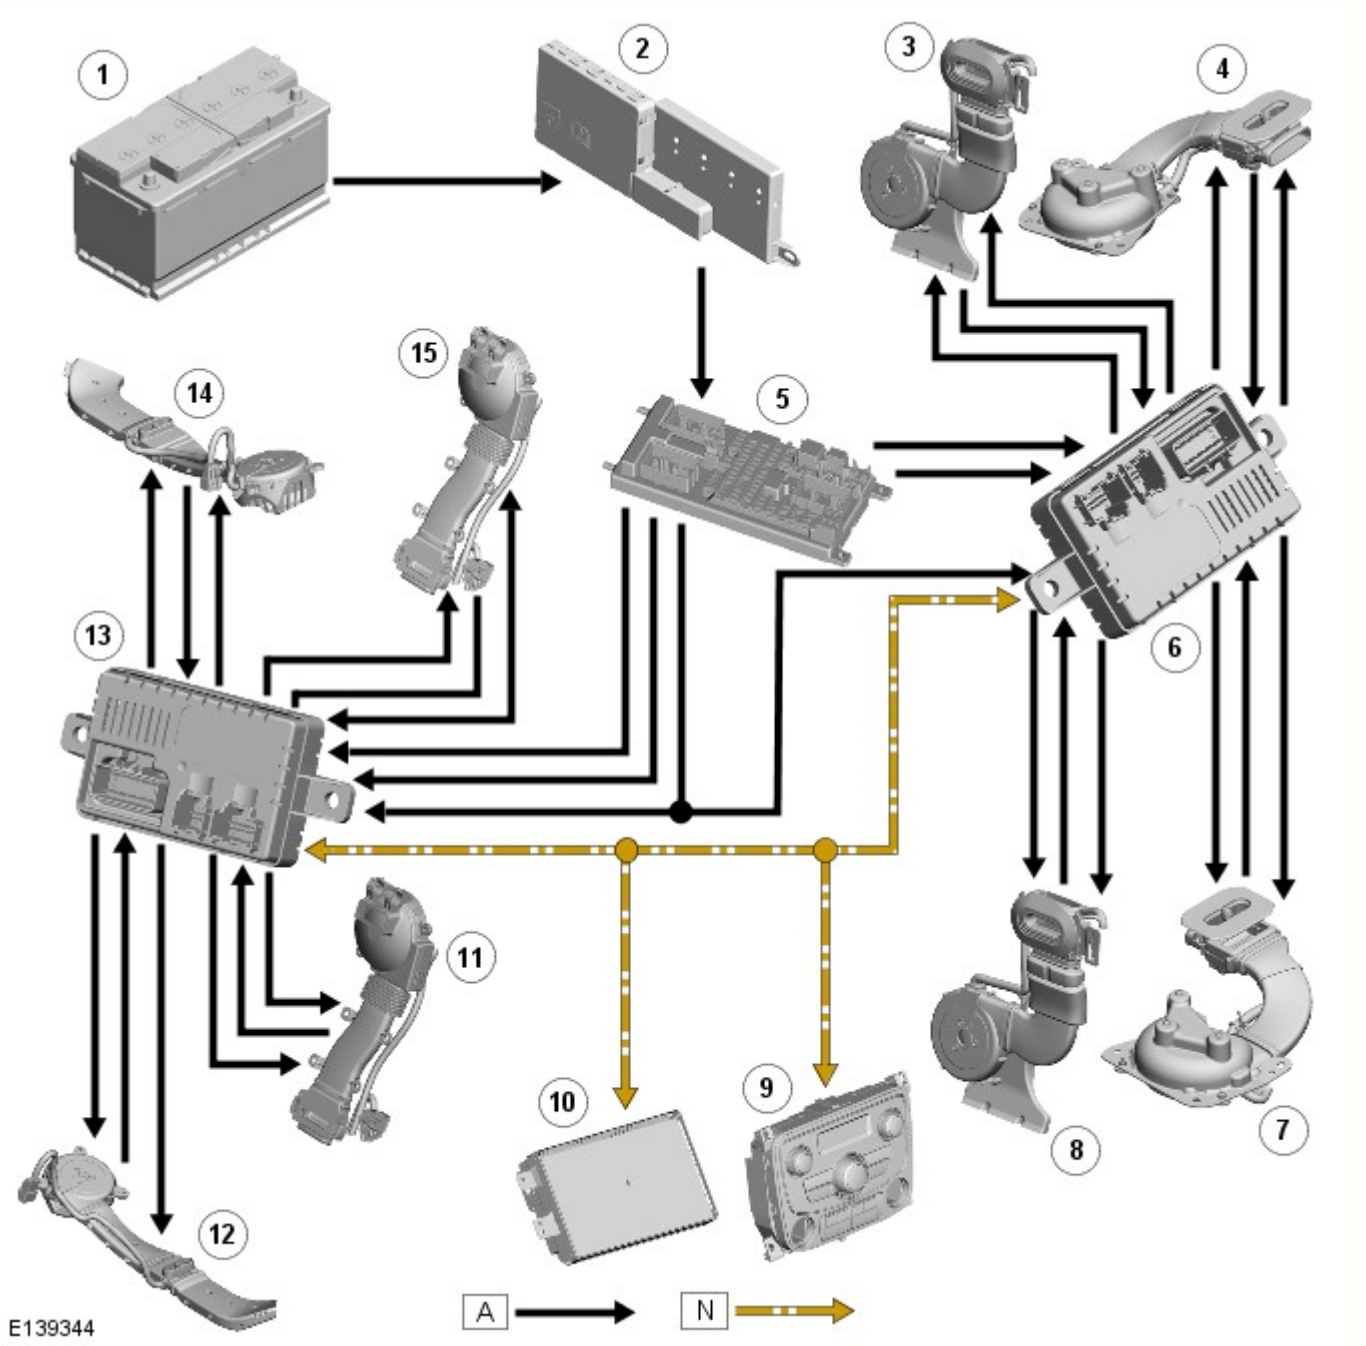
HEATED SEATS - FRONT AND REAR



Item	Description
1	Battery
2	BJB
3	CJB
4	Rear RH seat heater module
5	Rear RH cushion heater
6	Rear RH squab heater
7	Rear LH seat heater module
8	Rear LH cushion heater
9	Rear LH squab heater
10	Front LH squab heater
11	Front RH squab heater
12	Front RH cushion heater
13	Front LH seat heater module
14	Front LH cushion heater
15	ATC (automatic temperature control) module
16	Front RH seat heater module

17	RJB

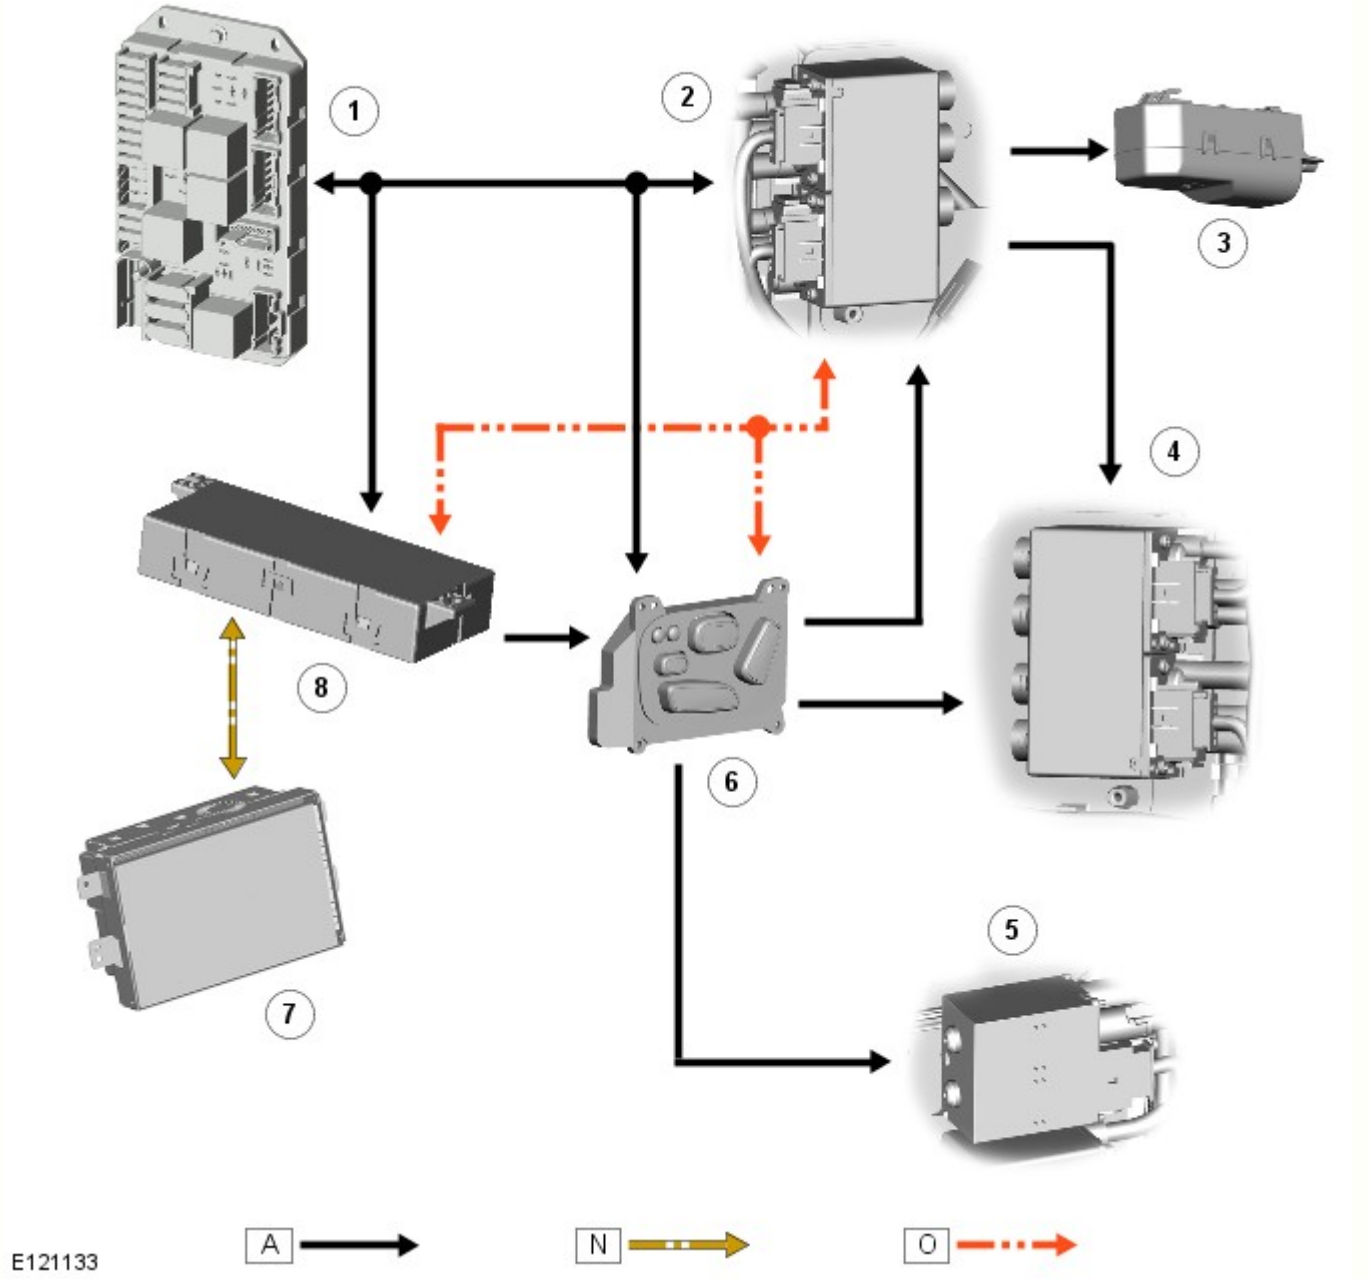
CLIMATE SEATS - FRONT AND REAR



Item	Description
1	Battery
2	BJB
3	Front RH seat squab climate module
4	Front RH seat cushion climate module
5	CJB
6	Front seat climate control module
7	Front LH seat cushion climate module
8	Front LH seat squab climate module
9	Rear climate control panel
10	Touch Screen Display (TSD)
11	Rear RH seat squab climate module
12	Rear RH seat cushion climate module
13	Rear seat climate control module

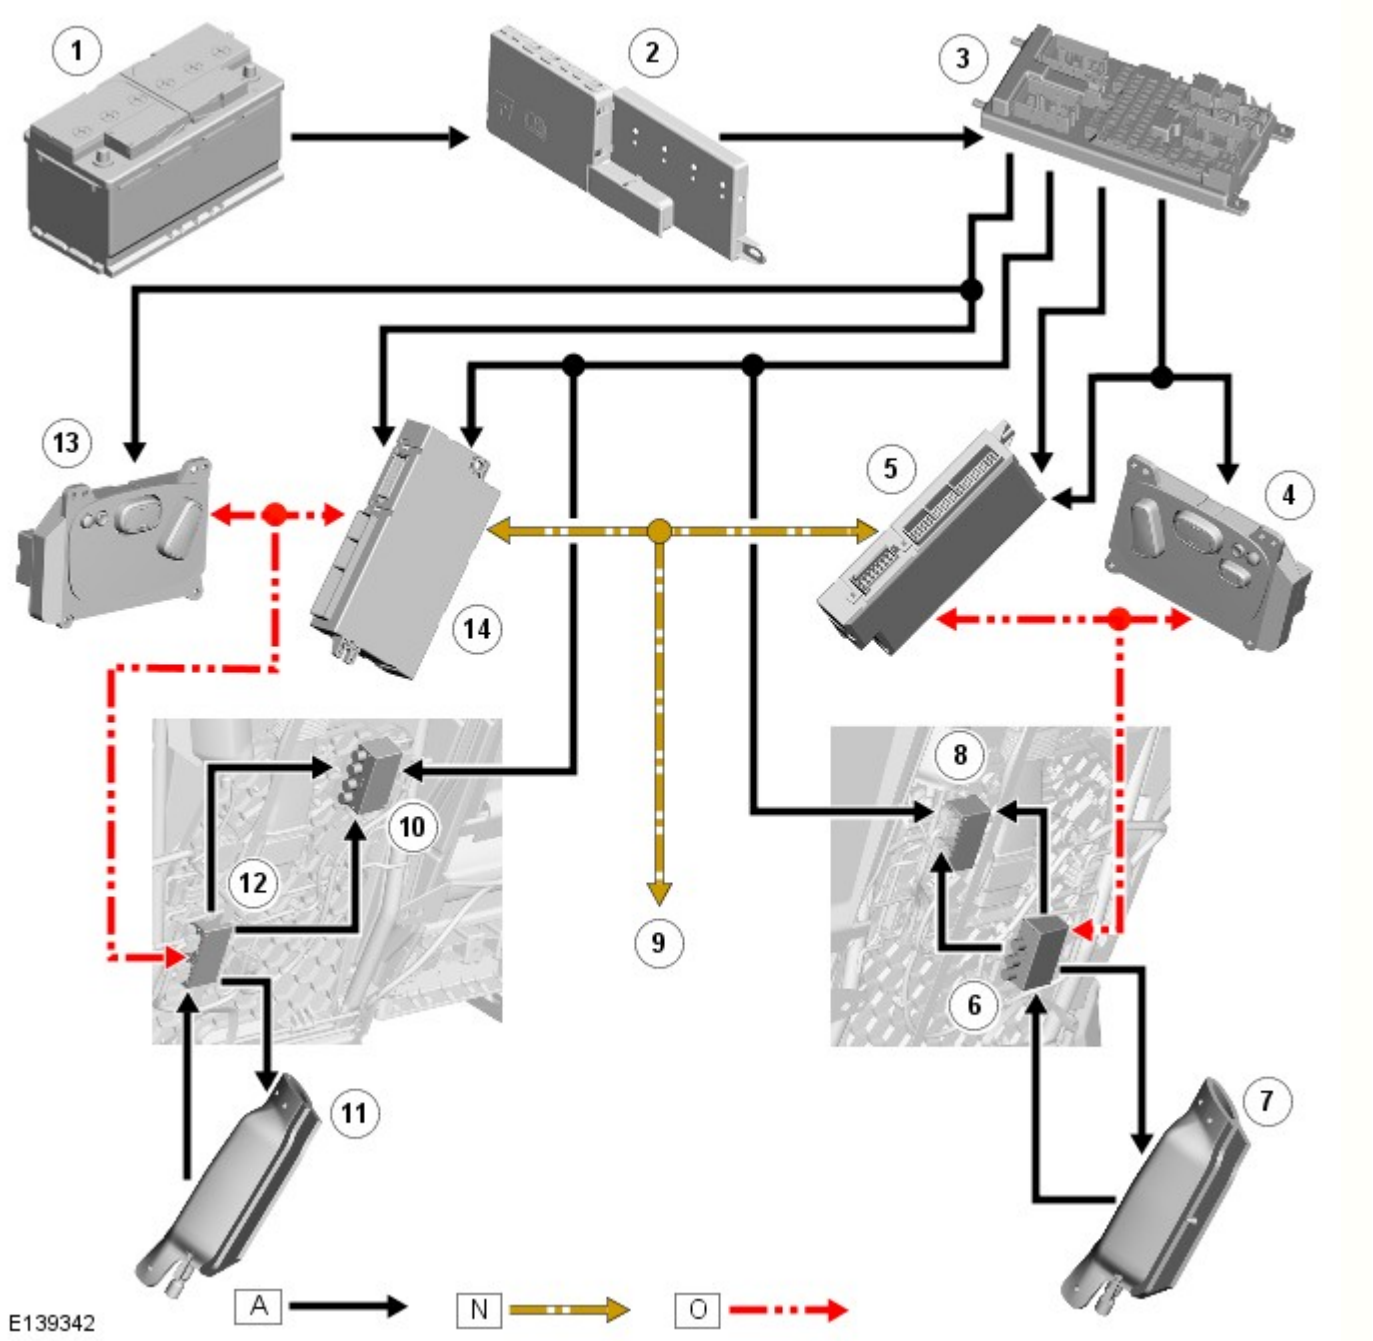
14	Rear LH seat cushion climate module
15	Rear LH seat squab climate module

SEAT MASSAGE - FRONT SEATS



Item	Description
1	RJB
2	Master massage solenoid
3	Air pump
4	Slave massage and adjustable bolster solenoid
5	Lumbar solenoid
6	Seat switch pack
7	Touch-screen
8	Seat module

SEAT MASSAGE - REAR SEATS



Item	Description
1	Battery
2	Battery Junction Box (BJB)
3	Central Junction Box (CJB)
4	Rear RH seat switch pack
5	RH rear seat module
6	RH slave massage solenoid
7	RH seat air pump
8	RH master massage solenoid
9	Medium speed CAN to other vehicle systems
10	LH master massage solenoid
11	LH seat air pump
12	LH slave massage solenoid
13	Rear LH seat switch pack
14	LH rear seat module

System Operation

PRINCIPLES OF OPERATION

FRONT SEATS

Adjustment - Non-memory Seats

On non-memory front seats, each seat switch pack receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the air pump and associated solenoid valves.

For the adjustment motors, when a switch is operated power is connected to the applicable side of the related motor and a ground is connected to the opposite side of the motor, which then runs in the required direction. To move the motor in the opposite direction the polarity is reversed.

When the lumbar inflate switch is pressed, power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

Adjustment - Memory Seats

On memory front seats, the seat module receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the seat module.

Permanent power supplies are also connected from the CJB to the memory switch pack and from the RJB to the seat switch pack.

The seat switch pack is connected to the seat module by a LIN (local interconnect network) bus for the seat adjustment switches. Any selection for seat adjustment generates a message which is passed via the LIN bus to the seat module. The seat module processes the request and operates the applicable seat motor as required using the power supplies from the CJB .

The seat module on the driver seat is also connected to the medium speed CAN bus. This allows the driver seat module to monitor the position of the door mirrors and the steering column, using signals from the door modules and CJB respectively, when storing and recalling memory settings.

The memory switch pack has two hardwired connections with the related seat switch pack. One is for the three channel switches and one is for the memory switch. Operation of the any of the memory switches is relayed from the seat switch pack to the seat module on the LIN bus.

Memory settings are stored in the seat module by pressing the memory switch and then, within 5 seconds, one of the channel switches. When the memory switch is pressed the LED (light emitting diode) in the switch comes on. After the channel switch is pressed, the LED goes off and a chime sounds to confirm that the settings have been memorized. If the ignition is on, the message center will display a confirmation message. Any previously stored settings on the selected channel will be over-written.

Memory settings are recalled by pressing the applicable channel switch. If the ignition is on, the message center will display a confirmation message.

On seats with 2-way lumbar adjustment, when the inflate switch is pressed power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

On seats with 4-way lumbar adjustment and bolster adjustment, when an inflate switch is pressed, power is simultaneously connected to the air pump and the related inflate solenoid valve. When a deflate switch is pressed, power is connected to the related deflate solenoid valve, which opens to deflate the support. On vehicles with massage seats, power is connected to the inflate and deflate solenoid valves in the same way, but when an inflate selection is made the air pump is activated by a LIN bus message to the master solenoid valve, which then operates the air pump.

Stall Detection

A seat adjustment motor is deemed to have stalled if there is no change in the input from the feedback sensor of the motor for 200 ms. If a stall condition is detected then the drive to that motor is cancelled for the remainder of the memory recall operation or until the switch is re-selected (manual movement). The motor may be activated again, to move past the stall position, by pressing the appropriate switch for more than 2 seconds. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again, when a further 0.5 second of activation is permitted. This is known as inch mode, which allows seat adjustment to be maintained if sensor feedback is lost.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the adjustment motors.

Battery Monitor

If the battery voltage drops below 10.5 V, then the driver seat module ignores all requests for a memory recall until the battery voltage has reached 11.5 V. This will conserve as much power in the vehicle battery as possible to enable engine cranking.

Massage Seats

Seat massage requests from the START / STOP buttons on the TSD are sent via the medium speed CAN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on the LIN bus connection.

When a START button is pressed, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When a STOP button is pressed, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

Anti-Whiplash System (AWS)

Depending on the weight of the occupant and the severity of the collision, the mechanisms begin to operate at a relative impact speed of between approximately 8.7 and 11.2 mph (13.9 and 17.9 km/h). At the point of a rear impact, the forward energy of the impact and the inertia of the occupant combine to push the backrest against the occupant's back. That causes the AWS mechanism to begin a controlled sequence of movements. First, while remaining in an upright position, the backrest moves rearwards by approximately 50 mm. Next, the backrest reclines through an angle dependant upon the direction and relative speed of the collision, up to a maximum of approximately 15 degrees.

The combined effect of these movements is to absorb some of the energy of the impact and reduce the relative acceleration of head and body, thereby helping to reduce the possibility of whiplash injury.

HEATED SEATS

The heater elements only operate when the engine is running. Power for the heater elements is supplied to the seat heater modules from the heated seat relay in the RJB , which is controlled by a hardwired ignition signal from the CJB .

Seat heating selections made on the TSD and the rear climate control panel are transmitted to the ATC module.
Refer to: Heating and Ventilation (412-01 Climate Control, Description and Operation).

When the ATC module receives a seat heating request, it sends a LIN bus message to the appropriate seat heater module to energize the heater elements in the cushion and the squab. The seat heater module relays the temperature signal, from the thermal sensor in the cushion heater element, back to the ATC module. The ATC module uses the temperature signal to regulate the heater elements at the selected heat setting.

CLIMATE SEATS

The heating/cooling of the climate seats only operates when the engine is running. Power for the climate modules is supplied to the climate seat control modules by two permanent power supplies from the CJB . The climate seat control modules also receive a power supply from the ignition relay in the CJB .

Heating/Cooling selections on the TSD and the rear climate control panel are transmitted to the appropriate climate seat control module on the medium speed CAN bus. The climate seat control module then energizes the Peltier cell and the blower of the climate module(s) in the appropriate seat. The climate seat control module uses the signals from the temperature sensors in the squab and the cushion climate modules to regulate the seat at the selected temperature. If full seat heating/cooling is selected, both the squab and the cushion climate modules are activated. If partial seat heating/cooling is selected, only the squab climate module is activated.

REAR SEATS

Adjustment

The rear seat adjustment is only active when the smart key is in the vehicle and the ignition is on.

Each rear seat switchpack receives a logic power supply from the CJB via fuse F47. Each switchpack is connected to its respective rear seat control module by a LIN bus connection.

Each rear seat module receives two power supplies from the CJB to operate the recline motor, the lumbar pump and the solenoids.

Operation of the rear seat switchpack switches for seat recline produces a LIN bus message to the respective rear seat control module. The seat control module then provides a power supply to the applicable seat recline motor. Each recline motor has a Hall effect sensor to determine the position of the seat.

A seat recline motor is deemed to have stalled if there is no change in the input from the Hall sensor of the motor for 200 ms. If a stall condition is detected then the power supply to the motor is removed until the switch is re-selected. The motor may be activated again. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If Hall sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the recline motors.

Massage Seats

Seat massage requests from the seat switchpack are passed on a LIN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on a LIN bus connection.

When the ON button is pressed on the seat switchpack, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When the OFF button is pressed on the seat switchpack, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

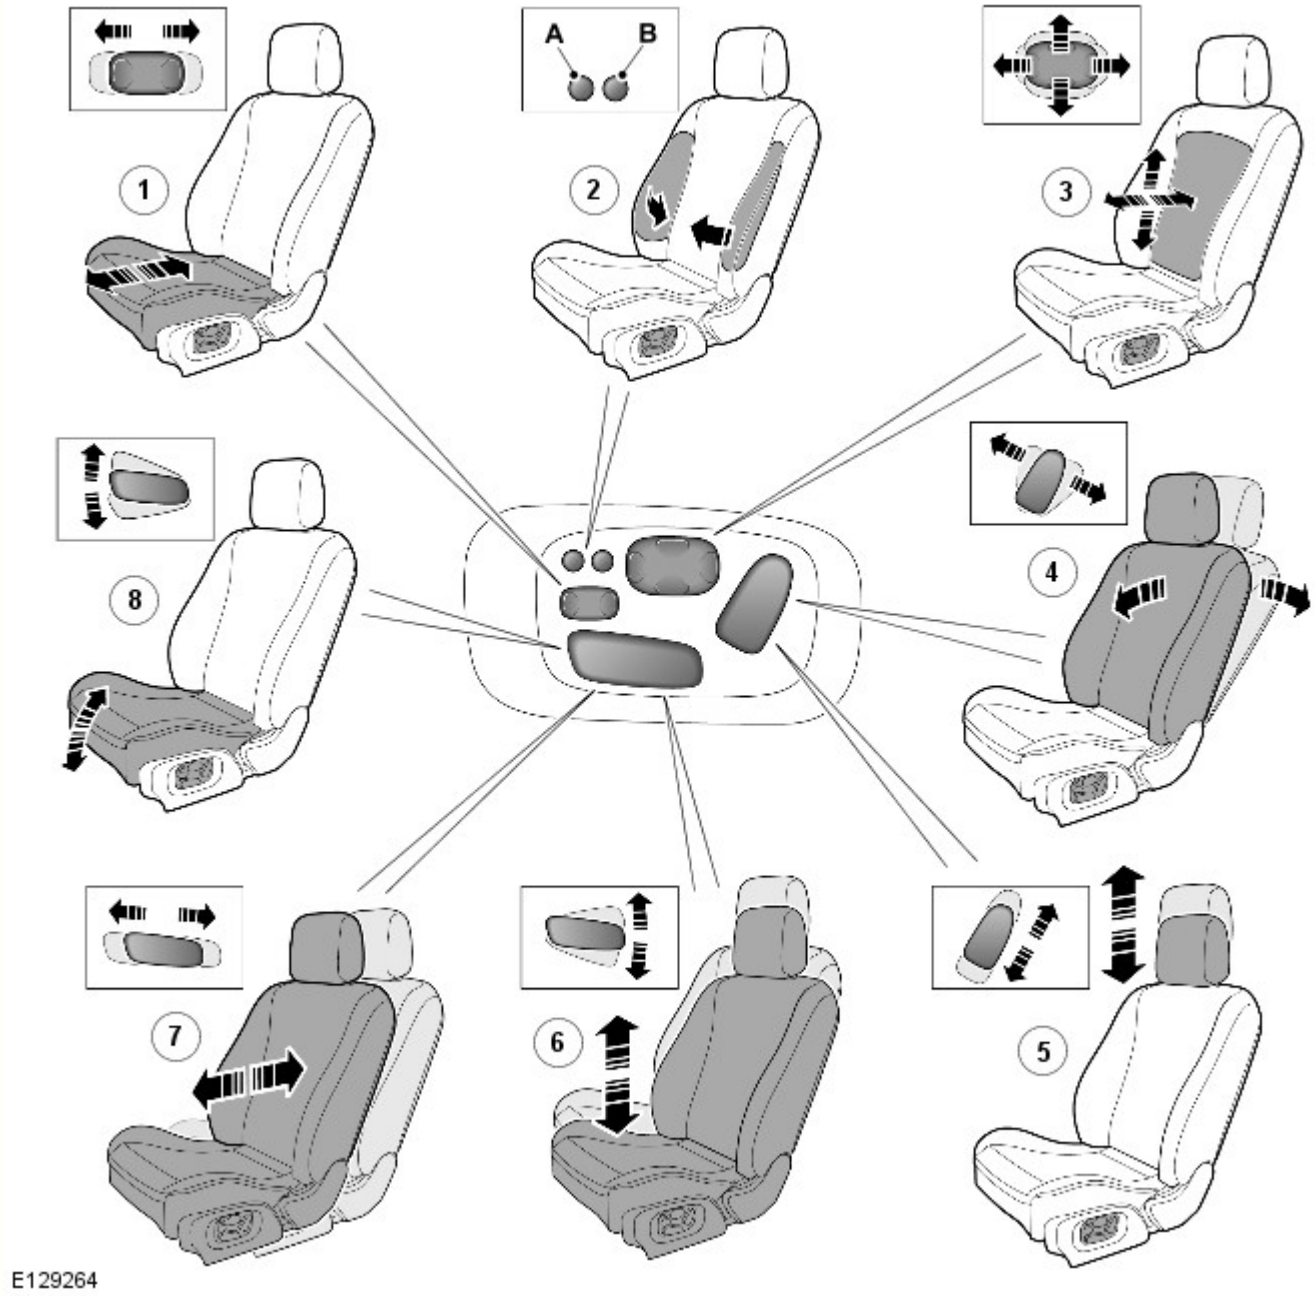
Component Description

FRONT SEATS ADJUSTMENT

Electric motors are used to provide adjustment of seat slide, seat height, squab recline and, where fitted, cushion tilt, head restraint and cushion extension. An air pump and inflatable cushions are used to provide adjustment of the lumbar support and the squab bolster supports (where fitted).

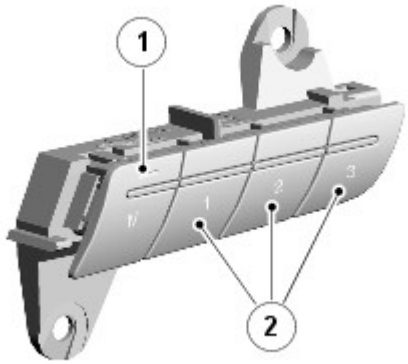
All of the seat adjustments are controlled from the seat switch pack on the outside of the seat cushion. On non memory seats, the control switches are connected directly to the adjustment motors. On memory seats, the switches are connected to the adjustment motors via a seat control module. Memory seats also have a memory switch pack in the related door panel.

Adjustment Switches



Item	Description
1	Cushion extension
2A	Bolster inflate
2B	Bolster deflate
3	Lumbar support (4-way shown; 2-way uses only fore/aft positions for inflate/deflate)
4	Squab recline
5	Head restraint
6	Seat height
7	Seat slide
8	Cushion tilt

Memory Switch Pack



Item	Description
1	Channel switches
2	Memory switch

Seat Motors

Each adjustment motor contains a Hall position sensor. The sensors provide position feedback signals which, on seats with a memory function, are used for memory store and recall operation.

The seat slide motor is an integral component of the cushion frame. The motor drives a gear on a worm drive lead screw, which is integral with the floor rail. The lead screw has a stop at each end to limit the fore and aft seat movement.

The seat height motor is located below the seat. The motor drives a gear on a lead screw. The lead screw moves a lever mechanism, which raises or lowers the seat cushion.

The squab recline motor is located in the squab frame. The recline motor rotates a shaft connected to the squab frame, which changes the angle of the squab.

The tilt motor is located below the seat. The tilt motor drives a gear on a lead screw to raise the front of the seat cushion.

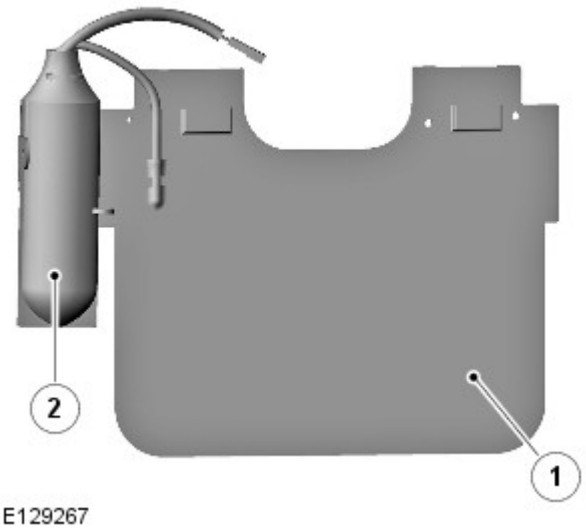
The head restraint motor is located in the upper section of the squab frame and is accessible by removal of the seat back. The motor moves a cradle by a rack and pinion arrangement. The cradle has two head restraint stems, which raise and lower the head restraint as the motor moves the cradle.

The cushion extend motor is located below the seat. The motor drives a gear on a lead screw, which extends or retracts the front of the seat cushion.

Lumbar Adjustment

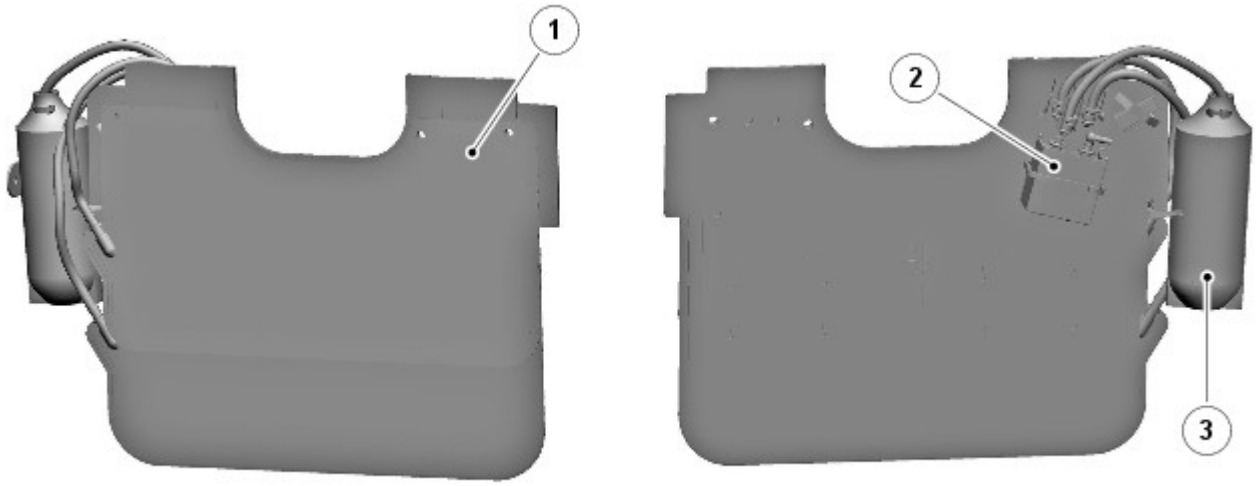
Lumbar adjustment is provided by a lumbar support and air pump installed in the squab. The lumbar support consists of an inflatable cushion with either a single air cell (2-way lumbar support) or dual air cells (4-way lumbar support), depending on vehicle specification. On vehicles with massage seats, the dual cell lumbar support is operated by the air pump of the massage system.

2-way Lumbar Support



Item	Description
1	Lumbar support
2	Air pump

4-way Lumbar Support



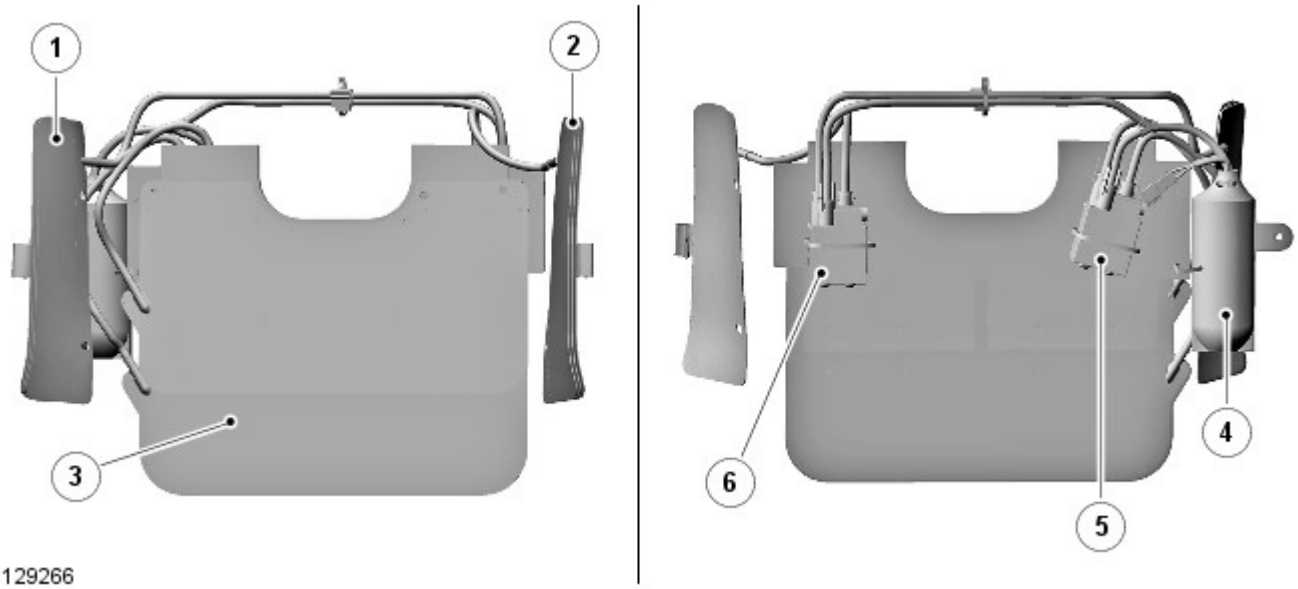
E129268

Item	Description
1	Lumbar support
2	Solenoid valves
3	Air pump

Squab Bolster Adjustment

Squab bolster adjustment is provided by inflatable cushions on the inside faces of the squab bolsters. The inflatable cushions are operated simultaneously by a solenoid valve block and the air pump of the lumbar support or the massage seat system. On vehicles with massage seats, the squab bolster solenoid valves are incorporated into the valve block containing the slave massage solenoid valves.

Squab and Lumbar Support



E129266

Item	Description
1	RH squab bolster support
2	LH squab bolster support
3	4-way lumbar support

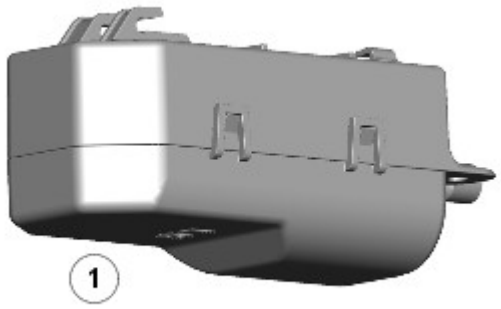
4	Air pump
5	Lumbar support solenoid valves
6	Squab support solenoid valves

MASSAGE FRONT SEATS

Where fitted, the massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar and squab bolster supports. The slave solenoid block also incorporates the solenoid valves used to control the squab bolster supports.

Operation of the massage system is controlled with START and STOP buttons on the climate menu of the TSD and is independent of the lumbar and squab bolster adjustments.

Air Pump



E121128

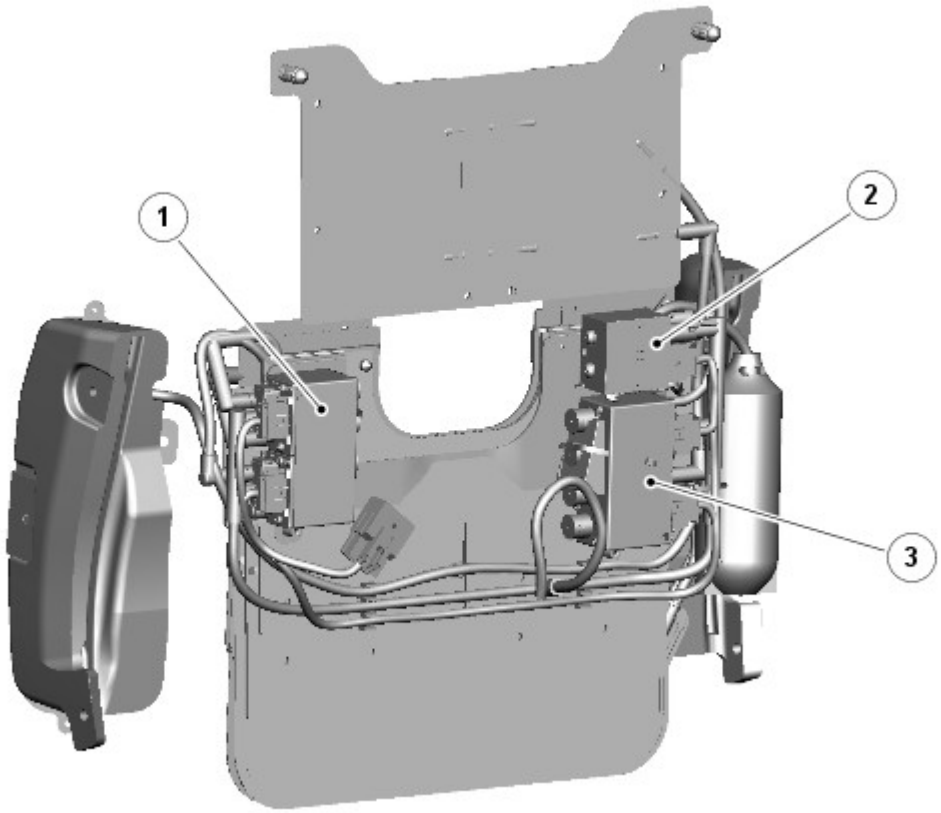
Item	Description
1	Air pump

The air pump is located underneath the seat at the rear of the squab. The pump is housed inside a NVH (noise, vibration and harshness) casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the lumbar solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in ^{2} .).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves

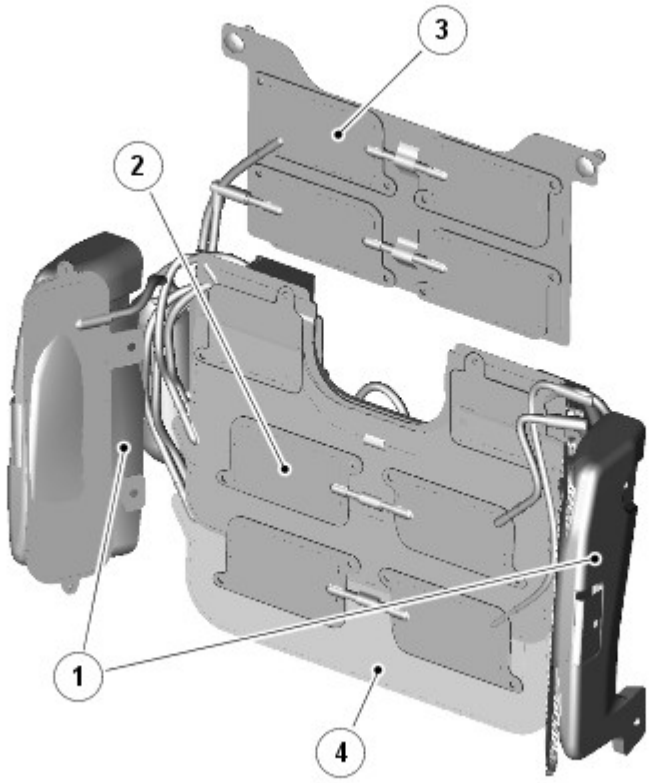


E121129

Item	Description
1	Master massage solenoid valves
2	Lumbar solenoid valves
3	Slave massage and adjustable bolster solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

Air Cell Pads



E121130

Item	Description
1	Squab bolster cells (2 off)
2	Lower massage cells (3 pairs)
3	Upper massage cells (2 pairs)
4	Lumber cells (2 off)

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in ^{2} .). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

HEATED FRONT AND REAR SEATS

Heated seats incorporate heater elements in the cushion and the squab of the seat. Power to the heater elements of the front seats is controlled by two seat heater modules attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Power to the heater elements of the two outside rear seats is controlled by two seat heater modules attached to a bracket on the back of the rear seat squab.

Each cushion heater element has a thermal sensor, which supplies a feedback temperature signal to the related seat heater module. The squab heater elements do not have a thermal sensor, and are regulated at the same temperature as the cushion heater elements.

Seat heating for the front and rear seats can be selected on the climate menu of the TSD. Seat heating for the rear seats can also be selected on the rear climate control panel. Three levels of heating are available. Heating can also be selected for either the cushion and the squab or just the squab.

CLIMATE FRONT AND REAR SEATS

Climate seats incorporate climate modules in the cushion and the squab of the seat. Operation of the climate modules of the front seats is controlled by a climate seat control module attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Operation of the climate modules of the two outside rear seats is controlled by a climate seat control module attached to the body, behind the of the rear seat squab.

The climate modules contain Peltier cells, which heat up or cool down depending on the voltage provided by the climate seat control module. Each climate module also contains a blower, which blows air over the Peltier cell to distribute the heated or cooled air through liners in the related cushion or squab. The blower is also controlled by the climate seat control module.

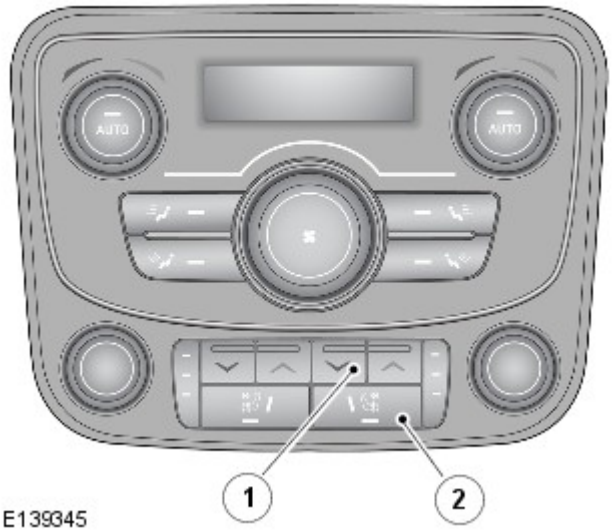
Seat heating and cooling for the front and rear seats can be selected on the climate menu of the TSD. Seat heating and cooling for the rear seats can also be selected on the rear climate control panel. Three levels of heating and three levels of cooling are available. Heating and cooling can also be selected for either the cushion and the squab, or just the squab.

Touch Screen Display

E129269

Item	Description
1	Temperature control buttons
2	Zone control button
3	Massage control buttons

Rear Climate Control Panel



E139345

Item	Description
1	Temperature control switch
2	Zone control switch

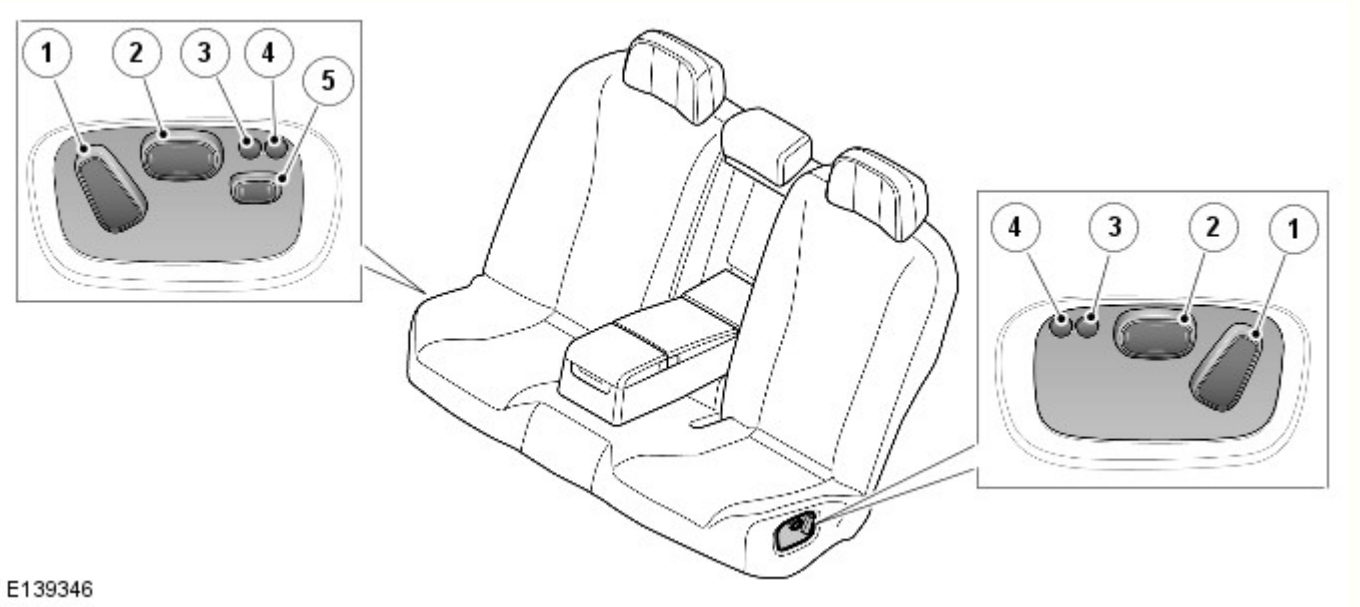
REAR SEATS ADJUSTMENT

An electric recline motor is used to provide adjustment of seat squab recline. An air pump and inflatable cushions are used to provide adjustment of the lumbar support.

All of the seat adjustments are controlled from the seat switchpack on the outside of the seat cushion. The control switches are connected via a LIN bus to the seat control module to the adjustment motors via a seat control module.

Rear seat switchpack functions are disabled if the rear window isolation switch has been activated.

Adjustment Switches (LHD (left-hand drive) version shown



Item	Description
1	Seat squab recline control
2	Lumbar support adjustment
3	Massage OFF
4	Massage ON
5	Front passenger seat away - forward or rearward adjustment

The rear seat control switchpack on the passenger side of the vehicle also has a front passenger seat away switch. This switch when pressed will move the front passenger seat forwards or backwards to allow more room for the rear seat passenger on that side. A second switch for this function is located on the inside face of the front passenger seat back to allow the driver to operate the function.

Front Passenger Seat Away Switch

E139347

The front passenger seat way function allows the driver to adjust the position of the front passenger seat using a switch located on the passenger seat bolster.

The two-way rocker switch allows the driver to move the front passenger seat forward or rearwards to adjust leg room for the rear seat passenger.

The rear seat adjustment switchpack for the rear seat behind the front passenger seat, has an additional two-way switch to move the front passenger seat forwards or rearwards, allowing the passenger to adjust the available leg room.

MASSAGE REAR SEATS

Where fitted, the rear seat massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar supports.

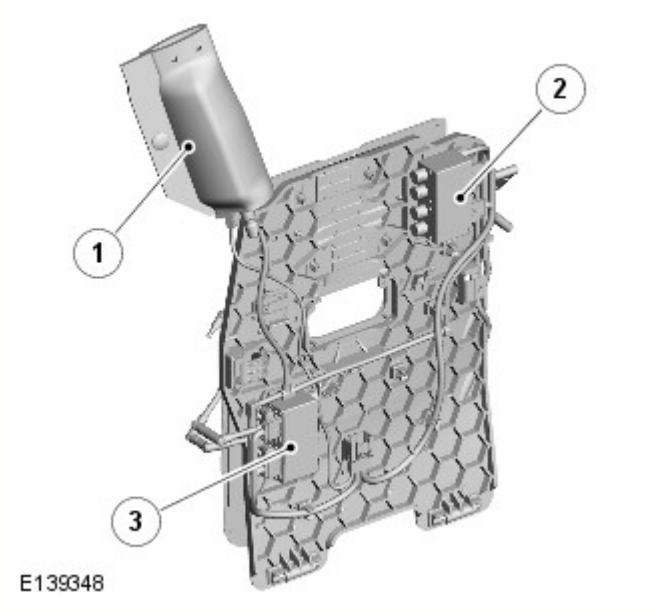
Operation of the massage system is controlled with START and STOP buttons on the rear seat adjustment switches.

The air pump is located at the rear of the squab. The pump is housed inside a NVH casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the slave solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in2.).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves



Item	Description
1	Air pump
2	Slave massage solenoid valves
3	Master massage solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in2.). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

Seating - Seats - Overview

Description and Operation

OVERVIEW

Leather Seat Covers

Leather is a natural product, therefore it bears natural characteristics, such as grain variations, growth & bush marks. These non-weakening marks show the true nature of the hide and are the hallmarks of Leather. In order to maintain the beauty of the vehicles natural Leather upholstery it requires regular cleaning, which if neglected, may cause deterioration. Where dust and dirt are allowed to accumulate and become ingrained in the surface of the Leather, the upholstery may become permanently damaged.

Light coloured upholstery can be particularly susceptible to soiling and staining and care should be taken to ensure that where there is evidence of any soiling or staining on the upholstery then this should be cleaned immediately using the Jaguar/Land Rover approved products, failure to do this could lead to the stain becoming permanent, this applies to all leather upholstery and is not colour specific.

Leather trimmed seats will naturally exhibit areas of creasing and wrinkling over a period of time and is a normal characteristic as the Leather ages.

Particular care should be taken where there is evidence of soiling or staining on the leather, this should be cleaned immediately. Failure to do this could lead to the stain becoming permanent.

Particular care should be taken to prevent damage from studs, zips and buckles.

NOTES:

Please refer to Leather care label attached to seats for more information.

Creasing and wrinkling does not represent a manufacturing defect.

Damage from studs, zips and buckles do not represent manufacturing defects.

Use only Jaguar/Land Rover approved products in accordance with the instructions for use.

Front Seats

Various options are available for the front seats with regard to temperature control and electrical adjustment. Seats are non-heated, heated or heated and cooled (climate), with the following adjustment options:

- 10-way adjustment on the driver seat and 8-way adjustment on the passenger seat.
- 16-way adjustment on the driver seat and 12-way adjustment on the passenger seat.
- 18-way adjustment on the driver and passenger seats.

8-way adjustments consist of seat slide, seat height, squab recline and 2-way lumbar adjustment. 10-way adjustment adds cushion tilt. 12-way adjustment adds head restraint. 16-way adjustment adds cushion extension and replaces 2-way lumbar adjustment with 4-way. 18-way adjustment adds squab bolster adjustment. The controls for seat adjustment are installed in the outboard side shield of the related seat cushion.

The driver seat on all options has a 3-channel memory for easy recall of stored position settings for the seat, steering column and door mirrors. Passenger seats with 18-way adjustment also have a 3-channel memory. The controls for memory operation are in the related front door casing. Lumbar and squab bolster settings are not included in the memory function.

Some climate seats with 18-way adjustment also incorporate a massage function. The massage function is produced using additional lumbar cells. Operation of the massage function is controlled from the Climate / Front Climate / Front Seats menu of the Touch Screen Display (TSD).

Operation of the temperature settings for heated and climate seats is controlled from the Climate / Front Climate / Front Seats menu of the TSD.

Both front seats incorporate an Anti-Whiplash System (AWS) consisting of active, energy absorbent backrest mechanisms. Together with correctly positioned head rests, the AWS helps reduce the likelihood of neck and spinal injury in the event of a rear impact. In a low speed rear impact, AWS automatically moves and reclines the backrest by a small amount, to change the posture of the seat occupant and reduce the relative front to rear motion between body and head.

A map pocket is installed on the rear of each front seat squab. Depending on trim level, some vehicles also have a folding tray attached to the rear of the squabs.

Rear Seats

The following options are available for the two outer rear seats:

- Non-heated seats.
- Heated seats.
- Climate seats
- Recline function
- Front passenger seat away function
- Massage seats.

Operation of the temperature settings for heated and climate seats is controlled from the rear climate control panel and/or the Climate / Rear Climate / Rear Seats menu of the TSD.

ISOFIX fastening points are attached to the vehicle floor to provide secure fastening for compatible child seats in the rear seats.

From 12MY rear seat recline, massage and front passenger seat away functions are introduced. The functions are controlled by a switch pack on each end of the rear seat cushion and an additional seat control module for each seat. A chauffeur switch is fitted to the front passenger seat to allow the front passenger seat away function to be operated by the driver.

Seating - Seats Vehicles With: Lumbar/Massage

Diagnosis and Testing

Principles of Operation

For a detailed description of the Seating system, refer to the relevant Description and Operation section in the workshop manual.REFER to: (501-10 Seating)

Seats (Description and Operation),
Seats (Description and Operation),
Seats (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern

2. Visually inspect for obvious signs of damage and system integrity

Visual Inspection

Mechanical	Electrical
• Lumbar/massage air pump(s) • Upper massage cells • Lower massage cells • Seat massage air hoses	• Fuses • Wiring harnesses and connectors • Driver seat module • Passenger seat module • Rear left seat module • Rear right seat module • Touch screen • LIN bus • Massage switchpack(s) • Lumbar/massage air pump(s) • Lumbar/massage solenoid(s) • Massage master solenoid(s) • Massage slave solenoid(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index

5. Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required

Symptom Charts

2-Way Lumbar - Non-memory Front Seats

Symptom	Possible Causes	Action
All seat functions inoperative	• Seat switchpack power or ground circuit open circuit, high resistance • Seat switchpack internal failure	• GO to Pinpoint Test A.
	• Seat switchpack internal failure	

Lumbar inflate inoperative	• Lumbar air pump circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	• GO to Pinpoint Test B.
Lumbar deflate inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked	• GO to Pinpoint Test C.

4-Way Lumbar and Bolster - Non-memory Front Seats

Symptom	Possible Causes	Action
All seat functions inoperative	• Seat switchpack power or ground circuit open circuit, high resistance • Seat switchpack internal failure	• GO to Pinpoint Test A.
Lumbar forward/up/down AND bolster inflate inoperative	• Seat switchpack internal failure • Lumbar air pump circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Relief valve stuck open	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test D.
Lumbar forward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test E.
Lumbar rearward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test F.
Lumbar up inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test G.
Lumbar down inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test H.
	• Seat switchpack internal failure	

Bolster inflate inoperative	• Lumbar air pump circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hoses blocked/leaking • Air cells leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test I.
Bolster deflate inoperative	• Seat switchpack internal failure • Bolster solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hoses blocked	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test J.

4-Way Lumbar and Bolster - Memory Front Seats

Symptom	Possible Causes	Action
All seat functions inoperative	• Seat system fault • Seat switchpack power or ground circuit open circuit, high resistance • Seat switchpack internal failure	• GO to Pinpoint Test A.
Lumbar forward/up/down AND bolster inflate inoperative	• Seat switchpack internal failure • Lumbar air pump circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Relief valve stuck open	NOTES: Lumbar/massage air pump operation will be inhibited if the motor temperature exceeds 72±4°C (162±7°F). The lumbar/massage air pump will not re-start until 10 minutes after the temperature has decreased below the cut-off temperature. This condition is not a fault. The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test D.
Lumbar forward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test E.
Lumbar rearward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test F.
Lumbar up inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test G.

Lumbar down inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test H.
Bolster inflate inoperative	• Seat switchpack internal failure • Lumbar air pump circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hoses blocked/leaking • Air cells leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test K.
Bolster deflate inoperative	• Seat switchpack internal failure • Bolster solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hoses blocked	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test L.

4-Way Lumbar - Rear Seats

Symptom	Possible Causes	Action
All seat functions inoperative	• Seat system fault • Seat switchpack power or ground circuit open circuit, high resistance • Seat switchpack internal failure	• Using the manufacturer approved diagnostic system, check the rear left/right seat module for related DTCs and refer to the relevant DTC index
Lumbar forward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • Using the manufacturer approved diagnostic system, check the rear left/right seat module for related DTCs and refer to the relevant DTC index
Lumbar rearward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • Using the manufacturer approved diagnostic system, check the rear left/right seat module for related DTCs and refer to the relevant DTC index
Lumbar up inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • Using the manufacturer approved diagnostic system, check the rear left/right seat module for related DTCs and refer to the relevant DTC index

Lumbar down inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • Using the manufacturer approved diagnostic system, check the rear left/right seat module for related DTCs and refer to the relevant DTC index

4-Way Lumbar, Bolster and Massage - Front Seats

Symptom	Possible Causes	Action
All seat functions inoperative	• Seat system fault • Seat switchpack power or ground circuit open circuit, high resistance • Seat switchpack internal failure	• GO to Pinpoint Test A.
Lumbar forward/up/down AND bolster inflate AND massage functions inoperative	• Seat switchpack internal failure • Master massage solenoid power or ground circuit open circuit, high resistance • Lumbar air pump circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Relief valve stuck open	NOTES: Lumbar/massage air pump operation will be inhibited if the motor temperature exceeds 72±4°C (162±7°F). The lumbar/massage air pump will not re-start until 10 minutes after the temperature has decreased below the cut-off temperature. This condition is not a fault. The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • Using the manufacturer approved diagnostic system, perform routine - On Demand Self Test. Check the relevant seat module for related DTCs and refer to the relevant DTC index
Lumbar forward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test E.
Lumbar rearward inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test F.
Lumbar up inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test G.

Lumbar down inoperative	• Seat switchpack internal failure • Lumbar solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hose blocked • Air hose leaking • Air cell leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test H.
Bolster inflate inoperative	• Seat switchpack internal failure • Lumbar air pump circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hoses blocked/leaking • Air cells leaking	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test K.
Bolster deflate inoperative	• Seat switchpack internal failure • Bolster solenoid circuit short circuit to ground, short circuit to power, open circuit, high resistance • Air hoses blocked	NOTE: The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test L.
Seat massage functions inoperative (all seats)	• Incorrect power mode • Vehicle interior temperature too high/low	NOTE: The engine must be running and the vehicle interior temperature must be between 0°C (32°F) and 50°C (122°F) for the seat massage functions to operate. • Start the engine and retest • Cool or warm the vehicle interior as necessary and retest
Seat massage functions inoperative (one seat only)	• Lumbar/massage air pump thermal protection active • LIN bus • Massage master solenoid • Massage slave solenoid • Air hose blocked • Air hose leaking • Air cell leaking	NOTES: Lumbar/massage air pump operation will be inhibited if the motor temperature exceeds 72±4°C (162±7°F). The lumbar/massage air pump will not re-start until 10 minutes after the temperature has decreased below the cut-off temperature. The Lumbar/Massage solenoid block is fitted with an air exhaust valve that is designed to expel air under operating conditions. This is not an air leak and does not represent a solenoid block failure. • GO to Pinpoint Test M.
Seat massage functions will not operate indefinitely	• Massage seat functions cease when the timed cycle is complete	NOTE: The seat massage cycle lasts approximately 10 minutes. • Operate the massage seat switches again to repeat the cycle
Seat massage uncommanded operation	• Auto massage function active	NOTE: The auto massage function allows seat massage to commence automatically after a preset time (5, 15, 30 or 60 minutes). • Set the auto massage function to off as necessary

On Demand Self Test (ODST)

The On Demand Self Test (ODST) is performed using the manufacturer approved diagnostic system as follows:

1. Begin a Diagnostic session
2. Select 'Body'
3. Select 'Seating'
4. Select the relevant seat
5. Run the On Demand Self Test (ODST) application

DTC Index

For a complete list of all diagnostic trouble codes that could be logged on this vehicle, please refer to Section 100-00. REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Driver/Passenger Seat Module (DSM/PSM) (100-00 General Information, Description and Operation).

Pinpoint Tests

PINPOINT TEST A : SEAT SWITCHPACK TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: SEAT SWITCHPACK TEST 1	
	1 Check the specification of the seat
	Are there memory functions for the seat? **Yes** GO to A2 . **No** GO to A3 .
A2: SEAT SWITCHPACK TEST 2	
	NOTE: Some DTCs can only be set if the fault is detected during the On Demand Self Test routine.
	1 Using the manufacturer approved diagnostic system, perform routine - On Demand Self Test
	2 Using the manufacturer approved diagnostic system, check the relevant seat module for related DTCs and refer to the relevant DTC index
	Are any relevant DTCs set? **Yes** Perform the relevant corrective action **No** GO to A3 .
A3: SEAT SWITCHPACK TEST 3	
	NOTE: Perform this test at every power circuit terminal in the seat switchpack connector.
	1 Set a multimeter to measure voltage
	2 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 3 Refer to the relevant section of the workshop manual and remove the seat switchpack
	4 Set the ignition to on
	NOTE: Circuit reference - VBATT / GND - 5 Connect the multimeter across the seat switchpack power terminal and the ground terminal
	Is the measured voltage less than battery voltage? **Yes** GO to A4 . **No** Install a new seat switchpack
A4: SEAT SWITCHPACK TEST 4	
	NOTE: Circuit reference - GND - 1 Connect the multimeter to the seat switchpack ground terminal and battery negative
	Is the measured voltage greater than 0V? **Yes** Refer to the electrical circuit diagrams and check seat switchpack ground circuit for open circuit, high resistance. Repair the harness as necessary **No**

	Refer to the electrical circuit diagrams and check seat switchpack power circuit for open circuit, high resistance. Repair the harness as necessary

PINPOINT TEST B : 2-WAY LUMBAR INFLATE TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: 2-WAY LUMBAR INFLATE TEST 1	
	1 Set the ignition to on
	2 Operate the seat switchpack lumbar inflate switch
	3 Listen for the lumbar air pump operating
	Was the lumber air pump operation audible? **Yes** GO to B2 . **No** GO to B3 .
B2: 2-WAY LUMBAR INFLATE TEST 2	
	NOTE: The battery support unit must be connected during this test to ensure that the power supply is stable.
	NOTES: Circuit reference - VBATT - The 2-way lumbar inflate circuit current specification is 1.05A ± 10%. 1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack lumbar inflate switch
	Is the measured current within specification? **Yes** Check the lumbar air cell hose for leaks/blockages **No** Refer to the electrical circuit diagrams and check the lumbar air pump / lumbar inflate solenoid circuit for open circuit, high resistance
B3: 2-WAY LUMBAR INFLATE TEST 3	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - LUMBAR PUMP / GND - 4 Connect the multimeter across the seat switchpack lumbar pump terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack lumbar inflate switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the lumbar air pump / lumbar inflate solenoid circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST C : 2-WAY LUMBAR DEFLATE TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: 2-WAY LUMBAR DEFLATE TEST 1	
	NOTE: The battery support unit must be connected during this test to ensure that the power supply is stable.
	NOTES: Circuit reference - VBATT -

	The 2-way lumbar deflate circuit current specification is 0.50A ± 10%. 1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack lumbar deflate switch
	Is the measured current less than specification? **Yes** GO to C2 . **No** Check the lumbar air cell hoses for blockages
C2: 2-WAY LUMBAR DEFLATE TEST 2	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - LUMBAR DEFLATE / GND - 4 Connect the multimeter across the seat switchpack lumbar deflate terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack lumbar deflate switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the lumbar deflate solenoid circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST D : 4-WAY LUMBAR AND BOLSTER INFLATE TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
D1: 4-WAY LUMBAR AND BOLSTER INFLATE TEST 1	
	1 Set the ignition to on
	2 Operate the seat switchpack lumbar forward switch
	3 Listen for the lumbar air pump operating
	Was the lumber air pump operation audible? **Yes** GO to D2 . **No** GO to D3 .
D2: 4-WAY LUMBAR AND BOLSTER INFLATE TEST 2	
NOTE: The battery support unit must be connected during this test to ensure that the power supply is stable.	
	NOTES: Circuit reference - VBATT - The 4-way lumbar forward circuit current specification is 1.55A ± 10%. 1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack lumbar forward switch
	Is the measured current greater than specification? **Yes** Check the lumbar air pump hose for blockages **No** Check the lumbar air pump hoses for leaks
D3: 4-WAY LUMBAR AND BOLSTER INFLATE TEST 3	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack

	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - LUMBAR PUMP / GND - 4 Connect the multimeter across the seat switchpack lumbar pump terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack lumbar forward switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the lumbar air pump circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST E : 4-WAY LUMBAR FORWARD TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: 4-WAY LUMBAR FORWARD TEST 1	
NOTES: When the seat switchpack lumbar forward switch is operated, the lumbar upper and lower inflate solenoids are energised.	
The battery support unit must be connected during this test to ensure that the power supply is stable.	
	NOTES: Circuit reference - VBATT - The 4-way lumbar forward circuit current specification is 1.55A ± 10%. 1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack lumbar forward switch
	Is the measured current less than specification? **Yes** GO to E2 . **No** Check the lumbar/bolster pump hose and the lumbar air cell hoses for blockages/leaks
E2: 4-WAY LUMBAR FORWARD TEST 2	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - LUMBAR FWD / GND - 4 Connect the multimeter across the seat switchpack lumbar forward terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack lumbar forward switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the lumbar forward circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST F : 4-WAY LUMBAR REARWARD TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: LUMBAR REARWARD TEST 1	
NOTES:	

When the seat switchpack lumbar rearward switch is operated, the lumbar upper and lower deflate solenoids are energised.

The battery support unit must be connected during this test to ensure that the power supply is stable.

	NOTES: Circuit reference - VBATT - The 4-way lumbar rearward circuit current specification is 1.00A ± 10%.
	1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack lumbar rearward switch
	Is the measured current less than specification? **Yes** GO to F2 . **No** Check the lumbar air cell hoses for blockages
F2: 4-WAY LUMBAR REARWARD TEST 2	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only.
	1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - LUMBAR RWD / GND - 4 Connect the multimeter across the seat switchpack lumbar rearward terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack lumbar rearward switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the lumbar rearward circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST G : 4-WAY LUMBAR UP TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: 4-WAY LUMBAR UP TEST 1	

NOTES:

When the seat switchpack lumbar up switch is operated, the lumbar upper inflate solenoid and the lower deflate solenoids are energised.

The battery support unit must be connected during this test to ensure that the power supply is stable.

	NOTES: Circuit reference - VBATT - The 4-way lumbar up circuit current specification is 1.55A ± 10%.
	1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack lumbar up switch
	Is the measured current less than specification? **Yes**

	GO to G2 . **No** Check the lumbar/bolster pump hose and the lumbar air cell hoses for blockages/leaks
G2: 4-WAY LUMBAR UP TEST 2	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - LUMBAR UP / GND - 4 Connect the multimeter across the seat switchpack lumbar up terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack lumbar up switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the lumbar up circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST H : 4-WAY LUMBAR DOWN TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: LUMBAR DOWN TEST 1	
NOTES: When the seat switchpack lumbar down switch is operated, the lumbar upper deflate solenoid and the lower inflate solenoids are energised.	
The battery support unit must be connected during this test to ensure that the power supply is stable.	
	NOTES: Circuit reference - VBATT - The 4-way lumbar down circuit current specification is 1.55A ± 10%. 1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack lumbar down switch
	Is the measured current less than specification? **Yes** GO to H2 . **No** Check the lumbar/bolster pump hose and the lumbar air cell hoses for blockages/leaks
H2: LUMBAR DOWN TEST 2	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - LUMBAR DWN / GND - 4 Connect the multimeter across the seat switchpack lumbar down terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack lumbar down switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A.

	No Refer to the electrical circuit diagrams and check the lumbar down circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST I : BOLSTER INFLATE TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
I1: BOLSTER INFLATE TEST 1	
NOTE: The battery support unit must be connected during this test to ensure that the power supply is stable.	
	NOTES: Circuit reference - VBATT - The bolster inflate circuit current specification is 1.05A ± 10%.
	1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack bolster inflate switch
	Is the measured current less than specification? **Yes** GO to I2 . **No** Check the lumbar/bolster pump hose and the bolster air cell hoses for blockages/leaks
I2: BOLSTER INFLATE TEST 2	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only.
	1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - BOLSTER INF / GND - 4 Connect the multimeter across the seat switchpack bolster inflate terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack bolster inflate switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the bolster inflate circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST J : BOLSTER DEFLATE TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
J1: BOLSTER DEFLATE TEST 1	
NOTE: The battery support unit must be connected during this test to ensure that the power supply is stable.	
	NOTES: Circuit reference - VBATT - The bolster deflate circuit current specification is 0.50A ± 10%.
	1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack bolster deflate switch
	Is the measured current less than specification? **Yes** GO to J2 . **No**

	Check the bolster air cell hoses for blockages
J2: BOLSTER DEFLATE TEST 2	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - BOLSTER DEF / GND - 4 Connect the multimeter across the seat switchpack bolster deflate terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack bolster deflate switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the bolster deflate circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST K : MEMORY SEAT BOLSTER INFLATE TESTS	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
K1: MEMORY SEAT BOLSTER INFLATE TEST 1	
	NOTE: Some DTCs can only be set if the fault is detected during the On Demand Self Test routine.
	1 Using the manufacturer approved diagnostic system, perform routine - On Demand Self Test
	2 Using the manufacturer approved diagnostic system, check the relevant seat module for related DTCs and refer to the relevant DTC index
	Are any relevant DTCs set? **Yes** Perform the relevant corrective action **No** GO to K2 .
K2: MEMORY SEAT BOLSTER INFLATE TEST 2	
	NOTE: The battery support unit must be connected during this test to ensure that the power supply is stable.
	NOTES: Circuit reference - VBATT - The bolster inflate circuit current specification is 1.05A ± 10%. 1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack bolster inflate switch
	Is the measured current less than specification? **Yes** GO to K3 . **No** Check the lumbar/bolster pump hose and the bolster air cell hoses for blockages/leaks
K3: MEMORY SEAT BOLSTER INFLATE TEST 3	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - BOLSTER INF / GND - 4 Connect the multimeter across the seat switchpack bolster inflate terminal and the ground terminal
	5 Set the ignition to on

	6 Operate the seat switchpack bolster inflate switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the bolster inflate circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST L : MEMORY SEAT BOLSTER DEFLATE TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
L1: MEMORY SEAT BOLSTER DEFLATE TEST 1	
	NOTE: Some DTCs can only be set if the fault is detected during the On Demand Self Test routine.
	1 Using the manufacturer approved diagnostic system, perform routine - On Demand Self Test
	2 Using the manufacturer approved diagnostic system, check the relevant seat module for related DTCs and refer to the relevant DTC index
	Are any relevant DTCs set? **Yes** Perform the relevant corrective action **No** GO to L2 .
L2: MEMORY SEAT BOLSTER DEFLATE TEST 2	
	NOTE: The battery support unit must be connected during this test to ensure that the power supply is stable.
	NOTES: Circuit reference - VBATT - The bolster deflate circuit current specification is 0.50A ± 10%. 1 Connect an inductive ammeter to the seat switchpack power circuit
	2 Set the ignition to on
	3 Operate the seat switchpack bolster deflate switch
	Is the measured current less than specification? **Yes** GO to L3 . **No** Check the bolster air cell hoses for blockages
L3: MEMORY SEAT BOLSTER DEFLATE TEST 3	
	NOTE: Do not disconnect the electrical connector during this step; the seat switchpack is removed for access to the wiring harness only. 1 Refer to the relevant section of the workshop manual and remove the seat switchpack
	2 Set a multimeter to measure voltage
	3 Using the multimeter, measure and record the battery voltage (reference voltage)
	NOTE: Circuit reference - BOLSTER DEF / GND - 4 Connect the multimeter across the seat switchpack bolster deflate terminal and the ground terminal
	5 Set the ignition to on
	6 Operate the seat switchpack bolster deflate switch
	Is the measured voltage less than battery voltage? **Yes** GO to Pinpoint Test A. **No** Refer to the electrical circuit diagrams and check the bolster deflate circuit for short circuit to ground, short circuit to power, open circuit, high resistance

PINPOINT TEST M : MASSAGE SEAT TESTS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
M1: MASSAGE SEAT TEST 1	
	1 Using the manufacturer approved diagnostic system, perform routine - On Demand Self Test
	2 Check the relevant seat module for related DTCs

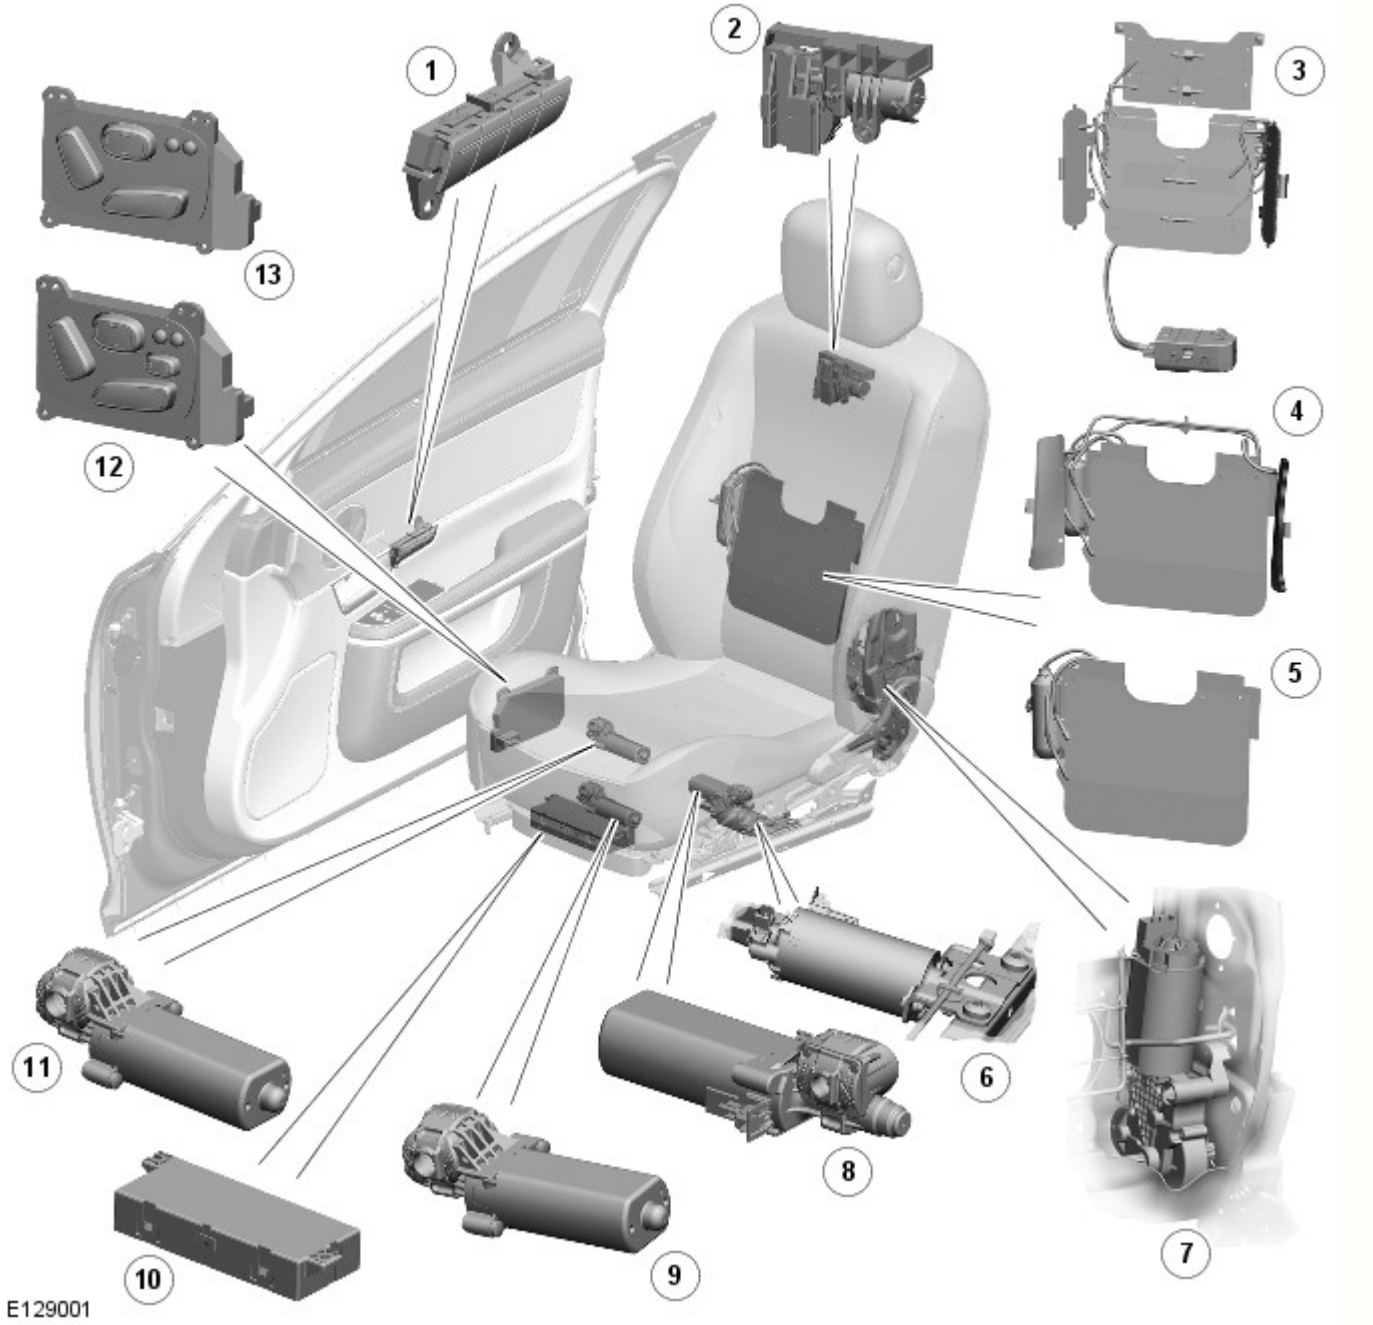
	Are any relevant DTCs set? **Yes** Perform the relevant corrective action **No** GO to M2 .
M2: MASSAGE SEAT TEST 2	
	NOTE: The massage circuit current specification is 1.10A ± 10%. 1 Connect an inductive ammeter to the massage master solenoid power circuit
	2 Set the seat massage function to on
	Is the measured current less than specification? **Yes** Refer to the electrical circuit diagrams and check the seat massage circuits for open circuit, high resistance **No** Check the massage air cell hoses for blockages/leaks

Published: 04-Oct-2011

Seating - Seats - Component Location

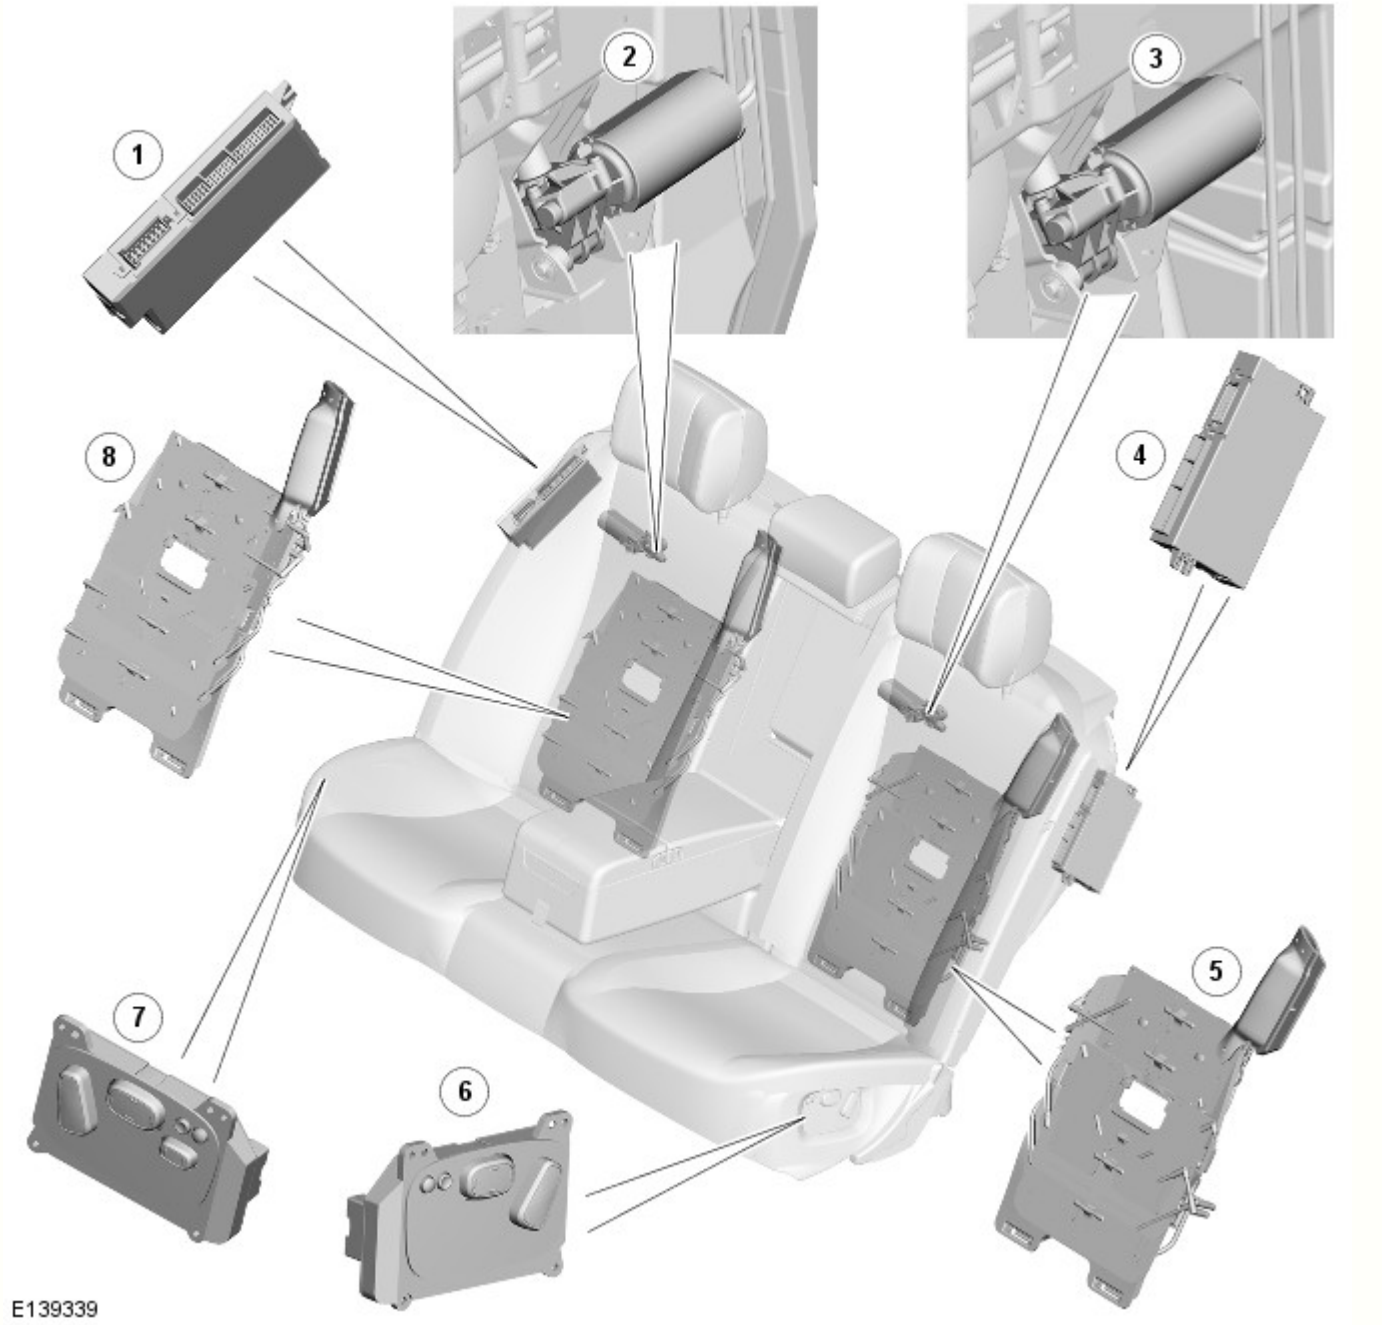
Description and Operation

COMPONENT LOCATION - FRONT SEAT ADJUSTMENT



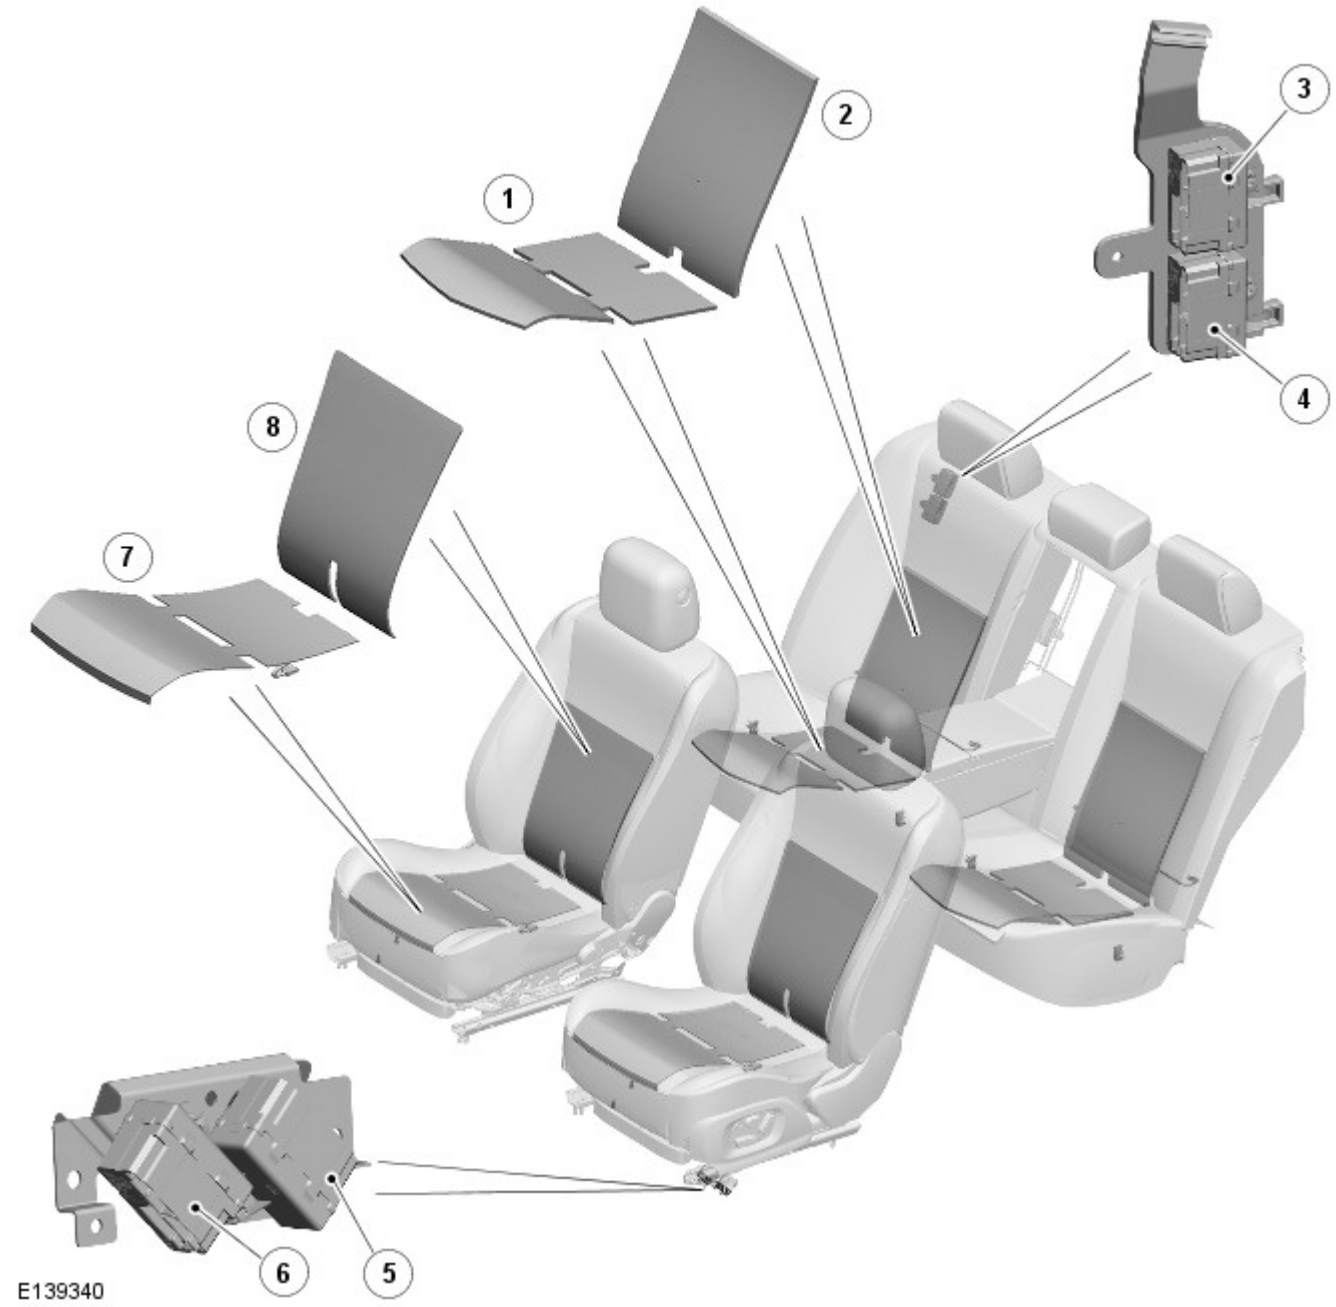
Item	Description
1	Memory switch pack
2	Head restraint motor
3	Pump, lumbar support, squab bolster supports and back massage cells
4	Pump, lumbar support and squab bolster supports
5	Pump and lumbar support (4-way support shown, 2-way similar)
6	Seat slide motor
7	Squab recline motor
8	Cushion tilt motor
9	Cushion extension motor
10	Seat control module
11	Seat height motor
12	Seat switch pack (16 and 18 way)
13	Seat switch pack (8, 10 and 12 way)

COMPONENT LOCATION - REAR SEAT ADJUSTMENT



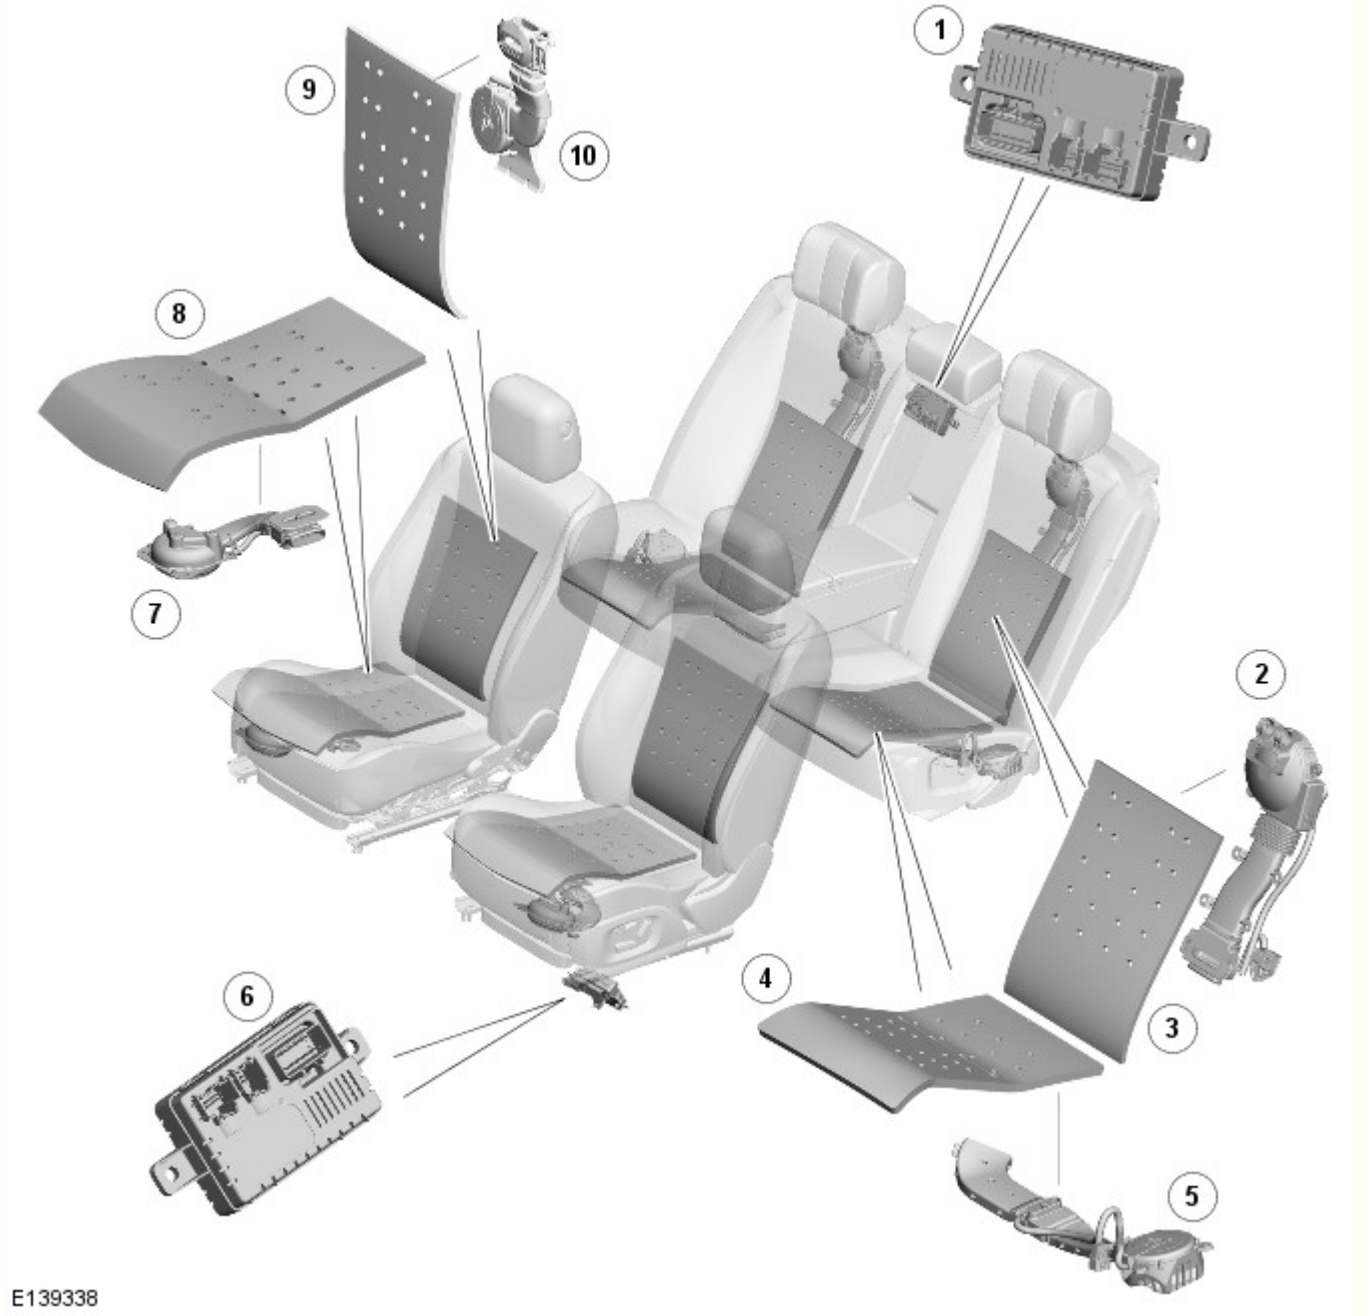
Item	Description
1	Right Hand (RH) rear seat module
2	RH rear seat recline motor
3	Left Hand (LH) rear seat recline motor
4	LH rear seat module
5	LH 4-way lumbar adjustment and massage
6	LH Rear seat adjustment switchpack (Left Hand Drive version shown)
7	RH Rear seat adjustment switchpack (Left Hand Drive version shown)
8	RH 4-way lumbar adjustment massage

COMPONENT LOCATION - HEATED FRONT AND REAR SEATS



Item	Description
1	Rear seat cushion heater element
2	Rear seat squab heater element
3	Rear RH seat heater module
4	Rear LH seat heater module
5	Front passenger seat heater module
6	Driver seat heater module
7	Front seat cushion heater element
8	Front seat squab heater element

COMPONENT LOCATION - FRONT AND REAR CLIMATE SEATS



Item	Description
1	Rear seats climate control module
2	Rear seat squab climate module
3	Rear seat squab pad assembly
4	Rear seat cushion pad assembly
5	Rear seat cushion climate module
6	Front seats climate control module
7	Front seat cushion climate module
8	Front seat cushion pad assembly
9	Front seat squab pad assembly
10	Front seat squab climate module

General Information - Diagnostic Trouble Code (DTC) Index DTC: Driver/Passenger Seat Module (DSM/PSM)

Description and Operation

Driver/Passenger Seat Module (DSM/PSM)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the warranty policy and procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system)

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the digital multimeter leads into account

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion

If diagnostic trouble codes are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals

Where an 'on demand self-test' is referred to, this can be accessed via the 'diagnostic trouble code monitor' tab on the manufacturers approved diagnostic system

Check DDW for open campaigns. Refer to the corresponding bulletins and SSM's which may be valid for the specific customer complaint and carry out the recommendations as needed.

The table below lists all diagnostic trouble codes (DTCs) that could be logged in the driver/passenger seat module, for additional diagnosis and testing information refer to the relevant diagnosis and testing section.
For additional information, refer to: Seats (501-10 Seating, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B105D-11	Seat Bolster Inflate Output - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105D-15	Seat Bolster Inflate Output - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105E-11	Seat Bolster Deflate Output - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105E-15	Seat Bolster Deflate Output - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat bolster circuit
B105F-11	Seat Cushion Extension Motor Output - Circuit short to ground	• Seat cushion extend motor circuit - Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat cushion extend motor circuit for circuit short to ground. Repair circuit as required, clear DTC and retest

B105F-15	Seat Cushion Extension Motor Output - Circuit short to battery or open	• Seat cushion extend motor circuit - Circuit short to power, open circuit, high resistance	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat cushion extend motor circuit for circuit short to power, open circuit, high resistance. Repair circuit as required, clear DTC and retest
B1060-11	Seat Headrest Motor Output - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat headrest motor circuit
B1060-15	Seat Headrest Motor Output - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat headrest motor circuit
B1063-31	Seat Cushion Extension Motor Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat cushion motor sensor circuit. Repair circuit as required. Clear DTC and retest
B1064-31	Seat Headrest Motor Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat headrest motor sensor circuit. Repair circuit as required. Clear DTC and retest
B1065-24	Cushion Extend Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1066-24	Cushion Retract Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1067-24	Lumbar In Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1068-24	Lumbar Out Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1069-24	Lumbar Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106A-24	Lumbar Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106B-24	Bolster Inflate Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
	Bolster Deflate	• Signal stuck high	• Check the switch function. Check the seat wiring harness/connectors for security/integrity.

B106C-24	Switch - Signal stuck high	• Switch malfunction	Refer to the electrical circuit diagrams and check the switch circuit
B106D-24	Headrest Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B106E-24	Headrest Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1087-83	LIN Bus "A" - Value of signal protection calculation incorrect	• LIN bus checksum error - Value of signal protection calculation incorrect • Generic LIN bus failure	• Check for other LIN Bus related DTCs. Refer to the electrical circuit diagrams and check the LIN Bus circuit
B1087-86	LIN Bus "A" - Signal invalid	• Generic LIN bus failure • Signal invalid - LIN bus Bit error / Parity Error /Synch Error	• Check for other LIN Bus related DTCs. Refer to the electrical circuit diagrams and check the LIN Bus circuit
B1087-87	LIN Bus "A" - Missing message	• Generic LIN bus failure • Missing message - Slave not responding or LIN bus short circuit to ground or power	• Check for other LIN Bus related DTCs. Refer to the electrical circuit diagrams and check the LIN Bus circuit
B1136-11	Lumbar Control A - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1136-12	Lumbar Control A - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1136-13	Lumbar Control A - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1137-11	Lumbar Control B - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1137-12	Lumbar Control B - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1137-13	Lumbar Control B - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1138-11	Lumbar Control C - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1138-12	Lumbar Control C - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit

B1138-13	Lumbar Control C - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1139-11	Lumbar Control D - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1139-12	Lumbar Control D - Circuit short to battery	• Circuit short to power	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B1139-13	Lumbar Control D - Circuit open	• Circuit open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B113A-00	General Failure on Seat Lumbar - No sub type information	• No sub type information	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B113B-00	Lumbar Control Multiple Failures - No sub type information	• No sub type information	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the lumbar control circuit
B12CC-00	Driver Seat Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B12D9-00	Driver Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B12DB-00	Passenger Seat Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B12E6-00	Passenger Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B13F6-11	Passenger Seat Away Switch - Circuit short to ground	• Passenger seat away switch circuit - short circuit to ground • Faulty switch	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the passenger seat away switch circuit for short circuit to ground • If no circuit faults are present, check and install new passenger seat away switch as required. Refer to the warranty policy and procedures

			manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component
B13F7-00	Right Rear Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B13F8-00	Left Rear Massage Module Pump Assembly - No sub type information	• Massage pump electrical or pneumatic connection disconnected • Massage pump unit failure	• Refer to the workshop manual and check the pump unit electrical and pneumatic connections. If no faults are found check and install a new massage module pump assembly. Refer to the warranty policy and procedures manual if a module is suspect
B13F9-00	Right Rear Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B13FA-00	Left Rear Seat Massage Module Back Carrier Assembly - No sub type information	• Massage unit valve block electrical connection disconnected of damaged • Massage unit valve block pneumatic pipe disconnected/leaking/blocked • Air bladder leaking • Massage electrical control unit or solenoid failure	• Refer to the workshop manual and check the massage unit valve block for damaged or disconnected wiring. Check the pneumatic pipes and air bladders for leaks/blockages. If no external faults are found suspect an internal fault within the massage control module or solenoid valves. Install a new assembly as required. Refer to the warranty policy and procedures manual if a module is suspect
B1B86-11	Seat Height Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat height motor circuit
B1B86-15	Seat Height Motor Relay - Circuit short to battery or open	• Circuit short to power or open	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat height motor circuit
B1B87-31	Seat Height Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat height motor sensor circuit. Repair circuit as required. Clear DTC and retest
B1B88-11	Seat Slide Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat slide motor relay circuit
B1B88-15	Seat Slide Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat slide motor relay circuit
	Seat Slide Motor	• Harness/connector problem	• Check the seat wiring harness/connectors for security/integrity

B1B89-31	Speed/Position Sensor - No signal	• No signal from sensor • Sensor/motor malfunction	• Refer to the electrical circuit diagrams and check the seat slide motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B90-11	Seat Tilt Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat tilt motor relay circuit
B1B90-15	Seat Tilt Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat tilt motor relay circuit
B1B91-31	Seat Tilt Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat tilt motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B92-11	Seat Recline Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat recline motor relay circuit
B1B92-15	Seat Recline Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat recline motor relay circuit
B1B93-31	Seat Recline Motor Speed/Position Sensor - No signal	• Harness/connector problem • No signal from sensor • Sensor/motor malfunction	• Check the seat wiring harness/connectors for security/integrity • Refer to the electrical circuit diagrams and check the seat recline motor speed sensor circuit. Repair circuit as required. Clear DTC and retest
B1B94-24	Seat Height Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B95-24	Seat Height Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B96-24	Seat Slide Forward Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B97-24	Seat Slide Backward Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B98-24	Seat Tilt Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1B99-24	Seat Tilt Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit

B1C00-24	Seat Recline Up Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C01-24	Seat Recline Down Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C02-24	Memory Store Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C03-24	Memory #1 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C04-24	Memory #2 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1C05-24	Memory #3 Switch - Signal stuck high	• Signal stuck high • Switch malfunction	• Check the switch function. Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the switch circuit
B1D94-11	Lumbar Motor Relay - Circuit short to ground	• Circuit short to ground	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat lumbar motor relay circuit
B1D94-15	Lumbar Motor Relay - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the seat wiring harness/connectors for security/integrity. Refer to the electrical circuit diagrams and check the seat lumbar motor relay circuit
U0010-88	Medium speed CAN Communication Bus - Bus off	• CAN signal fault. • Possible open circuit. • Faulty Control module.	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0140-00	Lost Communication With Central Junction Box - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Central Junction Box and Seat Module
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Instrument Cluster and Seat Module
			• Refer to the electrical circuit diagrams and check the power and ground connections to the

U0199-00	Lost Communication With "Door Control Module A" - No sub type information	• No sub type information	module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Driver Door Module and Seat Module
U0246-00	Lost Communication With Seat Control Module "E" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Rear Right Massage Seat Module and Rear Right Seat Module
U0247-00	Lost Communication With Seat Control Module "F" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Rear Left Massage Seat Module and Rear Left Seat Module
U024B-00	Lost Communication With Seat Control Module "G" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Passenger Front Massage Seat Module and Drivers Seat Module
U024C-00	Lost Communication With Seat Control Module "H" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Refer to the electrical circuit diagrams and check the LIN network between the Drivers Front Massage Seat Module and Drivers Seat Module
U0300-00	Software Incompatibility - No sub type information	• No sub type information	• Check the module configuration using the approved diagnostic system. Check that the module software versions are the latest release and update as necessary
U1A14-49	CAN Initialization Failure - Internal electronic failure	• Internal electronic failure	• Suspect the driver seat module, check and install a new module as required, refer to the Warranty Policy and Procedures manual if a module is suspect
U1A4C-00	Build / End of Line mode Active - No sub type information	• Vehicle configuration incorrect	• Check the module configuration using the approved diagnostic system
U2100-00	Initial Configuration Not Complete - No sub type information	• Car Configuration Data not loaded (Central Junction Box installed to vehicle and not initialized) • Internal Central Junction Box failure	• Install car config to Central Junction Box. Clear DTC and retest systems
U2101-00	Control Module Configuration Incompatible - No sub type information	• Car Configuration Data transmitted over CAN does not match seat control module internal config	• Carry out the new module software installation procedure
U3000-49	Control Module - Internal electronic failure	• Internal electronic failure - Internal RAM/ROM error	• Renew the Control module. Refer to the Warranty Policy and Procedures manual if a module is suspect
	Control Module		

U3001-46	Improper Shutdown - Calibration/parameter memory failure	• Event information	• DTC for information only. Clear the DTC and retest. If the problem persists, renew the module. Refer to the warranty policies and procedures before renewing a control module
U3002-81	Vehicle Identification Number - Invalid serial data received	• Invalid serial data received	• Configure the module using the manufacturers approved diagnostic system
U3003-16	Battery Voltage - Circuit voltage below threshold	• Battery voltage below threshold (8 volts)	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module
U3003-17	Battery Voltage - Circuit voltage above threshold	• Battery voltage above threshold	• Check vehicle battery and charging system. Refer to the relevant section in the workshop manual. Refer to the electrical circuit diagrams and check the power supply circuits to the module

Seating - Seats - Overview

Description and Operation

OVERVIEW

Leather Seat Covers

Leather is a natural product, therefore it bears natural characteristics, such as grain variations, growth & bush marks. These non-weakening marks show the true nature of the hide and are the hallmarks of Leather. In order to maintain the beauty of the vehicles natural Leather upholstery it requires regular cleaning, which if neglected, may cause deterioration. Where dust and dirt are allowed to accumulate and become ingrained in the surface of the Leather, the upholstery may become permanently damaged.

Light coloured upholstery can be particularly susceptible to soiling and staining and care should be taken to ensure that where there is evidence of any soiling or staining on the upholstery then this should be cleaned immediately using the Jaguar/Land Rover approved products, failure to do this could lead to the stain becoming permanent, this applies to all leather upholstery and is not colour specific.

Leather trimmed seats will naturally exhibit areas of creasing and wrinkling over a period of time and is a normal characteristic as the Leather ages.

Particular care should be taken where there is evidence of soiling or staining on the leather, this should be cleaned immediately. Failure to do this could lead to the stain becoming permanent.

Particular care should be taken to prevent damage from studs, zips and buckles.

NOTES:

Please refer to Leather care label attached to seats for more information.

Creasing and wrinkling does not represent a manufacturing defect.

Damage from studs, zips and buckles do not represent manufacturing defects.

Use only Jaguar/Land Rover approved products in accordance with the instructions for use.

Front Seats

Various options are available for the front seats with regard to temperature control and electrical adjustment. Seats are non-heated, heated or heated and cooled (climate), with the following adjustment options:

- 10-way adjustment on the driver seat and 8-way adjustment on the passenger seat.
- 16-way adjustment on the driver seat and 12-way adjustment on the passenger seat.
- 18-way adjustment on the driver and passenger seats.

8-way adjustments consist of seat slide, seat height, squab recline and 2-way lumbar adjustment. 10-way adjustment adds cushion tilt. 12-way adjustment adds head restraint. 16-way adjustment adds cushion extension and replaces 2-way lumbar adjustment with 4-way. 18-way adjustment adds squab bolster adjustment. The controls for seat adjustment are installed in the outboard side shield of the related seat cushion.

The driver seat on all options has a 3-channel memory for easy recall of stored position settings for the seat, steering column and door mirrors. Passenger seats with 18-way adjustment also have a 3-channel memory. The controls for memory operation are in the related front door casing. Lumbar and squab bolster settings are not included in the memory function.

Some climate seats with 18-way adjustment also incorporate a massage function. The massage function is produced using additional lumbar cells. Operation of the massage function is controlled from the Climate / Front Climate / Front Seats menu of the Touch Screen Display (TSD).

Operation of the temperature settings for heated and climate seats is controlled from the Climate / Front Climate / Front Seats menu of the TSD.

Both front seats incorporate an Anti-Whiplash System (AWS) consisting of active, energy absorbent backrest mechanisms. Together with correctly positioned head rests, the AWS helps reduce the likelihood of neck and spinal injury in the event of a rear impact. In a low speed rear impact, AWS automatically moves and reclines the backrest by a small amount, to change the posture of the seat occupant and reduce the relative front to rear motion between body and head.

A map pocket is installed on the rear of each front seat squab. Depending on trim level, some vehicles also have a folding tray attached to the rear of the squabs.

Rear Seats

The following options are available for the two outer rear seats:

- Non-heated seats.
- Heated seats.
- Climate seats
- Recline function
- Front passenger seat away function
- Massage seats.

Operation of the temperature settings for heated and climate seats is controlled from the rear climate control panel and/or the Climate / Rear Climate / Rear Seats menu of the TSD.

ISOFIX fastening points are attached to the vehicle floor to provide secure fastening for compatible child seats in the rear seats.

From 12MY rear seat recline, massage and front passenger seat away functions are introduced. The functions are controlled by a switch pack on each end of the rear seat cushion and an additional seat control module for each seat. A chauffeur switch is fitted to the front passenger seat to allow the front passenger seat away function to be operated by the driver.

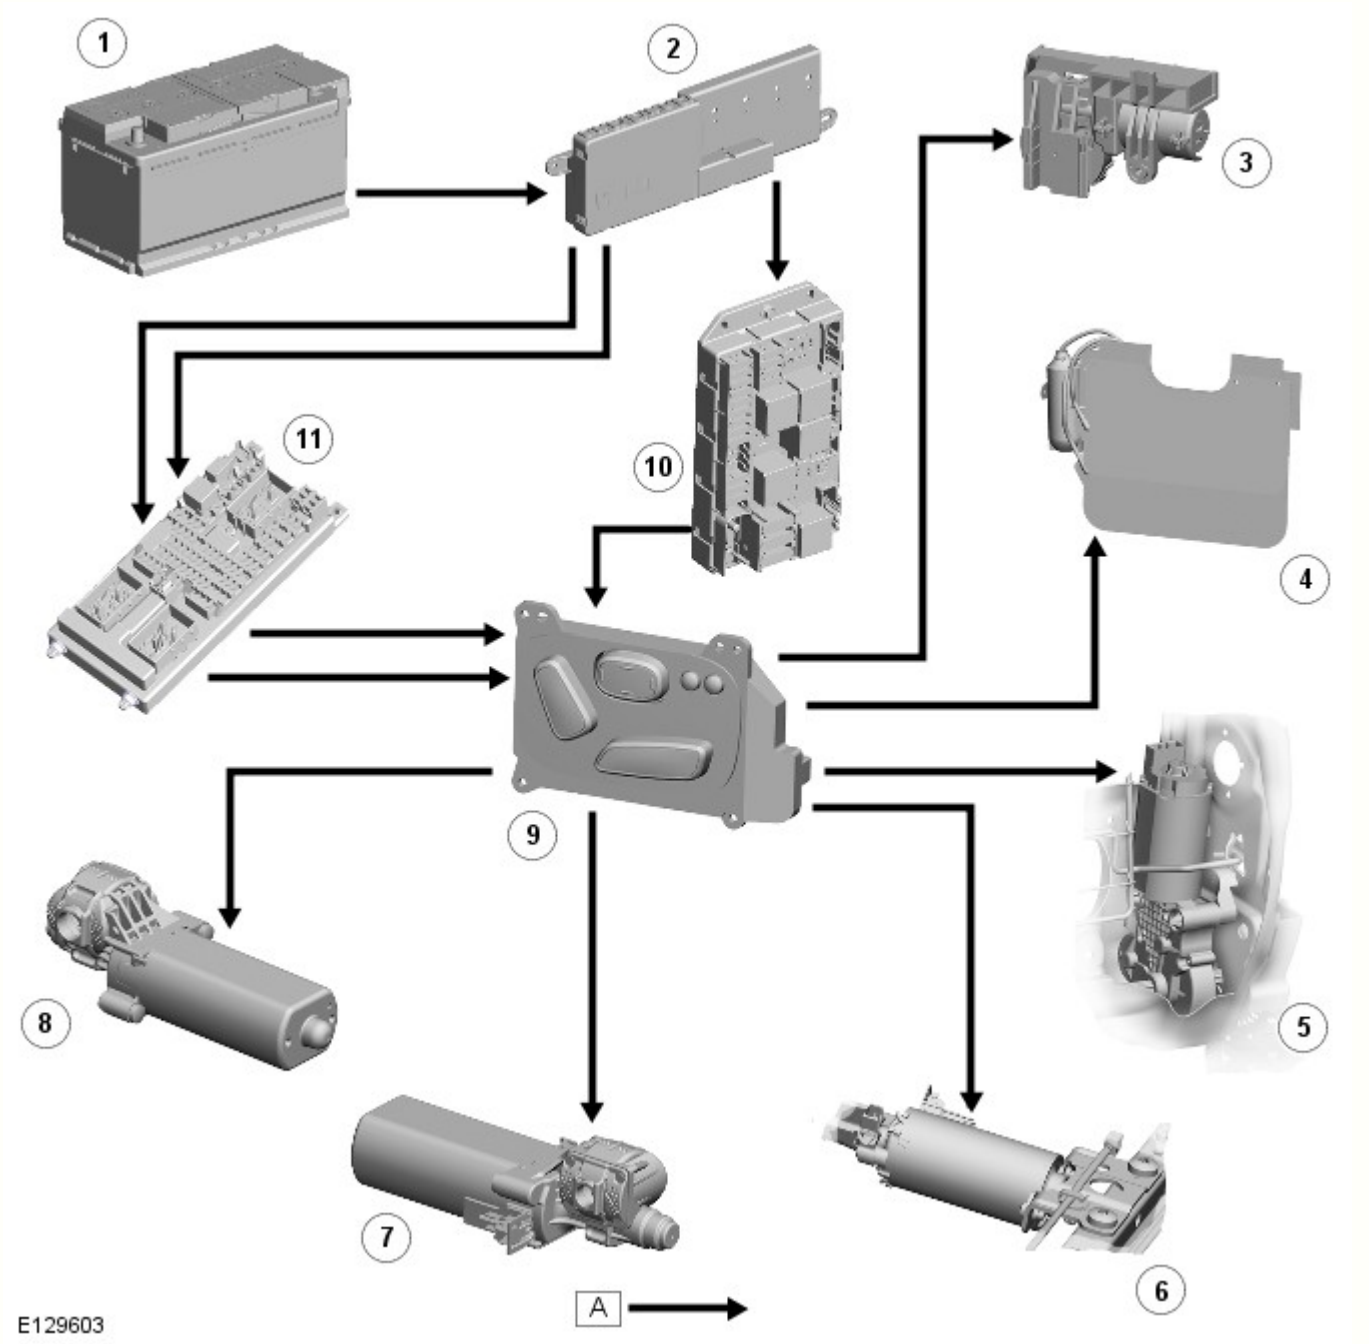
Seating - Seats - System Operation and Component Description

Description and Operation

Control Diagram

NOTE: **A** = Hardwired; **N** = Medium Speed CAN bus; **O** = LIN Bus

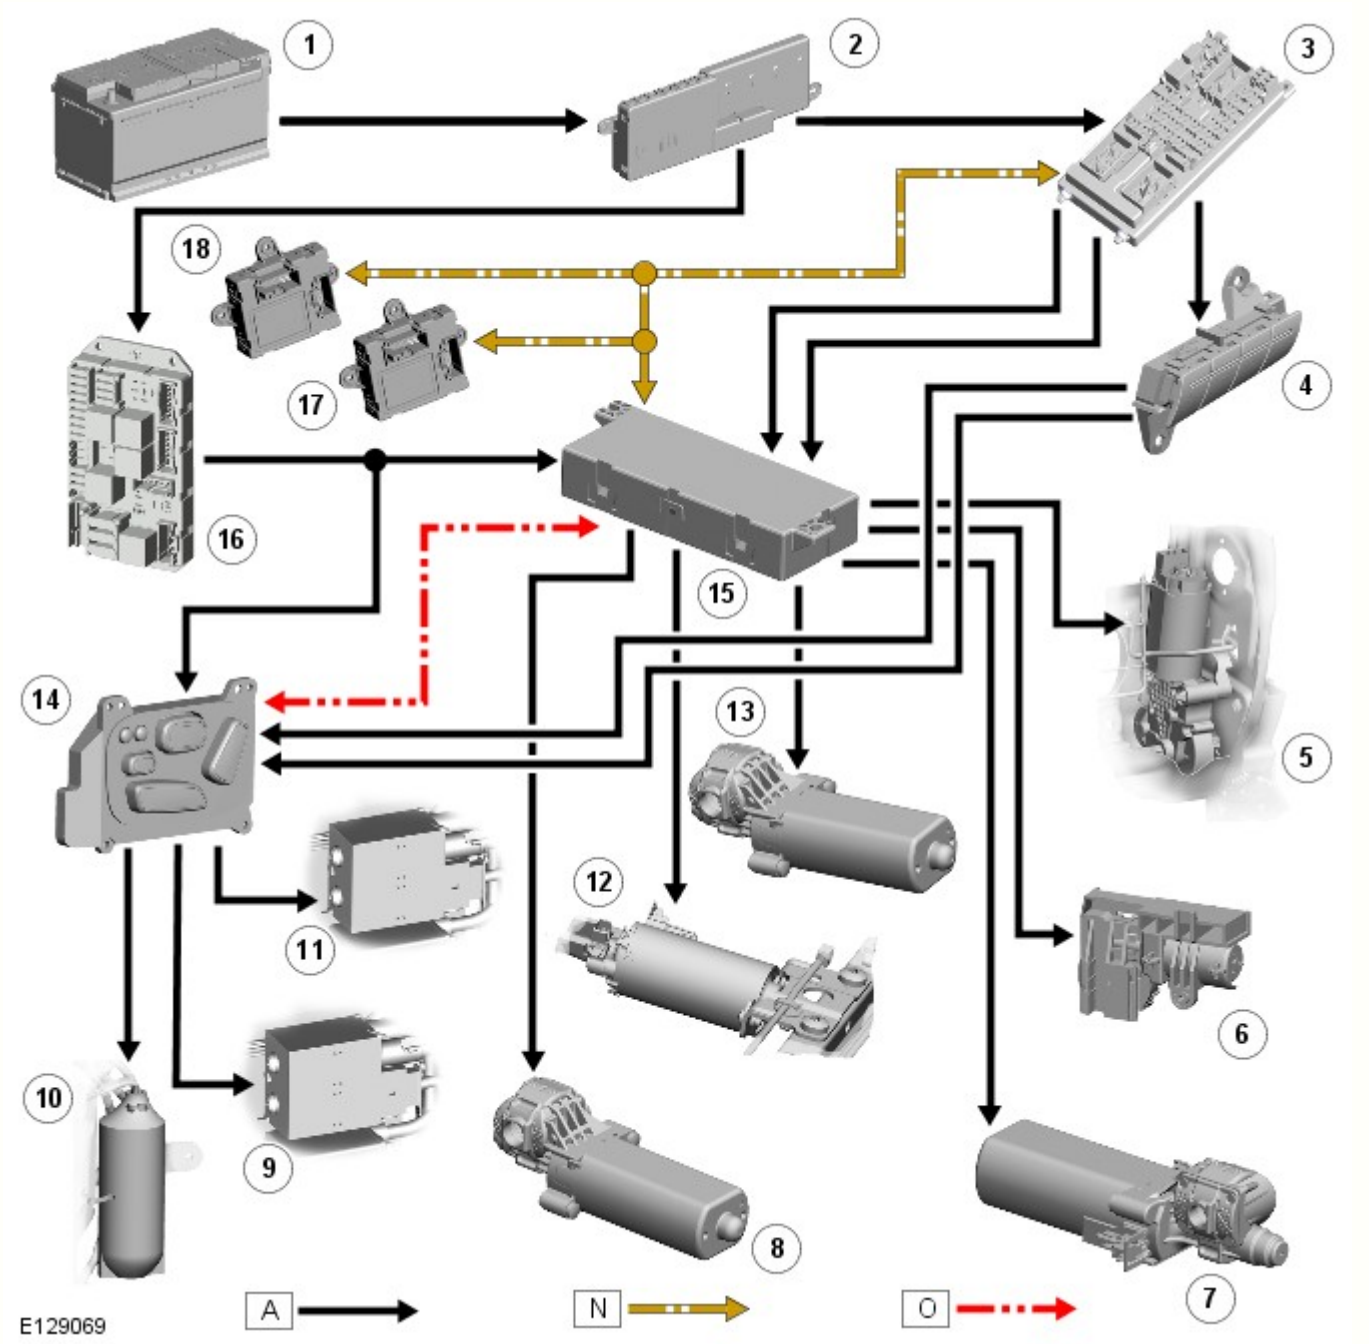
ADJUSTMENT - NON-MEMORY FRONT SEAT



Item	Description
1	Battery
2	BJB (battery junction box)
3	Head restraint motor
4	2-way lumbar adjustment
5	Squab recline motor
6	Seat slide motor
7	Cushion tilt motor
8	Seat height motor

9	Seat switch pack
10	RJB (rear junction box)
11	CJB (central junction box)

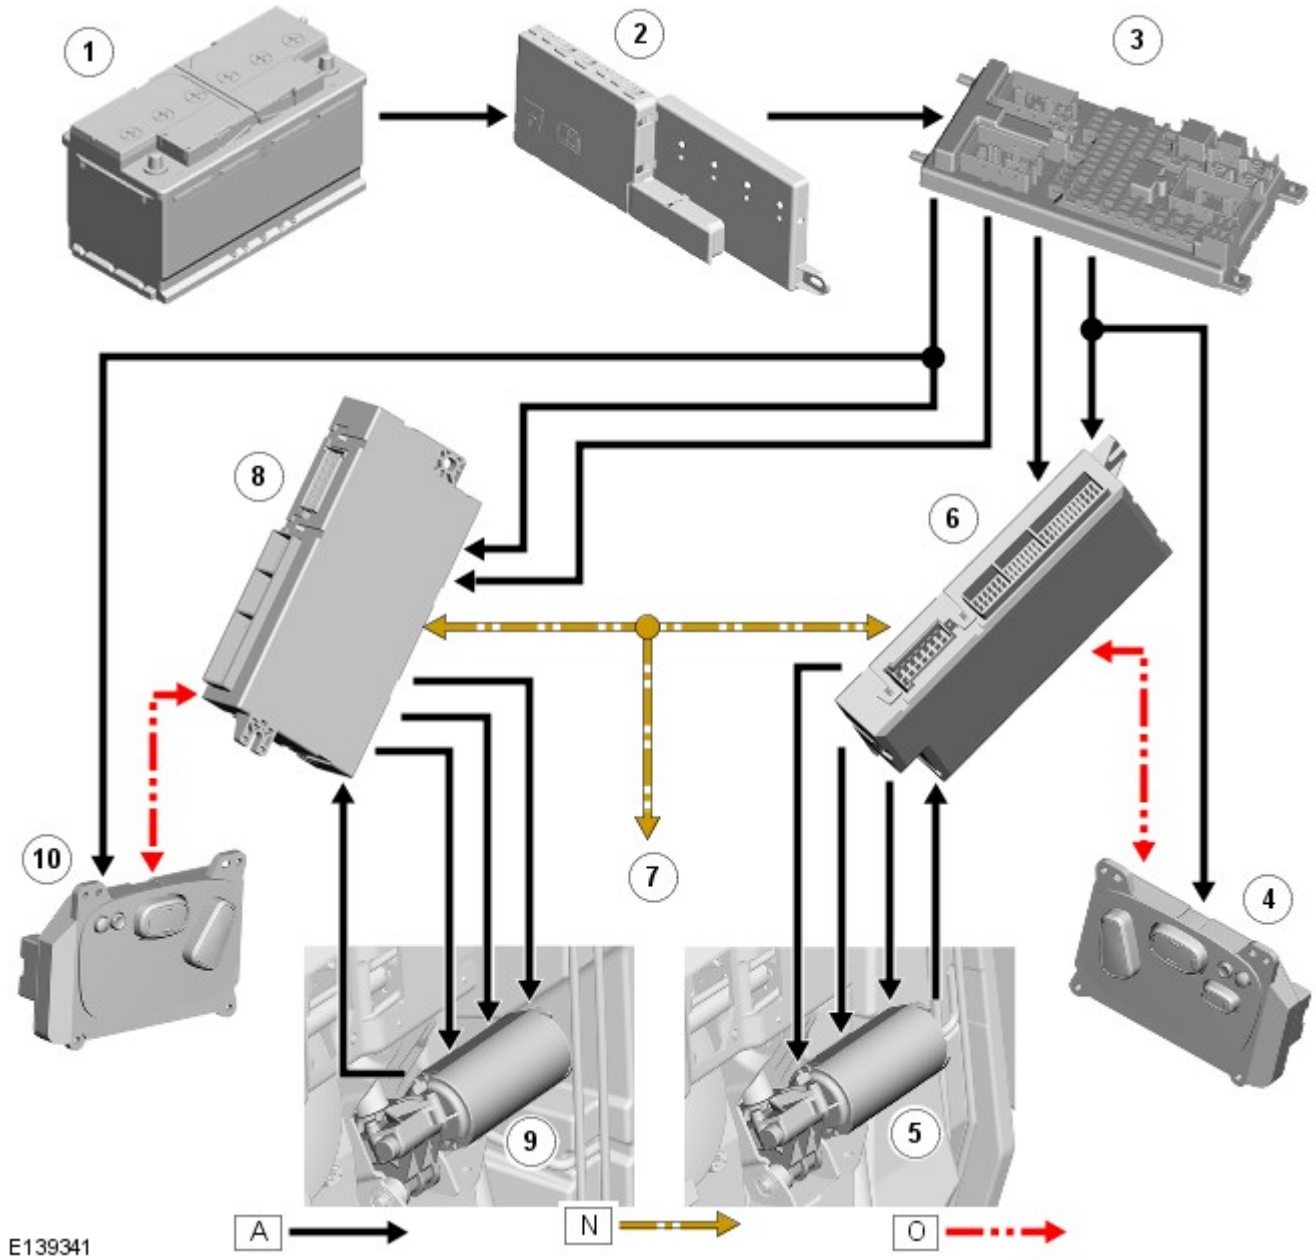
ADJUSTMENT - MEMORY FRONT SEAT



Item	Description
1	Battery
2	BJB
3	CJB
4	Seat memory switches
5	Squab recline motor
6	Head restraint motor
7	Cushion tilt motor
8	Seat height motor
9	Lumbar adjustment solenoids
10	Air pump
11	Squab bolster adjustment solenoids

12	Seat slide motor
13	Cushion extension motor
14	Seat switch pack
15	Driver seat module
16	RJB
17	LH (left-hand) door module
18	RH (right-hand) door module

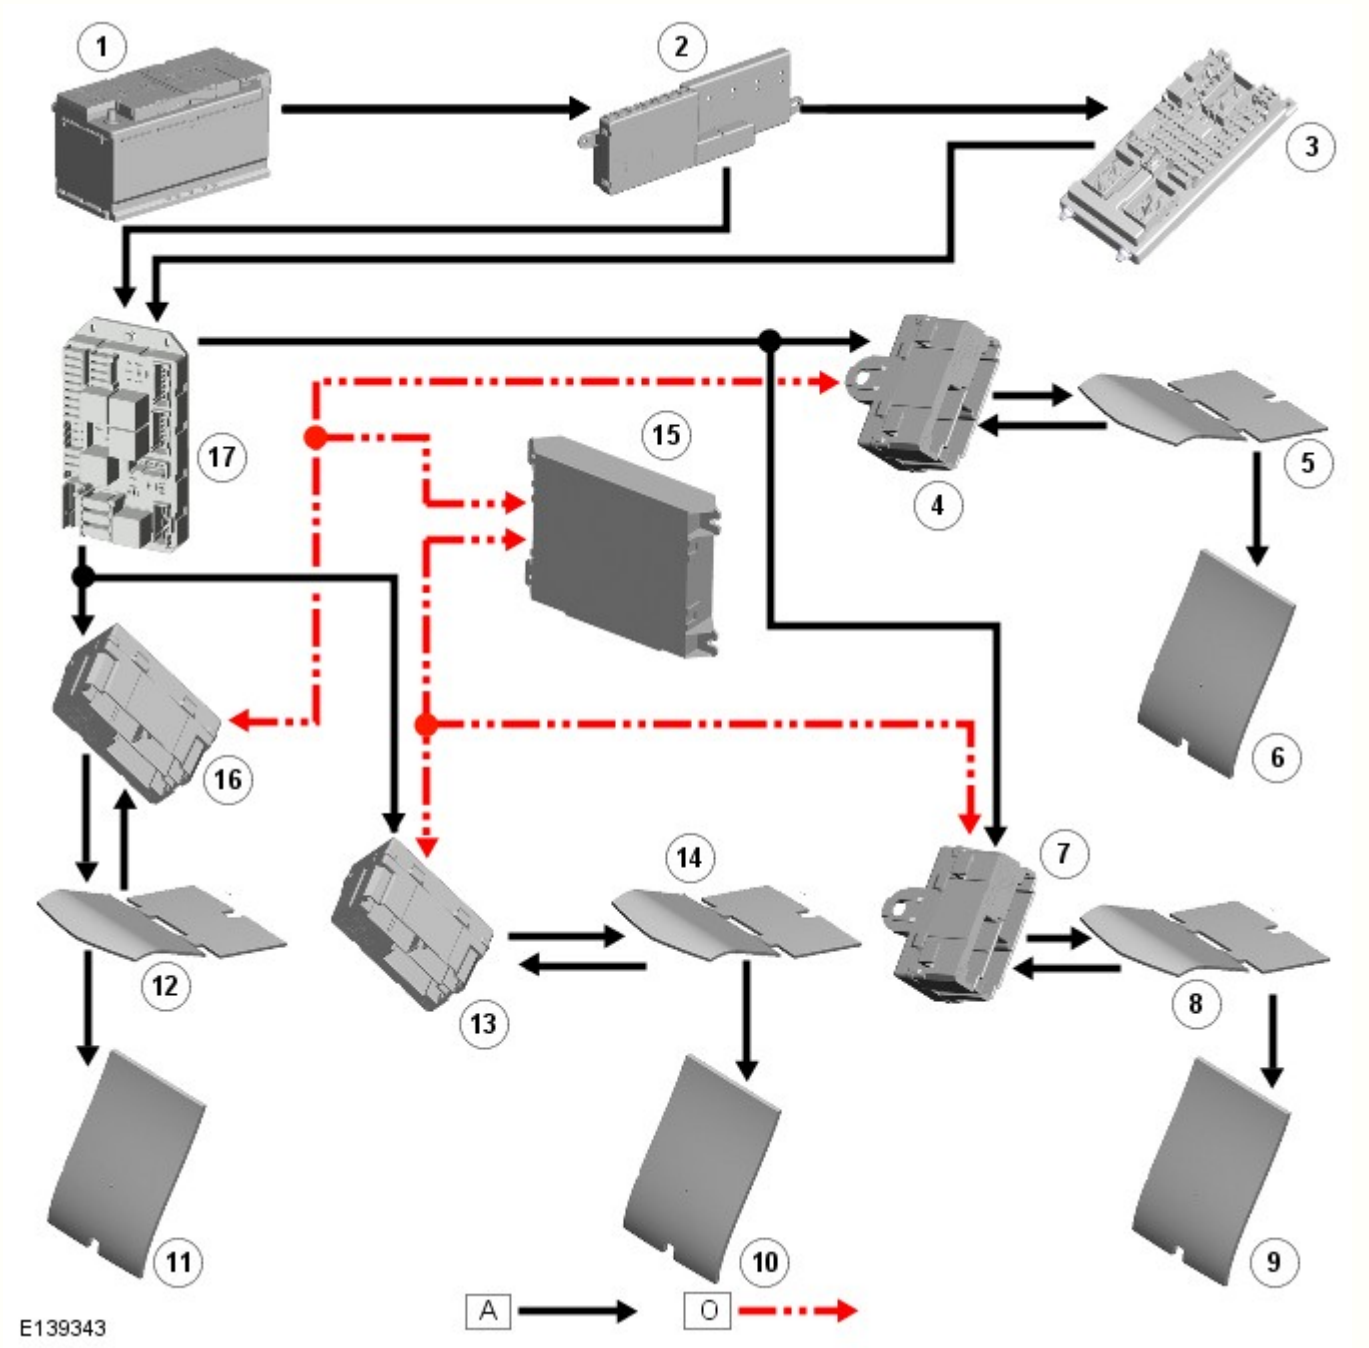
ADJUSTMENT - REAR SEATS



Item	Description
1	Battery
2	Battery Junction Box (BJB)
3	Central Junction Box (CJB)
4	Rear RH seat switchpack
5	RH recline motor
6	RH rear seat module
7	Medium speed CAN (controller area network) to other vehicle systems

8	LH rear seat module
9	LH recline motor
10	Rear LH seat switchpack

HEATED SEATS - FRONT AND REAR



Item	Description
1	Battery
2	BJB
3	CJB
4	Rear RH seat heater module
5	Rear RH cushion heater
6	Rear RH squab heater
7	Rear LH seat heater module
8	Rear LH cushion heater
9	Rear LH squab heater
10	Front LH squab heater
11	Front RH squab heater

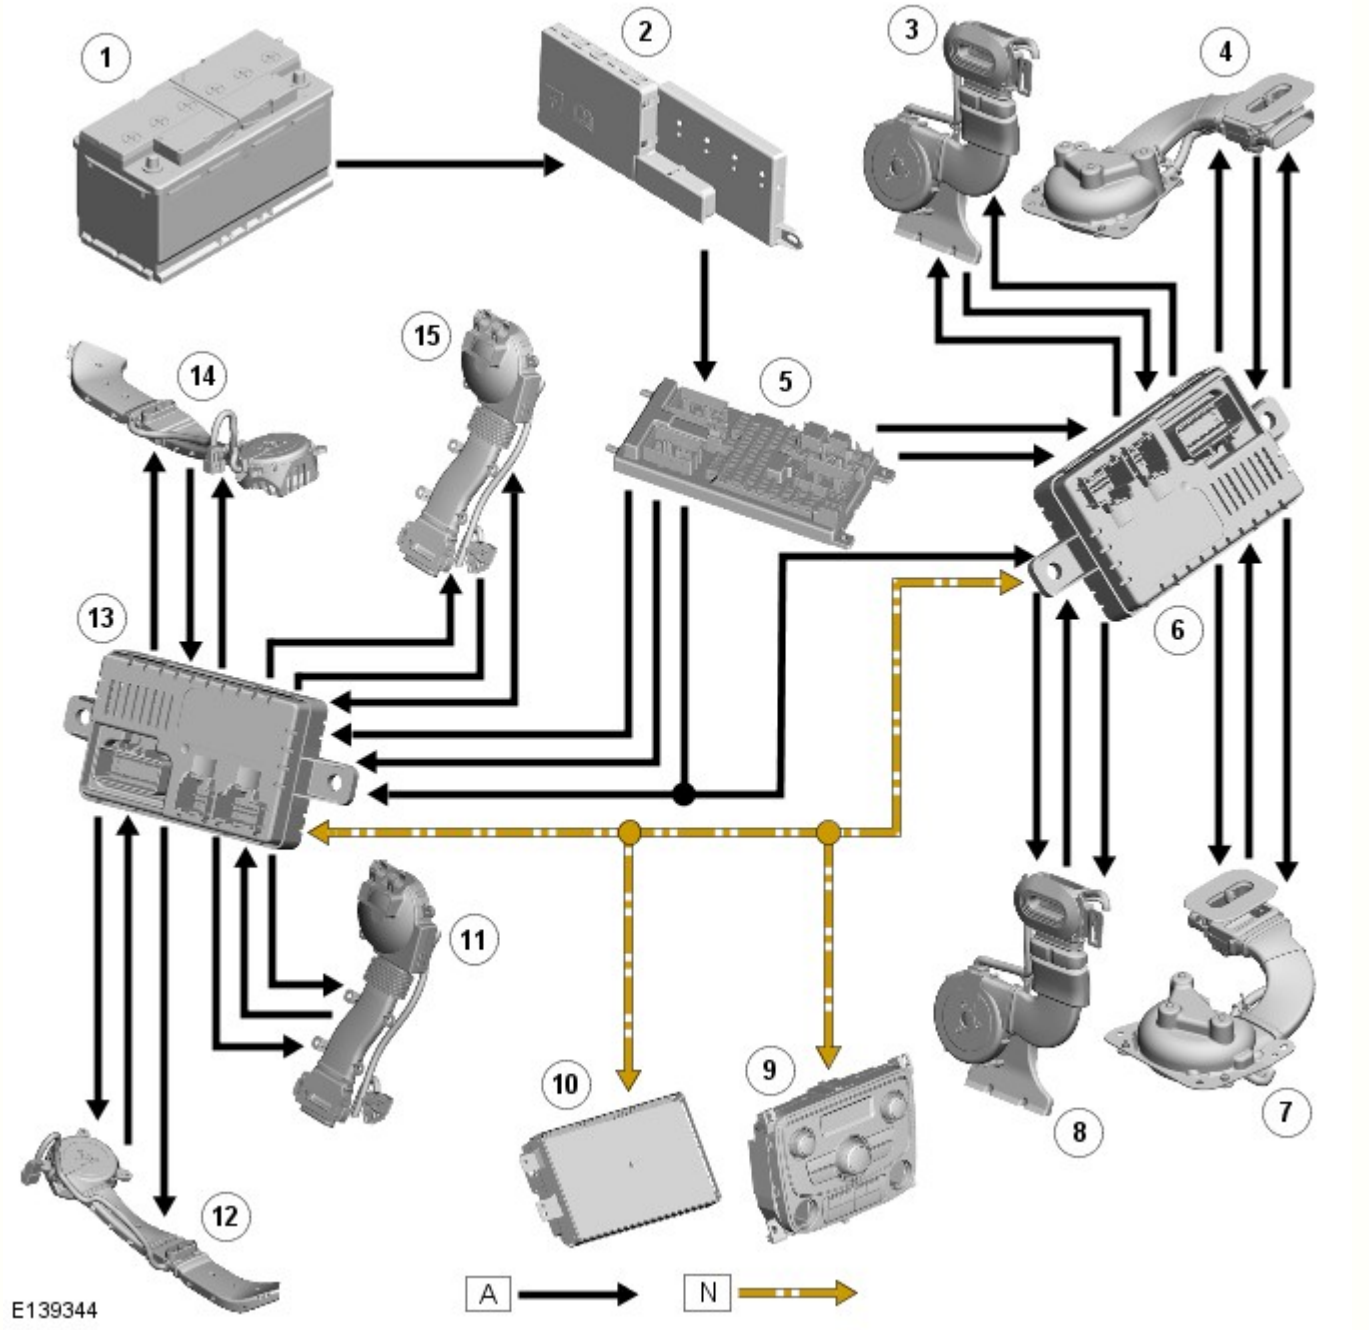
13	Front LH seat heater module
14	Front LH cushion heater
15	ATC (automatic temperature control) module
16	Front RH seat heater module
17	RJB

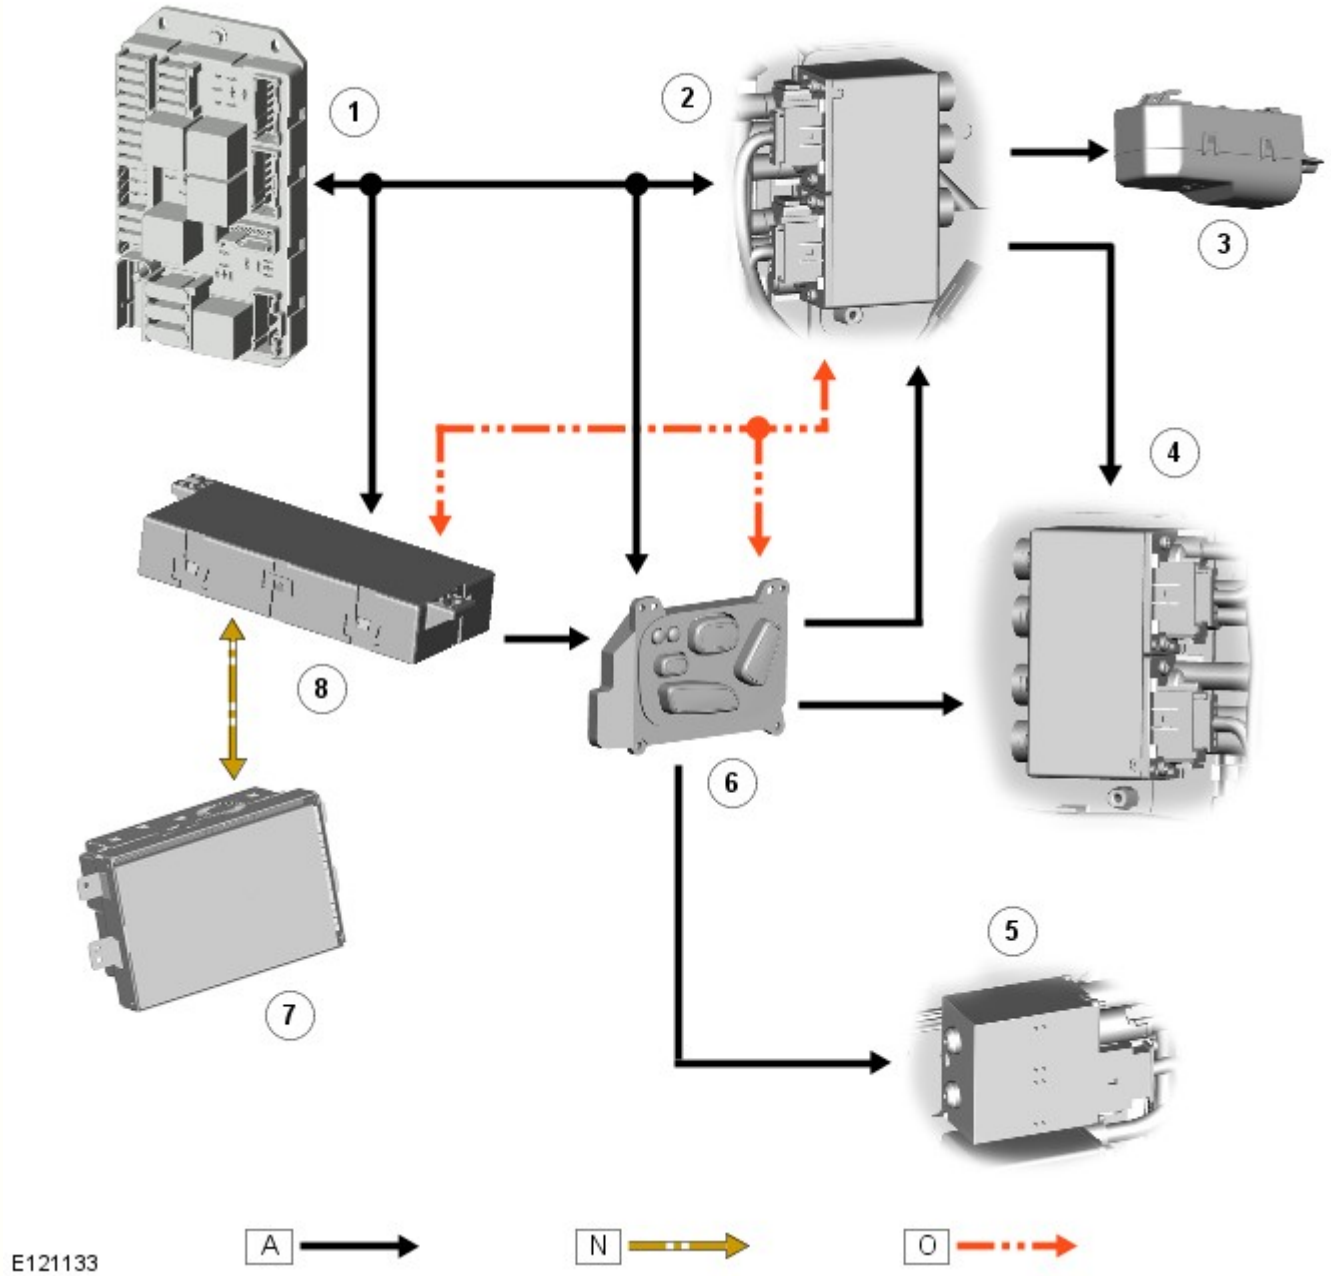
CLIMATE SEATS - FRONT AND REAR



Item	Description
1	Battery
2	BJB
3	Front RH seat squab climate module
4	Front RH seat cushion climate module
5	CJB
6	Front seat climate control module
7	Front LH seat cushion climate module
8	Front LH seat squab climate module

9	Rear climate control panel
10	Touch Screen Display (TSD)
11	Rear RH seat squab climate module
12	Rear RH seat cushion climate module
13	Rear seat climate control module
14	Rear LH seat cushion climate module
15	Rear LH seat squab climate module

SEAT MASSAGE - FRONT SEATS

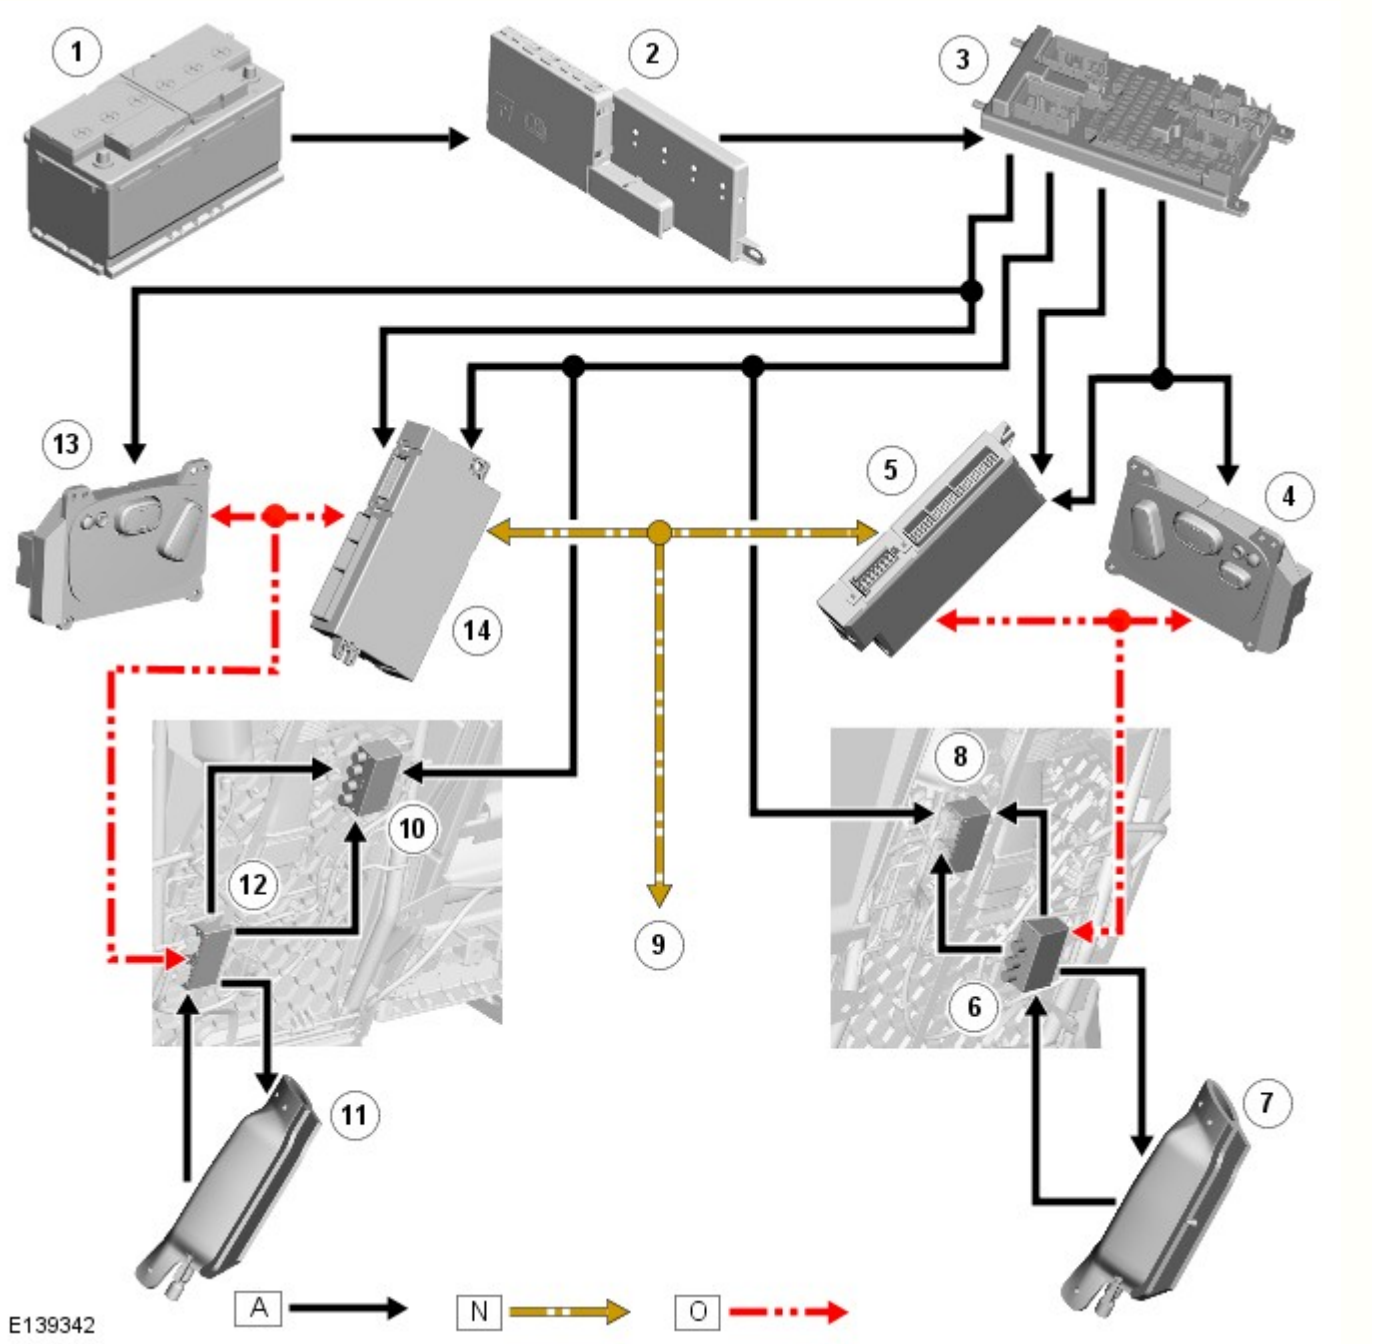


E121133

Item	Description
1	RJB
2	Master massage solenoid
3	Air pump
4	Slave massage and adjustable bolster solenoid
5	Lumbar solenoid
6	Seat switch pack
7	Touch-screen

8	Seat module

SEAT MASSAGE - REAR SEATS



Item	Description
1	Battery
2	Battery Junction Box (BJB)
3	Central Junction Box (CJB)
4	Rear RH seat switch pack
5	RH rear seat module
6	RH slave massage solenoid
7	RH seat air pump
8	RH master massage solenoid
9	Medium speed CAN to other vehicle systems
10	LH master massage solenoid
11	LH seat air pump
12	LH slave massage solenoid
13	Rear LH seat switch pack

System Operation

PRINCIPLES OF OPERATION

FRONT SEATS

Adjustment - Non-memory Seats

On non-memory front seats, each seat switch pack receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the air pump and associated solenoid valves.

For the adjustment motors, when a switch is operated power is connected to the applicable side of the related motor and a ground is connected to the opposite side of the motor, which then runs in the required direction. To move the motor in the opposite direction the polarity is reversed.

When the lumbar inflate switch is pressed, power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

Adjustment - Memory Seats

On memory front seats, the seat module receives three permanent power supplies; two from the CJB and one from the RJB . The power supplies from the CJB are used to operate the adjustment motors. The power supply from the RJB is used to operate the seat module.

Permanent power supplies are also connected from the CJB to the memory switch pack and from the RJB to the seat switch pack.

The seat switch pack is connected to the seat module by a LIN (local interconnect network) bus for the seat adjustment switches. Any selection for seat adjustment generates a message which is passed via the LIN bus to the seat module. The seat module processes the request and operates the applicable seat motor as required using the power supplies from the CJB .

The seat module on the driver seat is also connected to the medium speed CAN bus. This allows the driver seat module to monitor the position of the door mirrors and the steering column, using signals from the door modules and CJB respectively, when storing and recalling memory settings.

The memory switch pack has two hardwired connections with the related seat switch pack. One is for the three channel switches and one is for the memory switch. Operation of the any of the memory switches is relayed from the seat switch pack to the seat module on the LIN bus.

Memory settings are stored in the seat module by pressing the memory switch and then, within 5 seconds, one of the channel switches. When the memory switch is pressed the LED (light emitting diode) in the switch comes on. After the channel switch is pressed, the LED goes off and a chime sounds to confirm that the settings have been memorized. If the ignition is on, the message center will display a confirmation message. Any previously stored settings on the selected channel will be over-written.

Memory settings are recalled by pressing the applicable channel switch. If the ignition is on, the message center will display a confirmation message.

On seats with 2-way lumbar adjustment, when the inflate switch is pressed power is connected to the air pump to inflate the support. When the deflate switch is pressed, power is connected to the deflate solenoid valve, which opens to deflate the support.

On seats with 4-way lumbar adjustment and bolster adjustment, when an inflate switch is pressed, power is simultaneously connected to the air pump and the related inflate solenoid valve. When a deflate switch is pressed, power is connected to the related deflate solenoid valve, which opens to deflate the support. On vehicles with massage seats, power is connected to the inflate and deflate solenoid valves in the same way, but when an inflate selection is made the air pump is activated by a LIN bus message to the master solenoid valve, which then operates the air pump.

Stall Detection

A seat adjustment motor is deemed to have stalled if there is no change in the input from the feedback sensor of the motor for 200 ms. If a stall condition is detected then the drive to that motor is cancelled for the remainder of the memory recall operation or until the switch is re-selected (manual movement). The motor may be activated again, to move past the stall position, by pressing the appropriate switch for more than 2 seconds. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again, when a further 0.5 second of activation is permitted. This is known as inch mode, which allows seat adjustment to be maintained if sensor feedback is lost.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the adjustment motors.

Battery Monitor

If the battery voltage drops below 10.5 V, then the driver seat module ignores all requests for a memory recall until the battery voltage has reached 11.5 V. This will conserve as much power in the vehicle battery as possible to enable engine cranking.

Massage Seats

Seat massage requests from the START / STOP buttons on the TSD are sent via the medium speed CAN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on the LIN bus connection.

When a START button is pressed, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When a STOP button is pressed, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

Anti-Whiplash System (AWS)

Depending on the weight of the occupant and the severity of the collision, the mechanisms begin to operate at a relative impact speed of between approximately 8.7 and 11.2 mph (13.9 and 17.9 km/h). At the point of a rear impact, the forward energy of the impact and the inertia of the occupant combine to push the backrest against the occupant's back. That causes the AWS mechanism to begin a controlled sequence of movements. First, while remaining in an upright position, the backrest moves rearwards by approximately 50 mm. Next, the backrest reclines through an angle dependant upon the direction and relative speed of the collision, up to a maximum of approximately 15 degrees.

The combined effect of these movements is to absorb some of the energy of the impact and reduce the relative acceleration of head and body, thereby helping to reduce the possibility of whiplash injury.

HEATED SEATS

The heater elements only operate when the engine is running. Power for the heater elements is supplied to the seat heater modules from the heated seat relay in the RJB , which is controlled by a hardwired ignition signal from the CJB .

Seat heating selections made on the TSD and the rear climate control panel are transmitted to the ATC module.
Refer to: Heating and Ventilation (412-01 Climate Control, Description and Operation).

When the ATC module receives a seat heating request, it sends a LIN bus message to the appropriate seat heater module to energize the heater elements in the cushion and the squab. The seat heater module relays the temperature signal, from the thermal sensor in the cushion heater element, back to the ATC module. The ATC module uses the temperature signal to regulate the heater elements at the selected heat setting.

CLIMATE SEATS

The heating/cooling of the climate seats only operates when the engine is running. Power for the climate modules is supplied to the climate seat control modules by two permanent power supplies from the CJB . The climate seat control modules also receive a power supply from the ignition relay in the CJB .

Heating/Cooling selections on the TSD and the rear climate control panel are transmitted to the appropriate climate seat control module on the medium speed CAN bus. The climate seat control module then energizes the Peltier cell and the blower of the climate module(s) in the appropriate seat. The climate seat control module uses the signals from the temperature sensors in the squab and the cushion climate modules to regulate the seat at the selected temperature. If full seat heating/cooling is selected, both the squab and the cushion climate modules are activated. If partial seat heating/cooling is selected, only the squab climate module is activated.

REAR SEATS

Adjustment

The rear seat adjustment is only active when the smart key is in the vehicle and the ignition is on.

Each rear seat switchpack receives a logic power supply from the CJB via fuse F47. Each switchpack is connected to its respective rear seat control module by a LIN bus connection.

Each rear seat module receives two power supplies from the CJB to operate the recline motor, the lumbar pump and the solenoids.

Operation of the rear seat switchpack switches for seat recline produces a LIN bus message to the respective rear seat control module. The seat control module then provides a power supply to the applicable seat recline motor. Each recline motor has a Hall effect sensor to determine the position of the seat.

A seat recline motor is deemed to have stalled if there is no change in the input from the Hall sensor of the motor for 200 ms. If a stall condition is detected then the power supply to the motor is removed until the switch is re-selected. The motor may be activated again. If sensor feedback is detected, then the motor will continue to be driven until the switch is released. If Hall sensor feedback is not detected, then the motor is only driven for 0.5 second and then stops until the switch is released and pressed again.

Initialization

When a replacement seat module is fitted, it should be calibrated using Jaguar approved diagnostic equipment so that the module can learn the positions of the recline motors.

Massage Seats

Seat massage requests from the seat switchpack are passed on a LIN bus to the appropriate seat module. The seat module processes the requests and transmits them to the master massage solenoid on a LIN bus connection.

When the ON button is pressed on the seat switchpack, the master massage solenoid operates the relevant master and slave solenoid valves and activates the pump. The massage function operates in 10 minute cycles. After a 10 minute cycle is complete the user must re-select the function if a further 10 minute cycle is required.

When the OFF button is pressed on the seat switchpack, the 10 minute cycle is completed, or the ignition is switched off, the solenoid valves are opened to deflate the massage cells and the air pump turned off.

During operation the bottom cell pair inflate and then deflate. As the first cell pair are deflating the second cell pair start to inflate. This sequence is repeated for all five cell pairs, from cell pair one at the bottom to cell pair five at the top. Cell inflation time, which varies between cell pairs, is as follows:

- Cell pair one - 3 seconds.
- Cell pair two - 2.6 seconds.
- Cell pair three - 2.8 seconds.
- Cell pair four - 2.2 seconds.
- Cell pair five - 1.6 seconds.

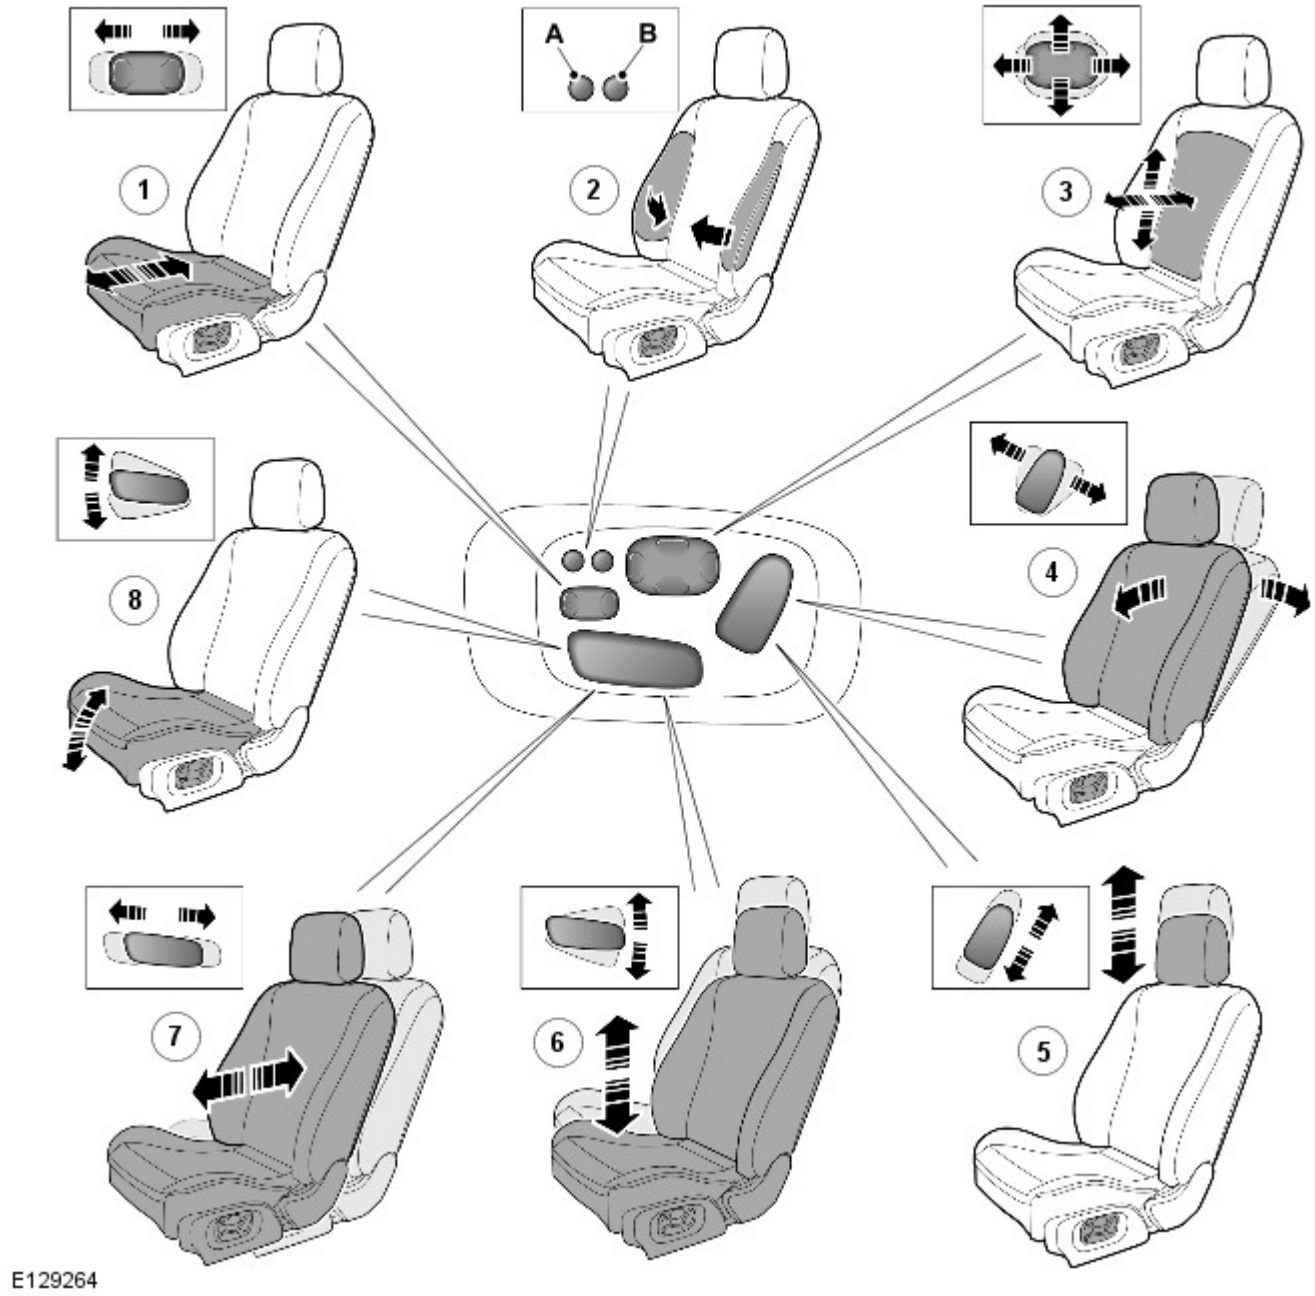
Component Description

FRONT SEATS ADJUSTMENT

Electric motors are used to provide adjustment of seat slide, seat height, squab recline and, where fitted, cushion tilt, head restraint and cushion extension. An air pump and inflatable cushions are used to provide adjustment of the lumbar support and the squab bolster supports (where fitted).

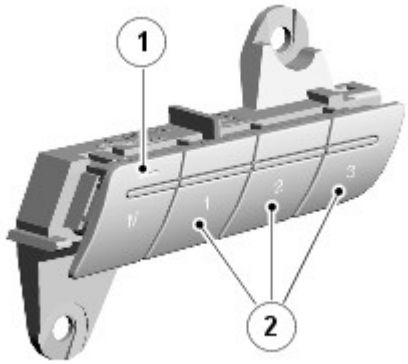
All of the seat adjustments are controlled from the seat switch pack on the outside of the seat cushion. On non memory seats, the control switches are connected directly to the adjustment motors. On memory seats, the switches are connected to the adjustment motors via a seat control module. Memory seats also have a memory switch pack in the related door panel.

Adjustment Switches



Item	Description
1	Cushion extension
2A	Bolster inflate
2B	Bolster deflate
3	Lumbar support (4-way shown; 2-way uses only fore/aft positions for inflate/deflate)
4	Squab recline
5	Head restraint
6	Seat height
7	Seat slide
8	Cushion tilt

Memory Switch Pack



Item	Description
1	Channel switches
2	Memory switch

Seat Motors

Each adjustment motor contains a Hall position sensor. The sensors provide position feedback signals which, on seats with a memory function, are used for memory store and recall operation.

The seat slide motor is an integral component of the cushion frame. The motor drives a gear on a worm drive lead screw, which is integral with the floor rail. The lead screw has a stop at each end to limit the fore and aft seat movement.

The seat height motor is located below the seat. The motor drives a gear on a lead screw. The lead screw moves a lever mechanism, which raises or lowers the seat cushion.

The squab recline motor is located in the squab frame. The recline motor rotates a shaft connected to the squab frame, which changes the angle of the squab.

The tilt motor is located below the seat. The tilt motor drives a gear on a lead screw to raise the front of the seat cushion.

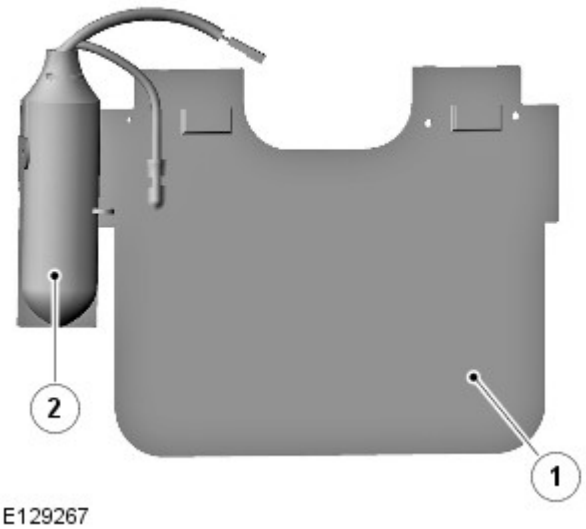
The head restraint motor is located in the upper section of the squab frame and is accessible by removal of the seat back. The motor moves a cradle by a rack and pinion arrangement. The cradle has two head restraint stems, which raise and lower the head restraint as the motor moves the cradle.

The cushion extend motor is located below the seat. The motor drives a gear on a lead screw, which extends or retracts the front of the seat cushion.

Lumbar Adjustment

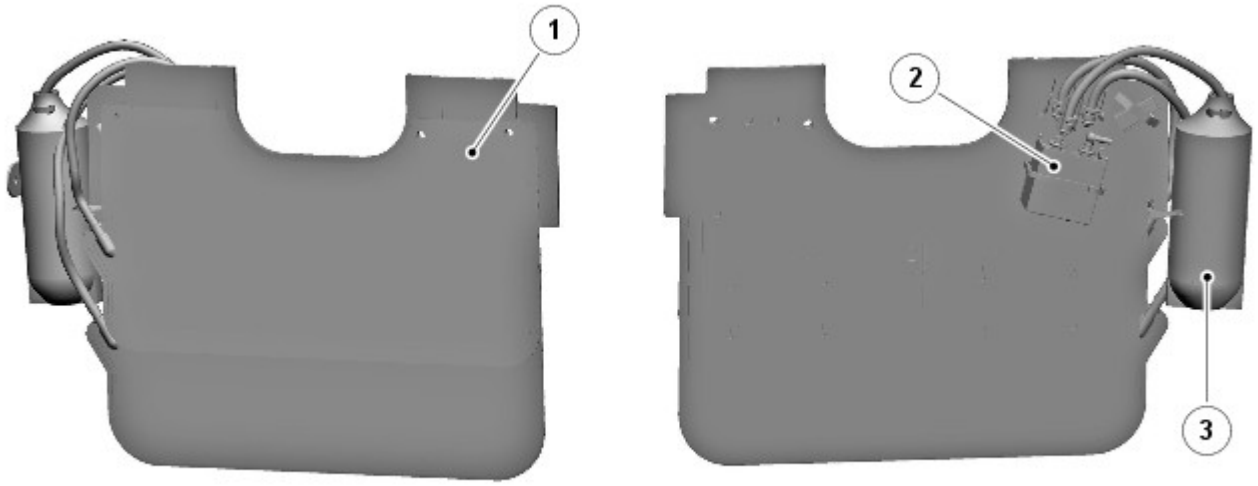
Lumbar adjustment is provided by a lumbar support and air pump installed in the squab. The lumbar support consists of an inflatable cushion with either a single air cell (2-way lumbar support) or dual air cells (4-way lumbar support), depending on vehicle specification. On vehicles with massage seats, the dual cell lumbar support is operated by the air pump of the massage system.

2-way Lumbar Support



Item	Description
1	Lumbar support
2	Air pump

4-way Lumbar Support



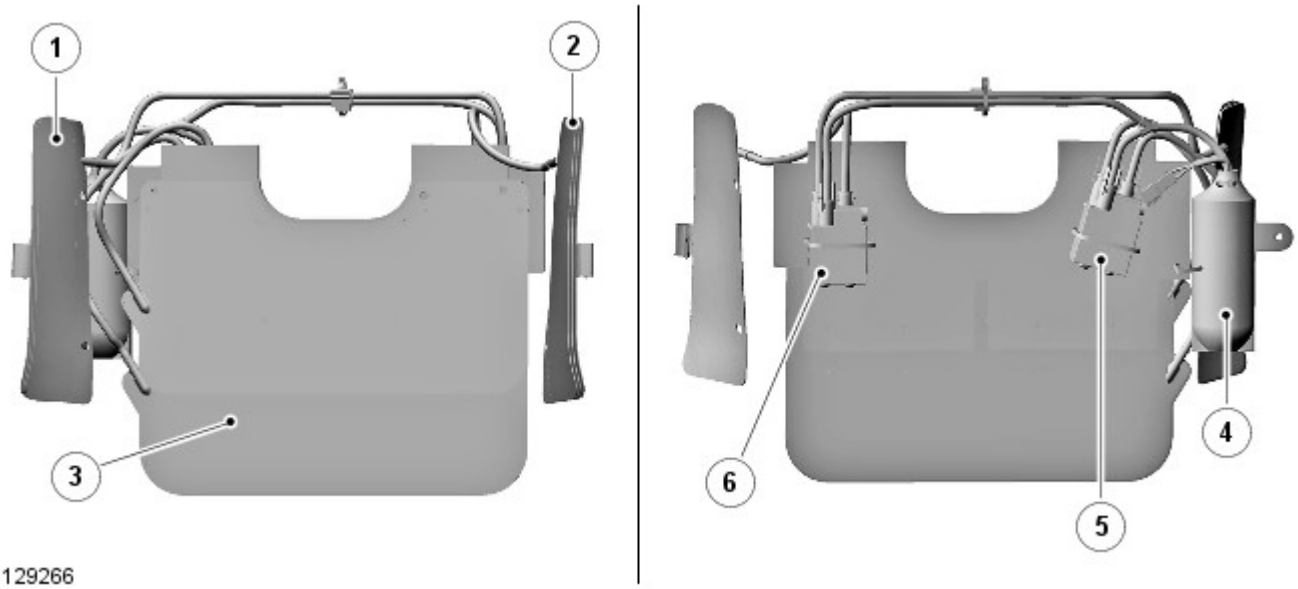
E129268

Item	Description
1	Lumbar support
2	Solenoid valves
3	Air pump

Squab Bolster Adjustment

Squab bolster adjustment is provided by inflatable cushions on the inside faces of the squab bolsters. The inflatable cushions are operated simultaneously by a solenoid valve block and the air pump of the lumbar support or the massage seat system. On vehicles with massage seats, the squab bolster solenoid valves are incorporated into the valve block containing the slave massage solenoid valves.

Squab and Lumbar Support



E129266

Item	Description
1	RH squab bolster support
2	LH squab bolster support
3	4-way lumbar support

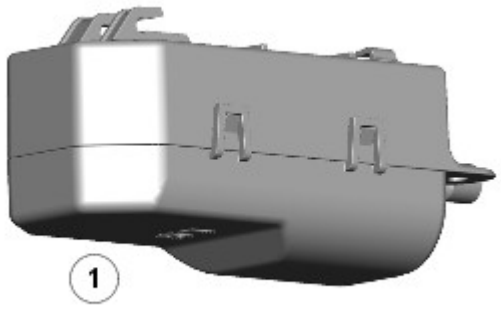
4	Air pump
5	Lumbar support solenoid valves
6	Squab support solenoid valves

MASSAGE FRONT SEATS

Where fitted, the massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar and squab bolster supports. The slave solenoid block also incorporates the solenoid valves used to control the squab bolster supports.

Operation of the massage system is controlled with START and STOP buttons on the climate menu of the TSD and is independent of the lumbar and squab bolster adjustments.

Air Pump



E121128

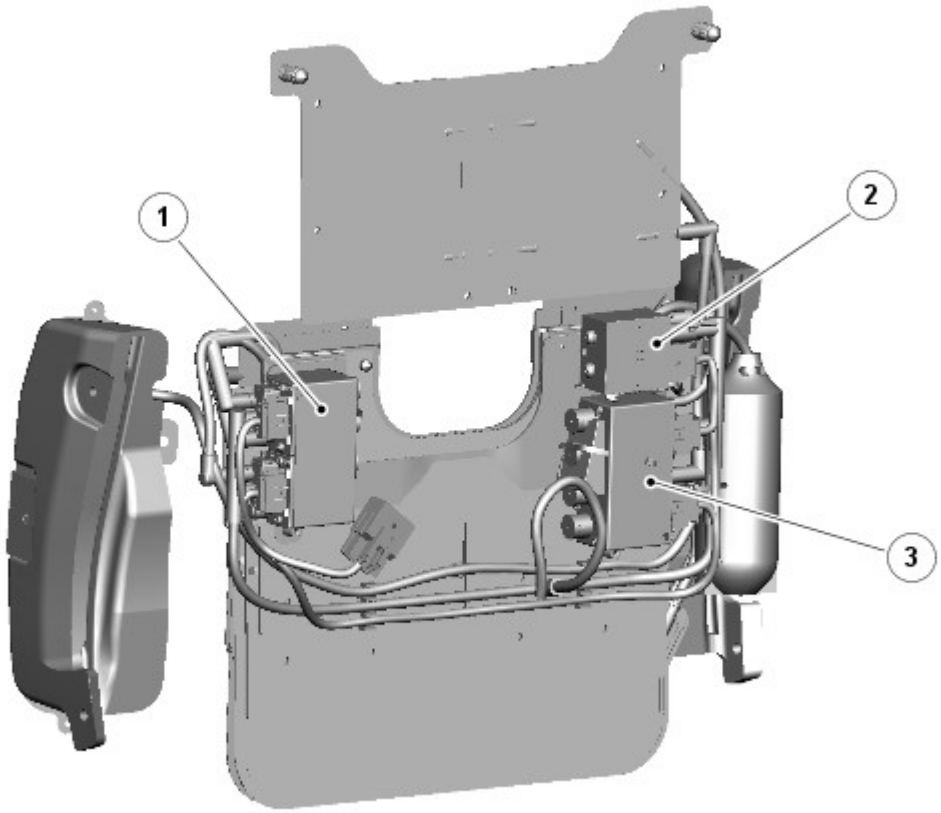
Item	Description
1	Air pump

The air pump is located underneath the seat at the rear of the squab. The pump is housed inside a NVH (noise, vibration and harshness) casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the lumbar solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in ^{2} .).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves

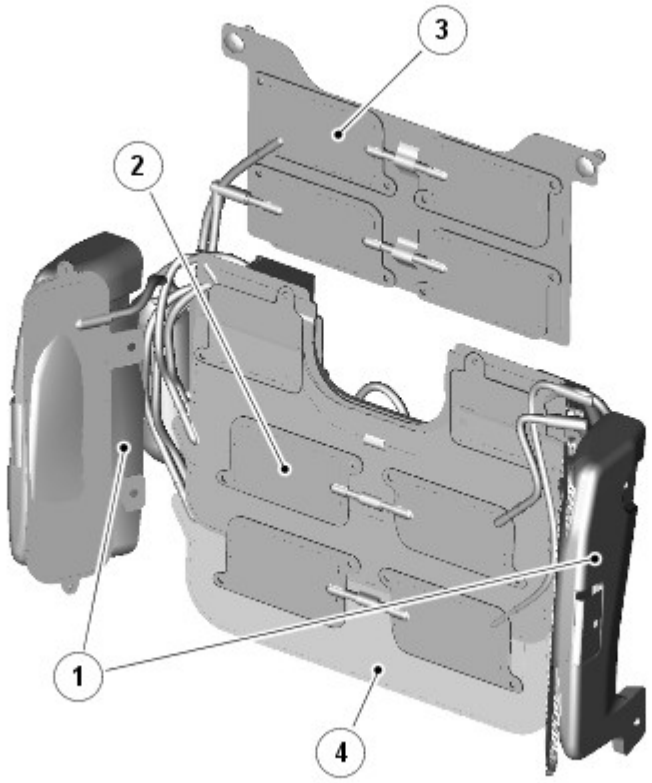


E121129

Item	Description
1	Master massage solenoid valves
2	Lumbar solenoid valves
3	Slave massage and adjustable bolster solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

Air Cell Pads



E121130

Item	Description
1	Squab bolster cells (2 off)
2	Lower massage cells (3 pairs)
3	Upper massage cells (2 pairs)
4	Lumber cells (2 off)

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in ^{2} .). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

HEATED FRONT AND REAR SEATS

Heated seats incorporate heater elements in the cushion and the squab of the seat. Power to the heater elements of the front seats is controlled by two seat heater modules attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Power to the heater elements of the two outside rear seats is controlled by two seat heater modules attached to a bracket on the back of the rear seat squab.

Each cushion heater element has a thermal sensor, which supplies a feedback temperature signal to the related seat heater module. The squab heater elements do not have a thermal sensor, and are regulated at the same temperature as the cushion heater elements.

Seat heating for the front and rear seats can be selected on the climate menu of the TSD. Seat heating for the rear seats can also be selected on the rear climate control panel. Three levels of heating are available. Heating can also be selected for either the cushion and the squab or just the squab.

CLIMATE FRONT AND REAR SEATS

Climate seats incorporate climate modules in the cushion and the squab of the seat. Operation of the climate modules of the front seats is controlled by a climate seat control module attached to a bracket on the cabin floor, under the carpet at the front left corner of the LH front seat. Operation of the climate modules of the two outside rear seats is controlled by a climate seat control module attached to the body, behind the of the rear seat squab.

The climate modules contain Peltier cells, which heat up or cool down depending on the voltage provided by the climate seat control module. Each climate module also contains a blower, which blows air over the Peltier cell to distribute the heated or cooled air through liners in the related cushion or squab. The blower is also controlled by the climate seat control module.

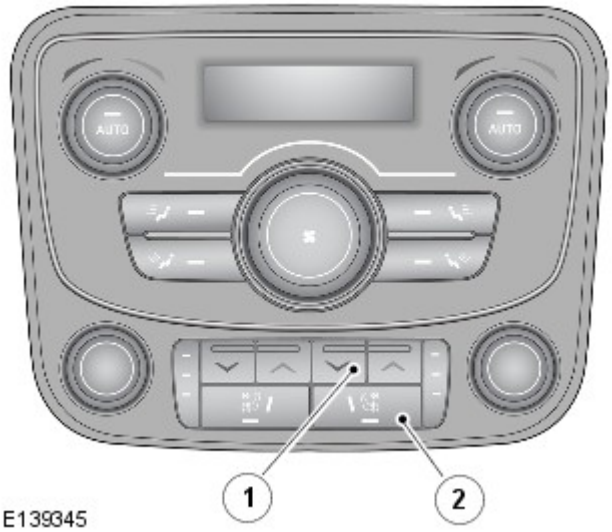
Seat heating and cooling for the front and rear seats can be selected on the climate menu of the TSD. Seat heating and cooling for the rear seats can also be selected on the rear climate control panel. Three levels of heating and three levels of cooling are available. Heating and cooling can also be selected for either the cushion and the squab, or just the squab.

Touch Screen Display

E129269

Item	Description
1	Temperature control buttons
2	Zone control button
3	Massage control buttons

Rear Climate Control Panel



E139345

Item	Description
1	Temperature control switch
2	Zone control switch

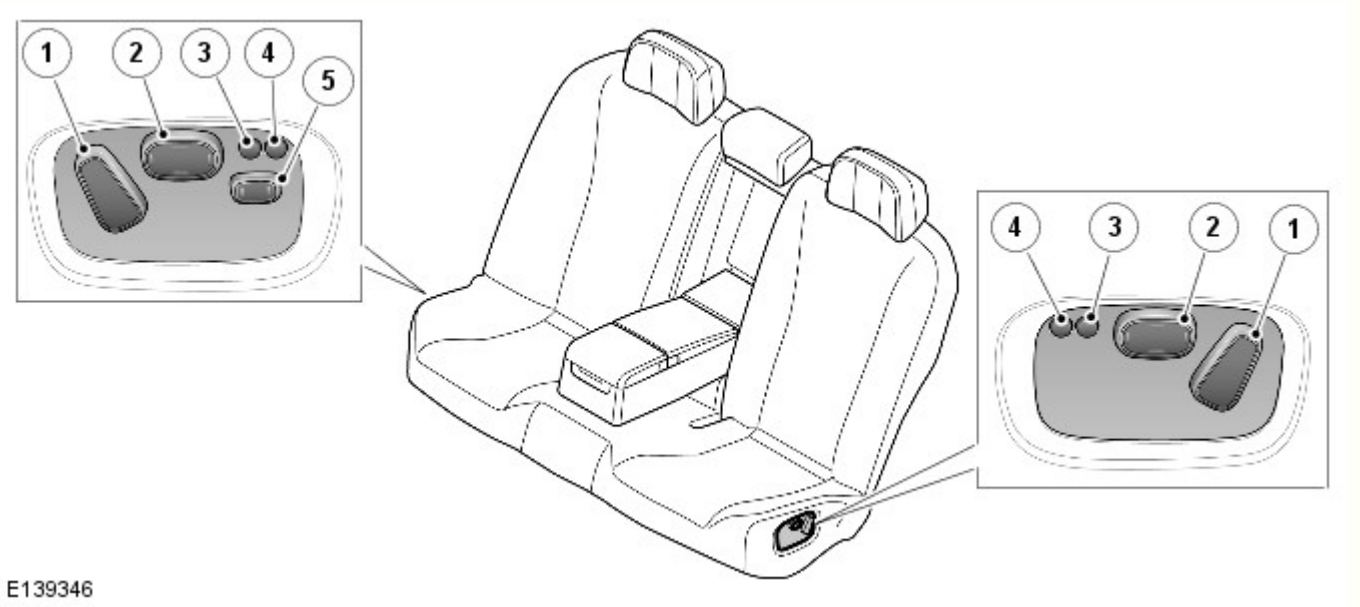
REAR SEATS ADJUSTMENT

An electric recline motor is used to provide adjustment of seat squab recline. An air pump and inflatable cushions are used to provide adjustment of the lumbar support.

All of the seat adjustments are controlled from the seat switchpack on the outside of the seat cushion. The control switches are connected via a LIN bus to the seat control module to the adjustment motors via a seat control module.

Rear seat switchpack functions are disabled if the rear window isolation switch has been activated.

Adjustment Switches (LHD (left-hand drive) version shown



Item	Description
1	Seat squab recline control
2	Lumbar support adjustment
3	Massage OFF
4	Massage ON
5	Front passenger seat away - forward or rearward adjustment

The rear seat control switchpack on the passenger side of the vehicle also has a front passenger seat away switch. This switch when pressed will move the front passenger seat forwards or backwards to allow more room for the rear seat passenger on that side. A second switch for this function is located on the inside face of the front passenger seat back to allow the driver to operate the function.

Front Passenger Seat Away Switch

E139347

The front passenger seat way function allows the driver to adjust the position of the front passenger seat using a switch located on the passenger seat bolster.

The two-way rocker switch allows the driver to move the front passenger seat forward or rearwards to adjust leg room for the rear seat passenger.

The rear seat adjustment switchpack for the rear seat behind the front passenger seat, has an additional two-way switch to move the front passenger seat forwards or rearwards, allowing the passenger to adjust the available leg room.

MASSAGE REAR SEATS

Where fitted, the rear seat massage system in each seat consists of an air pump, air cell pads, master and slave solenoid valve blocks. The air pump is also used for adjustment of the lumbar supports.

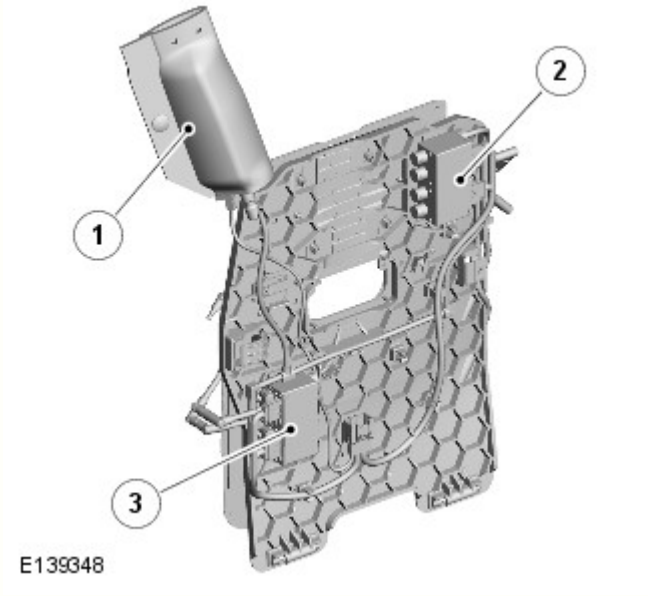
Operation of the massage system is controlled with START and STOP buttons on the rear seat adjustment switches.

The air pump is located at the rear of the squab. The pump is housed inside a NVH casing to cut down the pump operation sound level. Operation of the air pump is controlled by the master solenoid valve block.

The maximum pump pressure is controlled by a pressure relief valve in the slave solenoid valve block. The maximum pressure range is 310.5 to 379.5 mbar (4.5 to 5.5 lbf/in2.).

A thermal protection device in the air pump stops pump operation if the temperature increases to 72±4 °C (162±7 °F). The pump will not re-start until 10 minutes after the temperature decreases below the cut-off temperature.

Solenoid Valves



Item	Description
1	Air pump
2	Slave massage solenoid valves
3	Master massage solenoid valves

The master and slave solenoid valve blocks control the air supply to the massage air cells. During air cell deflation excess air is exhausted to atmosphere through the relevant solenoid valve block exhaust port.

The massage air cells are located in two pads in the front of the seat squab. The lower pad contains three separate pairs of cells, the upper pad contains two separate pairs of cells.

During operation the pressure of the air cells is approximately 207 to 379 mbar (3 to 5.5 lbf/in2.). This variation is due to the inflate time given to each air cell, the flow rate of the pump and the maximum pressure of the system.

System Operation

PRINCIPLES OF OPERATION

Operation of the heating and ventilation system is controlled by the ATC module.
Refer to: Control Components (412-01 Climate Control, Description and Operation).

The system can be operated in automatic or manual mode, with temperature settings selected using the switches on the integrated control panel and, on four zone systems, the rear climate control panel.

When the engine is running, coolant is constantly circulated through the heater core by the engine coolant pump.

The blower is supplied with power from the blower relay on the RJB and connected to ground via the blower control module. The blower control module regulates the voltage across the blower motor to control blower speed. The voltage set by the blower control module is controlled by a PWM (pulse width modulation) signal from the ATC module. The ATC module uses a feedback signal from the blower control module to monitor blower speed.

The heater assembly controls the temperature and flow of air supplied to the air distribution ducts. The heater assembly is mounted on the vehicle centerline, between the instrument panel and the engine bulkhead. The heater assemblies on two and four zones systems are the same.

The heater assembly consists of a casing that contains an A/C (air conditioning) evaporator, a heater core, distribution control doors and temperature control doors. On 3.0L diesel vehicles, the heater assembly also contains a PTC (positive temperature coefficient) electric booster heater.

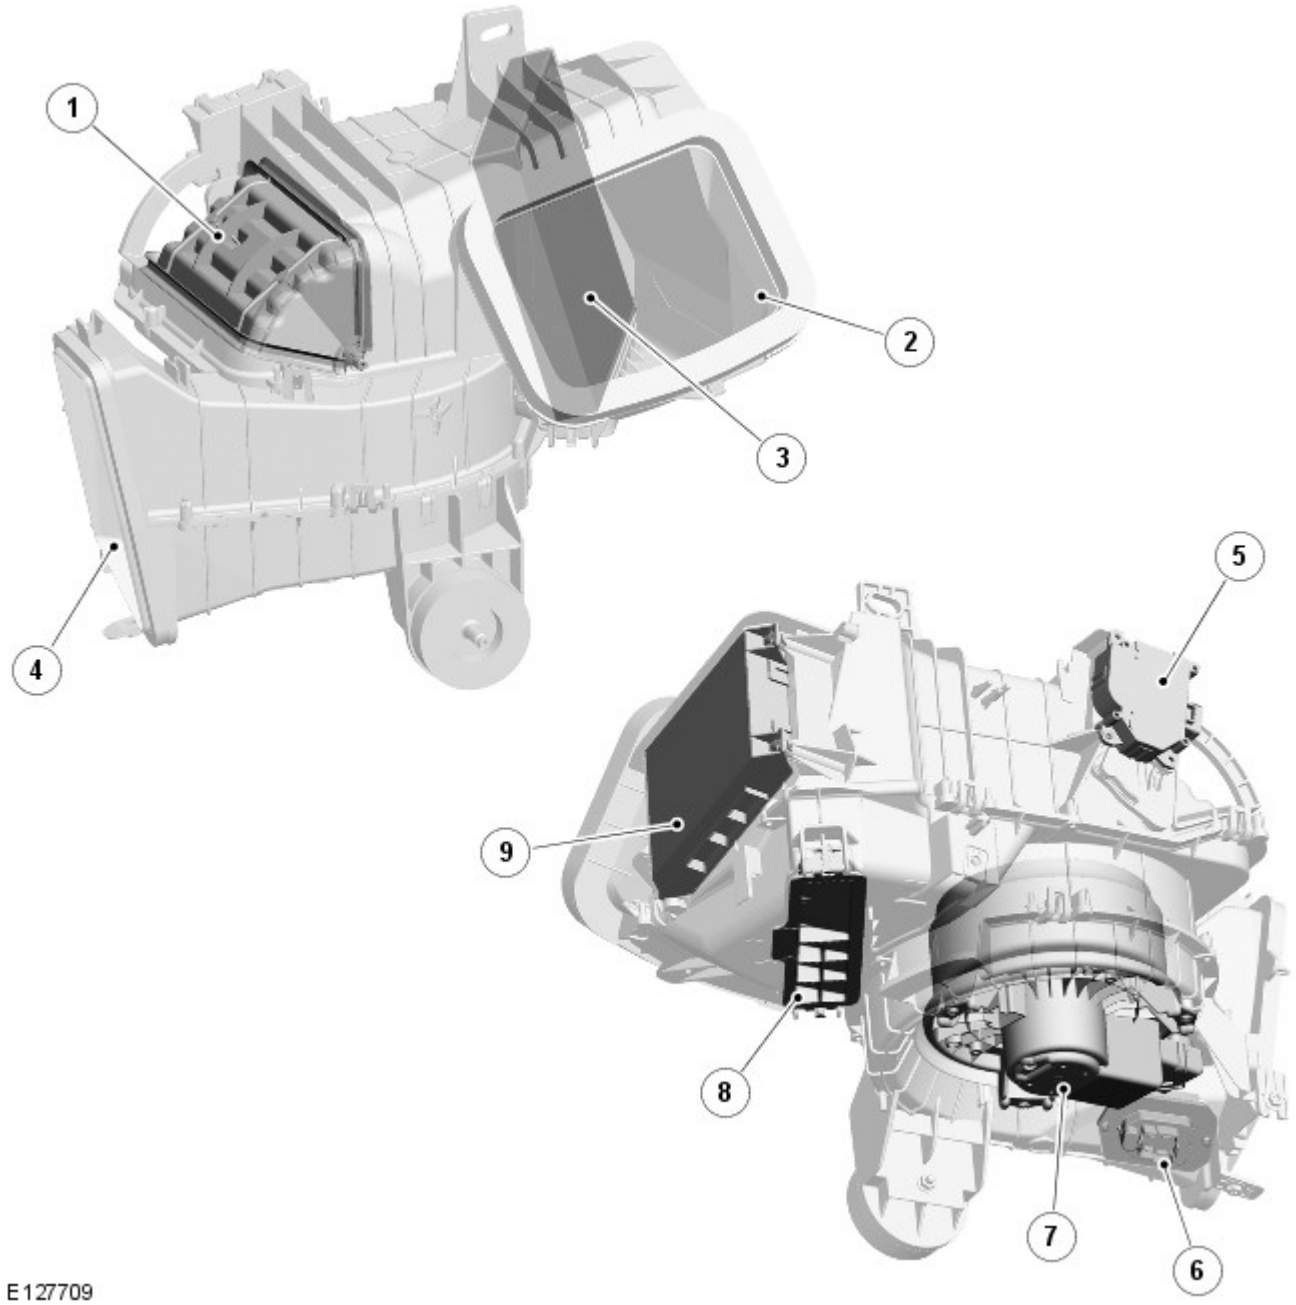
Mounted on the heater casing are 13 stepper motors. Each of the stepper motors is connected to either a distribution control door or a temperature control door.

NOTE: The stepper motors are particularly susceptible to low voltage and a range of stepper motor DTC (diagnostic trouble code) 's are likely due to low voltage at engine crank. Only take note of these if it is a permanent fault that recurs persistently.

The evaporator is part of the A/C system.
Refer to: Air Conditioning (412-01 Climate Control, Description and Operation).

The heater core provides the heat source to warm the air supplied to the passenger compartment. The heater core is an aluminum two pass, fin and tube heat exchanger, and is installed across the width of the heater housing. Two aluminum tubes attached to the heater core extend through the engine bulkhead and connect to the engine cooling system.

AIR INLET DUCT



E127709

Item	Description
1	Air inlet door (in fresh air position)
2	Air inlet
3	Pollen filter
4	Air outlet
5	Fresh air/recirculation servo motor
6	Blower control module
7	Blower
8	Pollen filter cover
9	ATC module

The air inlet duct connects the fresh air inlet in the engine bulkhead to the heater assembly. The air inlet duct is installed behind the instrument panel on the passenger side.

The air inlet duct consists of a casing that contains a pollen filter, an air inlet door, a blower and a blower control module. A recirculation air inlet is incorporated into the casing. A servo motor mounted on the casing is connected to the air inlet door, to allow selection between fresh and recirculated air.

The pollen filter is installed in the fresh air inlet of the air inlet duct. A cover on the underside of the air inlet duct allows access for replacement of the pollen filter.

The blower regulates the volume of air flowing through the air inlet duct to the heater assembly. The blower consists of an open hub, centrifugal fan and an electric motor.

The blower control module regulates the power supply to the blower motor. The blower control module is installed in the air inlet duct downstream of the blower, where any heat generated during operation is dissipated by the air flow.

VENTILATION OUTLETS

The ventilation outlets allow the free flow of air through the passenger compartment. The outlets are installed in the LH and RH rear quarter panels, behind the rear bumper. Each ventilation outlet consists of a grille covered by a soft rubber flaps, and is effectively a non-return valve. The flaps open and close automatically depending on the pressure differential between the air inside and outside the vehicle.

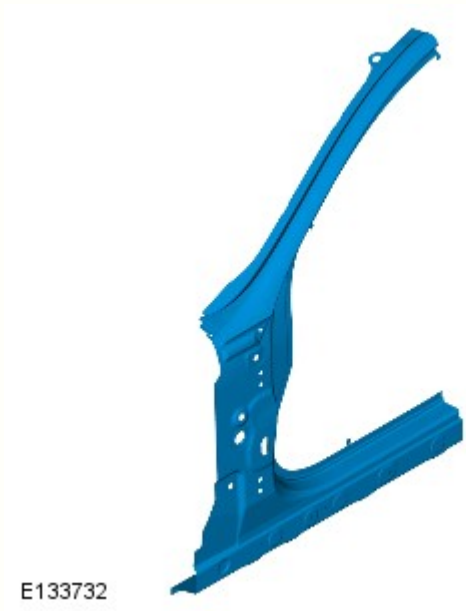
Side Panel Sheet Metal Repairs - A-Pillar Outer Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The A-pillar outer panel is a category A repair.



2. NOTE: The A-pillar outer panel is manufactured from aluminium alloy 6111-T4.

The A-pillar outer panel is serviced as a separate welded, bonded and riveted panel.

3. The A-pillar outer panel is replaced in conjunction with:
   - Front bumper cover
   - Hood
   - Hood hinge
   - Front door
   - Front fender
   - Headliner
   - Windshield glass remove and install
   - Instrument panel upper section

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Disconnect the generator electrical connectors.

7. Remove the front fender.
For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

8. Remove the hood hinge.
For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

9. If the passenger side A-pillar outer panel is to be installed, remove the hood release cable.

10. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

11. If the drivers side A-pillar outer panel is to be installed, remove the pedal box.

12. If the drivers side front side member and suspension top mount assembly is to be replaced, remove the brake master cylinder and brake booster.
For additional information, refer to: Brake Master Cylinder (206-06 Hydraulic Brake Actuation, Removal and Installation) / Brake Booster (206-07 Power Brake Actuation, Removal and Installation).

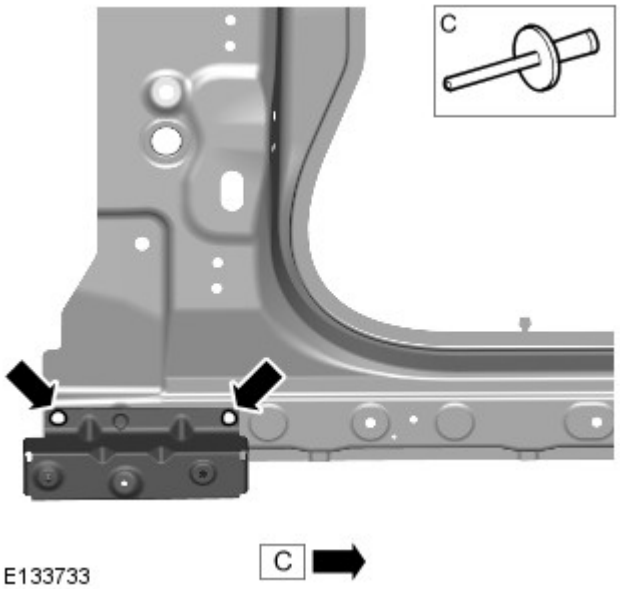
13. Remove the headliner.
For additional information, refer to: Headliner (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

15. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20B Supplemental Restraint System, Removal and Installation).

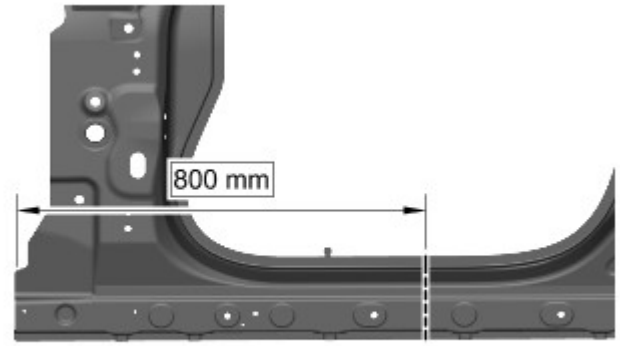
16. Remove any remaining miscellaneous components from the repair area as necessary.

17. Release the A-pillar outer panel wiring harness and position it to one side.



18. NOTE: If the front fender lower mounting bracket is undamaged, retain for re-use on installation.

Remove the monobolts as indicated.

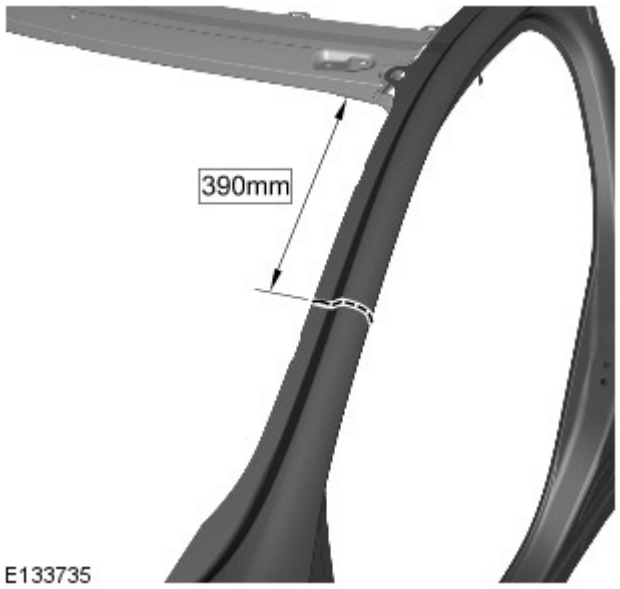


E133734

19. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old panel as indicated.



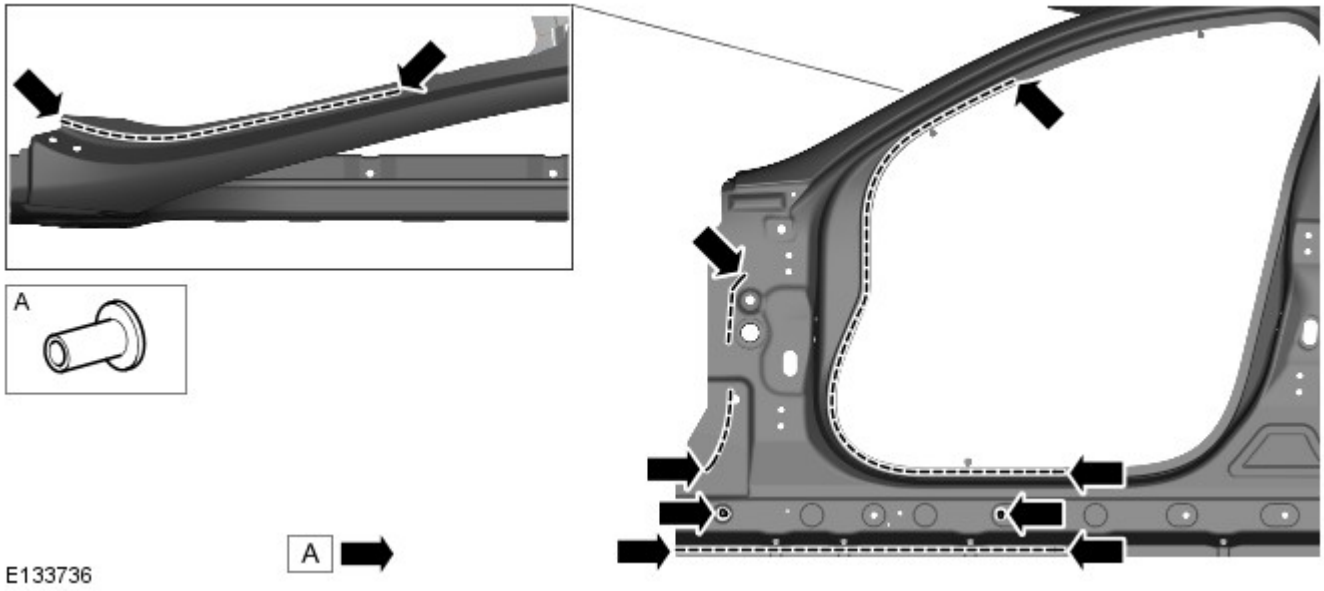
E133735

20. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old panel as indicated.

21. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets in the areas indicated.



E133736

22. NOTES:

Retain the old panel remnant as it will be used in installation.

Remove and retain the noise, vibration and harshness (NVH) component, if it is to be reused.

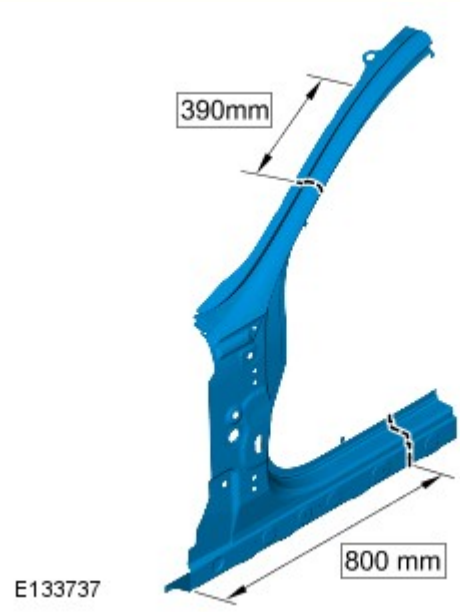
Separate the joints and remove the old panel, also releasing the NVH components.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.



4. NOTE: Retain the remnants of the new panel as these may be used for backing strips on installation.

Using the old panel for reference, measure, mark and cut the new A-pillar outer panel at the points where the MIG butt joints are to be made as indicated.

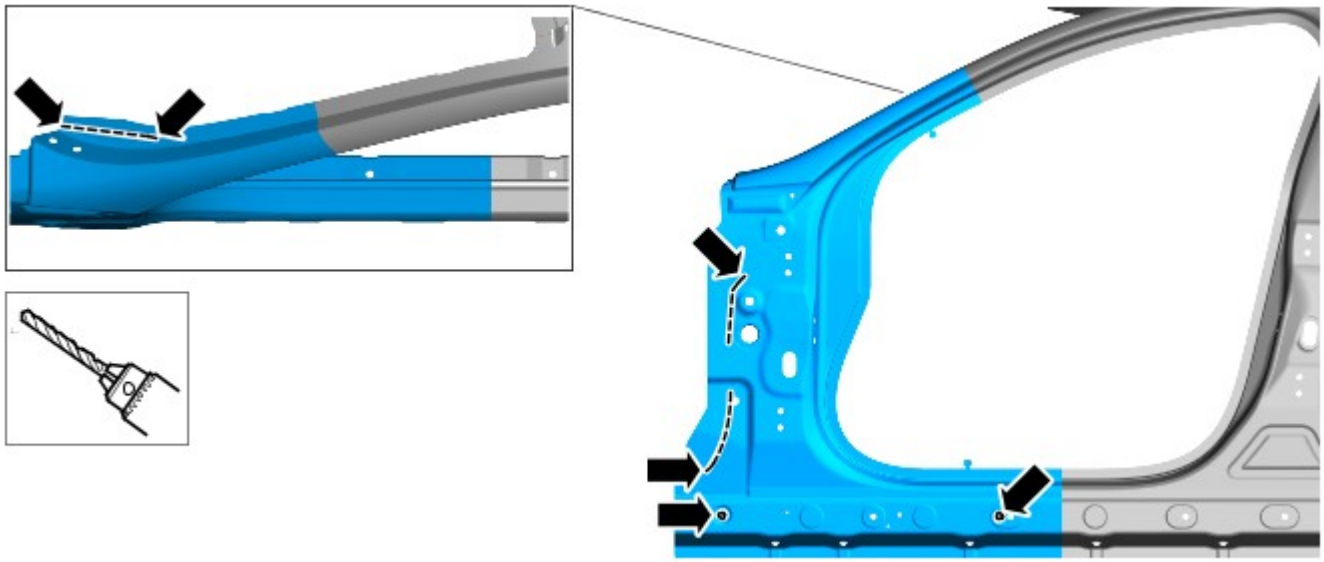
5. Debur the new panel.

6. Trim, clean and prepare the lower NVH component.

7. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

8. NOTE: The Hemloks will be installed adjacent to the original self piercing rivet location holes.

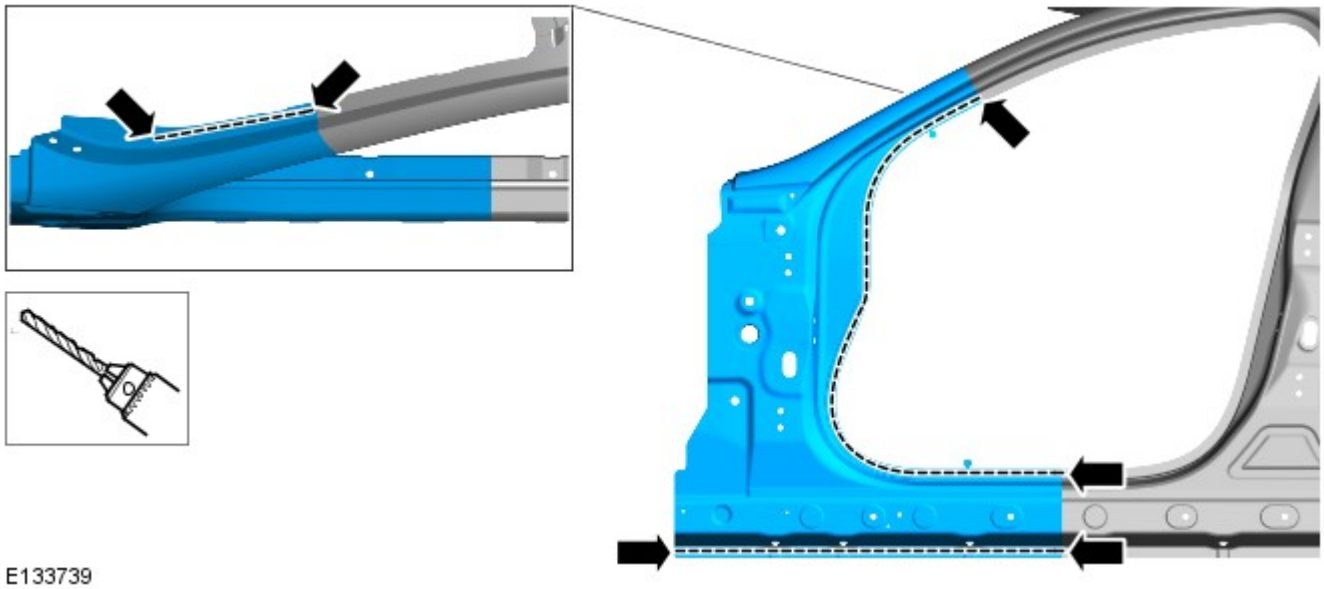
Using the old panel for reference, measure the positions of the removed self piercing rivet locations and mark these onto the new panel. Using a 6.5mm Cryobit drill bit, drill holes adjacent to these locations at the points where Hemloks are to be installed as indicated.



E133738

9. NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

Where the pitch of the removed self piercing rivets is 25mm or less, or there is no access for the ESN50, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes on the vehicle, into the new panel. Hemloks will be installed in these locations when the new A-pillar outer panel is installed.



E133739

10. Remove the new panel.

11. NOTE: The backing plates should be an interference fit.

Fabricate backing plates from the old A-pillar outer panel remnant. Debur and offer up the backing plates to the vehicle. If correct proceed to next step, if not, rectify and recheck before proceeding.

12. Remove the backing plates.

13. Fabricate run-on/run-off tabs from the old A-pillar outer panel remnant.

14. Debur the run-on/run-off tabs.

15. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

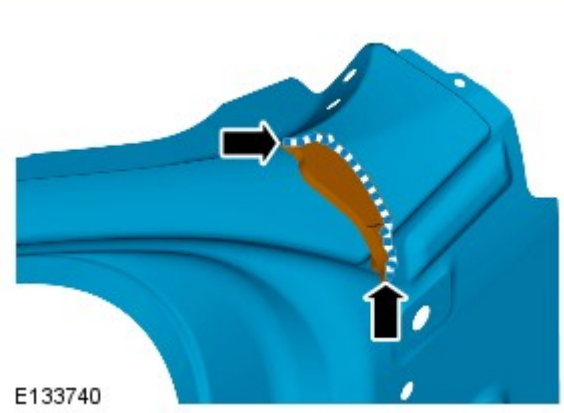
16. Using a Roloc fine bristle disc, clean and prepare the old and new panel joint surfaces.

17. NOTE: The backing plates are installed with an interference fit.

Install and align the backing plates to the vehicle.

18. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

19. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

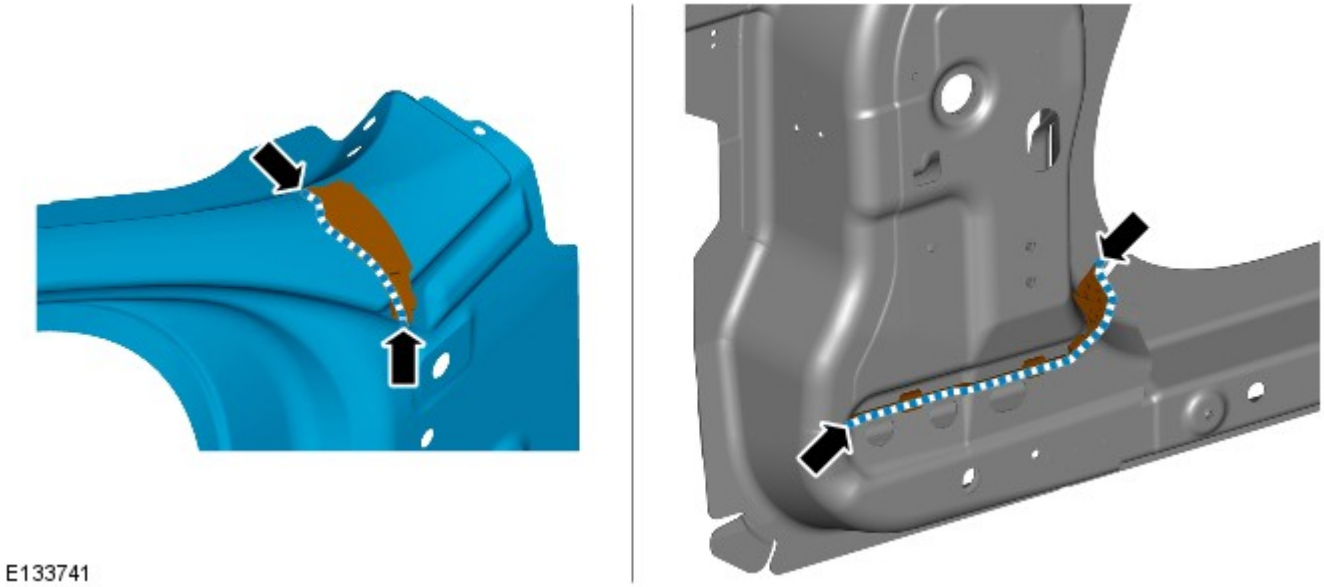


20. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the upper NVH component and install to the new A-pillar outer panel as indicated.

21. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the upper and lower NVH components.



E133741

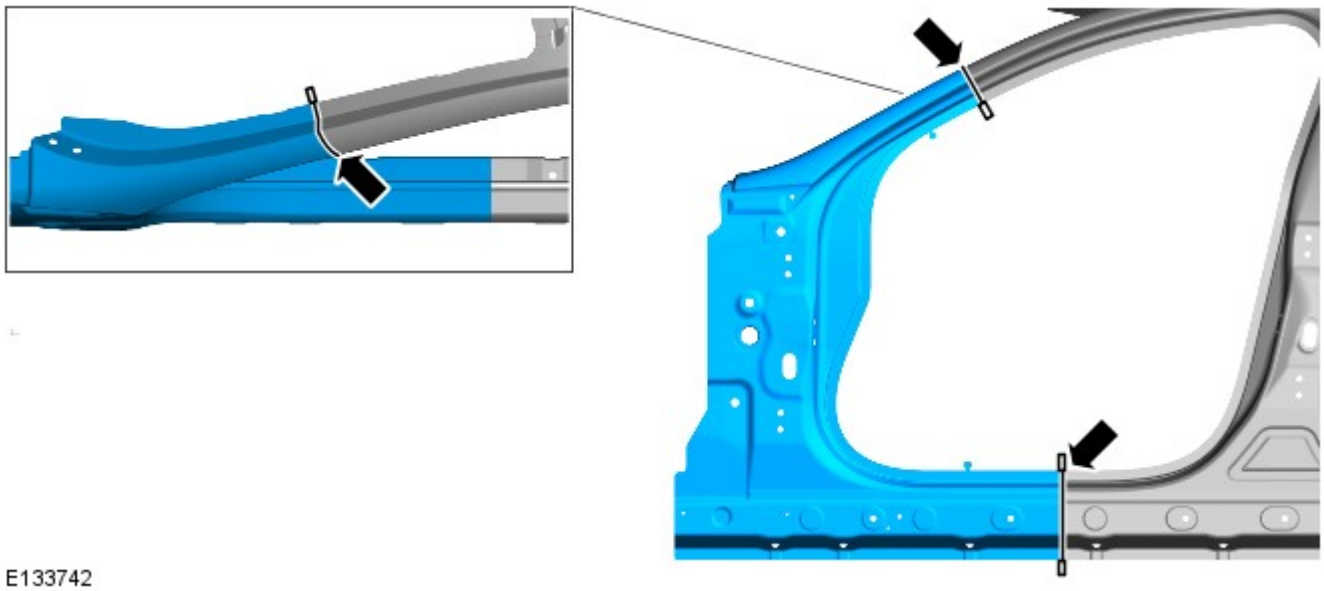
22. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

23. Offer up the new panel, align and clamp into position.

24. Tack weld the run-on/run-off tabs to all MIG butt joints.

25. MIG weld the MIG butt joints.



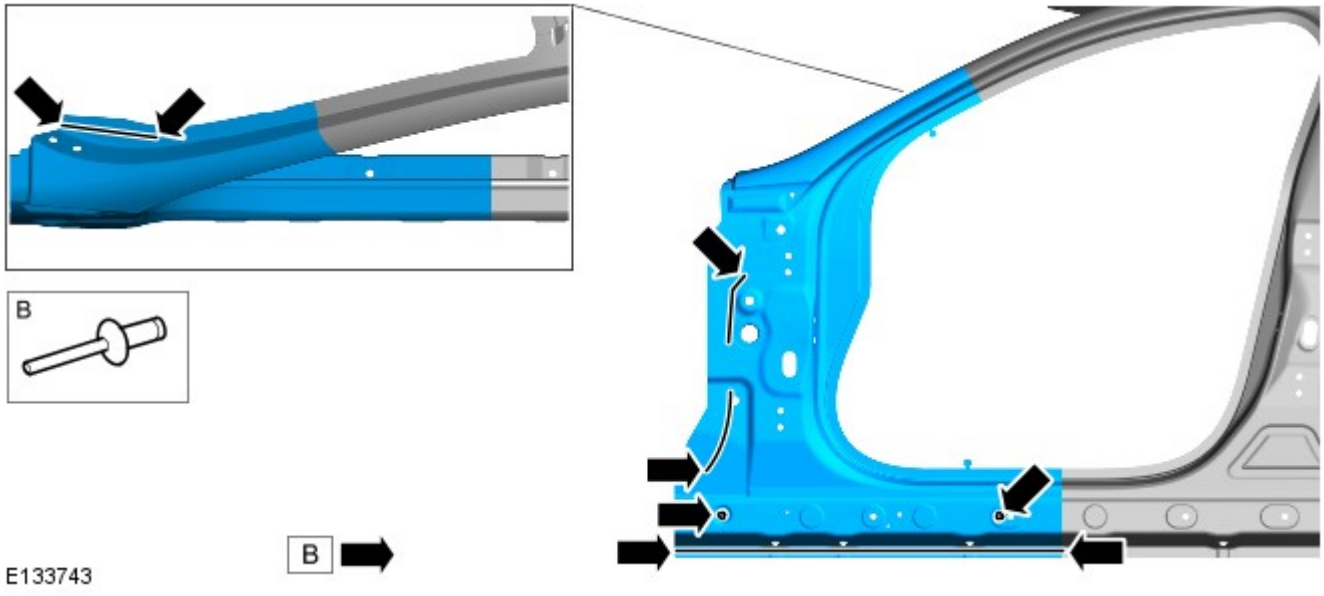
E133742

26. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install any remaining Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



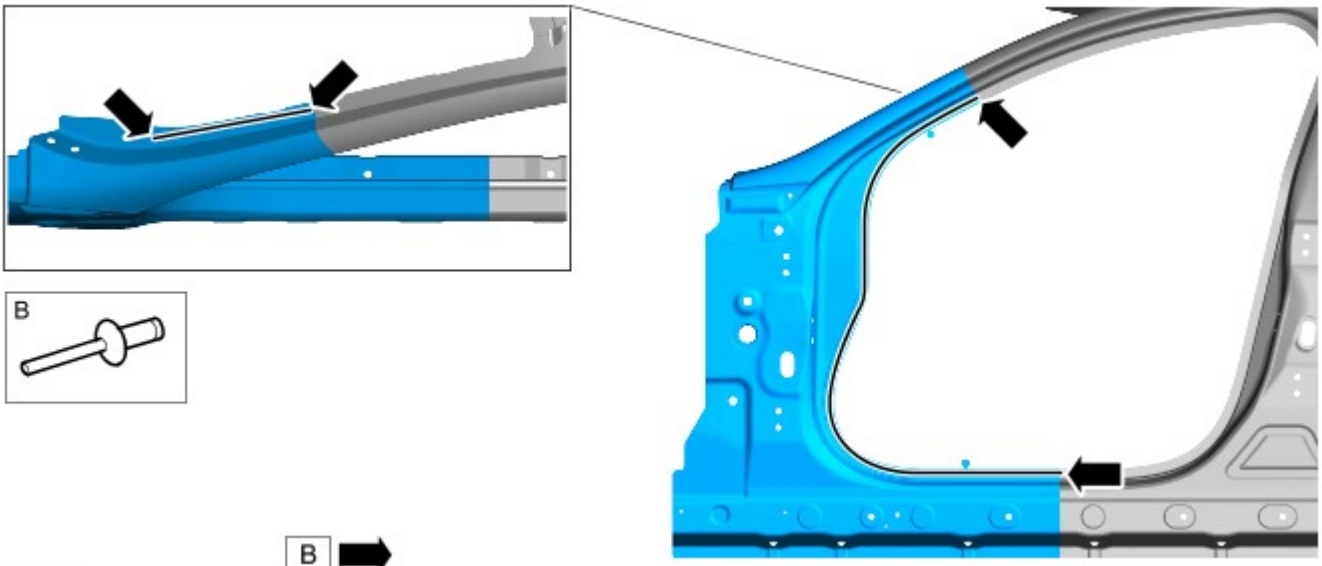
27. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install any remaining Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



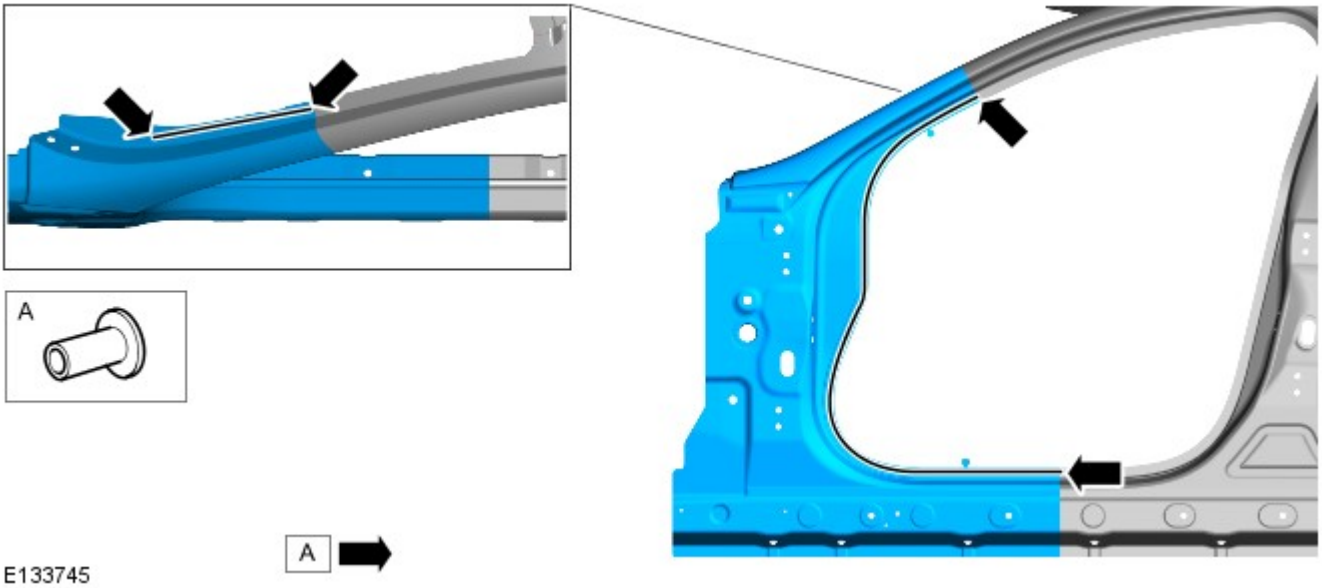
28. NOTES:

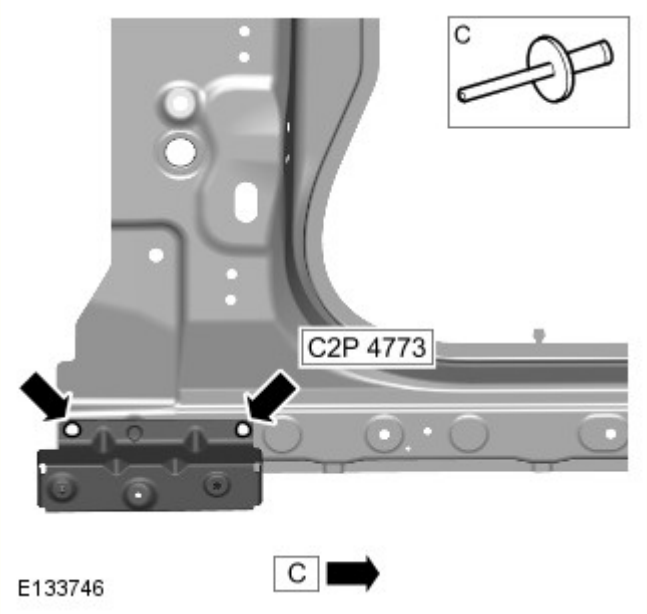
Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595





29. Using the Genesis G4, install the Monobolts to the front fender lower mounting bracket as indicated.

30. Remove any excess adhesive.

31. Remove the run-on/run-off tabs.

32. Dress the welded joints.

33. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

34. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

35. The installation of associated panels and components is the reversal of removal procedure.

Removal and Installation

Special Tool(s)

	JLR-412-147 Remover, Register

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

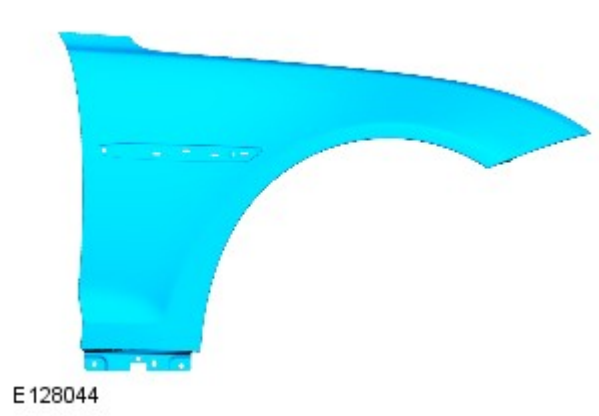
Front End Sheet Metal Repairs - Front Fender

Removal and Installation

Removal

1. The front fender is a category B repair.



E128044

2. NOTE: The front fender is manufactured from aluminium alloy 6111-T4.

   The front fender is serviced as a separate bolt-on panel.

3. The front fender is replaced in conjunction with:
   - Front bumper cover

     NOTE: Removal of the front door allows access to the front fender retaining bolts.

   - Front door

4. WARNING: The front fender and its associated components form part of the pedestrian protection system, it is essential that any repair or replacement operations do not affect the safe working of the system.

   For additional information relating to the pedestrian safety system please see the following:
   For additional information, refer to: Pedestrian Protection System (501-20C Pedestrian Protection System, Description and Operation).

5. For additional information relating to this repair procedure please see the following:
   For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. If the right-hand front fender is to be repaired, remove the windshield washer reservoir.
   For additional information, refer to: Windshield Washer Reservoir (501-16 Wipers and Washers, Removal and Installation).

8. Remove the headlamp assembly.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation) / Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

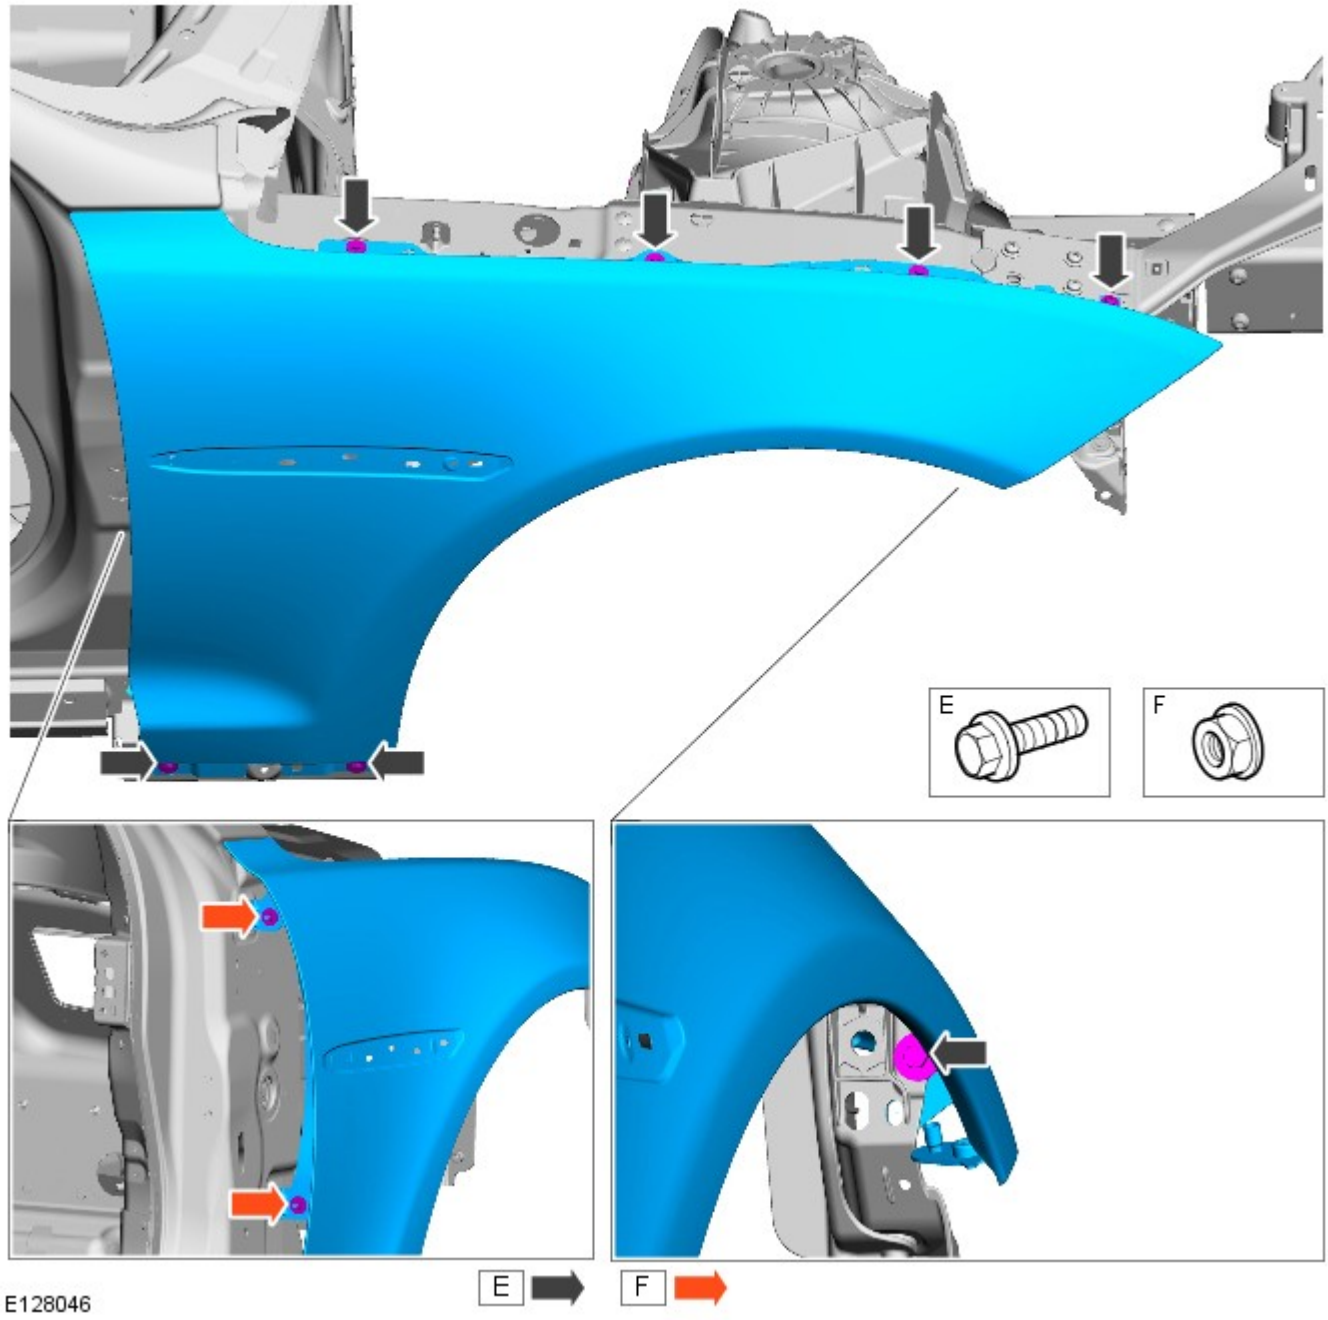
9. Remove the rocker panel outer moulding.

10. Remove the front door.
For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

11. Remove the plastic trim covering the front fender upper rear retaining nut.

12. NOTE: If necessary, remove and retain the front fender to A-pillar mounting brackets.

Remove the front fender retaining bolts.



13. NOTE: Do not disassemble further if the component is removed for access only.

Remove the front fender moulding.

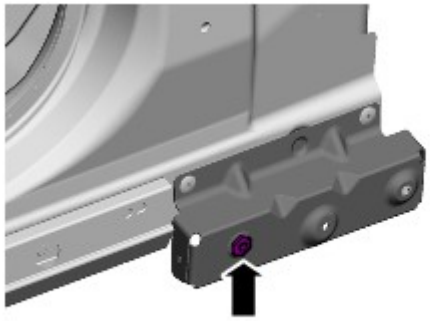
Installation

1. Clean and prepare the panel joint surfaces where the sealer adhesive is to be applied.

2. NOTES:

If necessary, install the front fender to A-pillar mounting brackets to the front fender.

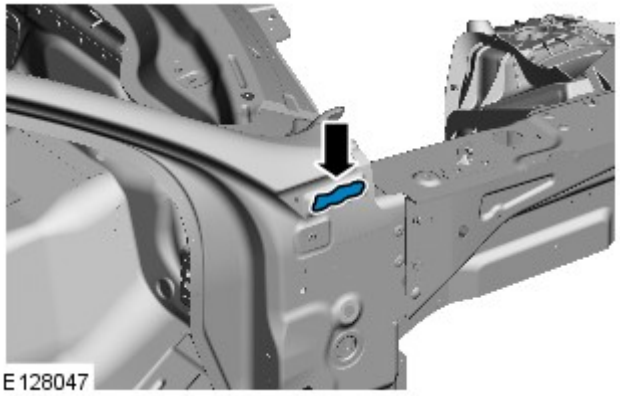
To aid alignment of the front fender to the front door, there is an adjustable mounting in the rocker panel where the front fender mounts.



E128048

Offer up the front fender and the front door. Check alignment, if correct proceed to next step, if not rectify and recheck before proceeding.

3. Remove the front fender and the front door.



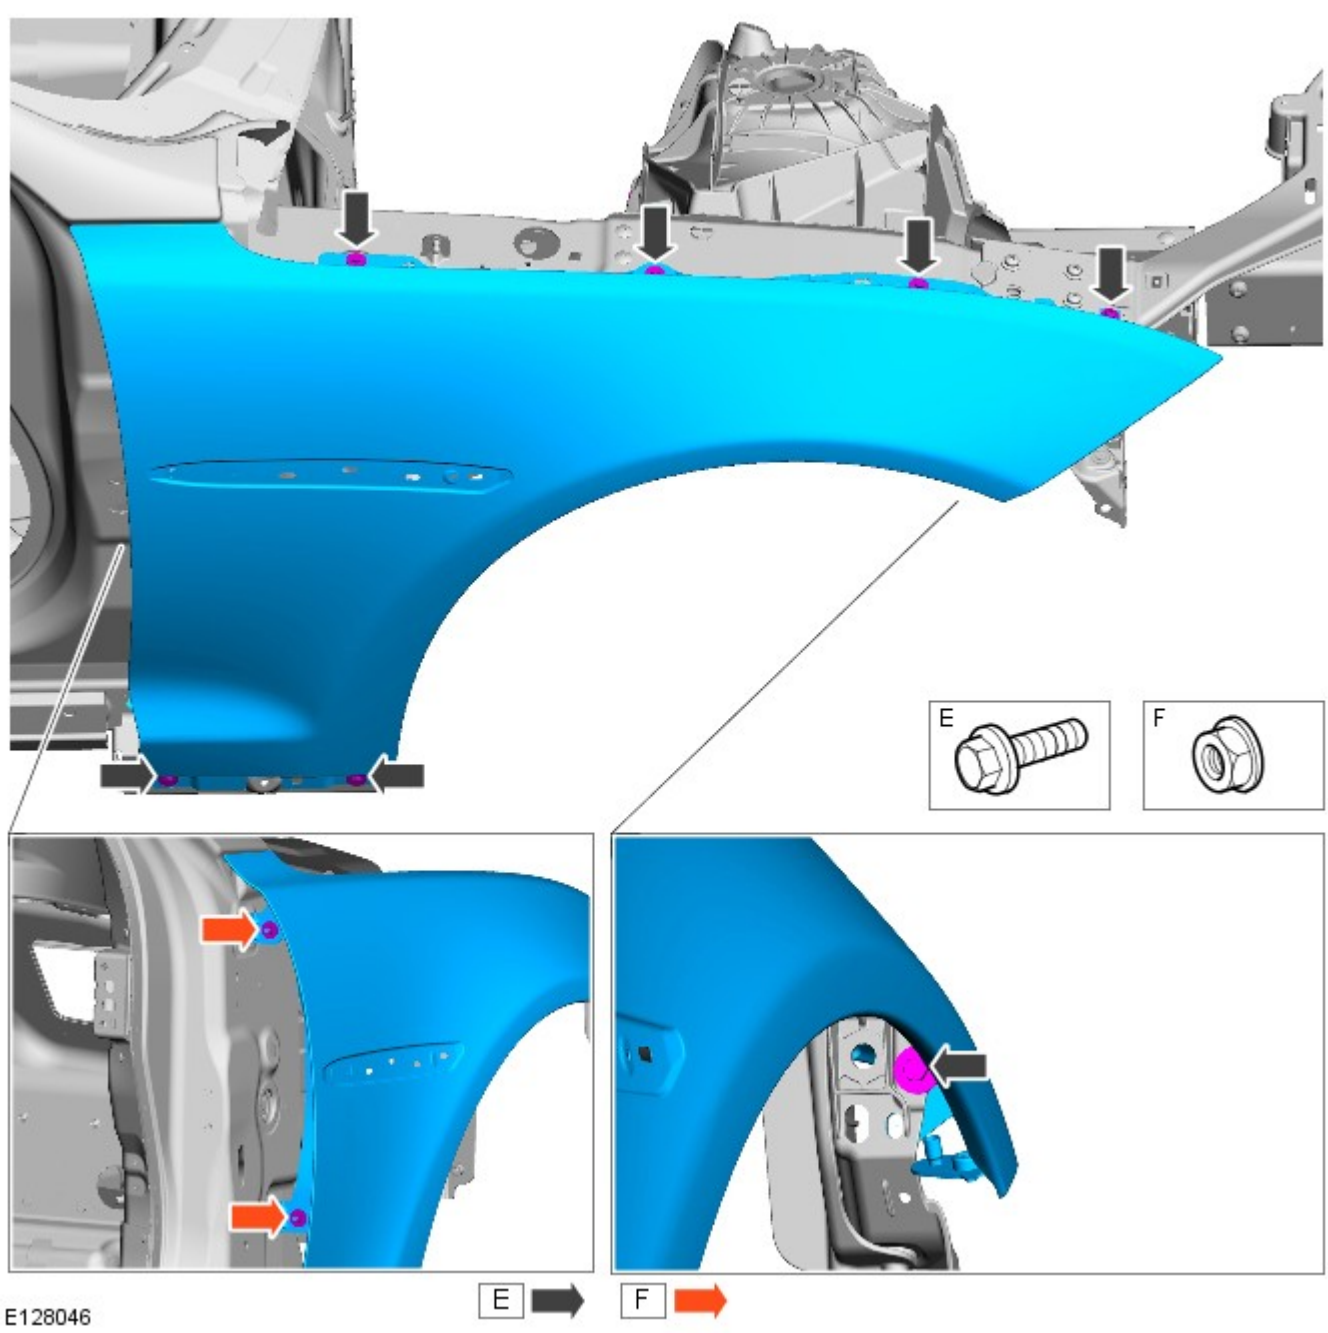
E128047

4. Apply sealer adhesive to the noise, vibration and harshness (NVH) components.

5. Offer up the front fender and the front door. Check alignment, if correct proceed to next step, if not rectify and recheck before proceeding.

NOTE: Bolts are pre-coated to inhibit galvanic corrosion and can be reused only if the coating is not damaged.

- Tighten to 10 Nm.



6. Remove the front door.

7. Install the plastic trim covering the front fender upper rear retaining nut.

8. The installation of associated panels and components is the reversal of removal procedure.

Published: 28-Dec-2012

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Hydraulic Brake Actuation - Brake Master Cylinder

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. WARNING: Make sure to support the vehicle with axle stands.

   Raise and support the vehicle.

2. CAUTIONS:

   Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

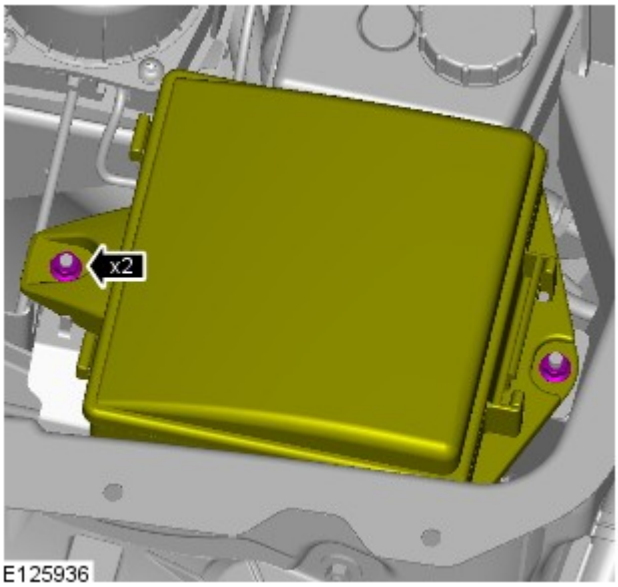
   Be prepared to collect escaping fluids.

   Make sure that all openings are sealed. Use new blanking caps.

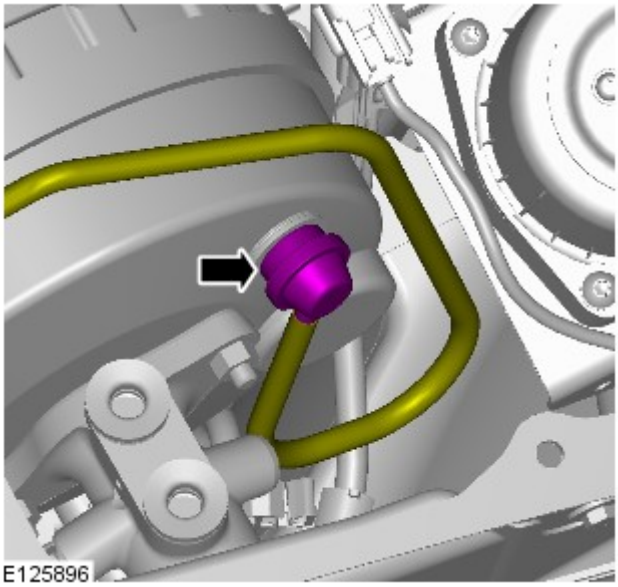
   For additional information, refer to: Brake Fluid Reservoir (206-06 Hydraulic Brake Actuation, Removal and Installation).

Right-hand drive vehicles

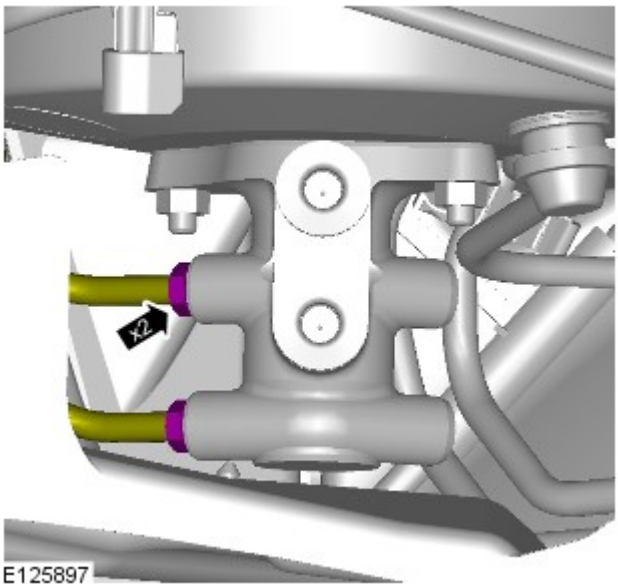
3. TORQUE: 4 Nm



All vehicles



4.

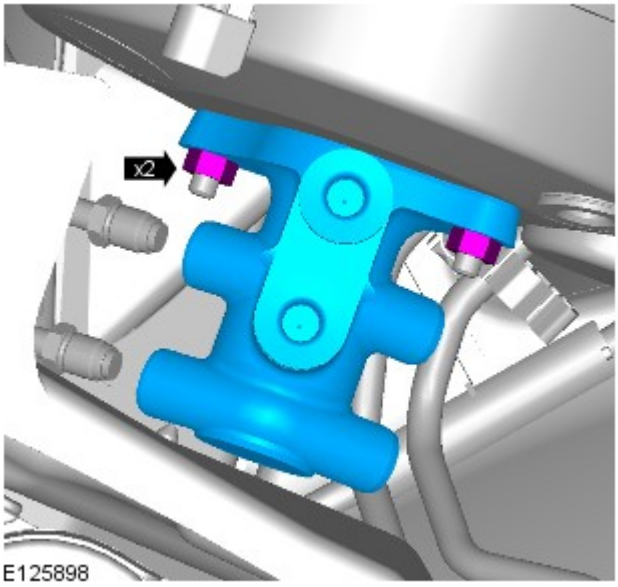


5. CAUTIONS:

Make sure that all openings are sealed. Use new blanking caps.

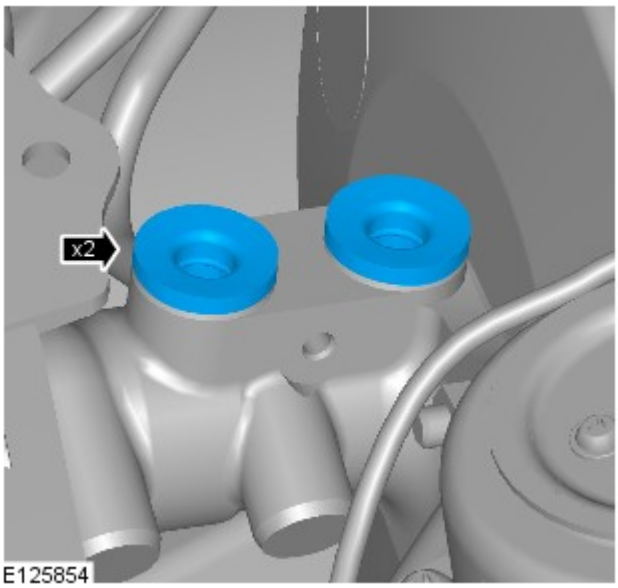
Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

TORQUE: 17 Nm



6. • TORQUE: 25 Nm
   • Install new retaining nuts.

Installation



1. CAUTION: Make sure the master cylinder is correctly aligned. Failure to make sure the master cylinder is correctly aligned to the brake booster actuation rod may cause component damage or poor brake performance.

   • Install new brake fluid reservoir seals.
   • Install a new O-ring seal.

2. To install, reverse the removal procedure.

Front End Sheet Metal Repairs - Hood Hinge

Removal and Installation

Removal

1. The hood hinge is a category B repair.

2. NOTE: The hood hinge is manufactured from mild steel.

The hood hinge is serviced as a separate bolt-on panel.

E128354

3. NOTE: The hood hinges deform during the pedestrian protection system deployment process and will need to be installed.

The hood hinge is replaced in conjunction with:

- Hood

4. WARNING: The hood hinge and its associated components form part of the pedestrian protection system, it is essential that any repair or replacement operations do not affect the safe working of the system.

For additional information relating to the pedestrian safety system please see the following:
For additional information, refer to: Pedestrian Protection System (501-20C Pedestrian Protection System, Description and Operation).

5. For additional information relating to this repair procedure please see the following:

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).

- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety

- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

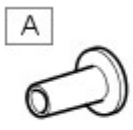
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

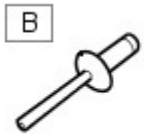
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

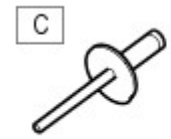
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

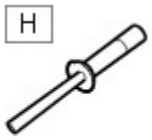
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

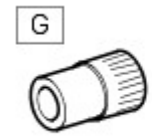
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

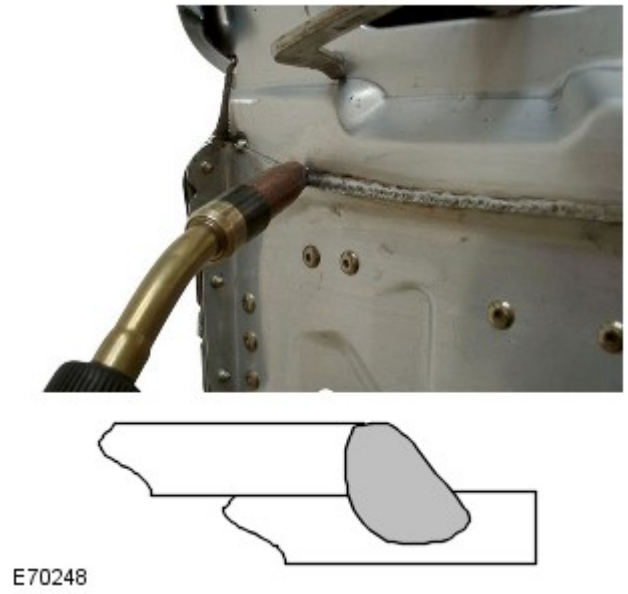
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

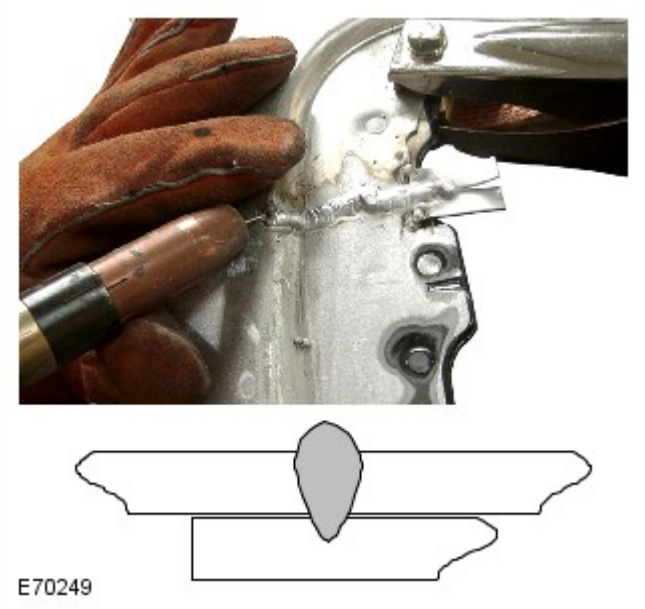
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

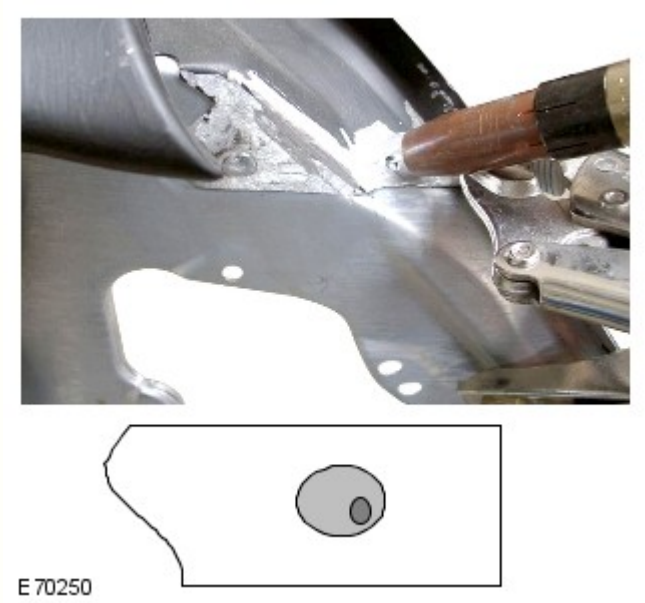
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

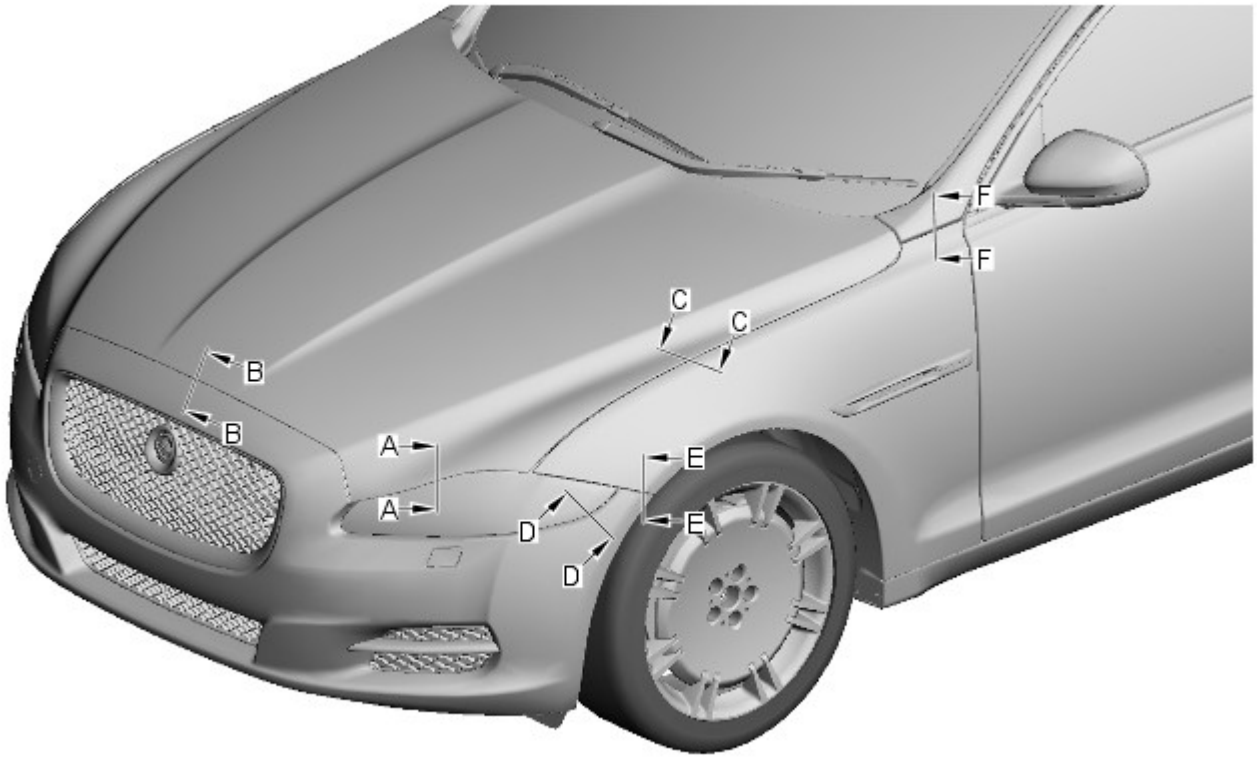
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

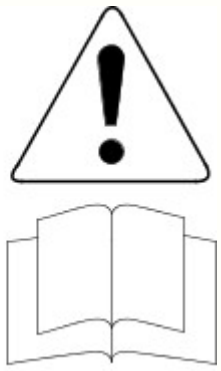
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

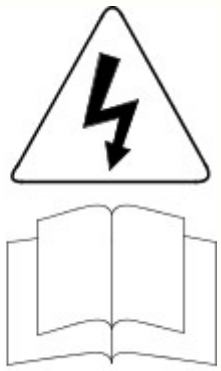
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



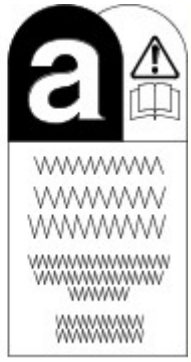
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



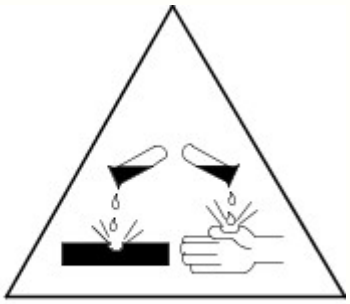
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Published: 10-Feb-2012

Supplemental Restraint System - Side Air Curtain Module

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Take extra care when handling supplemental restraint system (SRS) components.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Refer to: Interior Rear View Mirror (501-09 Rear View Mirrors, Removal and Installation).

3. Refer to: Overhead Console (501-12 Instrument Panel and Console, Removal and Installation).

4. NOTE: The procedure must be carried out on both sides.

Refer to: Sun Visor (501-05 Interior Trim and Ornamentation, Removal and Installation).

5. NOTE: The procedure must be carried out on both sides.

Refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

6. NOTE: The procedure must be carried out on both sides.

Refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

7. NOTE: The procedure must be carried out on both sides.

Refer to: C-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

8. NOTE: The procedure must be carried out on both sides.

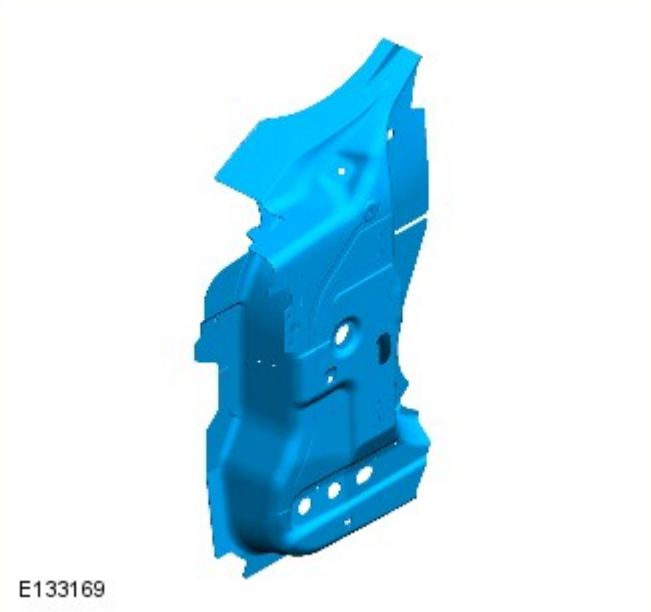
Side Panel Sheet Metal Repairs - A-Pillar Reinforcement

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation or, is being replaced in combination with panels other than those listed.

1. The A-pillar reinforcement is a category A repair.



2. NOTE: The A-pillar reinforcement is manufactured from aluminium alloy 5754-NG.

The A-pillar reinforcement is serviced as a separate rivetted and bonded panel, it includes its inner reinforcements.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The A-pillar reinforcement is replaced in conjunction with:
- Front bumper cover
- Hood
- Hood hinge
- Front door
- Front fender
- Hood latch panel
- A-pillar outer panel
- Fender apron panel closing panel
- Headliner
- Windshield glass remove and install
- Instrument panel upper section

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Remove the fender apron panel closing panel.
For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

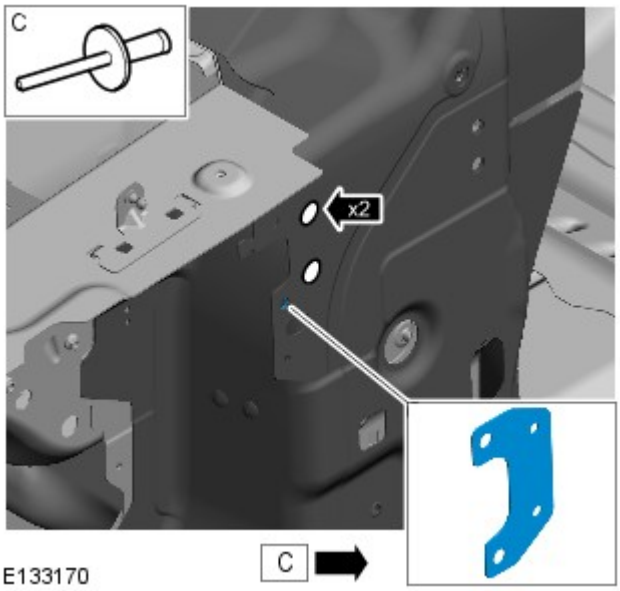
8. Remove the A-pillar outer panel.
For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

9. Remove the hood hinge.
For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

10. Release the A-pillar wiring harness and position it to one side.

11. Remove any remaining miscellaneous components from the repair area as necessary.

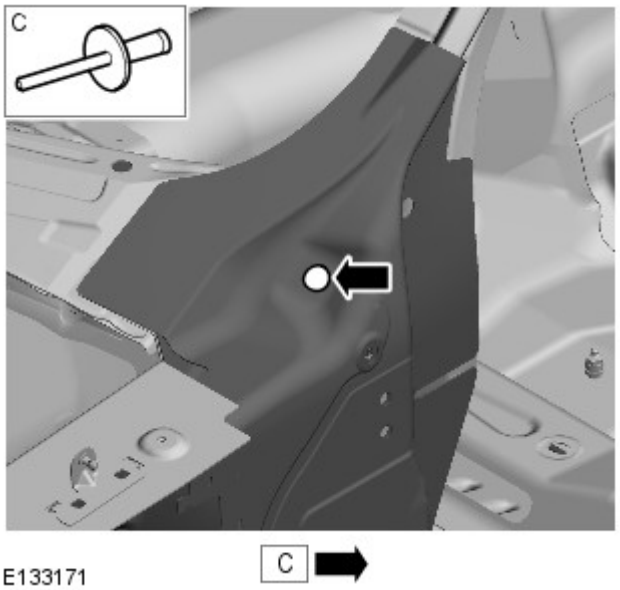
12. Prior to removal, mark the position of the A-pillar reinforcement in relation to adjacent panels, for ease of alignment on installation.



E133170

13. NOTE: If the fender apron panel closing panel bracket is to be installed, it is not necessary to remove it. Retain if being re-used.

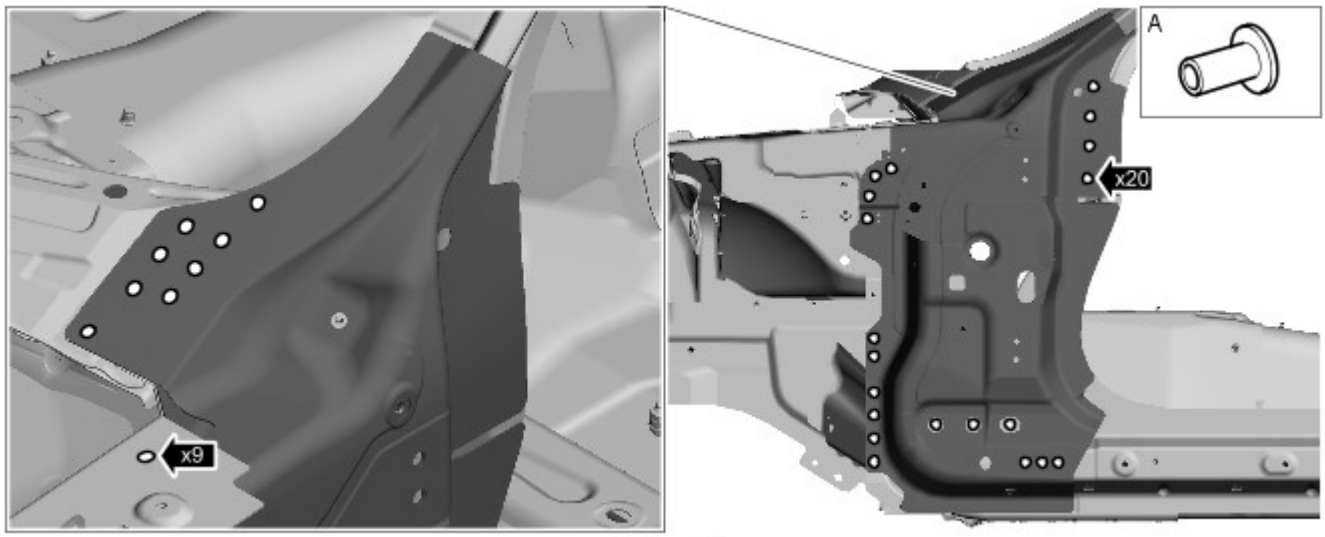
Remove the Monobolts, to release the fender apron panel closing panel bracket as indicated.



E133171

14. Remove the Monobolt as indicated.

15. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.



E133172

16. NOTES:

Retain the old panel as it will be used as a template.

Remove and retain the noise, vibration and harshness (NVH) components, if they are to be reused.

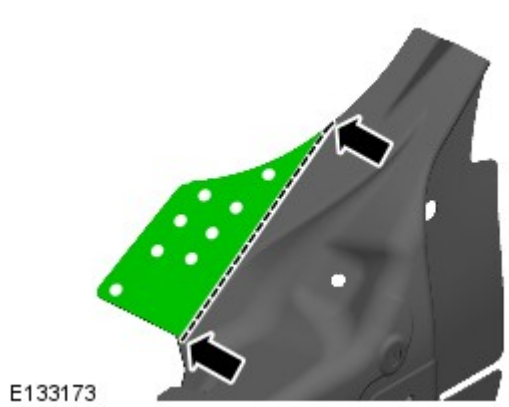
Separate the joints and remove the old panel, also releasing the inner NVH component.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

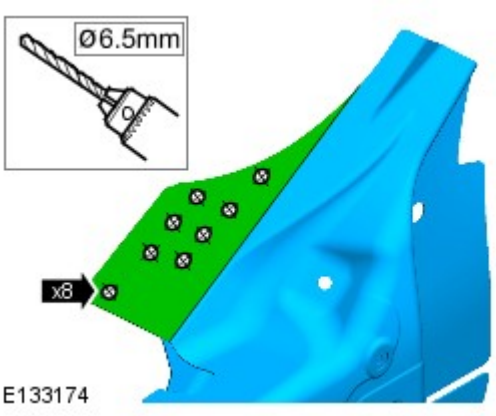
3. Cut a template from the old A-pillar reinforcement panel remnant as indicated.



E133173

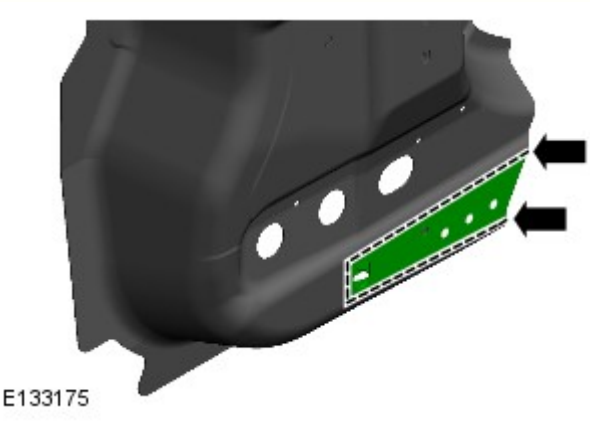
4. Clean and dress the template.

5.



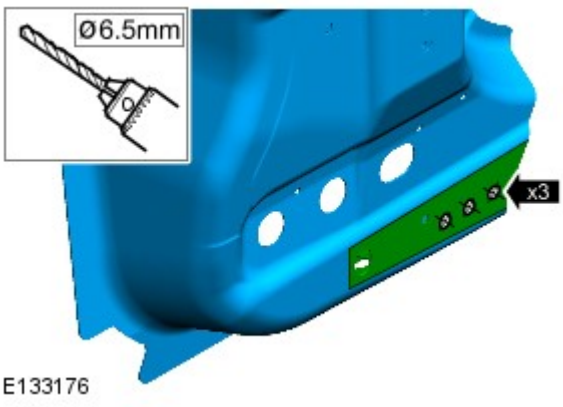
Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

6. Remove the template.



7. Cut a template from the old A-pillar reinforcement panel remnant as indicated.

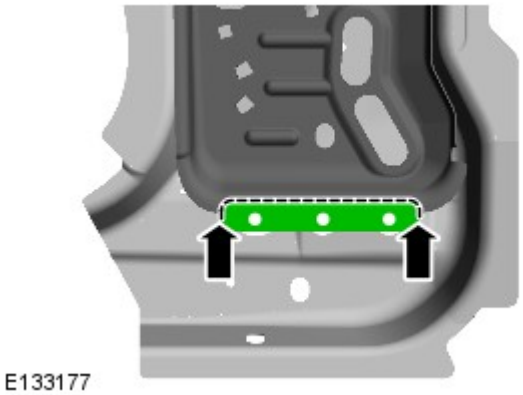
8. Clean and dress the template.



9. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

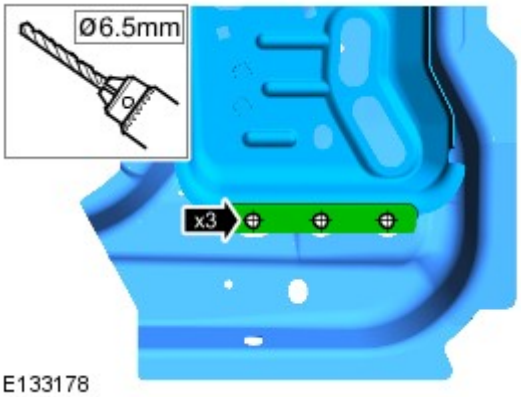
10. Remove the template.

11. Cut a template from the old A-pillar reinforcement panel remnant as indicated.



E133177

12. Clean and dress the template.



E133178

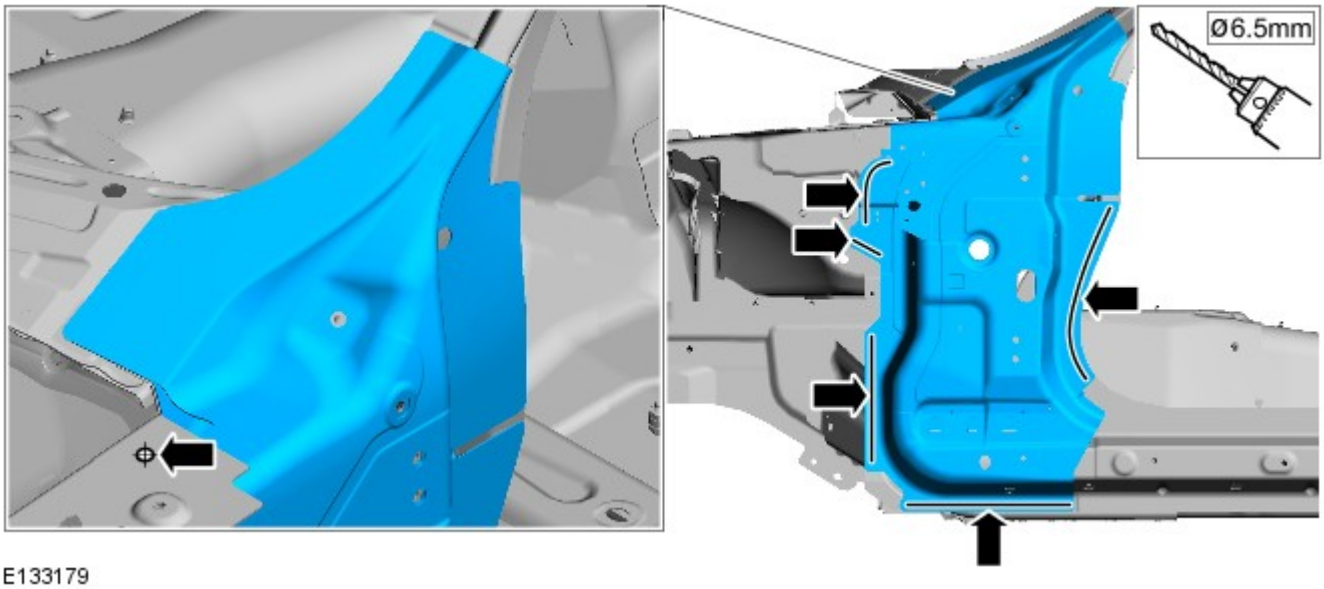
13. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

14. Remove the template.

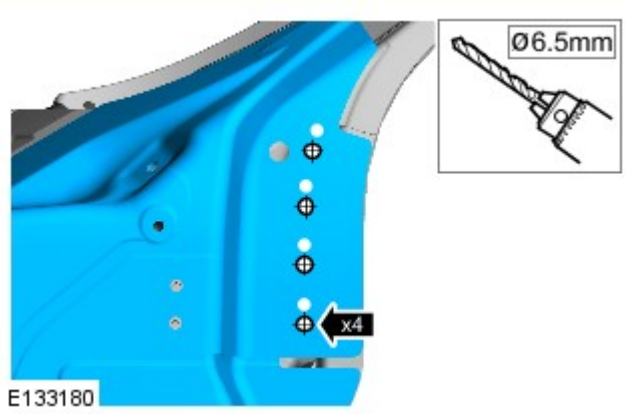
15. Debur the drilled holes in the new panel.

16. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

17. Using a 6.5mm Cryobit drill bit, drill holes through the removed self piercing rivet location holes in the areas as indicated.



E133179



E133180

18. Using the old panel for reference, mark and measure out the position of the removed self piercing rivet locations, as indicated. Using a 6.5mm Cryobit drill bit, drill holes below these locations at the points where Hemloks are to be installed as indicated.

19. Remove the new panel.

20. Debur the drilled holes in the new panel.

21. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces.

22. Trim, clean and prepare the NVH components.

23. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

24. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

25. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the inner NVH component and install it to the new A Pillar Reinforcement, then apply semi-rigid sealer to the exposed edge of the NVH component for installation to the vehicle.

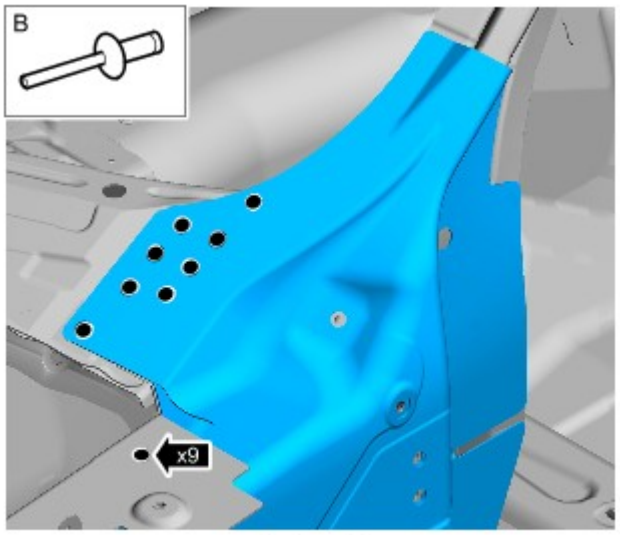
26.

NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

27. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

Offer up the new panel, align and clamp into position.

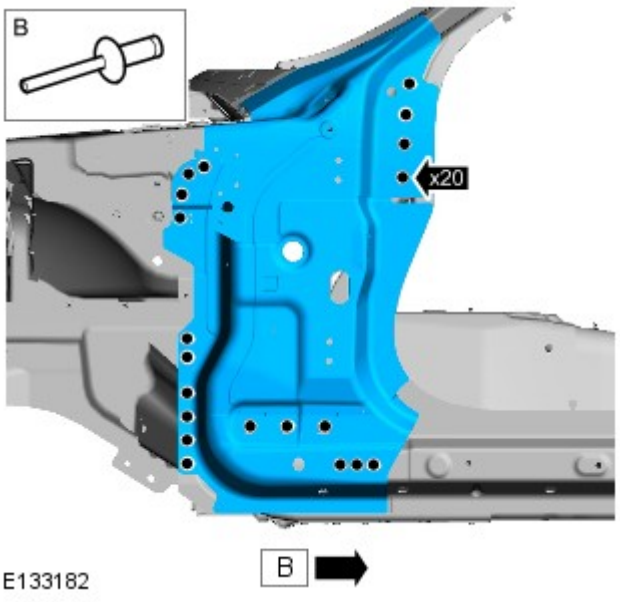


E133181

28. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



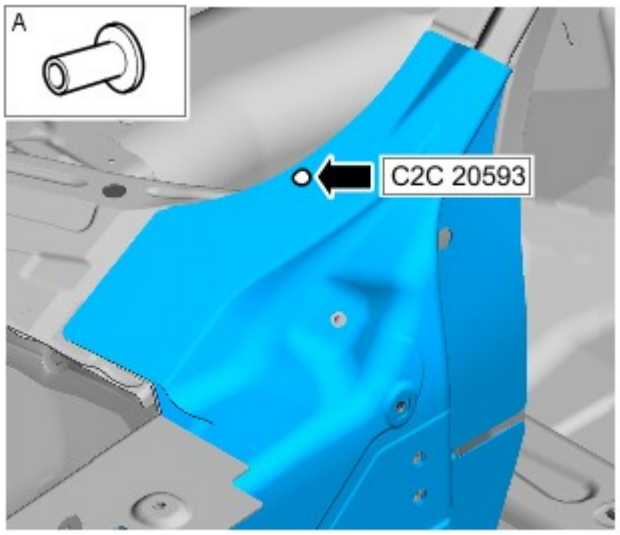
E133182

29. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

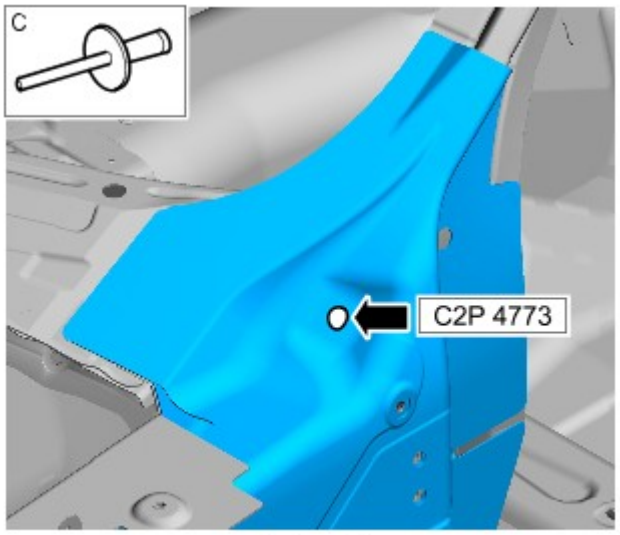
Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

30. Using the ESN50, install the self piercing rivet as indicated.

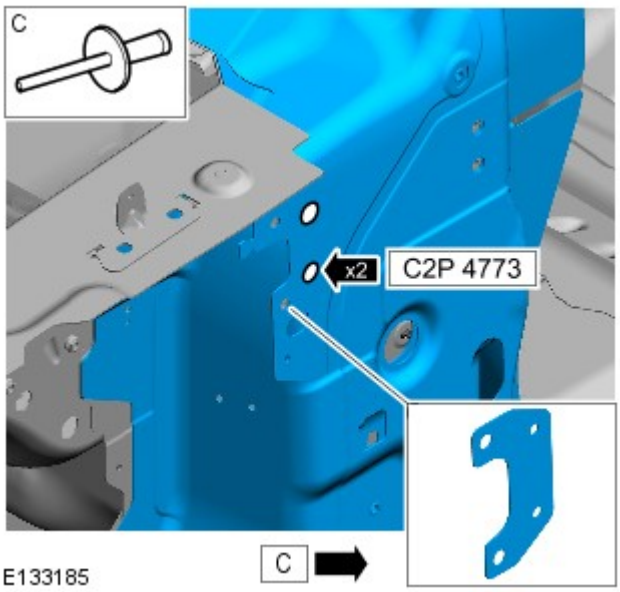


E133183



E133184

31. Using the Genesis G4, install the Monobolt.



E133185

32. Using the Genesis G4, install the Monobolts to the fender apron panel closing panel bracket as indicated.

33. Apply semi-rigid sealer to the outer lower NVH component and install it to the new A Pillar Reinforcement.

34. Remove any excess adhesive.

35. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

36. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Fender Apron Panel Closing Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The fender apron panel closing panel is a category A repair.

2. NOTE: The fender apron panel closing panel is manufactured from aluminium alloy 5754-NG.

The fender apron panel closing panel is serviced as a separate riveted and bonded panel, including its inner reinforcement.

3. The fender apron panel closing panel is replaced in conjunction with:
- Front bumper cover
- Front fender
- Front door
- Hood
- Hood latch panel

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the vehicle battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Remove the hood latch panel.
For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

7. Remove the front fender.
For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

8. Remove the pedestrian protection hood actuator and its mounting bracket.
For additional information, refer to: Pedestrian Protection Hood Actuator LH (501-20C, Removal and Installation) /
Pedestrian Protection Hood Actuator RH (501-20C, Removal and Installation).

9. If the left-hand fender apron panel closing panel is to be replaced, remove the anti-lock brake system (ABS) module.
For additional information, refer to: Anti-Lock Brake System (ABS) Module (206-09 Anti-Lock Control - Stability Assist, Removal and Installation).

10. If the left-hand fender apron panel closing panel is to be replaced, remove the fuel filter, (diesel engine only).
For additional information, refer to: Fuel Filter (310-01A, Removal and Installation).

11. If the left-hand fender apron panel closing panel is to be replaced, release and position the air conditioning (A/C) pipes to one side.

12. If the left-hand fender apron panel closing panel is to be replaced, remove the fuel lines.

13. If the left-hand fender apron panel closing panel is to be replaced, remove the anti-theft alarm horn.
For additional information, refer to: Anti-Theft Alarm Horn (419-01A Anti-Theft - Active, Removal and Installation).

14. If the right-hand fender apron panel closing panel is to be replaced, remove the engine junction box (EJB).
For additional information, refer to: Engine Junction Box (EJB) (418-00 Module Communications Network, Removal and Installation).

15. If the left-hand fender apron panel closing panel is to be replaced, remove the engine control module (ECM) and its mounting bracket.

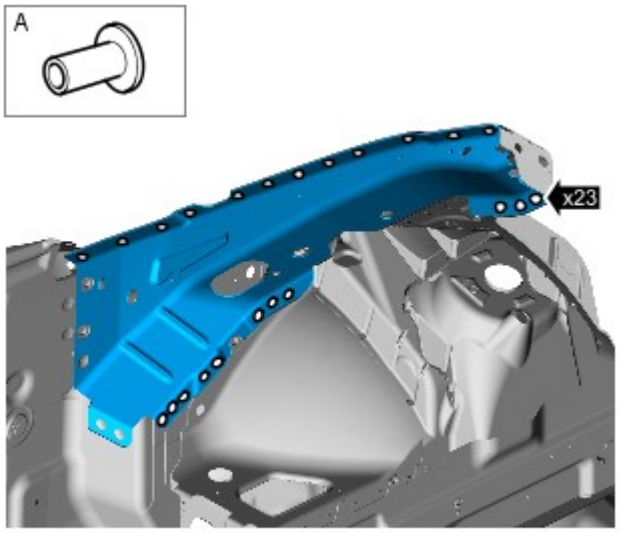
16. Remove any electrical components in the local area of repair to prevent damage.

17. Release the fender apron panel closing panel wiring harness and position it to one side.

18. Remove any remaining miscellaneous components from the repair area as necessary.

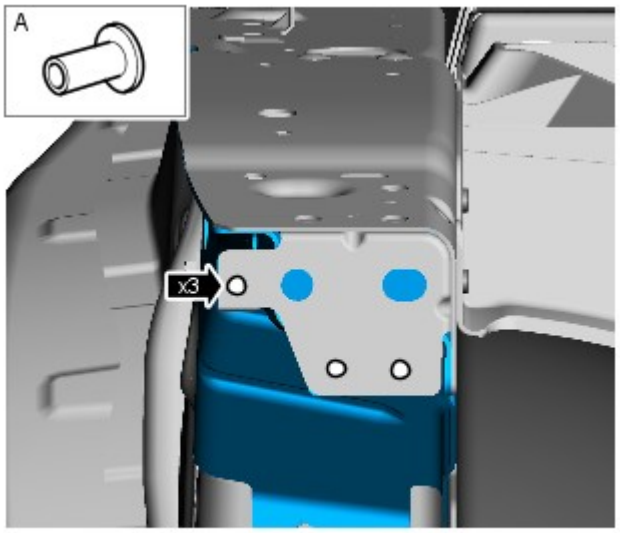
19. Prior to removal, mark the position of the fender apron panel in relation to adjacent panels, for ease of alignment on installation.

20. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.



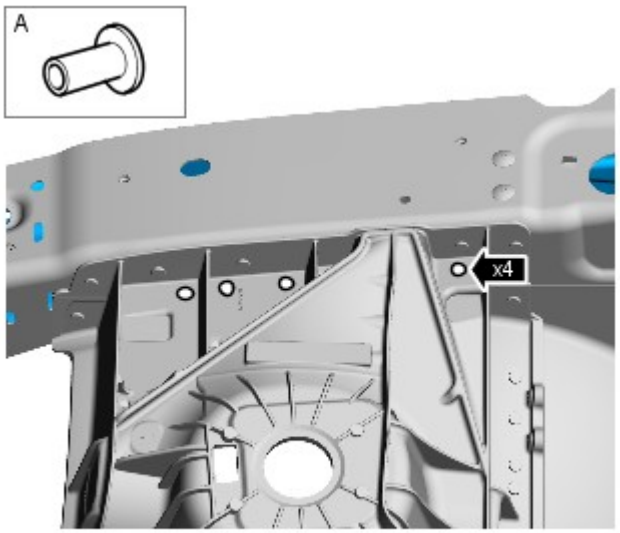
E131348

21. Using the ESN50, remove the self piercing rivets.

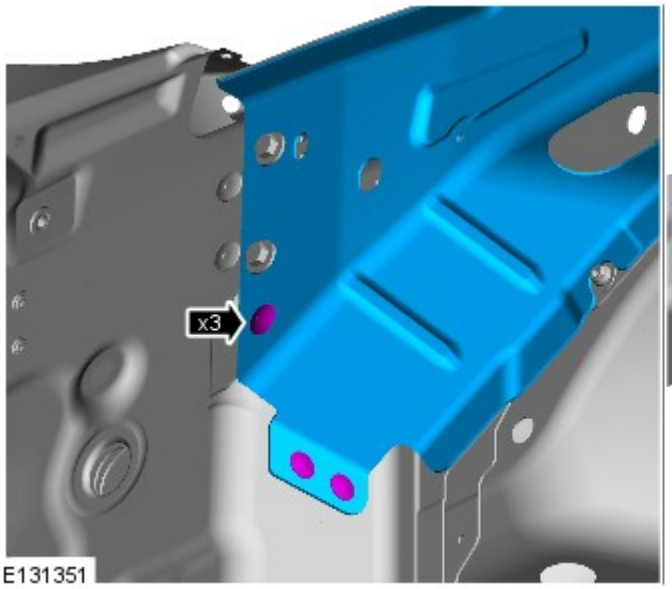


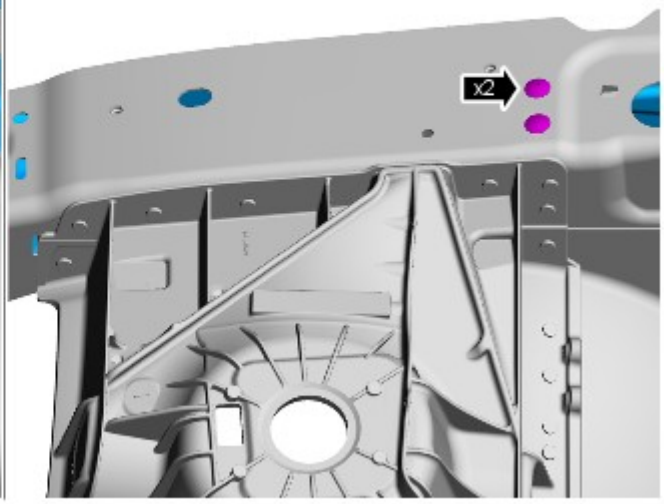
E131349

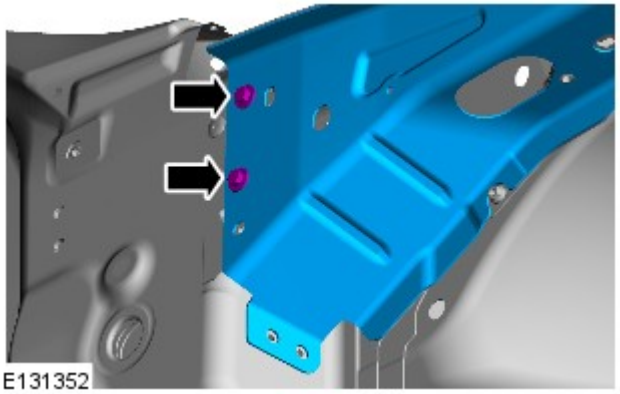
22. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets.



E131350







24. Remove the bolts.

25. NOTE: Remove and retain the noise vibration and harshness (NVH) components if they are to be reused.

Separate the joints and remove the old panel, also releasing the NVH components.

Installation

1. NOTE: New NVH components should be installed if the originals are damaged.

If the original NVH components are to be reused, trim and prepare them and their mating surfaces.

2. Remove rivet remnants.

3. Dress flanges where necessary.

4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

5. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel, at the points where Hemloks are to be installed.

6. Remove the new panel.

7. Debur the drilled holes.

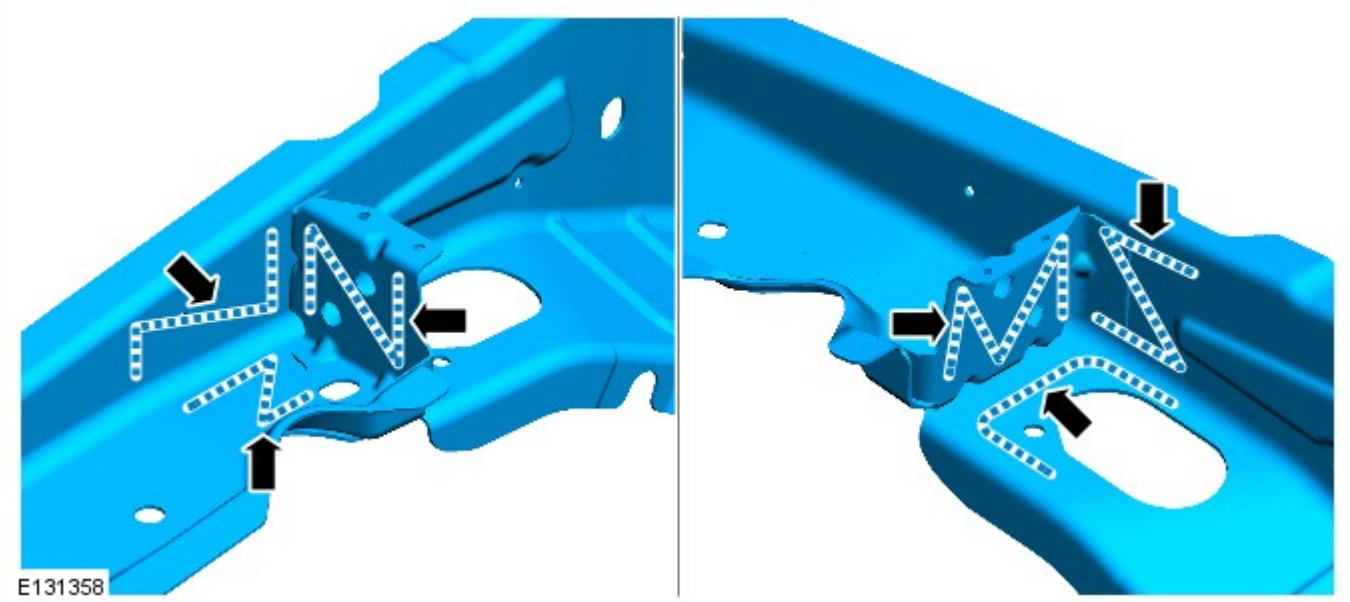
8. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

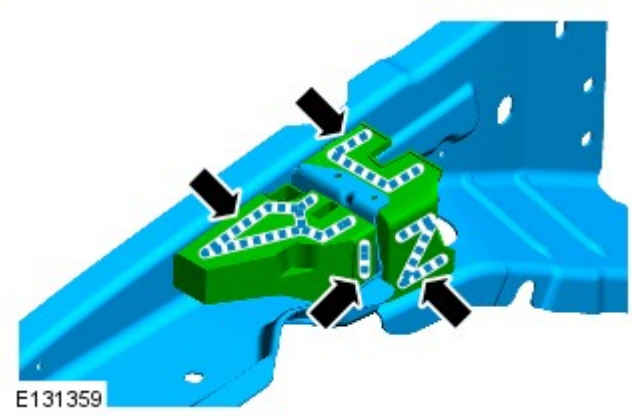
9. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

10. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

11. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the new panel where the NVH components are to be installed. Install the NVH components.



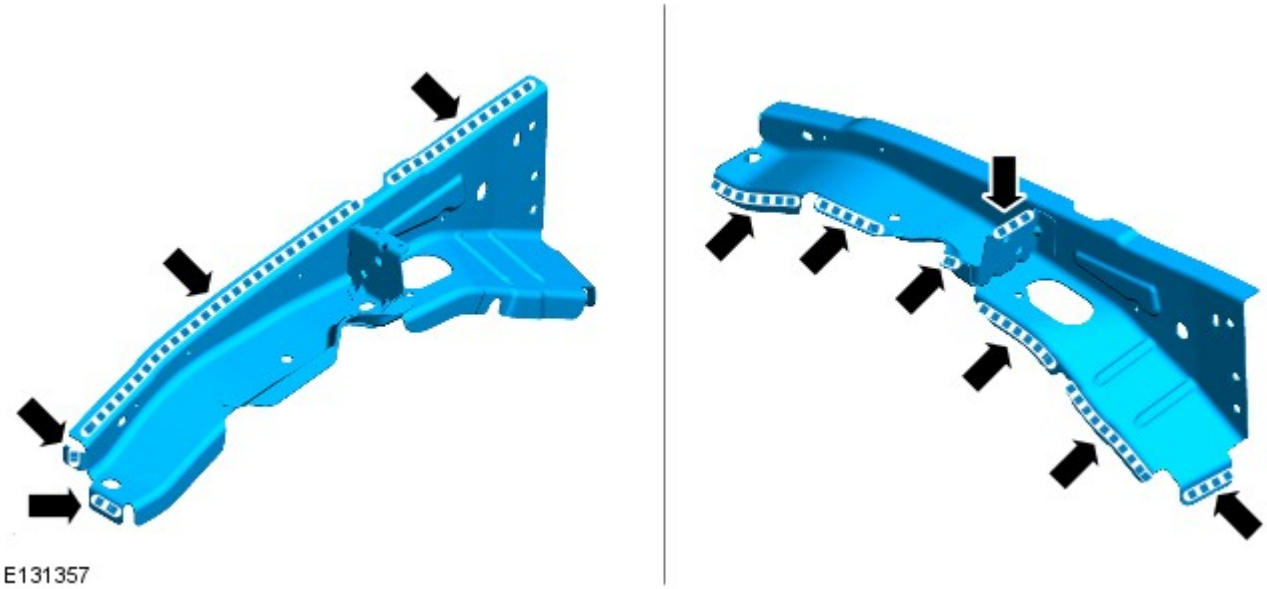


12. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH components.

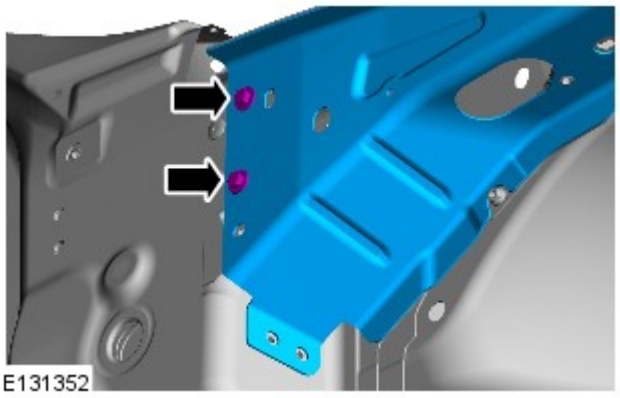
13. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive as indicated.



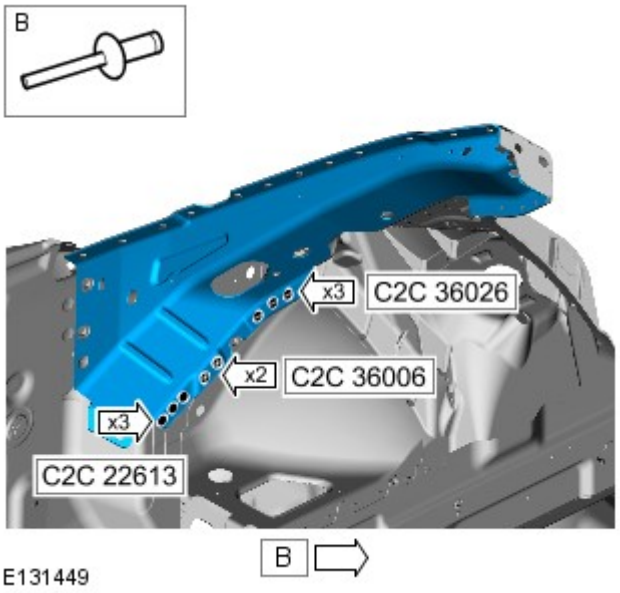
E131357

14. Offer up the new panel and clamp into position.



E131352

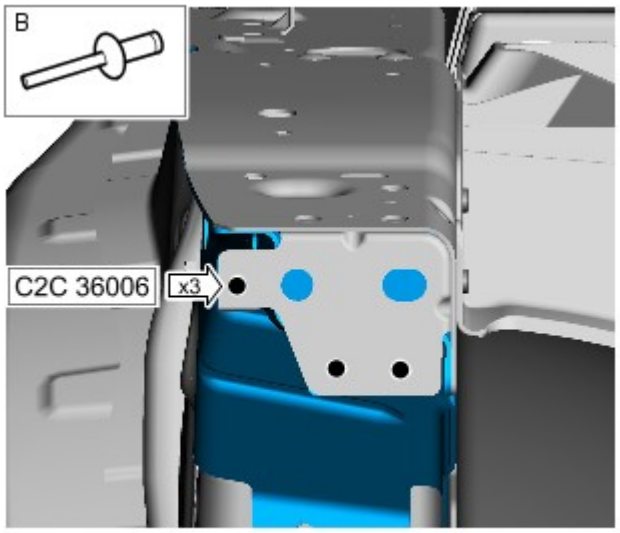
15. Loosely install the bolts, do not tighten.



E131449

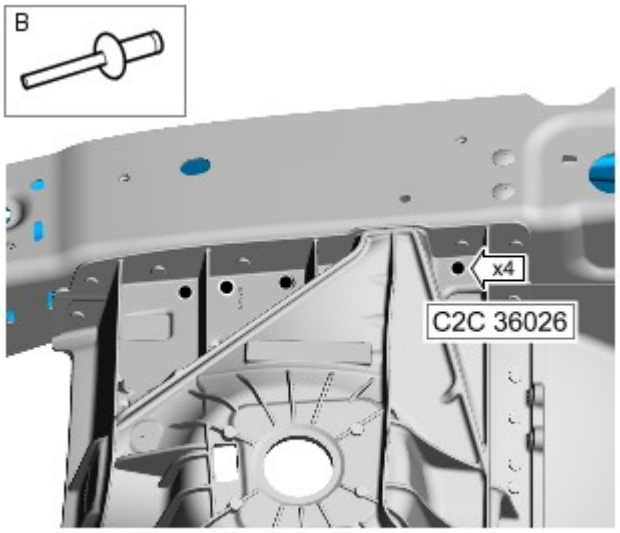
16. Using the Genesis G4, install the Hemloks.

17. Using the Genesis G4, install the Hemloks.



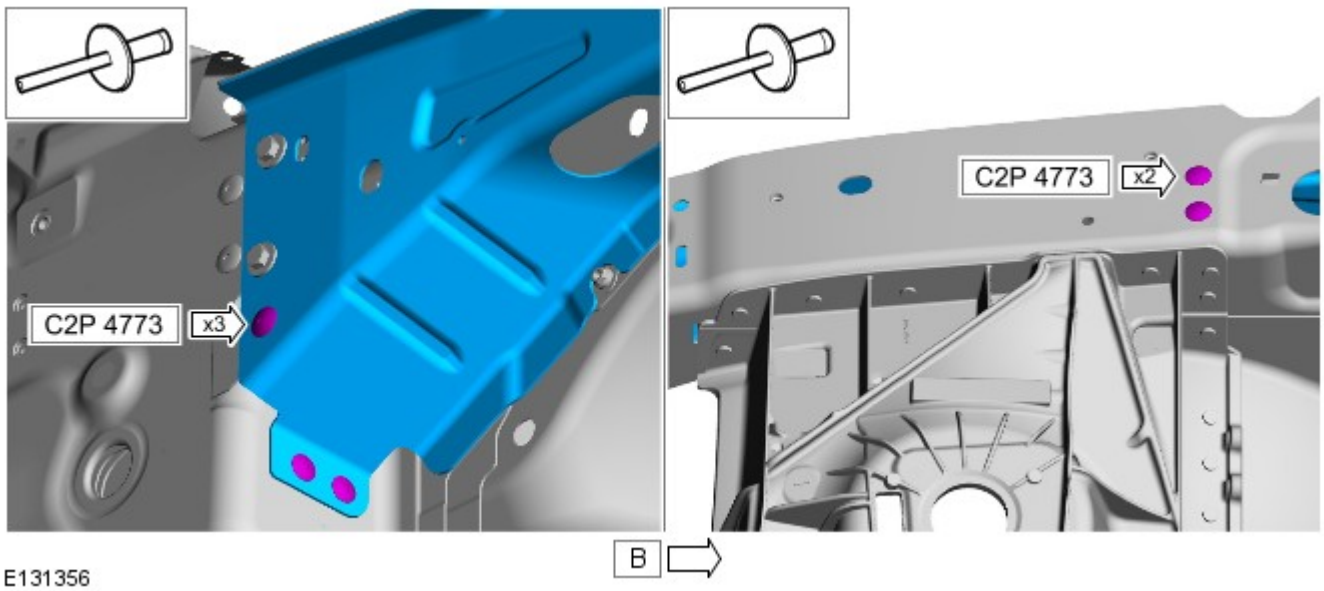
E131354

18. Using the Genesis G4, install the Hemloks.

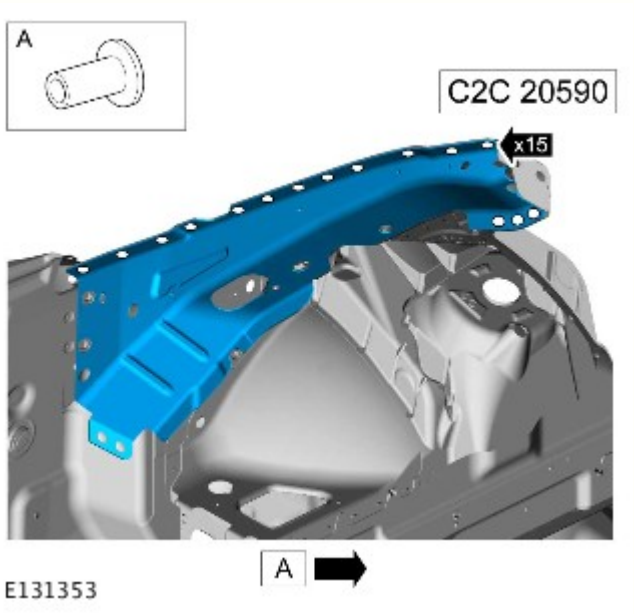


E131355

19. Using the Genesis G4, install the Monobolts.



E131356



20. Using the ESN50, install the self piercing rivets.

21. Fully tighten the bolts.

NOTE: Bolts are pre-coated to inhibit galvanic corrosion and can be reused only if the coating is not damaged.

- Tighten to 25 Nm.

22. Remove any excess adhesive.

23. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

24. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Front End Sheet Metal Repairs - Hood Hinge

Removal and Installation

Removal

1. The hood hinge is a category B repair.

E128354

2. NOTE: The hood hinge is manufactured from mild steel.

The hood hinge is serviced as a separate bolt-on panel.

3. NOTE: The hood hinges deform during the pedestrian protection system deployment process and will need to be installed.

The hood hinge is replaced in conjunction with:

- Hood

4. WARNING: The hood hinge and its associated components form part of the pedestrian protection system, it is essential that any repair or replacement operations do not affect the safe working of the system.

For additional information relating to the pedestrian safety system please see the following:
For additional information, refer to: Pedestrian Protection System (501-20C Pedestrian Protection System, Description and Operation).

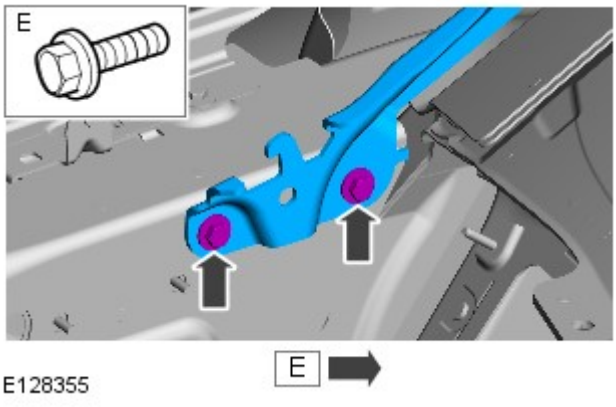
5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Remove the hood.
For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

7. Disconnect the battery ground cable.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

8. Remove the cowl vent screen.
For additional information, refer to: Windshield Wiper Motor - LHD RWD (501-16 Wipers and Washers, Removal and Installation).

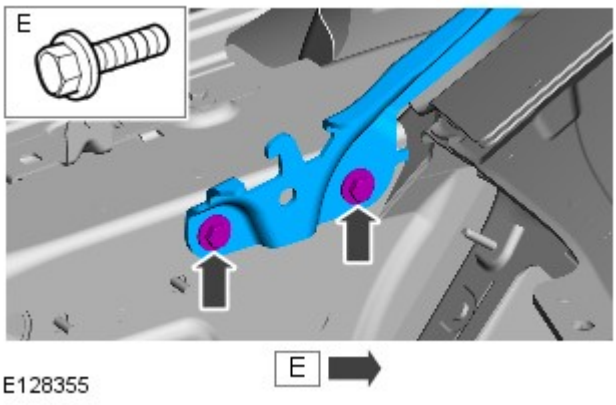
9. Remove the pedestrian protection hood actuator.
For additional information, refer to: Pedestrian Protection Hood Actuator LH (501-20C, Removal and Installation) / Pedestrian Protection Hood Actuator RH (501-20C, Removal and Installation).



10. Remove the retaining bolts to the fender apron panel.

Installation

1. Offer up the hood hinge. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.



2. Tighten the hood hinge retaining bolts.

NOTE: Bolts are pre-coated to inhibit galvanic corrosion and are reusable only if the coating is undamaged.

- Tighten to 25 Nm.

3. The installation of associated panels and components is the reversal of removal procedure.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

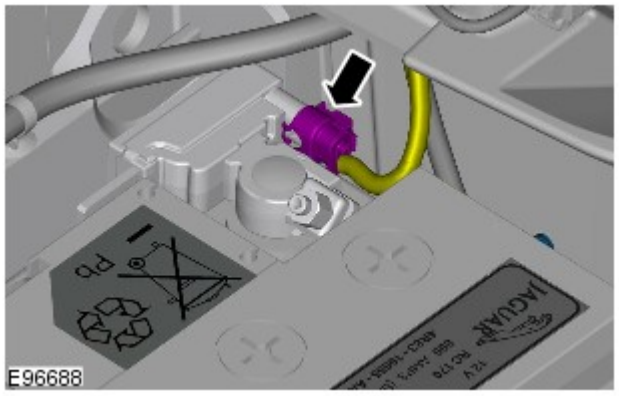
General Procedures

Disconnect

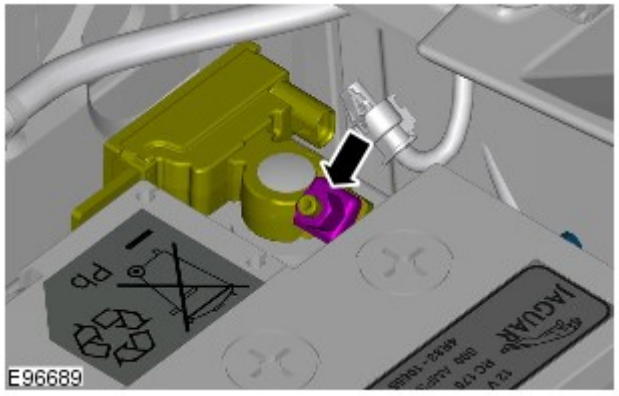
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

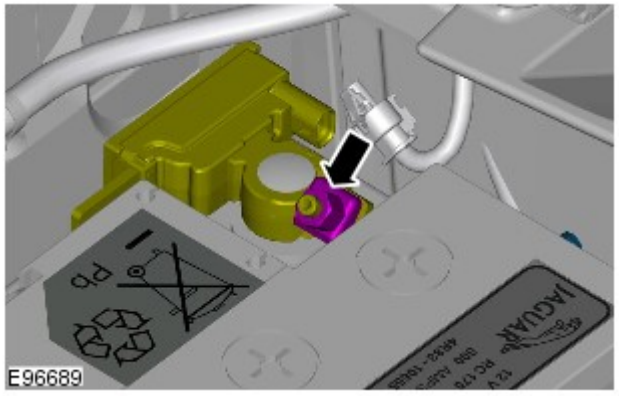


4. CAUTION: Take extra care not to damage the wiring harness.

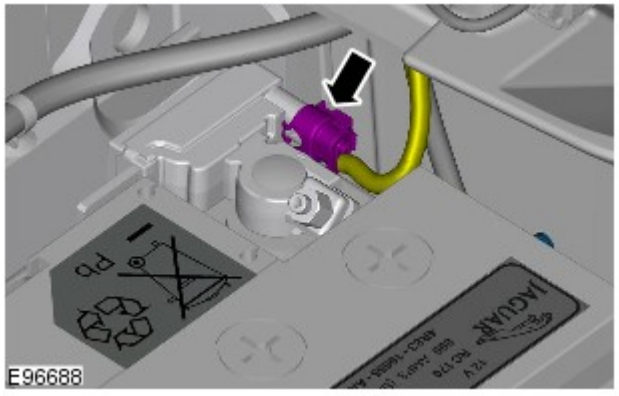


5.

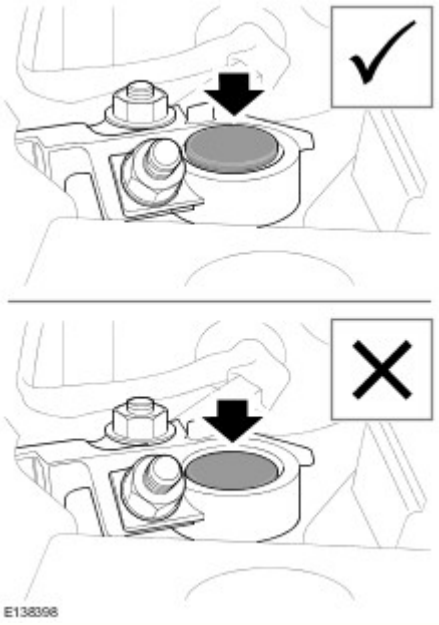
Connect



1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing

technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel

- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual

- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A

- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During	Yes - **caution** material sensitive to heat.	Yes - **must** be heated to maintain original alloy properties. Ideal

Repair	Range: 140 - 160°C Ideal panel temperature: **150°C**	panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

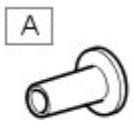
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

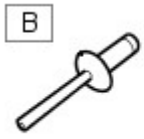
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

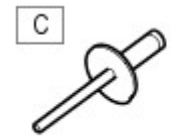
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

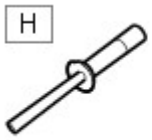
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

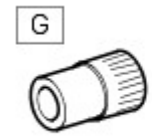
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

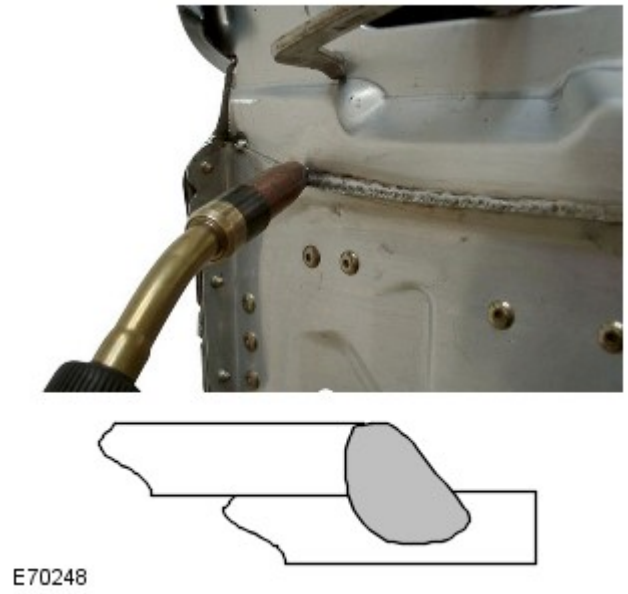
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

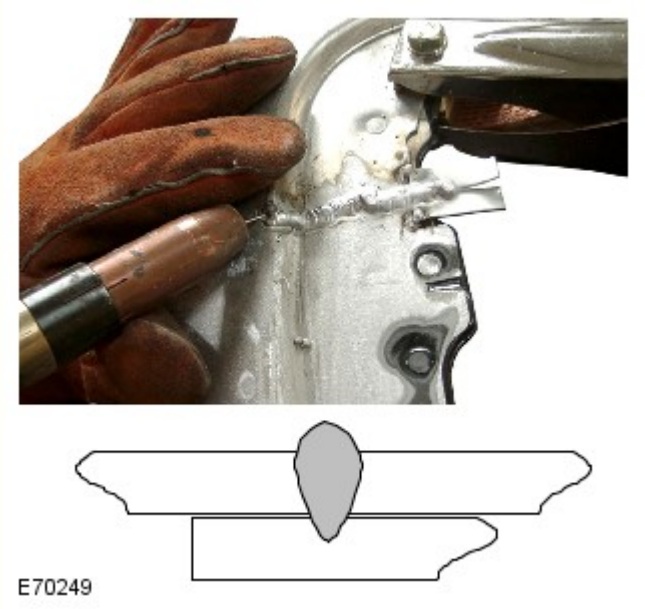
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

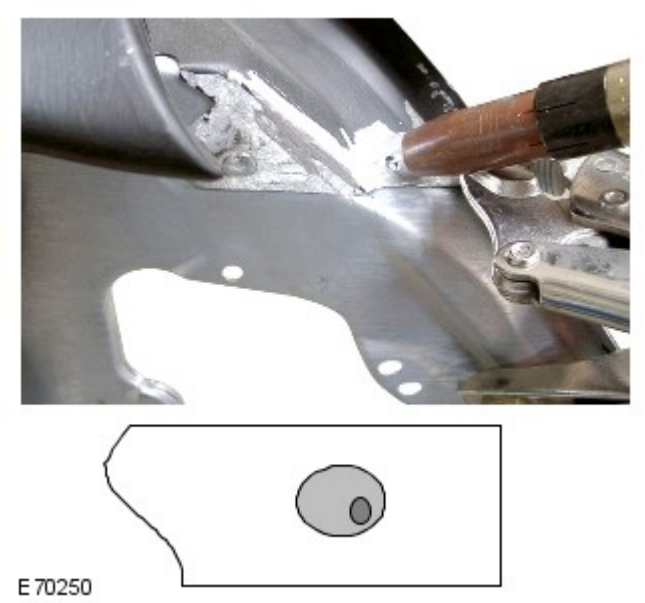
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

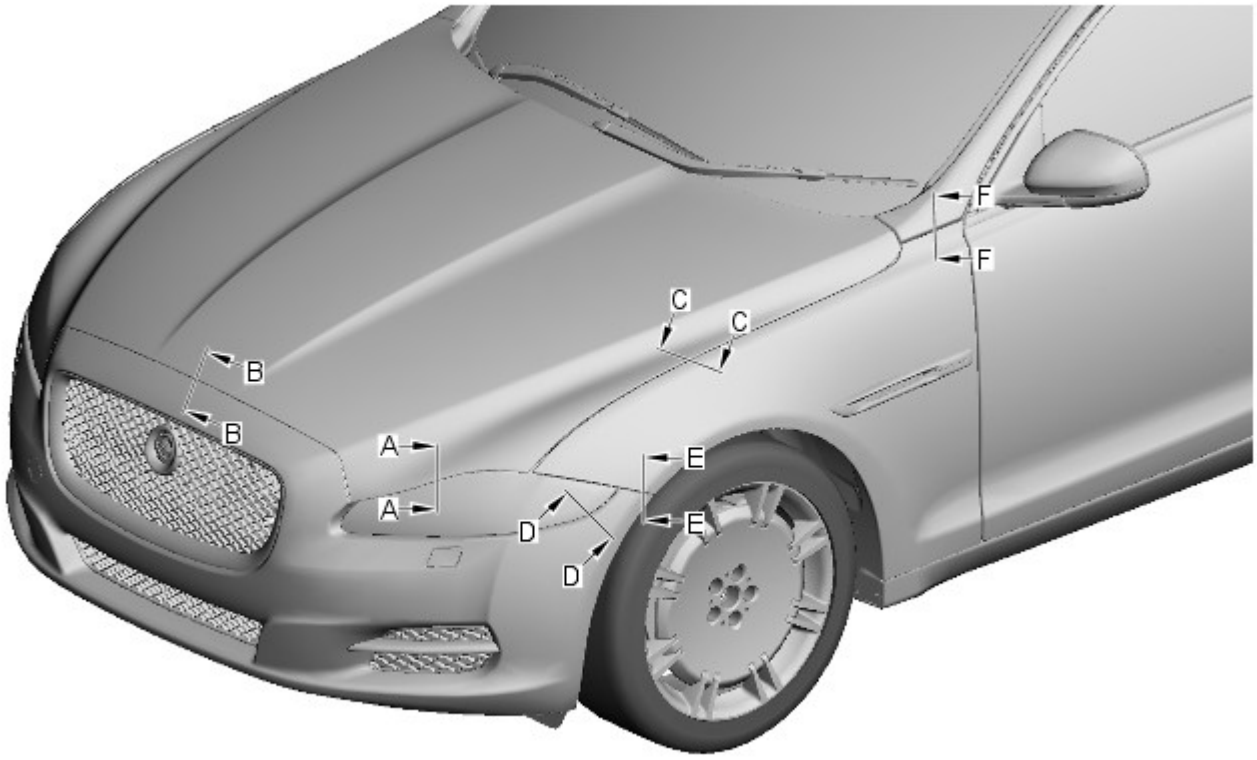
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

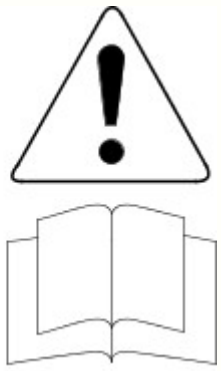
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

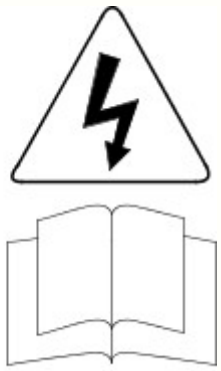
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



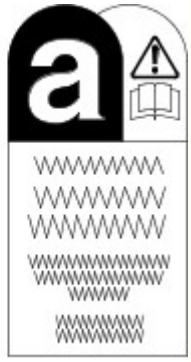
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



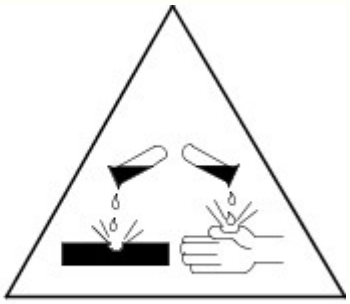
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Published: 11-May-2011

Side Panel Sheet Metal Repairs - A-Pillar Outer Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The A-pillar outer panel is a category A repair.

2. NOTE: The A-pillar outer panel is manufactured from aluminium alloy 6111-T4.

   The A-pillar outer panel is serviced as a separate welded, bonded and riveted panel.

3. The A-pillar outer panel is replaced in conjunction with:
   - Front bumper cover
   - Hood
   - Hood hinge
   - Front door
   - Front fender
   - Headliner
   - Windshield glass remove and install
   - Instrument panel upper section

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Disconnect the generator electrical connectors.

7. Remove the front fender.
For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

8. Remove the hood hinge.
For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

9. If the passenger side A-pillar outer panel is to be installed, remove the hood release cable.

10. Remove the instrument panel upper section.
For additional information, refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).

11. If the drivers side A-pillar outer panel is to be installed, remove the pedal box.

12. If the drivers side front side member and suspension top mount assembly is to be replaced, remove the brake master cylinder and brake booster.
For additional information, refer to: Brake Master Cylinder (206-06 Hydraulic Brake Actuation, Removal and Installation) / Brake Booster (206-07 Power Brake Actuation, Removal and Installation).

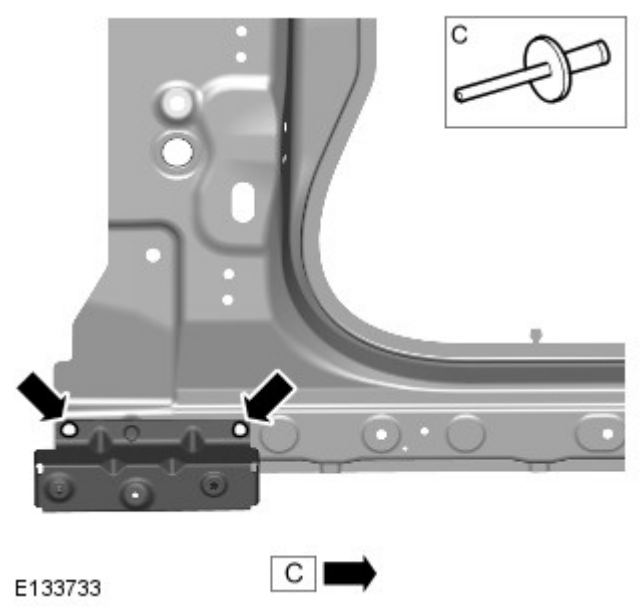
13. Remove the headliner.
For additional information, refer to: Headliner (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

15. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20B Supplemental Restraint System, Removal and Installation).

16. Remove any remaining miscellaneous components from the repair area as necessary.

17. Release the A-pillar outer panel wiring harness and position it to one side.



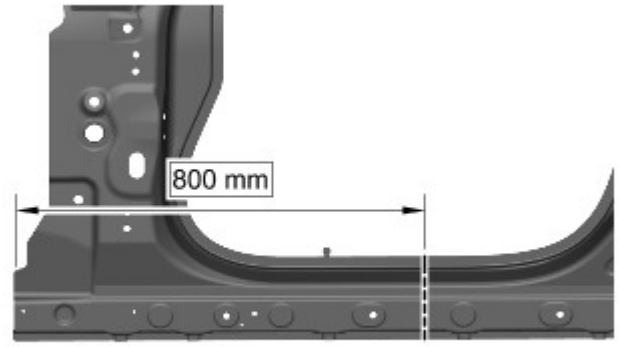
18. NOTE: If the front fender lower mounting bracket is undamaged, retain for re-use on installation.

Remove the monobolts as indicated.

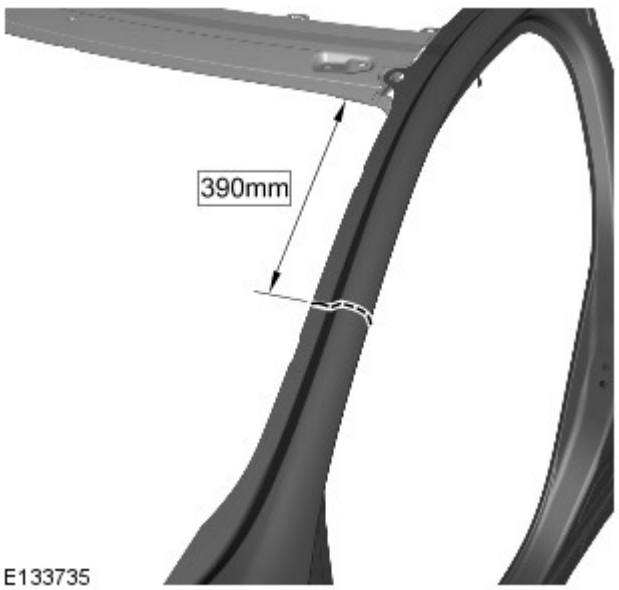
19. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old panel as indicated.



E133734



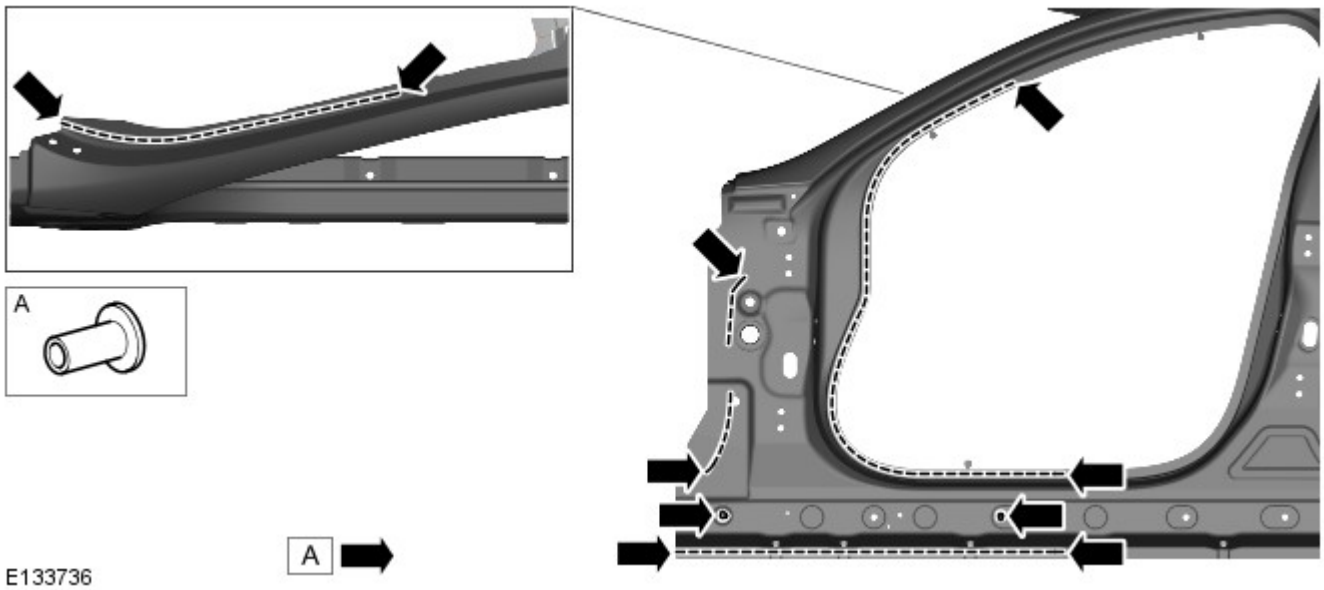
E133735

20. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Measure, mark and cut the old panel as indicated.

21. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets in the areas indicated.



E133736

22. NOTES:

Retain the old panel remnant as it will be used in installation.

Remove and retain the noise, vibration and harshness (NVH) component, if it is to be reused.

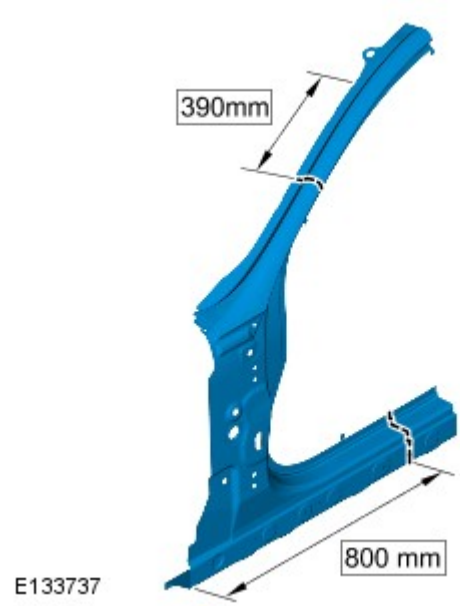
Separate the joints and remove the old panel, also releasing the NVH components.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.



4. NOTE: Retain the remnants of the new panel as these may be used for backing strips on installation.

Using the old panel for reference, measure, mark and cut the new A-pillar outer panel at the points where the MIG butt joints are to be made as indicated.

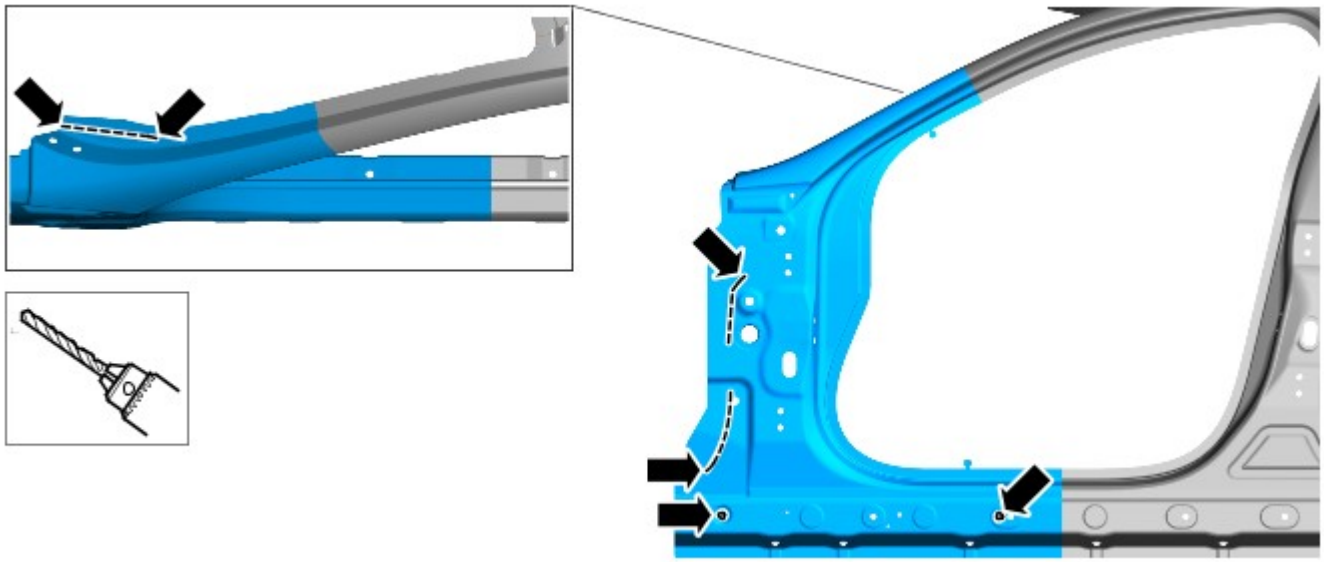
5. Debur the new panel.

6. Trim, clean and prepare the lower NVH component.

7. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

8. NOTE: The Hemloks will be installed adjacent to the original self piercing rivet location holes.

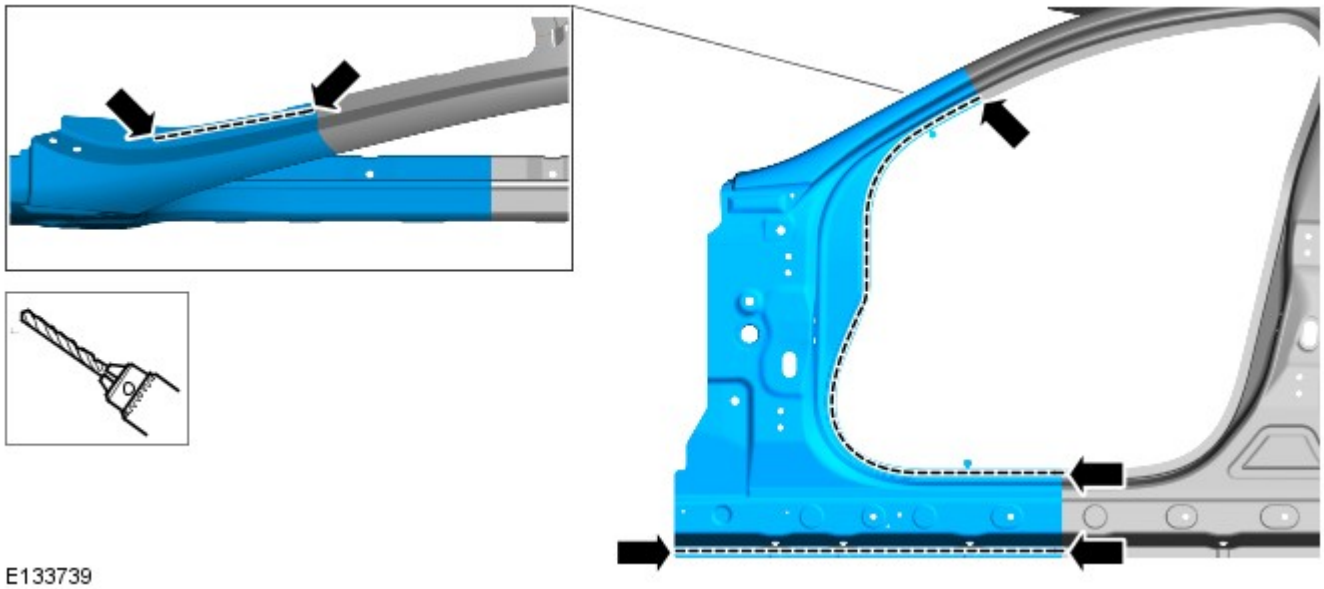
Using the old panel for reference, measure the positions of the removed self piercing rivet locations and mark these onto the new panel. Using a 6.5mm Cryobit drill bit, drill holes adjacent to these locations at the points where Hemloks are to be installed as indicated.



E133738

9. NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

Where the pitch of the removed self piercing rivets is 25mm or less, or there is no access for the ESN50, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes on the vehicle, into the new panel. Hemloks will be installed in these locations when the new A-pillar outer panel is installed.



E133739

10. Remove the new panel.

11. NOTE: The backing plates should be an interference fit.

Fabricate backing plates from the old A-pillar outer panel remnant. Debur and offer up the backing plates to the vehicle. If correct proceed to next step, if not, rectify and recheck before proceeding.

12. Remove the backing plates.

13. Fabricate run-on/run-off tabs from the old A-pillar outer panel remnant.

14. Debur the run-on/run-off tabs.

15. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

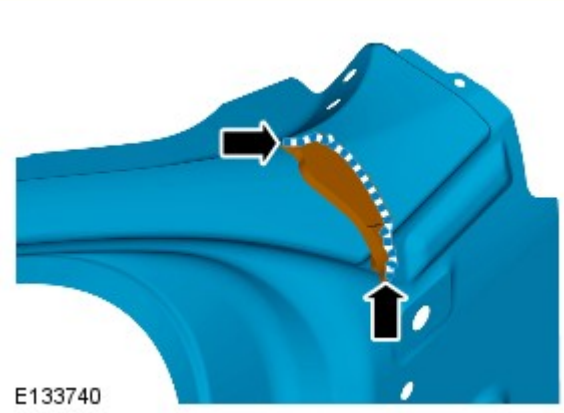
16. Using a Roloc fine bristle disc, clean and prepare the old and new panel joint surfaces.

17. NOTE: The backing plates are installed with an interference fit.

Install and align the backing plates to the vehicle.

18. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

19. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

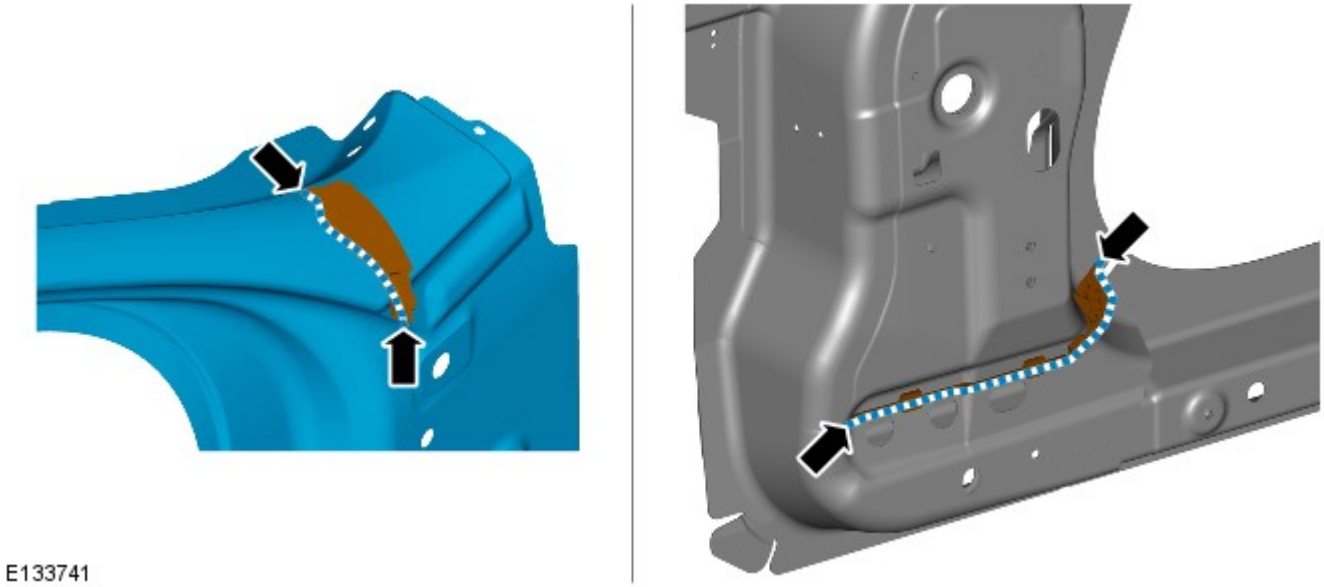


20. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the upper NVH component and install to the new A-pillar outer panel as indicated.

21. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the upper and lower NVH components.



E133741

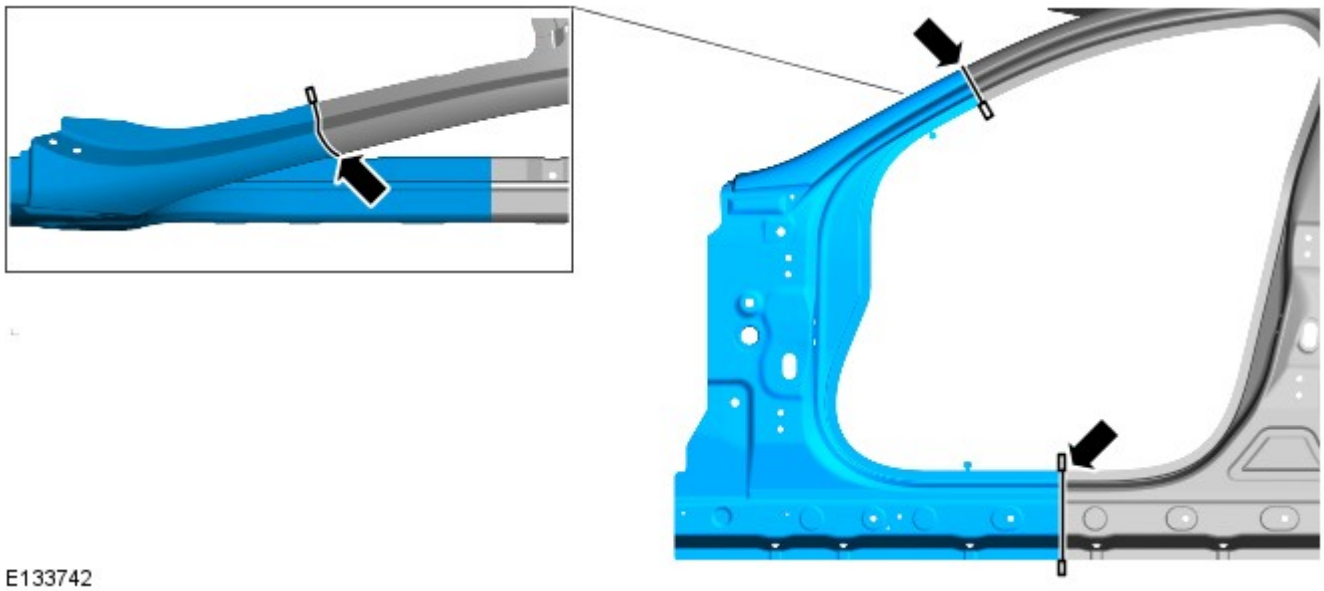
22. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

23. Offer up the new panel, align and clamp into position.

24. Tack weld the run-on/run-off tabs to all MIG butt joints.

25. MIG weld the MIG butt joints.



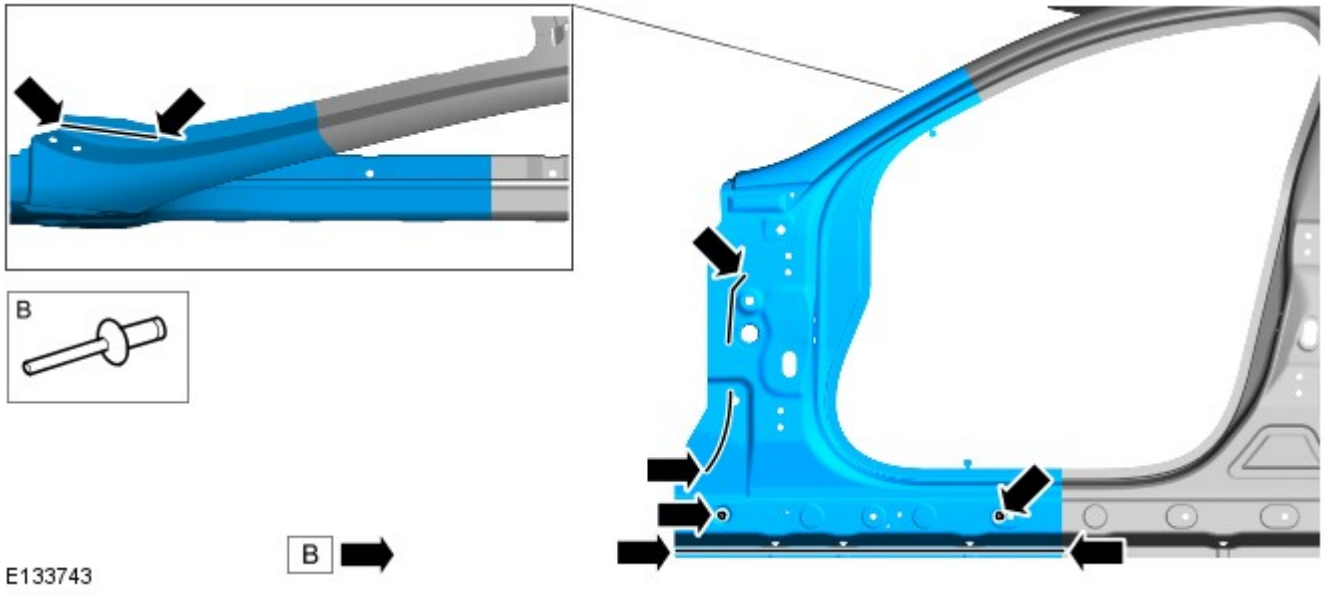
E133742

26. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install any remaining Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



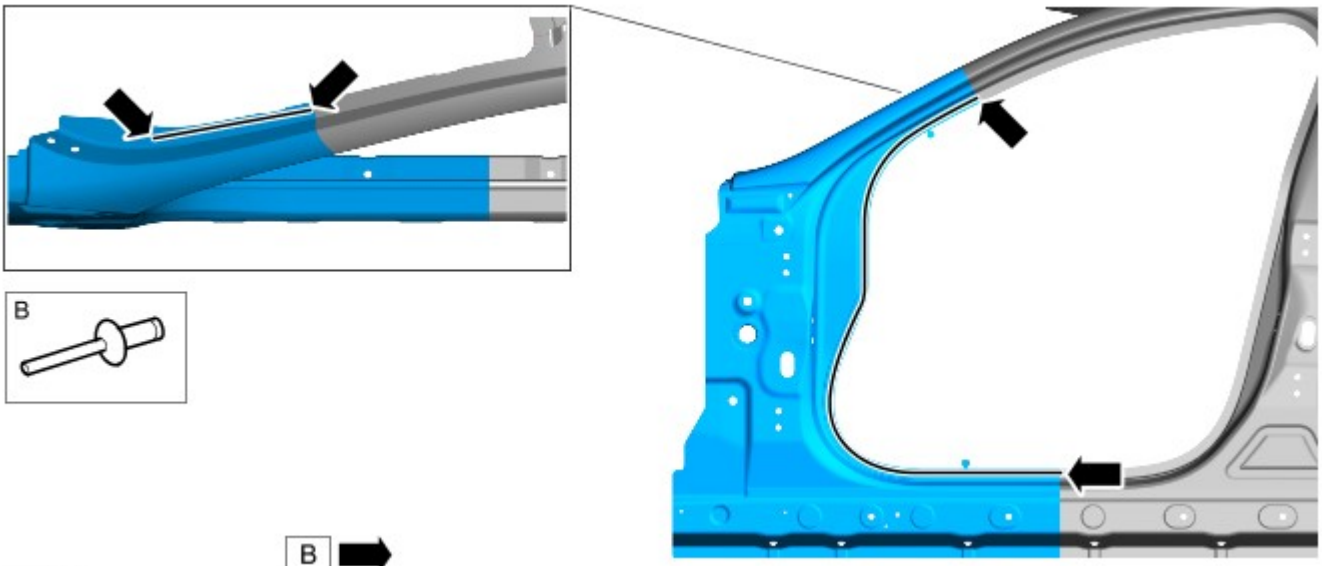
27. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install any remaining Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



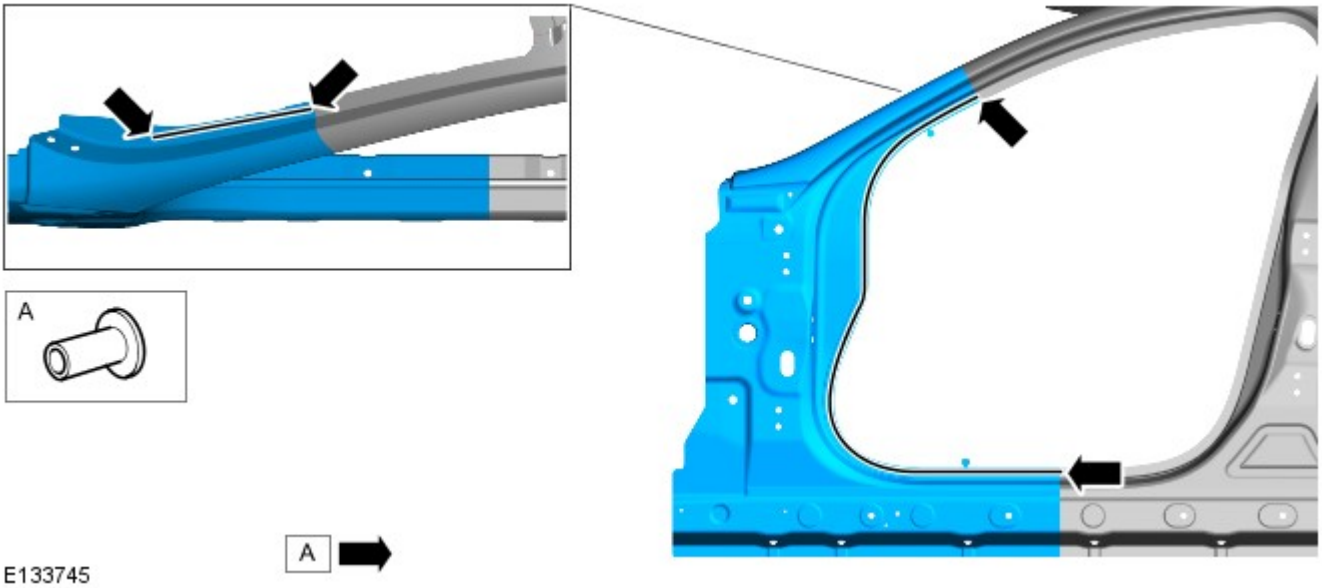
28. NOTES:

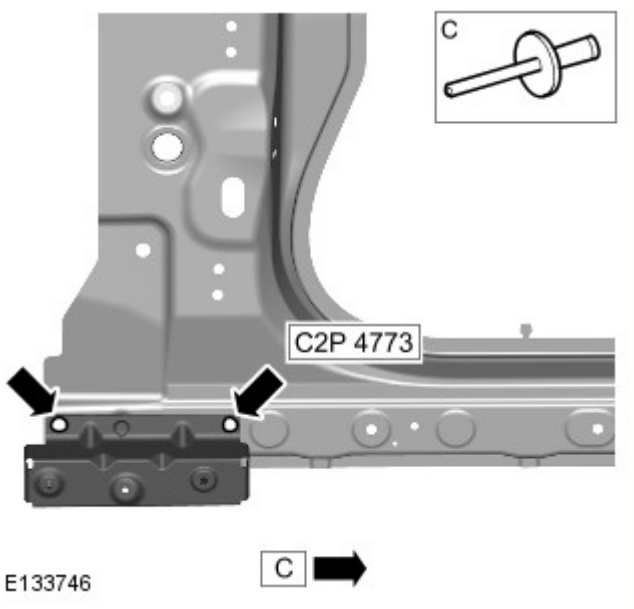
Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595





29. Using the Genesis G4, install the Monobolts to the front fender lower mounting bracket as indicated.

30. Remove any excess adhesive.

31. Remove the run-on/run-off tabs.

32. Dress the welded joints.

33. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

34. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

35. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - B-Pillar Inner Panel

Removal and Installation

Removal

1. NOTE: The B-pillar inner panel is manufactured from aluminium alloy 5754-NG.

The B-pillar inner panel is cut from the bodyside inner front section service panel.

2. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

3. The B-pillar inner panel is replaced in conjunction with:
- Front bumper cover
- Rear bumper cover
- Front door
- Rear door
- Front fender
- Hood
- Hood hinge
- Luggage compartment lid
- Hood latch panel
- Fender apron panel closing panel
- Quarter panel
- A-pillar outer panel
- A-pillar reinforcement
- Rocker panel and b-pillar outer panel
- B-pillar reinforcement
- Rocker panel
- Rocker panel inner reinforcement
- Headliner
- Windshield glass remove and install
- Rear window glass
- Instrument panel upper section
- Roof opening panel frame
- Roof glass front
- Roof glass rear

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the B-pillar reinforcement.
For additional information, refer to: B-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

6. Remove the A-pillar reinforcement.
For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

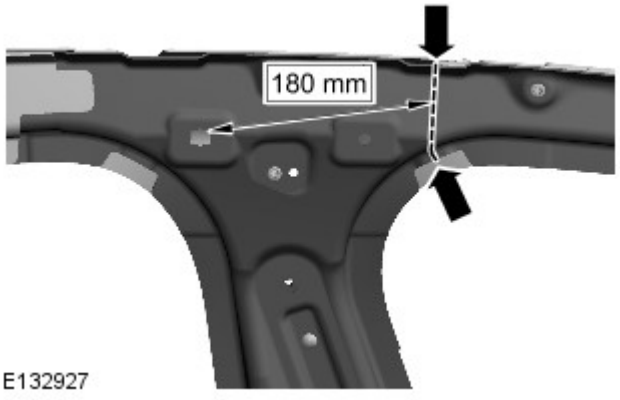
7. Remove the rocker panel inner reinforcement.
For additional information, refer to: Rocker Panel Inner Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

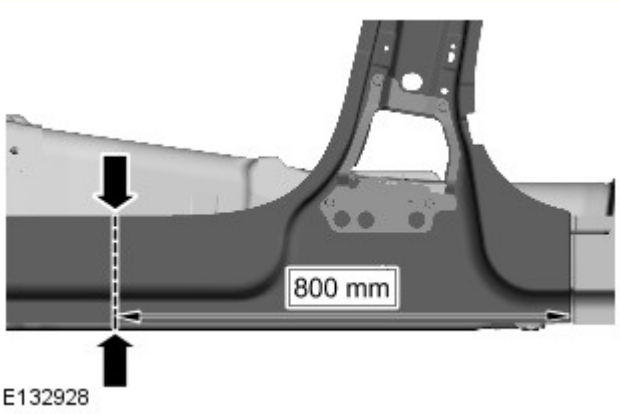
10. Remove any remaining miscellaneous components from the repair area as necessary.

11. Prior to removal, mark the position of the B-pillar inner in relation to adjacent panels, for ease of alignment on installation.



12. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

Measure, mark and cut the old panel, at the point where the upper MIG butt joint is to be performed as indicated.

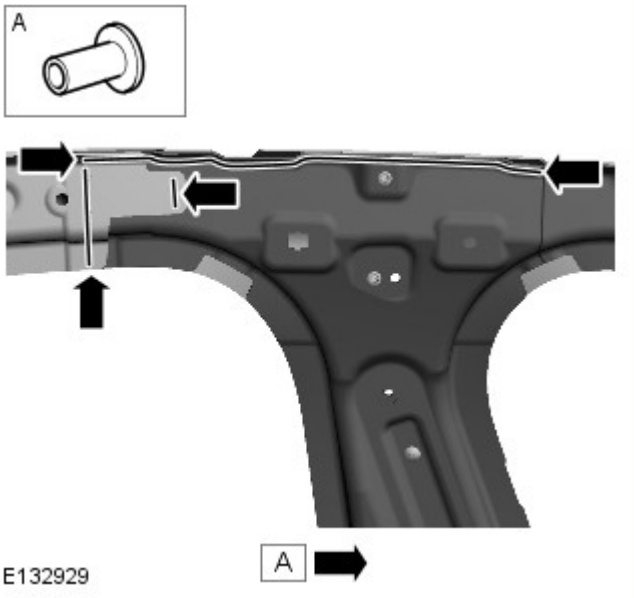


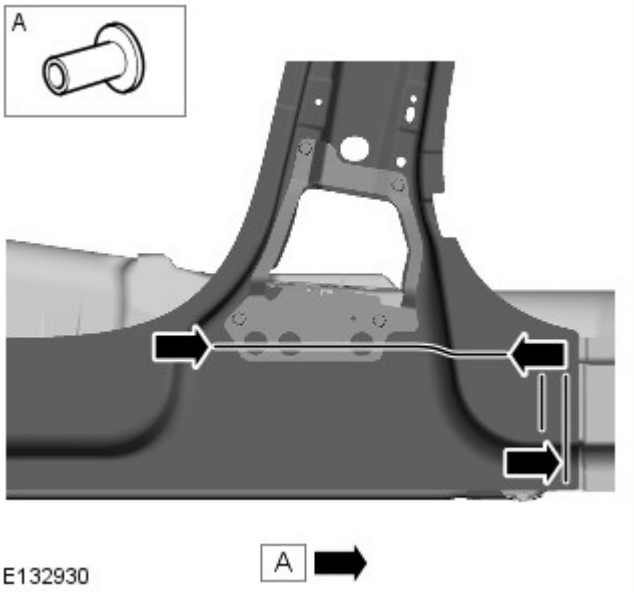
13. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

Measure, mark and cut the old panel, at the point where the lower MIG butt joint is to be performed as indicated.

14. CAUTION: Care should be taken not to drill through into inner panels or reinforcements.

Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove any remaining self piercing rivets from the areas indicated.





15. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove any remaining self piercing rivets from the areas indicated.

16. NOTE: Retain the old panel remnant as it may be used as a template and to fabricate backing strips and run-on/run off tabs.

Separate the joints and remove the old panel.

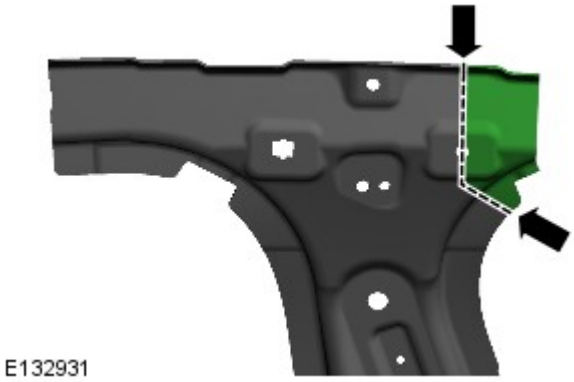
Installation

1. Remove rivet remnants.

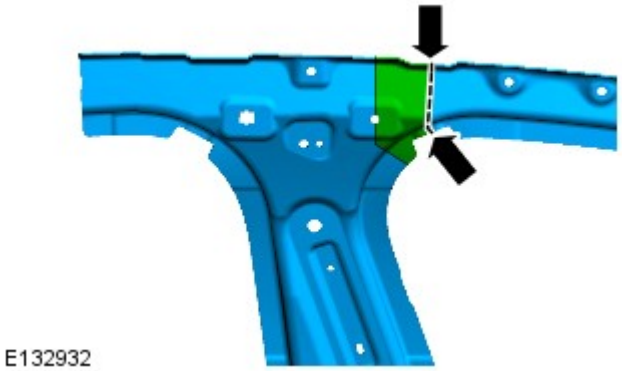
2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

4. Cut a template from the old B-pillar inner panel remnant as indicated. Clean and dress the template.

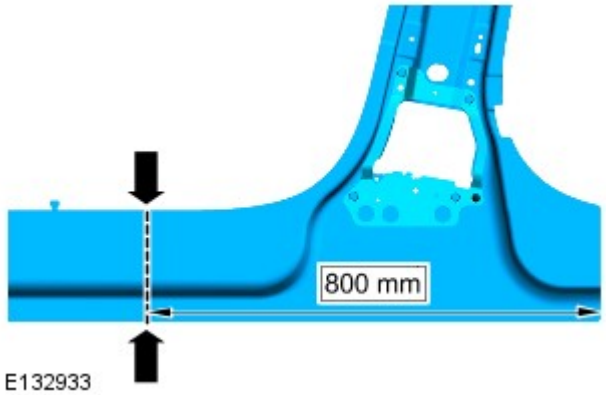


E132931



E132932

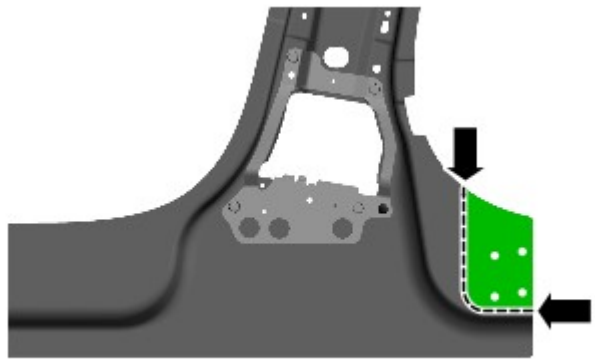
5. Offer up, align and clamp the template in place on the B-pillar inner service panel. Cut the B-pillar inner panel service panel at the point indicated.



E132933

6. NOTE: Retain the new panel remnant as it will be used as a template and to fabricate backing strips and run-on/run off tabs.

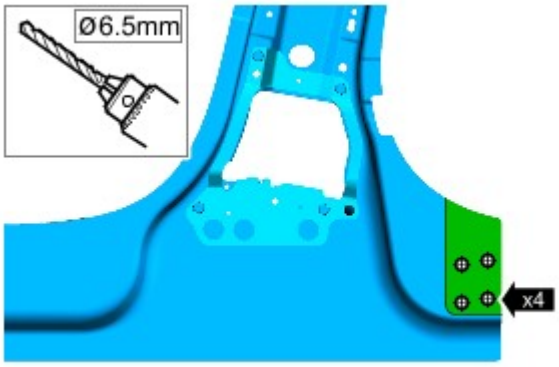
Measure, mark and cut the new panel, at the point where the lower MIG butt joint is to be performed as indicated.



E132934

7. Cut a template from the old B-pillar inner panel remnant as indicated. Clean and dress the template.

8. Offer up, align and clamp the template in place on the B-pillar inner service panel. Using a 6.5mm Cryobit drill bit, drill holes as indicated.

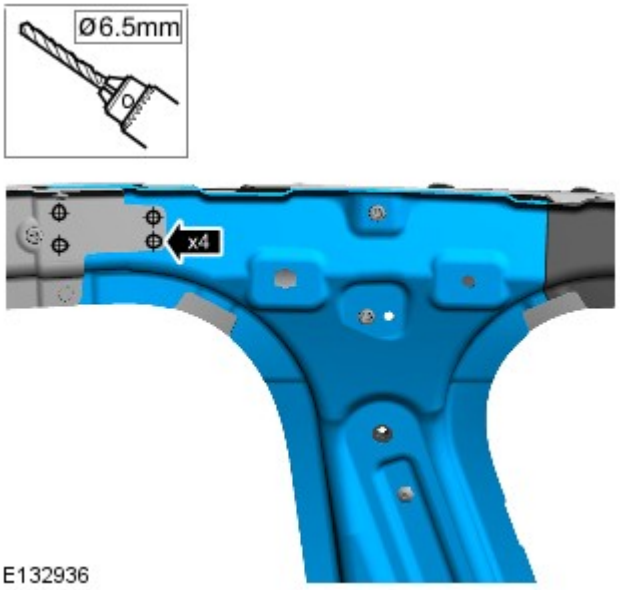


E132935

9. Debur the drilled holes and the section cuts.

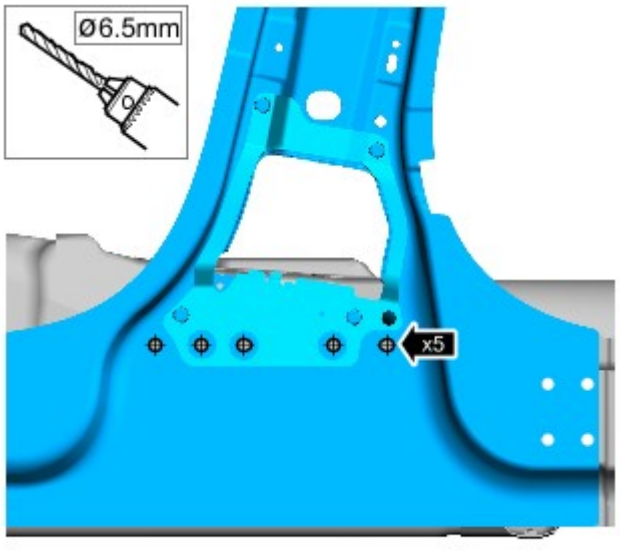
10. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

11. Using a 6.5mm Cryobit drill bit, drill holes for Hemloks in the areas indicated.



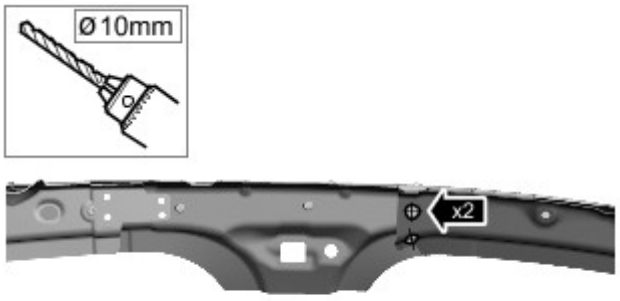
E132936

12. Using a 6.5mm Cryobit drill bit, drill holes for Hemloks in the areas indicated.



E132937

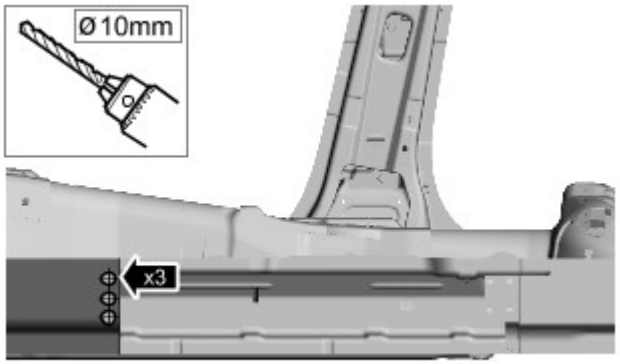
13. Remove the new panel.



E132938

14. CAUTION: Care should be taken not to drill through into inner panels or reinforcements.

Using a 10mm drill bit, drill holes for MIG plug welds for the installation of the upper backing plate as indicated.



E132939

15. CAUTION: Care should be taken not to drill through into inner panels or reinforcements.

Using a 10mm drill bit, drill holes for MIG plug welds for the installation of the lower backing plate as indicated.

16. Debur the drilled holes.

17. Cut run on/run off tabs from the unused part of the old/new B-pillar inner panel remnants.

18. NOTE: The backing plate should be wide enough to accommodate 10mm MIG plug welds.

Fabricate backing plates from the old/new B-pillar inner panel remnants. Debur and offer up the backing plates to the vehicle. If correct proceed to next step, if not, rectify and recheck before proceeding.

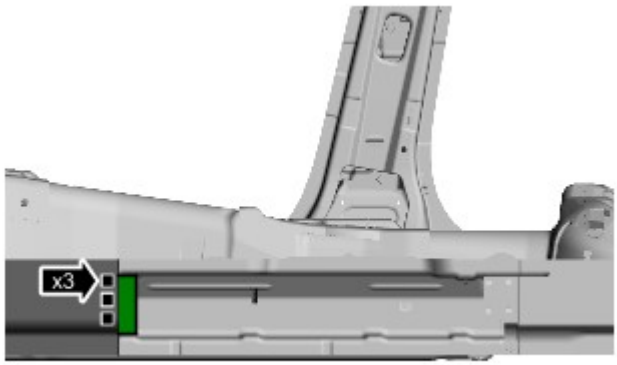
19. Remove the backing plates.

20. Using a Roloc fine bristle disc, clean the backing plates and the panel surfaces where the backing plates are to be welded.

21. Offer up the backing plates, align and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

22. MIG plug weld the upper backing plate to the vehicle as indicated.

E132940



E132941

23. MIG plug weld the lower backing plate to the vehicle as indicated.

24. Clean and prepare all remaining panel joint surfaces including the run on/run off tabs.

25. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

26. Apply the coupling agent and allow to dry.

27. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG weld.

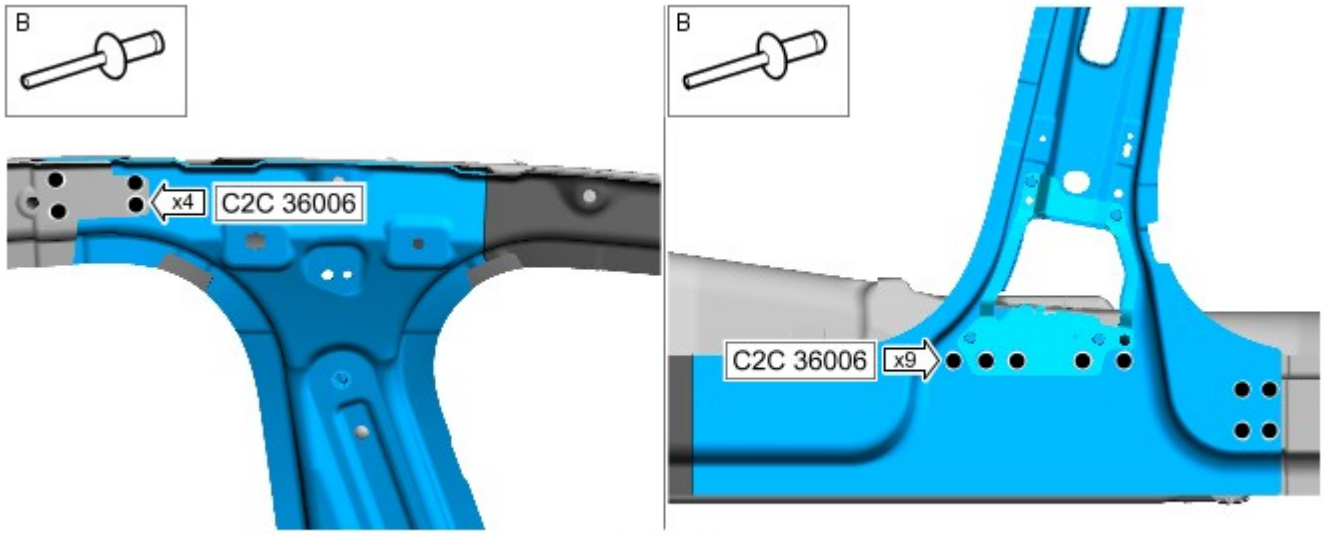
Apply a 5mm zig zag bead of 3M 8115 adhesive to the vehicle.

28. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of other panels. These joints must be left clamped until the adhesive has cured.

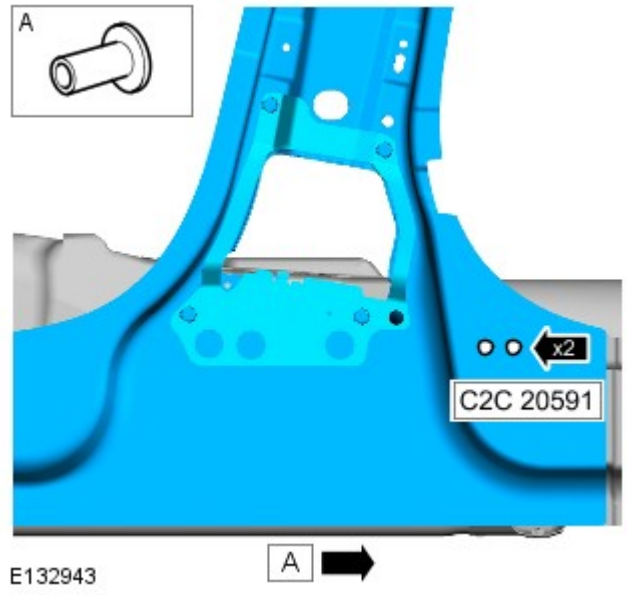
NOTE: If necessary and to aid alignment, the unattached side of the backing plate can be secured with panel pin clamps.

Offer up the new panel, align and clamp into position. If correct proceed to next step, if not, rectify and recheck before proceeding.

29. Using the Genesis G4, install the Hemloks.



E132942



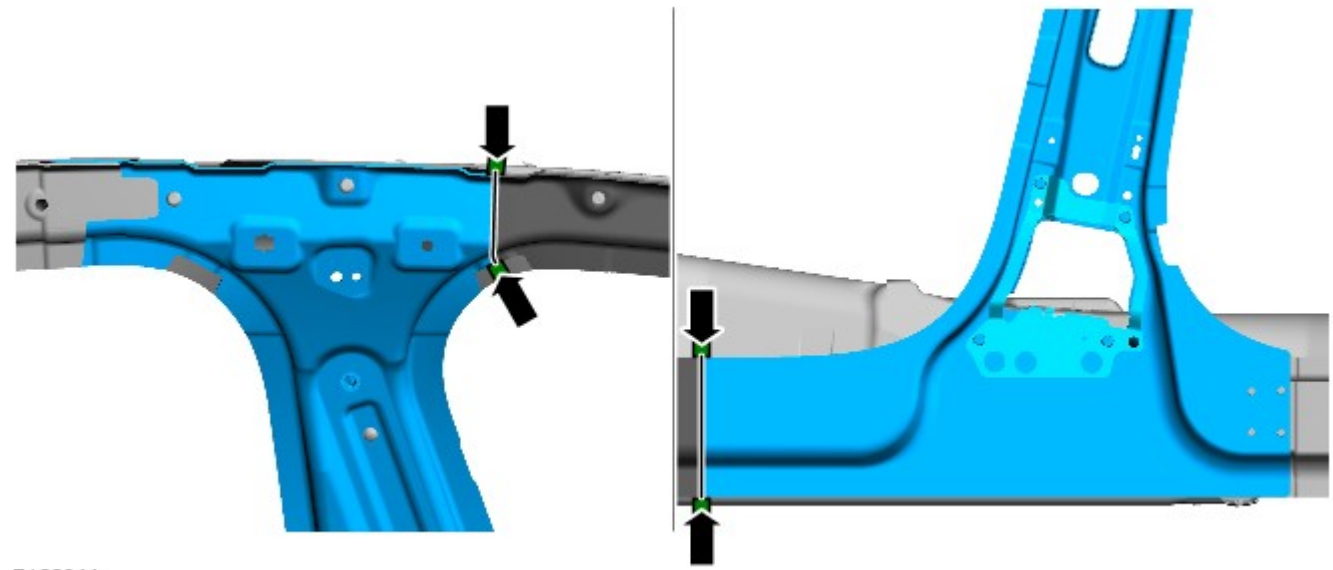
E132943

30. Using the ESN50, install the self piercing rivets as indicated.

31. Tack weld the run-on/run-off tabs to the rear side member closing panel section.

32. Clean the area of the MIG butt joint prior to welding.

33. MIG weld the B-pillar inner panel butt joints.



34. Cut off the run on/run off tabs.

35. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

36. Dress the MIG butt joints and the MIG plug welds.

37. Remove any excess adhesive.

38. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

39. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - A-Pillar Reinforcement

Removal and Installation

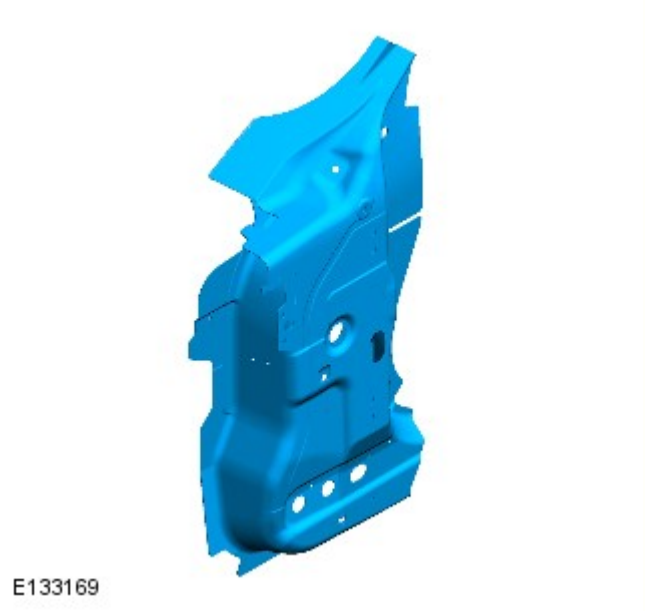
Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation or, is being replaced in combination with panels other than those listed.

1. The A-pillar reinforcement is a category A repair.

2. NOTE: The A-pillar reinforcement is manufactured from aluminium alloy 5754-NG.

   The A-pillar reinforcement is serviced as a separate rivetted and bonded panel, it includes its inner reinforcements.



3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The A-pillar reinforcement is replaced in conjunction with:
- Front bumper cover
- Hood
- Hood hinge
- Front door
- Front fender
- Hood latch panel
- A-pillar outer panel
- Fender apron panel closing panel
- Headliner
- Windshield glass remove and install
- Instrument panel upper section

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Remove the fender apron panel closing panel.
For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

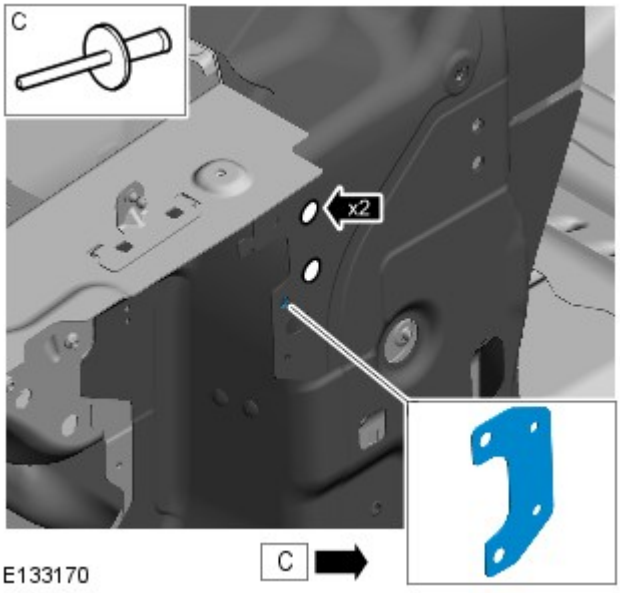
8. Remove the A-pillar outer panel.
For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

9. Remove the hood hinge.
For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

10. Release the A-pillar wiring harness and position it to one side.

11. Remove any remaining miscellaneous components from the repair area as necessary.

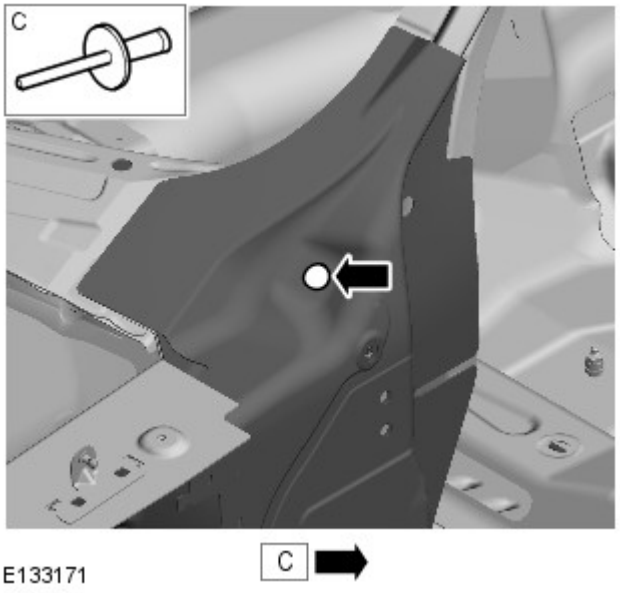
12. Prior to removal, mark the position of the A-pillar reinforcement in relation to adjacent panels, for ease of alignment on installation.



E133170

13. NOTE: If the fender apron panel closing panel bracket is to be installed, it is not necessary to remove it. Retain if being re-used.

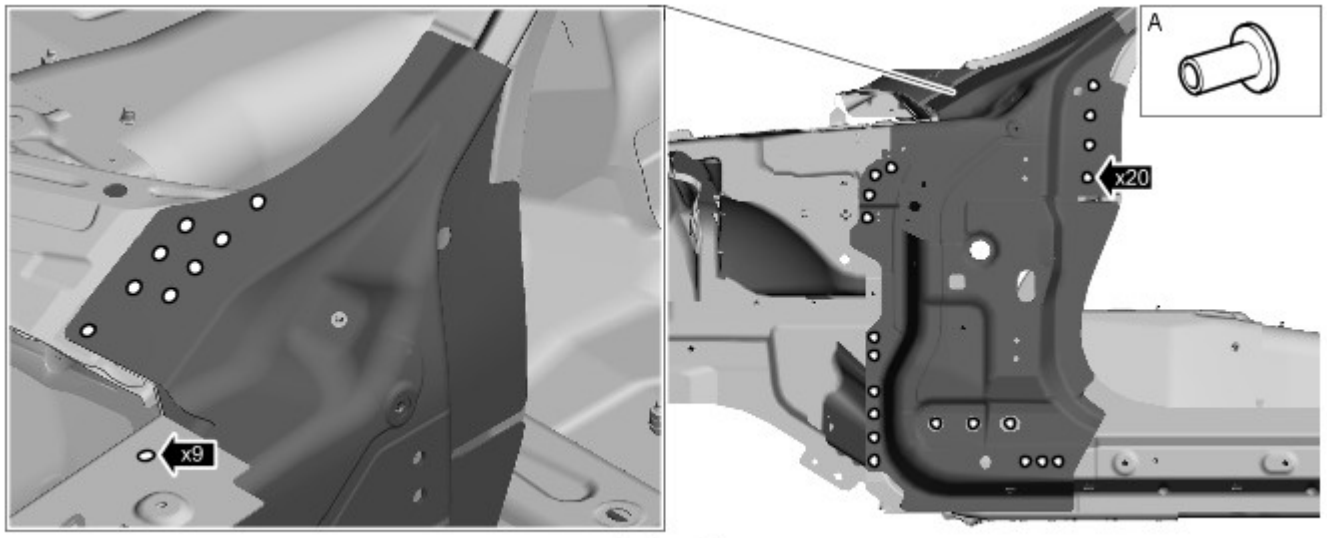
Remove the Monobolts, to release the fender apron panel closing panel bracket as indicated.



E133171

14. Remove the Monobolt as indicated.

15. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.



E133172

16. NOTES:

Retain the old panel as it will be used as a template.

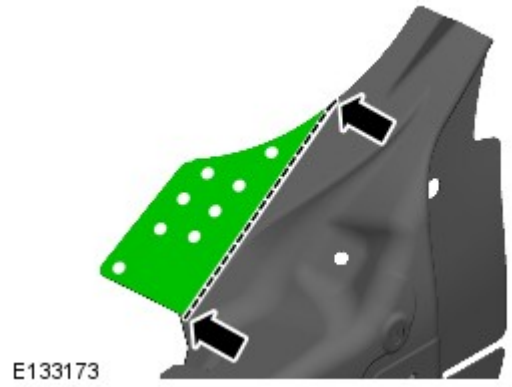
Remove and retain the noise, vibration and harshness (NVH) components, if they are to be reused.

Separate the joints and remove the old panel, also releasing the inner NVH component.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

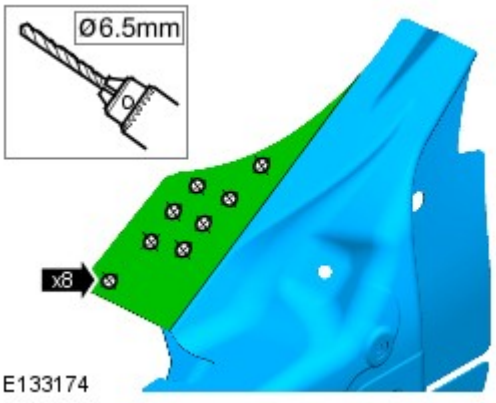


E133173

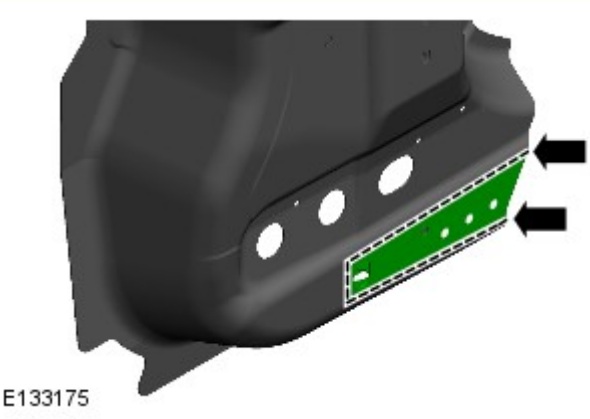
3. Cut a template from the old A-pillar reinforcement panel remnant as indicated.

4. Clean and dress the template.

5. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

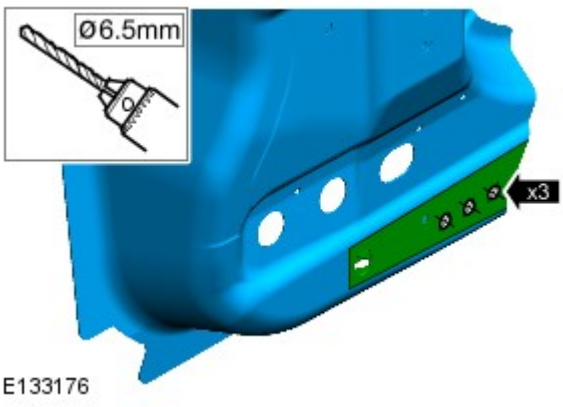


6. Remove the template.



7. Cut a template from the old A-pillar reinforcement panel remnant as indicated.

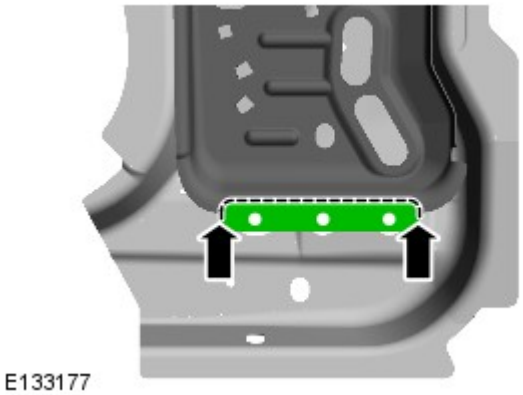
8. Clean and dress the template.



9. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

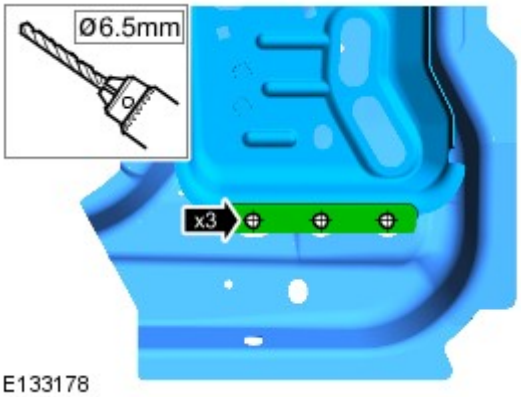
10. Remove the template.

11. Cut a template from the old A-pillar reinforcement panel remnant as indicated.



E133177

12. Clean and dress the template.



E133178

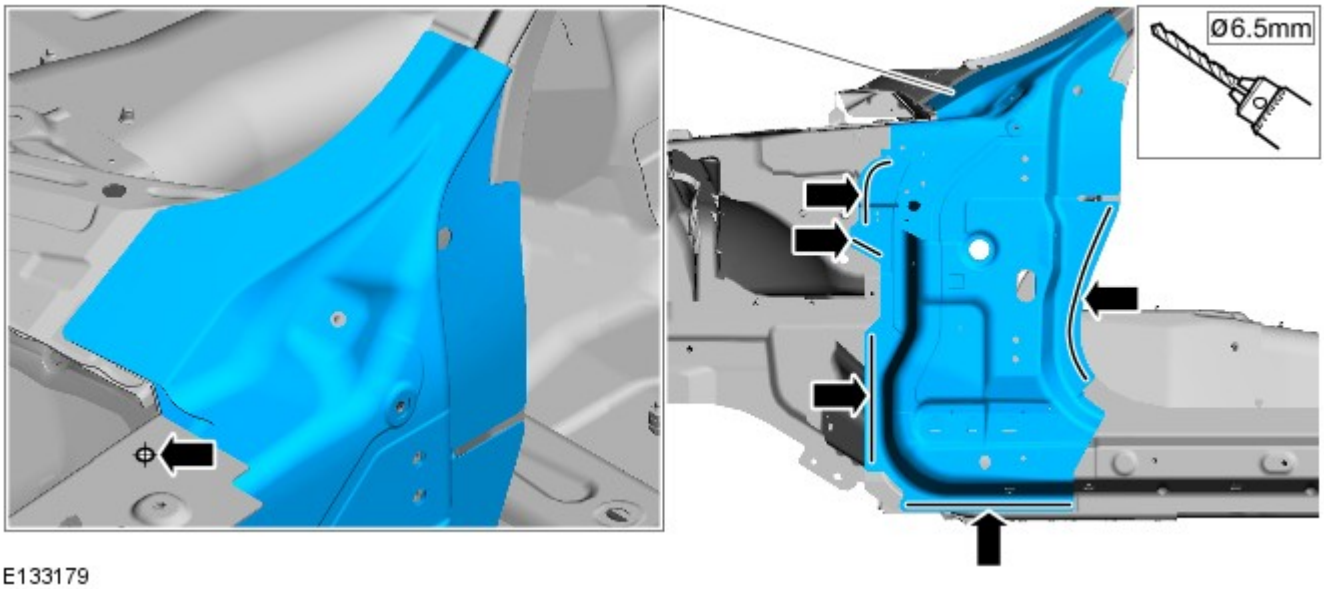
13. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

14. Remove the template.

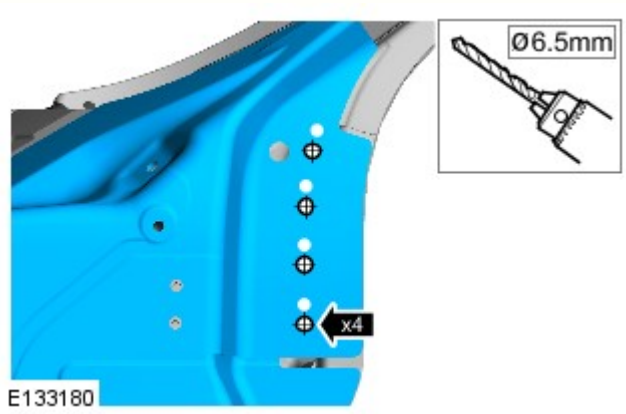
15. Debur the drilled holes in the new panel.

16. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

17. Using a 6.5mm Cryobit drill bit, drill holes through the removed self piercing rivet location holes in the areas as indicated.



E133179



E133180

18. Using the old panel for reference, mark and measure out the position of the removed self piercing rivet locations, as indicated. Using a 6.5mm Cryobit drill bit, drill holes below these locations at the points where Hemloks are to be installed as indicated.

19. Remove the new panel.

20. Debur the drilled holes in the new panel.

21. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces.

22. Trim, clean and prepare the NVH components.

23. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

24. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

25. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the inner NVH component and install it to the new A Pillar Reinforcement, then apply semi-rigid sealer to the exposed edge of the NVH component for installation to the vehicle.

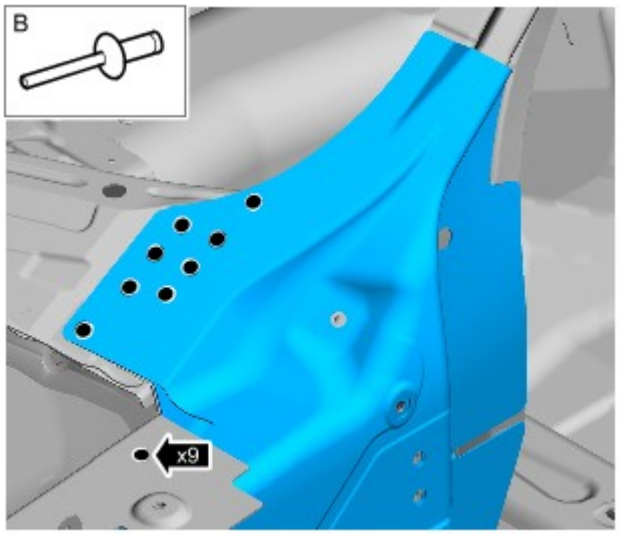
26.

NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

27. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

Offer up the new panel, align and clamp into position.

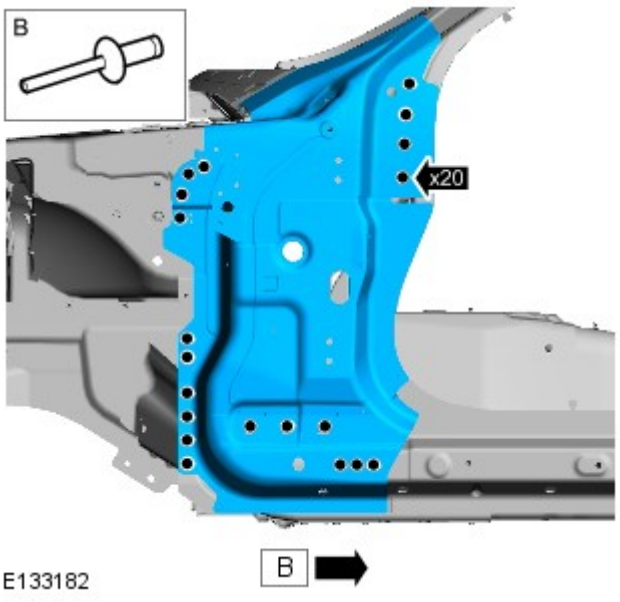


E133181

28. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



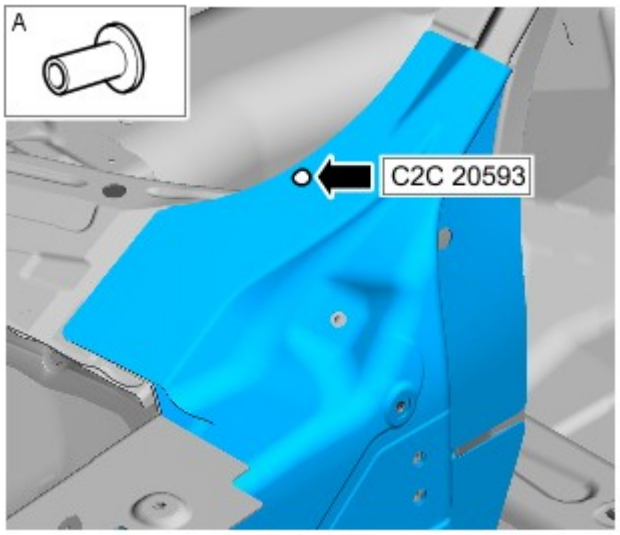
E133182

29. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

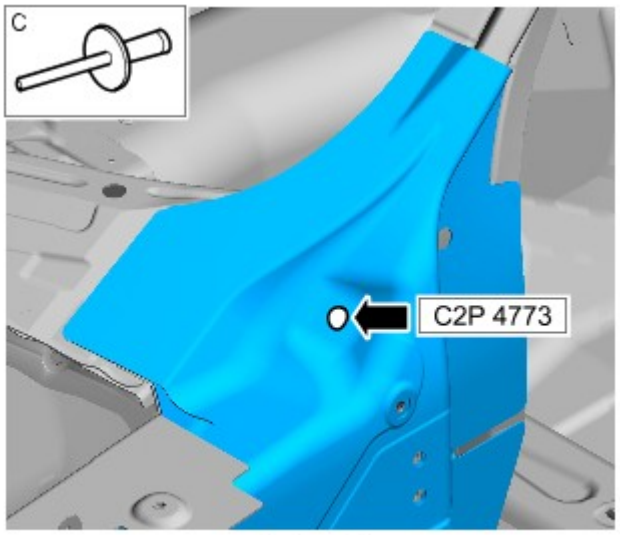
Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

30. Using the ESN50, install the self piercing rivet as indicated.

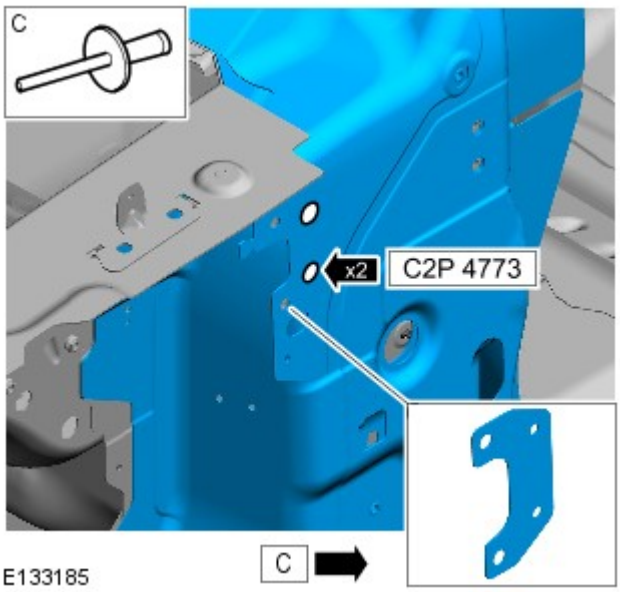


E133183



E133184

31. Using the Genesis G4, install the Monobolt.



E133185

32. Using the Genesis G4, install the Monobolts to the fender apron panel closing panel bracket as indicated.

33. Apply semi-rigid sealer to the outer lower NVH component and install it to the new A Pillar Reinforcement.

34. Remove any excess adhesive.

35. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

36. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Side Panel Sheet Metal Repairs - Rocker Panel Inner Reinforcement

Removal and Installation

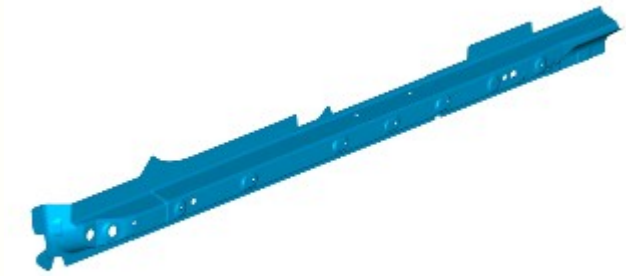
Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The rocker panel inner reinforcement is a category A repair.

2. NOTE: The rocker panel inner reinforcement is manufactured from aluminium alloy 5754-NG.

   The rocker panel inner reinforcement is serviced as a separate rivetted and bonded panel.



E133564

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The rocker panel inner reinforcement is replaced in conjunction with:

- Front bumper cover
- Rear bumper cover
- Front door
- Rear door
- Front fender
- Hood
- Hood hinge
- Luggage compartment lid
- Hood latch panel
- Fender apron panel closing panel
- Quarter panel
- A-pillar outer panel
- A-pillar reinforcement
- Rocker panel and b-pillar outer panel
- B-pillar reinforcement
- Rocker panel
- Headliner
- Windshield glass remove and install
- Rear window glass
- Instrument panel upper section
- Roof opening panel frame
- Roof glass front
- Roof glass rear

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Remove the B-pillar reinforcement.
For additional information, refer to: B-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

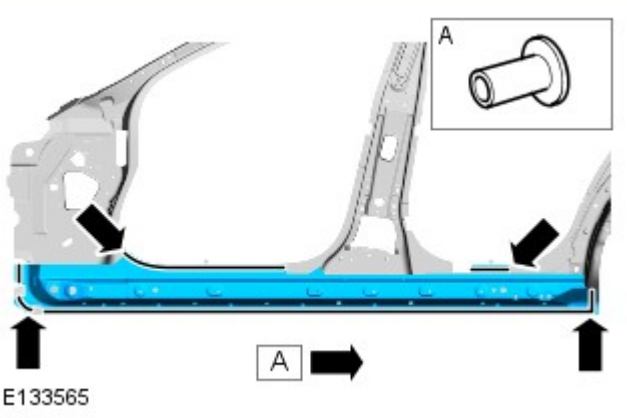
7. Remove the A-pillar reinforcement.
For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

8. Remove the rocker panel.
For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

9. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

10. Remove any remaining miscellaneous components from the repair area as necessary.

11. Prior to removal, mark the position of the rocker panel inner reinforcement in relation to adjacent panels, for ease of alignment on installation.



E133565

12. Using the ESN50, remove any remaining self piercing rivets from the areas indicated.

13. NOTE: Remove and retain the noise, vibration and harshness (NVH) component, if it is to be reused.

Separate the joints and remove the old panel, also releasing the NVH component if required.

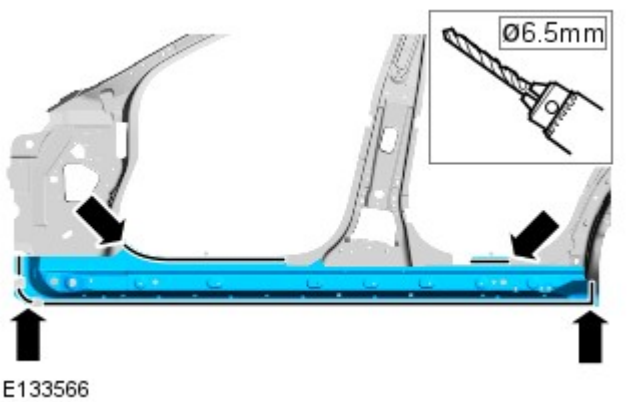
Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.

4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



E133566

5. NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

Where the pitch of the removed self piercing rivets is 25mm or less, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the outer panel is installed.

6. Remove the new panel.

7. Debur the drilled holes in the new panel.

8. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces, also removing any adhesive residue.

9. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

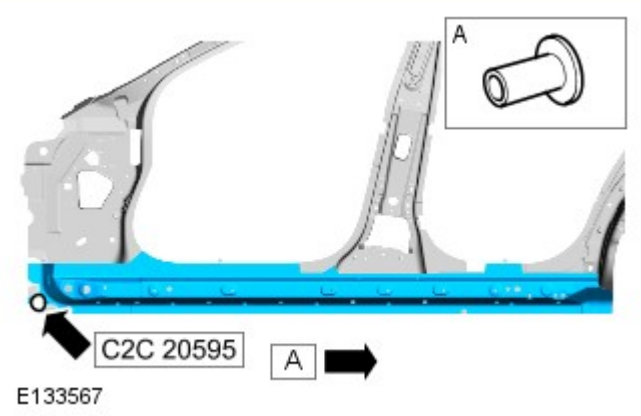
10. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

11. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the vehicle.

12. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of other panels. These joints must be left clamped until the adhesive has cured.

Offer up the new panel, align and clamp into position. If correct proceed to next step, if not, rectify and recheck before proceeding.

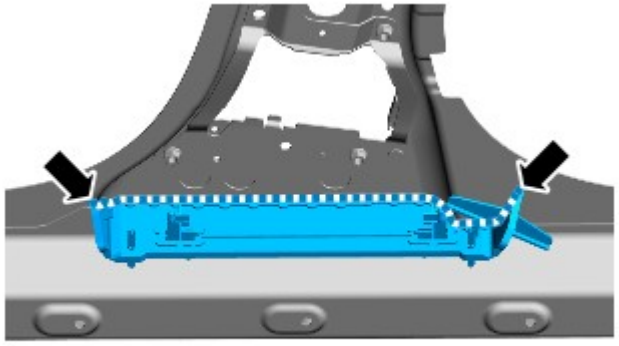


13. Using the ESN50, install the self piercing rivet as indicated.

14. Remove any excess adhesive.

15. Trim, clean and prepare the NVH component.

16. Apply semi-rigid sealer to the NVH component and install to the new panel.



E133568

17. The installation of associated panels and components is the reversal of removal procedure.

Published: 11-May-2011

Side Panel Sheet Metal Repairs - B-Pillar Reinforcement

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The B-pillar reinforcement is a category A repair.

E132834

2. NOTE: The B-pillar reinforcement is manufactured from aluminium alloy 6111-T4.

The B-pillar reinforcement is serviced as a separate riveted and bonded panel, it includes its inner reinforcements.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The B-pillar reinforcement is replaced in conjunction with:
   - Front door.
   - Rear door
   - Rocker panel and B-pillar outer panel
   - Headliner
   - Windshield glass remove and install
   - Roof opening panel frame
   - Roof glass front
   - Roof glass rear

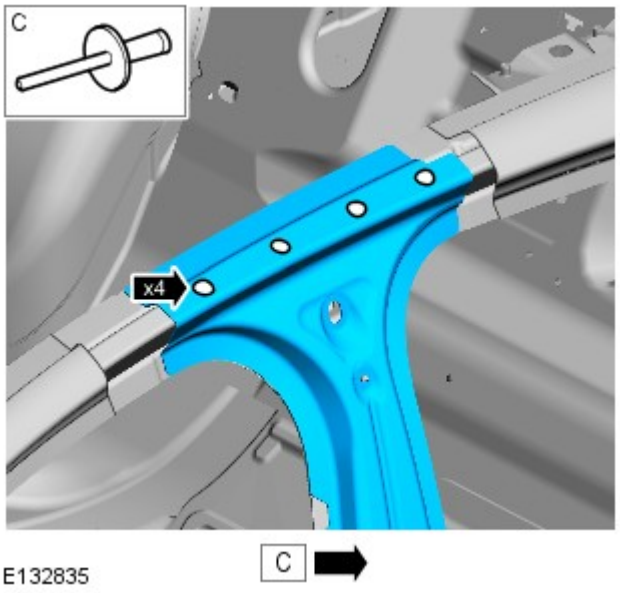
5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Remove the rocker panel and B-pillar outer panel.
For additional information, refer to: Rocker Panel and B-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

7. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

8. Remove any remaining miscellaneous components from the repair area as necessary.

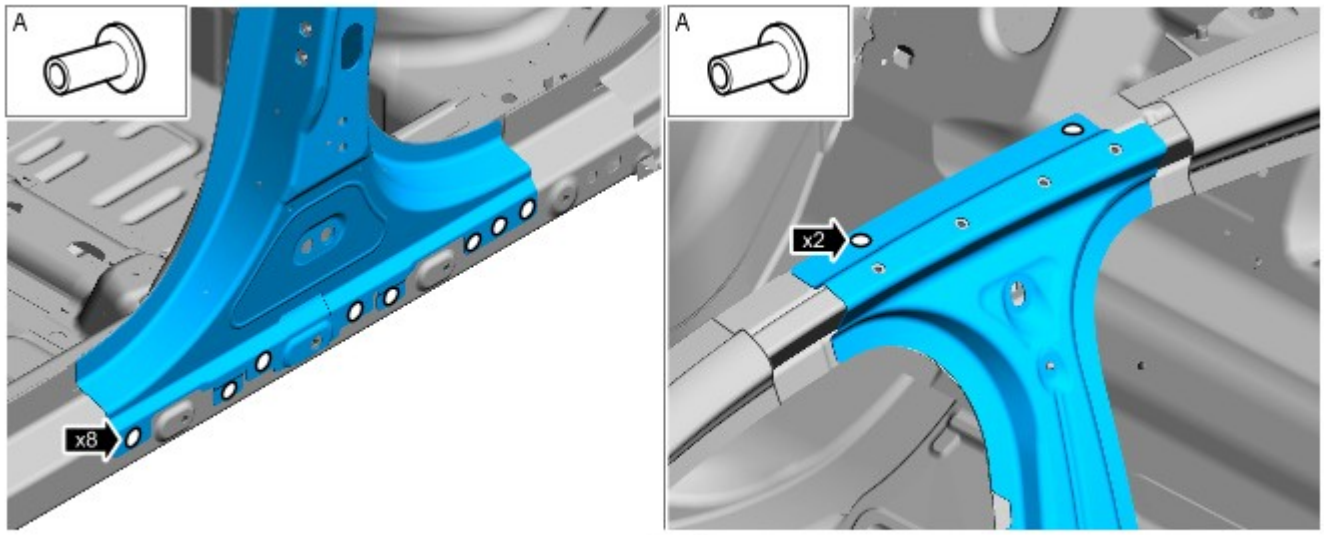
9. Prior to removal, mark the position of the B-pillar reinforcement in relation to adjacent panels, for ease of alignment on installation.



E132835

10. Remove the Monobolts as indicated.

11. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets as indicated.



E132836

A

12. NOTES:

Retain the old panel as it will be used as a template.

Remove and retain the central noise, vibration and harshness (NVH) component, if it is to be reused.

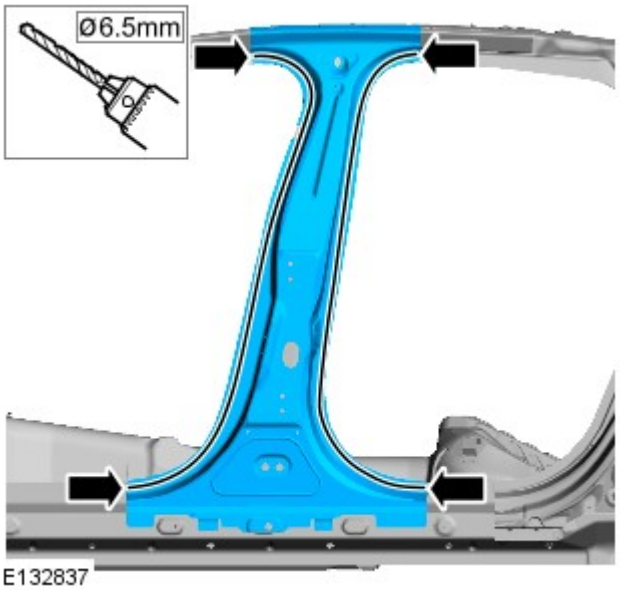
Separate the joints and remove the old panel, also releasing it from the lower NVH component.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

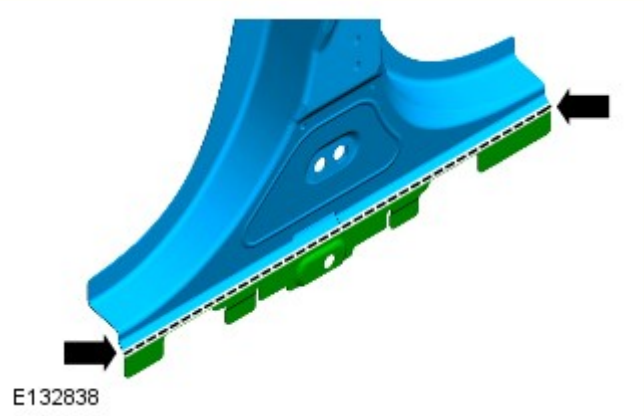


E132837

4. NOTE: New self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

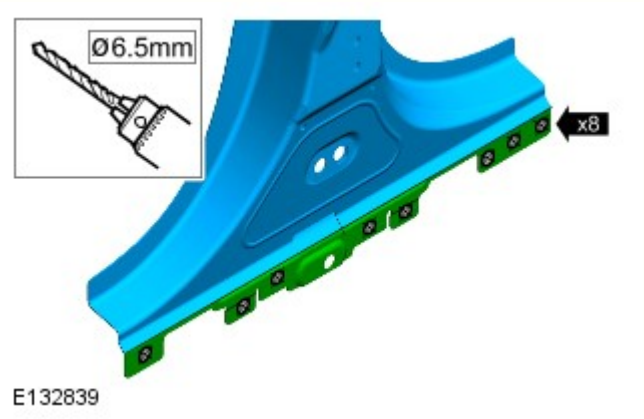
Where the pitch of the removed self piercing rivets is 25mm or less, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the outer panel is installed.

5. Remove the new panel.



6. Cut a section from the lower part of the old panel to be used as a template as indicated.

7. Debur the template.



8. Offer up, align and clamp the template to the new panel. Using a 6.5mm Cryobit drill bit, drill holes through the template into the new panel, ready for Hemloks to be installed.

9. Remove the template from the new panel.

10. Debur the drilled holes in the new panel.

11. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces.

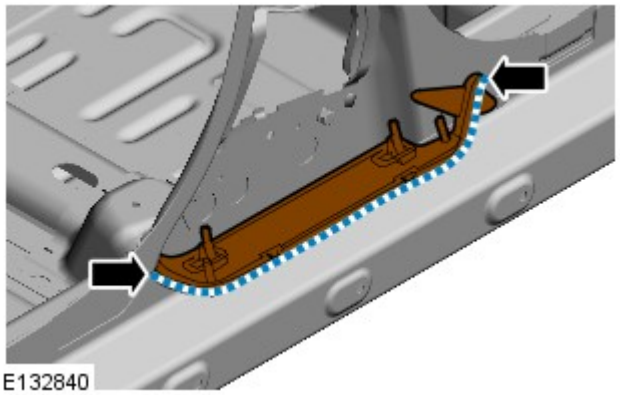
12. Trim, clean and prepare the NVH components.

13. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

14. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

15. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the lower NVH component.

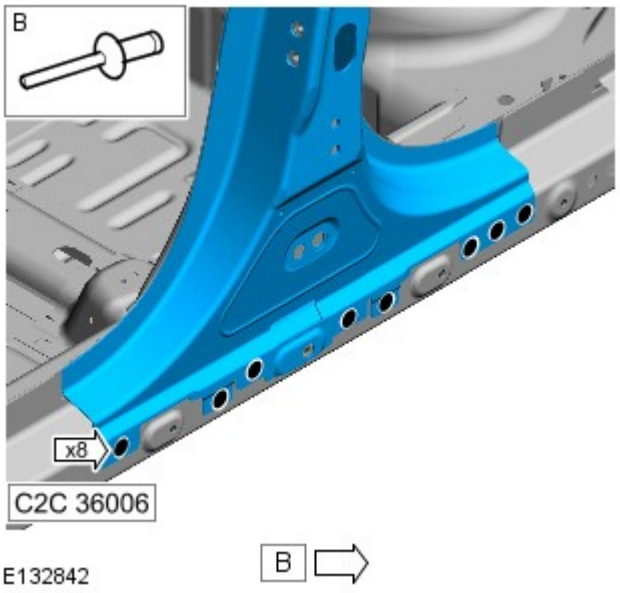


16. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

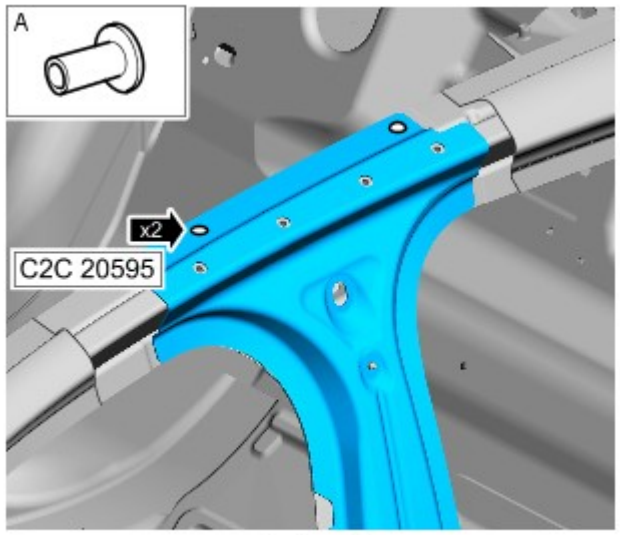
17. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

Offer up the new panel, align and clamp into position.



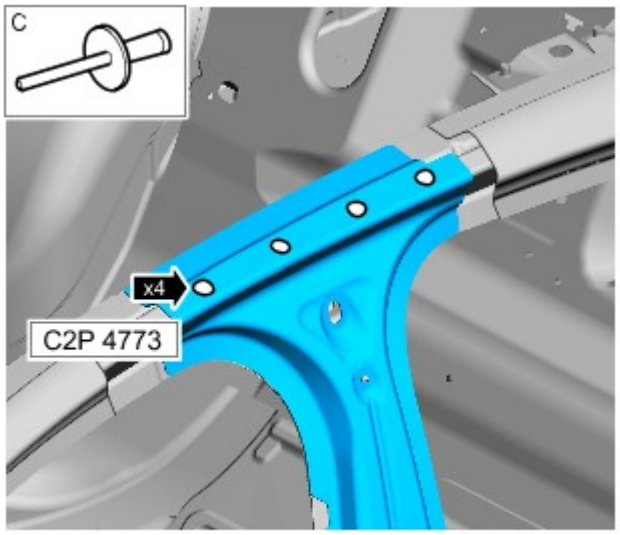
18. Using the Genesis G4, install the Hemloks.

19. Using the ESN50, install the self piercing rivets as indicated.



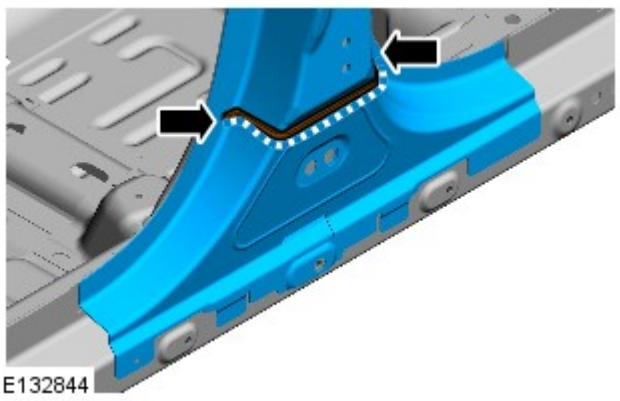
E132841

20. Using the Genesis G4, install the Monobolts.



E132843

21. Apply semi rigid to the central NVH component and install.



E132844

22. Remove any excess adhesive.

23. The installation of associated panels and components is the reversal of removal procedure.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

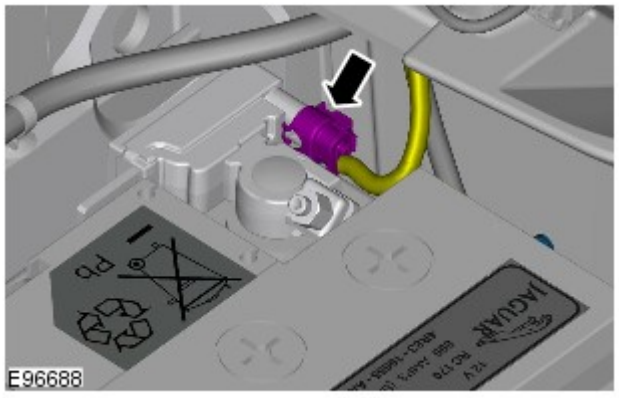
General Procedures

Disconnect

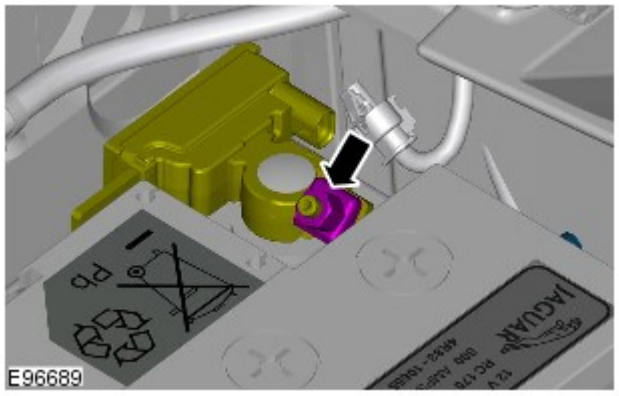
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

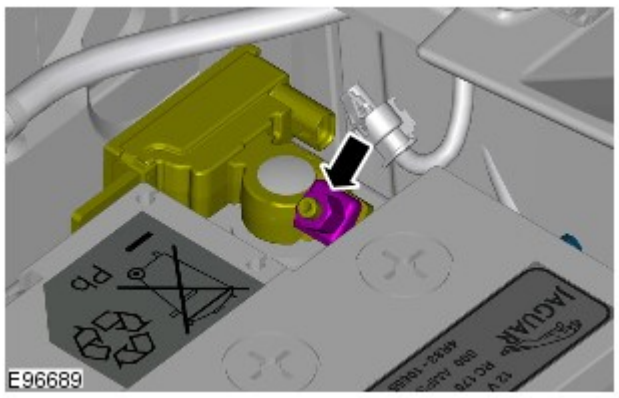


4. CAUTION: Take extra care not to damage the wiring harness.



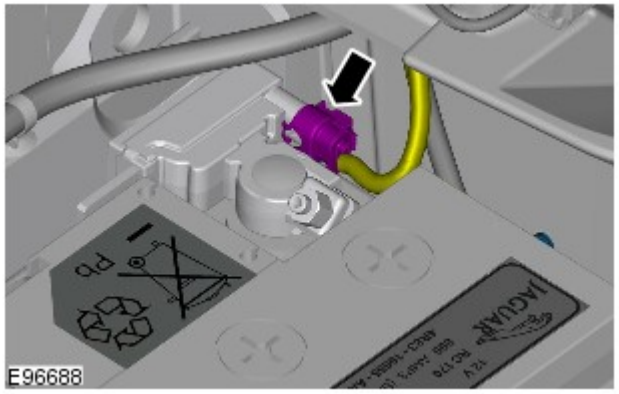
5.

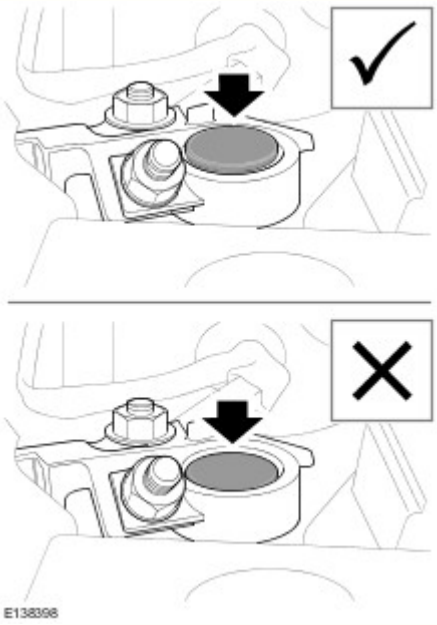
Connect



1. *Torque:* 6 Nm

2.





3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Published: 23-Apr-2015

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

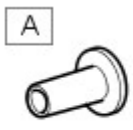
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

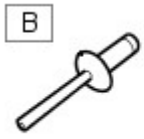
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

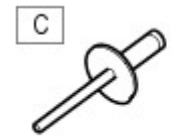
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

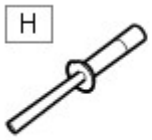
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

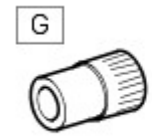
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

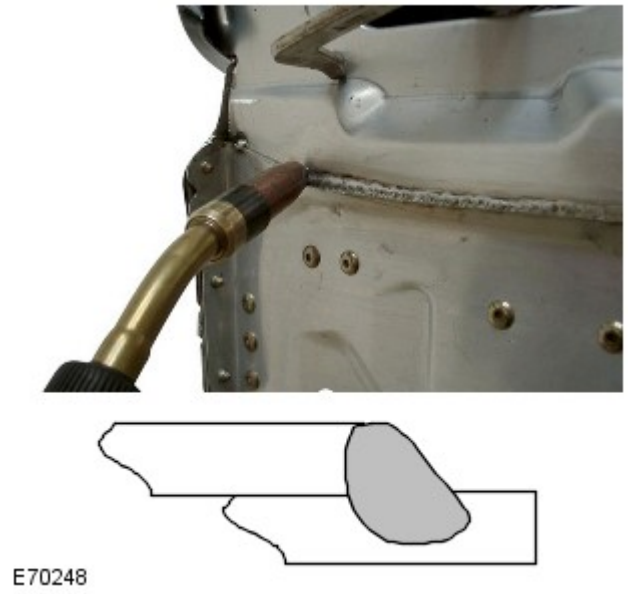
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

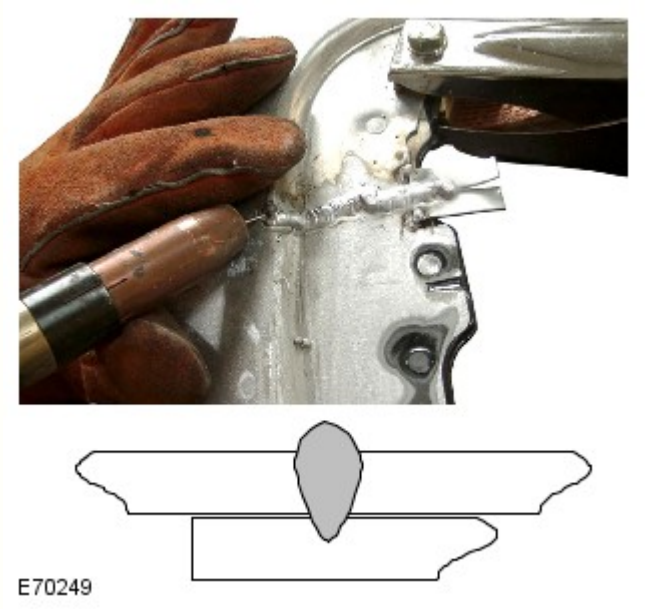
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

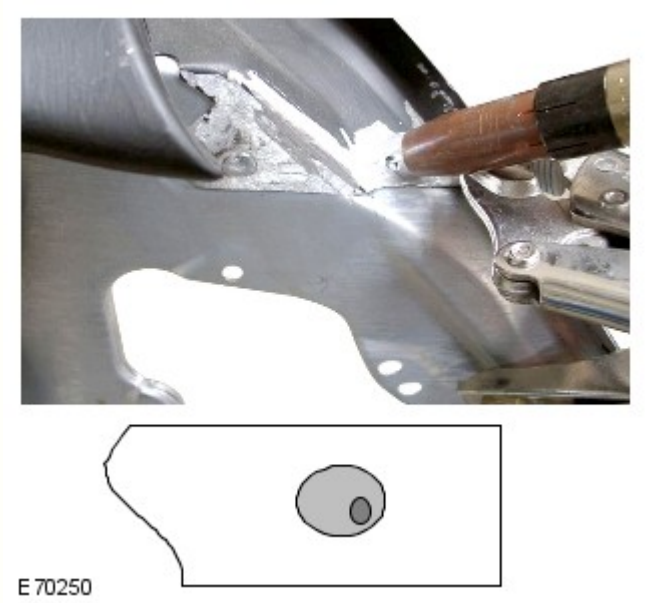
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

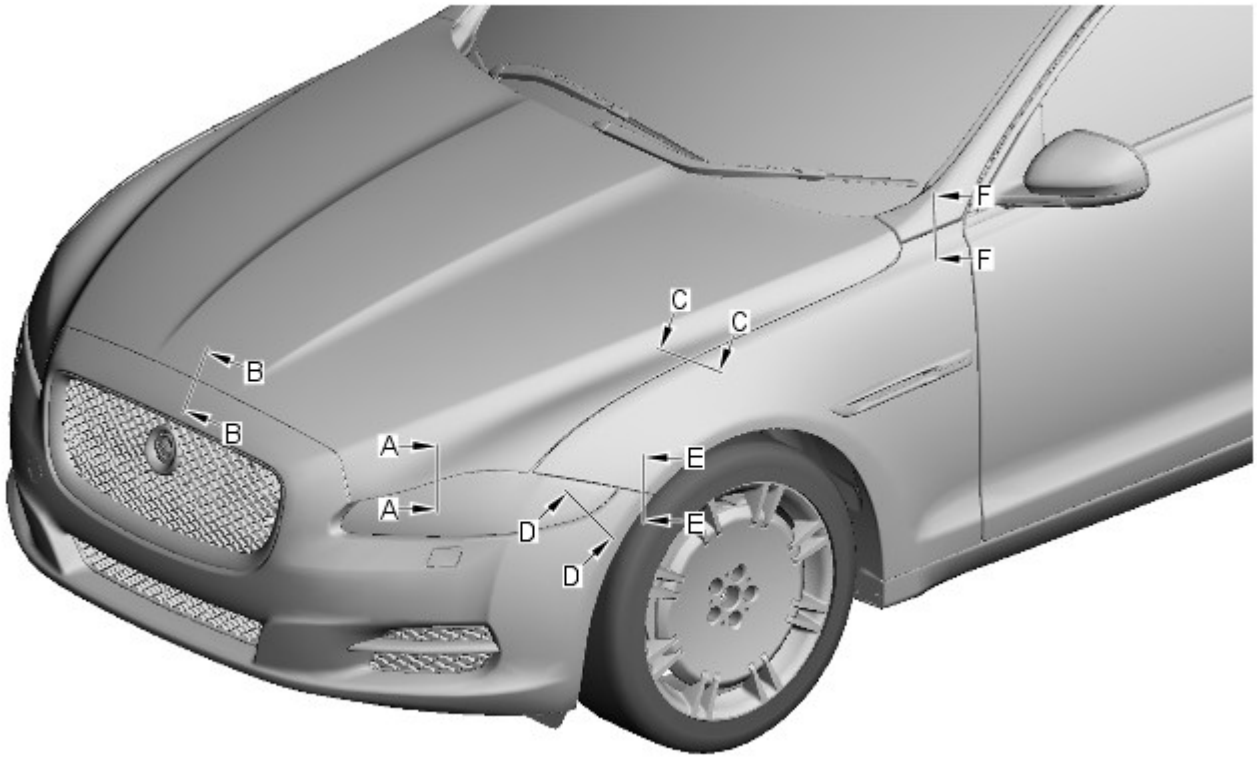
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

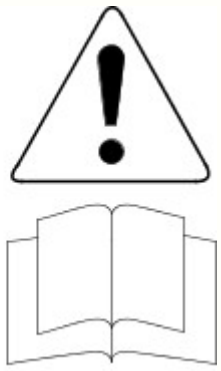
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

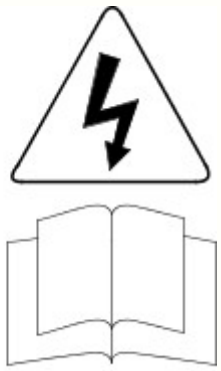
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



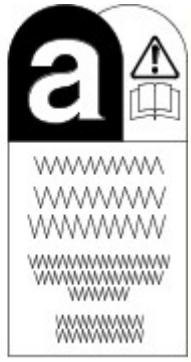
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



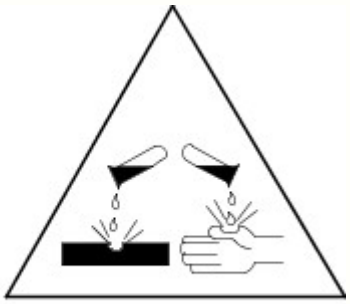
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Side Panel Sheet Metal Repairs - B-Pillar Reinforcement

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The B-pillar reinforcement is a category A repair.

2. NOTE: The B-pillar reinforcement is manufactured from aluminium alloy 6111-T4.

The B-pillar reinforcement is serviced as a separate riveted and bonded panel, it includes its inner reinforcements.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The B-pillar reinforcement is replaced in conjunction with:
- Front door.
- Rear door
- Rocker panel and B-pillar outer panel
- Headliner
- Windshield glass remove and install
- Roof opening panel frame
- Roof glass front
- Roof glass rear

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Remove the rocker panel and B-pillar outer panel.
For additional information, refer to: Rocker Panel and B-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

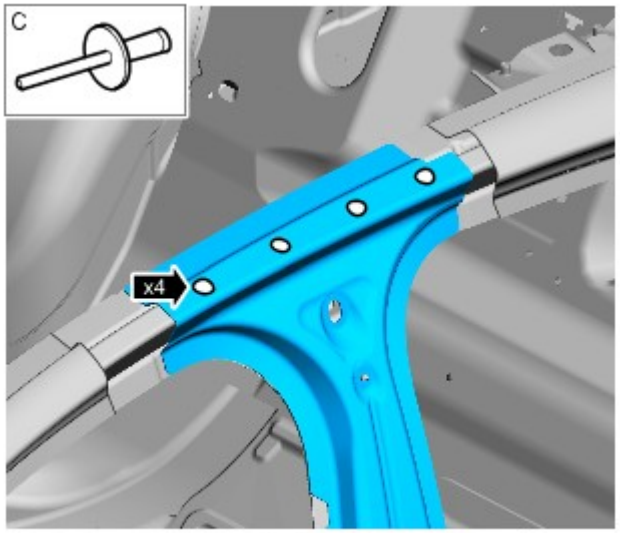
7.

Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

8. Remove any remaining miscellaneous components from the repair area as necessary.

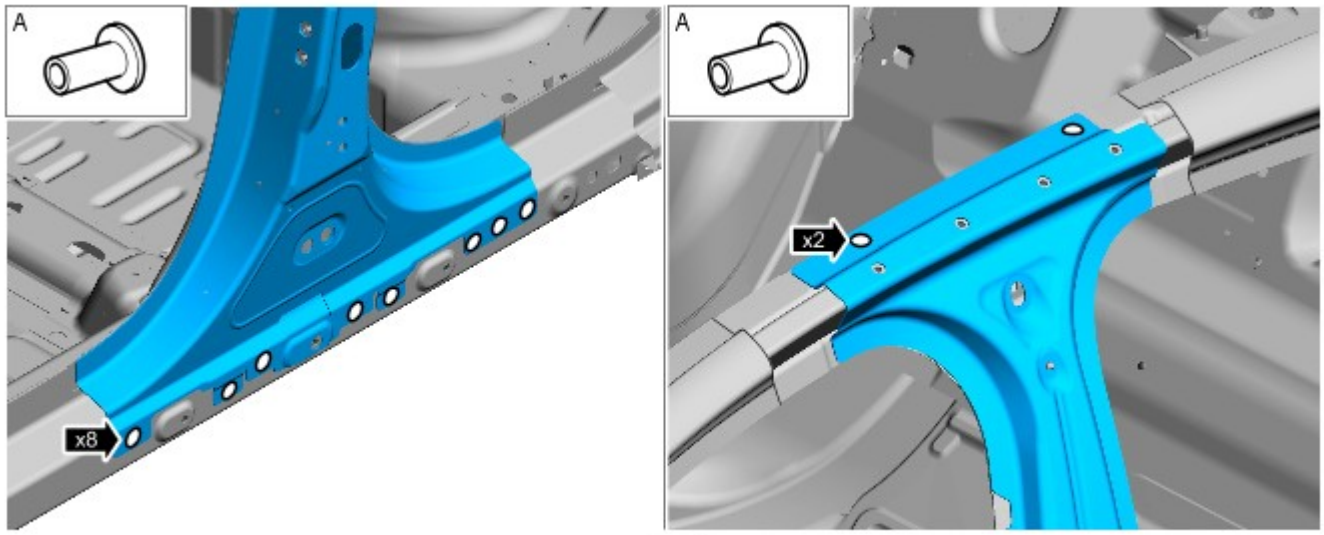
9. Prior to removal, mark the position of the B-pillar reinforcement in relation to adjacent panels, for ease of alignment on installation.

10. Remove the Monobolts as indicated.



E132835

11. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets as indicated.



E132836

12. NOTES:

Retain the old panel as it will be used as a template.

Remove and retain the central noise, vibration and harshness (NVH) component, if it is to be reused.

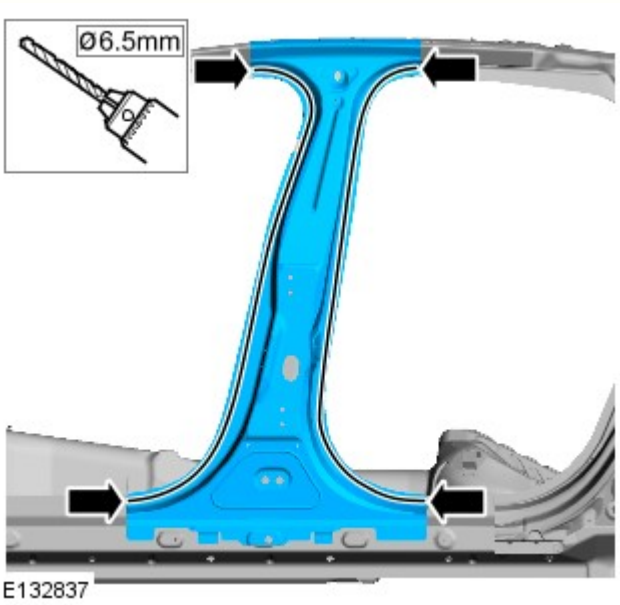
Separate the joints and remove the old panel, also releasing it from the lower NVH component.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

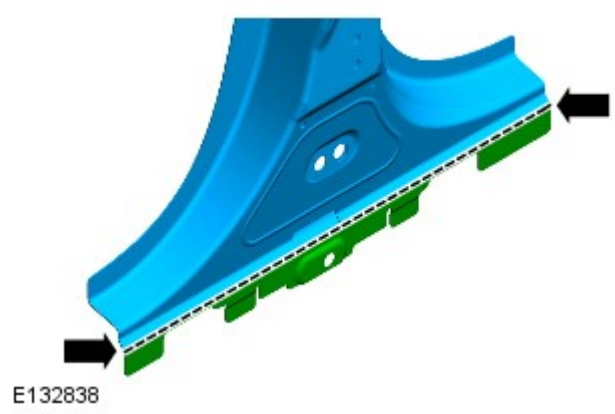
3. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



4. NOTE: New self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

Where the pitch of the removed self piercing rivets is 25mm or less, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the outer panel is installed.

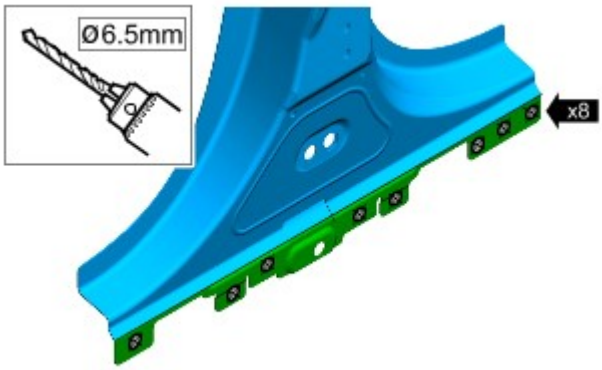
5. Remove the new panel.



6. Cut a section from the lower part of the old panel to be used as a template as indicated.

7. Debur the template.

8. Offer up, align and clamp the template to the new panel. Using a 6.5mm Cryobit drill bit, drill holes through the template into the new panel, ready for Hemloks to be installed.



E132839

9. Remove the template from the new panel.

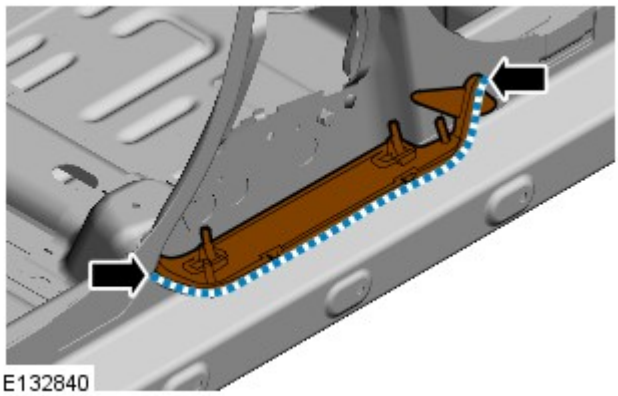
10. Debur the drilled holes in the new panel.

11. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces.

12. Trim, clean and prepare the NVH components.

13. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

14. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.



E132840

15. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the lower NVH component.

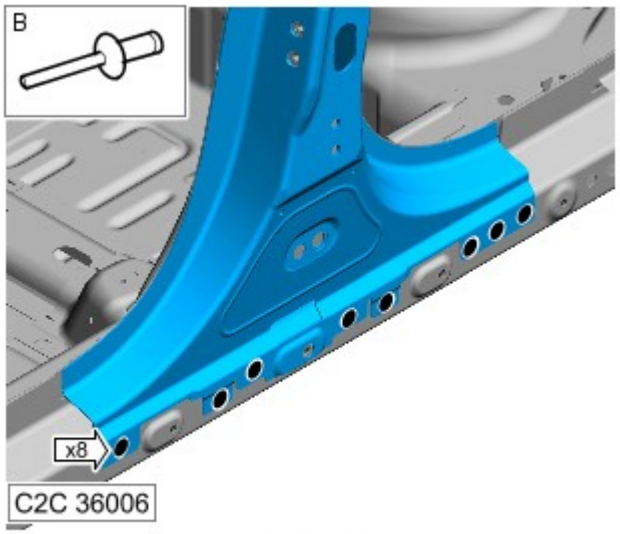
16. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

17. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

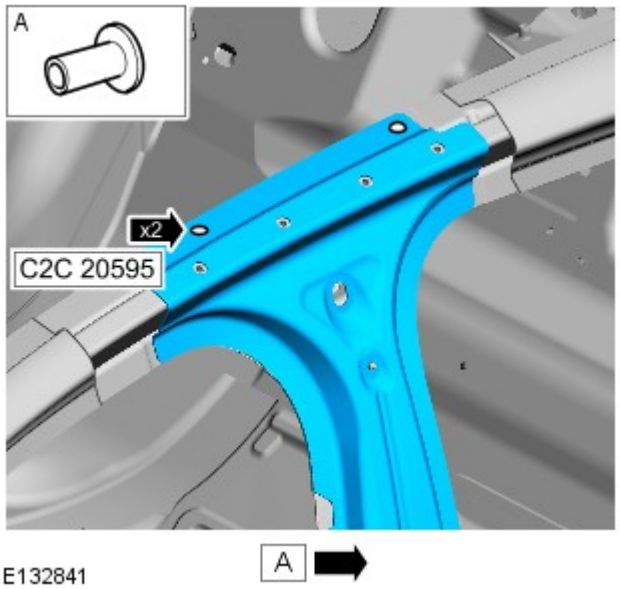
Offer up the new panel, align and clamp into position.

18. Using the Genesis G4, install the Hemloks.



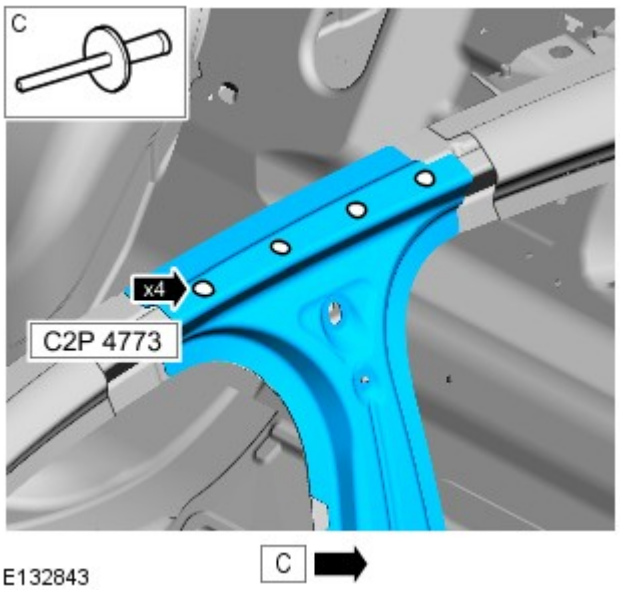
E132842

19. Using the ESN50, install the self piercing rivets as indicated.

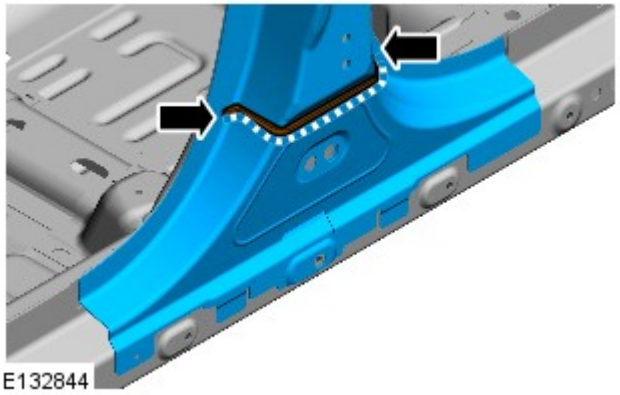


E132841

20. Using the Genesis G4, install the Monobolts.



E132843



21. Apply semi rigid to the central NVH component and install.

22. Remove any excess adhesive.

23. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

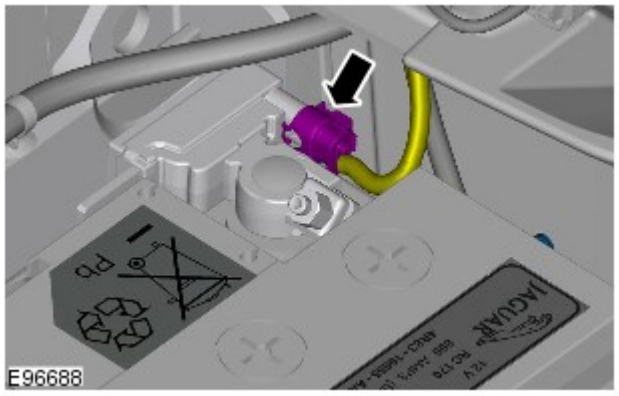
General Procedures

Disconnect

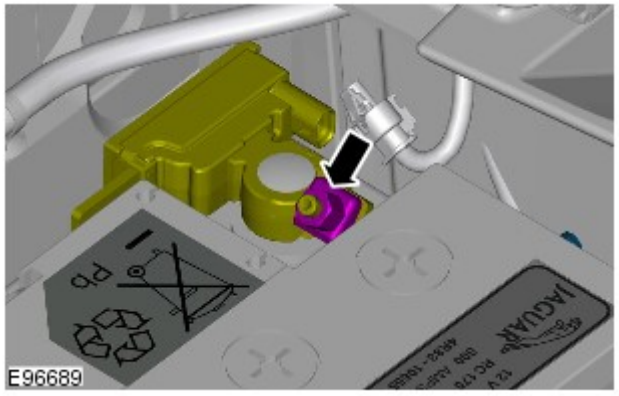
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

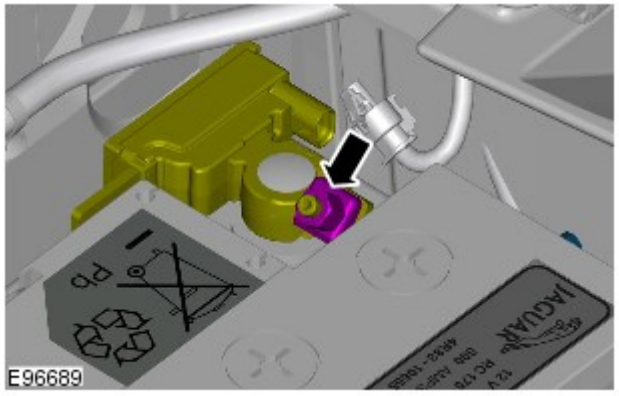


4. CAUTION: Take extra care not to damage the wiring harness.

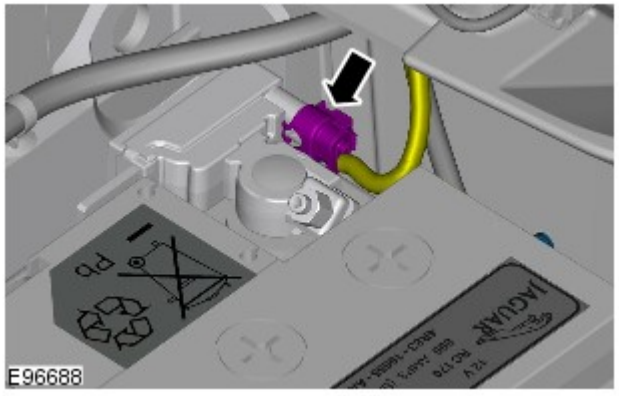


5.

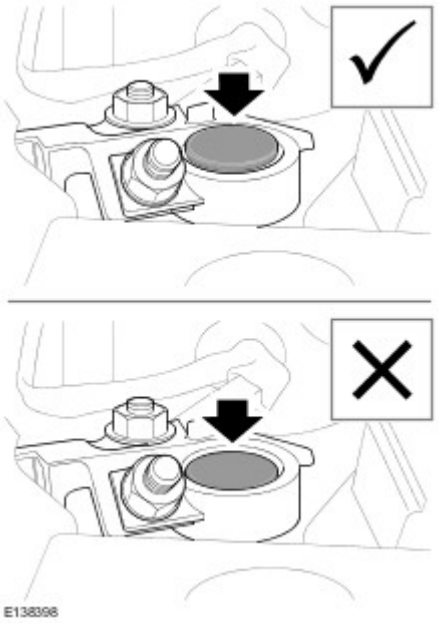
Connect



1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Side Panel Sheet Metal Repairs - Rocker Panel and B-Pillar Outer Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The rocker panel and B-pillar outer panel is a category A repair.

2. NOTE: The rocker panel and B-pillar outer panel is manufactured from aluminium alloy 6111-T4.

The rocker panel and B-pillar outer panel is serviced as a separate welded, bonded and riveted panel.

3. The rocker panel and B-pillar outer panel is replaced in conjunction with:
- Front door.
- Rear door
- Headliner
- Windshield glass remove and install
- Roof opening panel frame
- Roof glass front
- Roof glass rear

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Disconnect the generator electrical connectors.

7. Remove the roof opening panel frame.
For additional information, refer to: Roof Opening Panel Frame (501-17 Roof Opening Panel, Removal and Installation).

8. Remove the front door.
For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

9. Remove the rear door.
For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

10. Remove the rear door upper and lower hinges from the B-pillar.

11. Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

12. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20B Supplemental Restraint System, Removal and Installation).

13. Remove the rocker panel outer moulding.

14. Remove the front safety belt retractor.
For additional information, refer to: Front Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

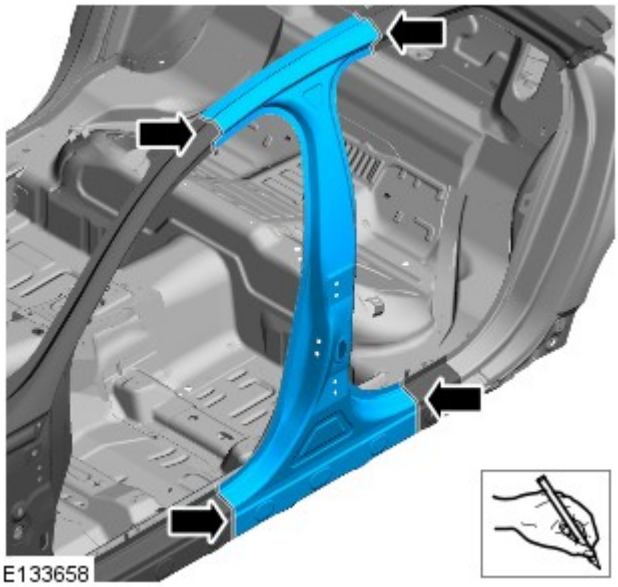
15. Remove the safety belt shoulder height adjuster.
For additional information, refer to: Safety Belt Shoulder Height Adjuster (501-20A Safety Belt System, Removal and Installation).

16. Release the floor covering and position it to one side.

17. Remove the underfloor splash shield.

18. Remove any remaining miscellaneous components from the repair area as necessary.

19. Release the inner rocker panel wiring harness and position to one side.



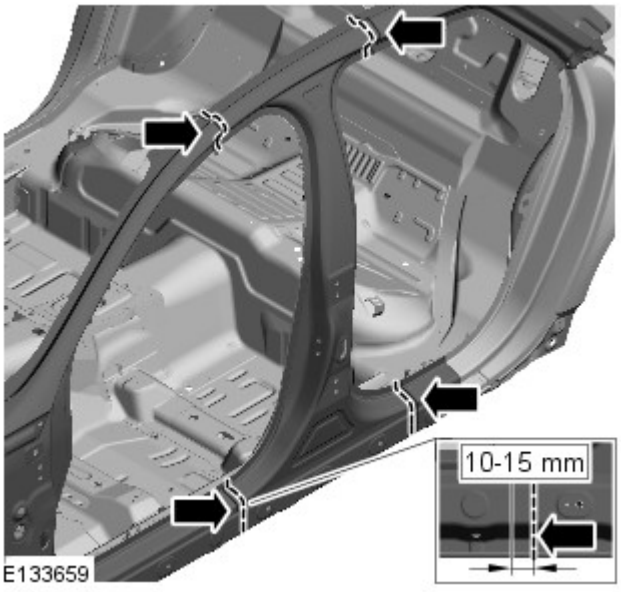
20. NOTE: The points marked on the vehicle are for reference only, do not cut the panels in these locations.

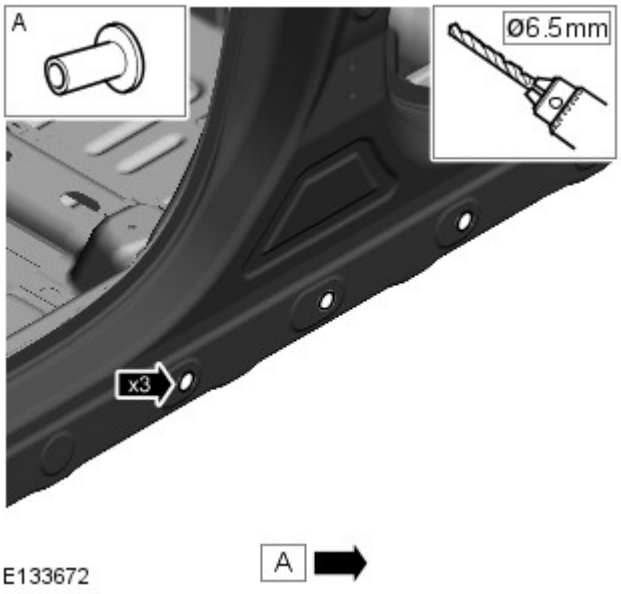
Offer up the new panel and clamp into position over the old panel. Mark the position of the new panel service cuts onto the vehicle as indicated.

21. Remove the new panel.

22. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

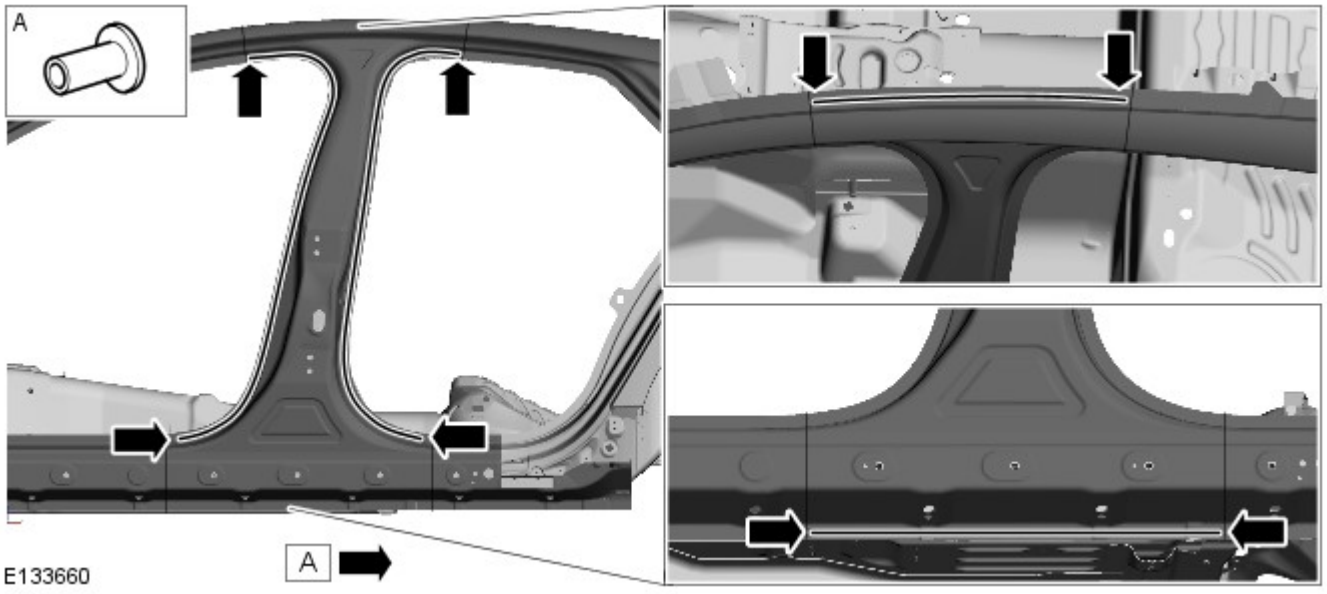
Cut the old rocker panel and B-pillar outer panel 10-15mm inside the previously marked positions as indicated.





23. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets.

24. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.



25. NOTE: Retain the old panel remnant as it may be used as a template and to fabricate backing strips and run-on/run off tabs.

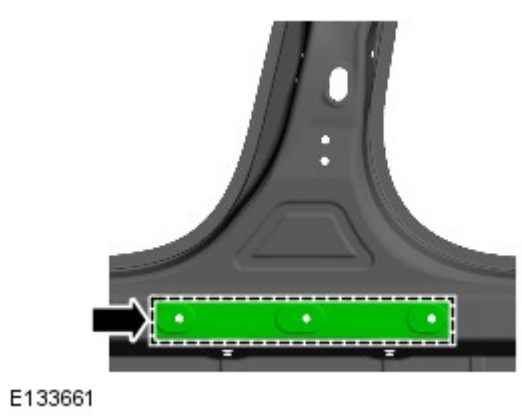
Separate the joints and remove the old panel, also releasing it from the central noise, vibration and harshness (NVH) component.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

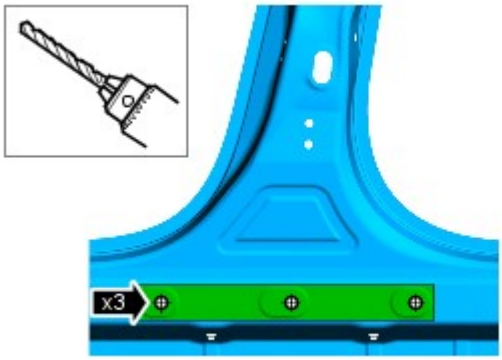
3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.



4. Cut a template from the old rocker panel and B-pillar outer panel remnant as indicated.

5. Clean and dress the template.

6. Offer up, align and clamp the template in place on the new rocker panel and B-pillar outer panel service panel. Drill through the template into the new panel at the points indicated.

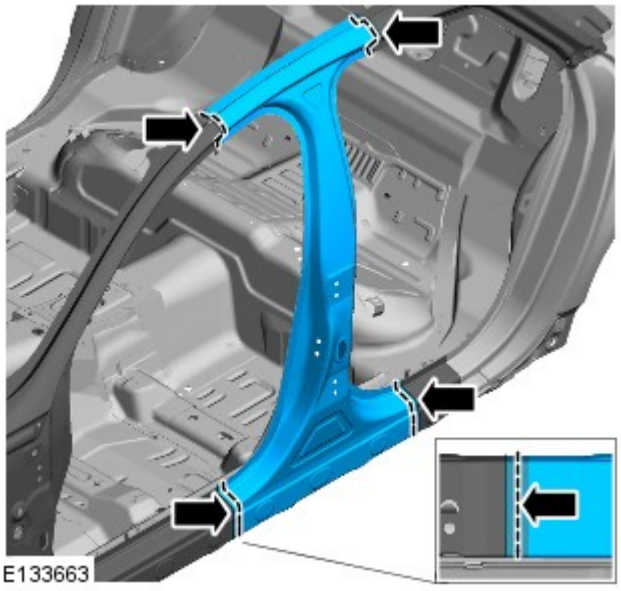


E133662

7. Remove the template.

8. Debur the drilled holes in the new panel.

9. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



E133663

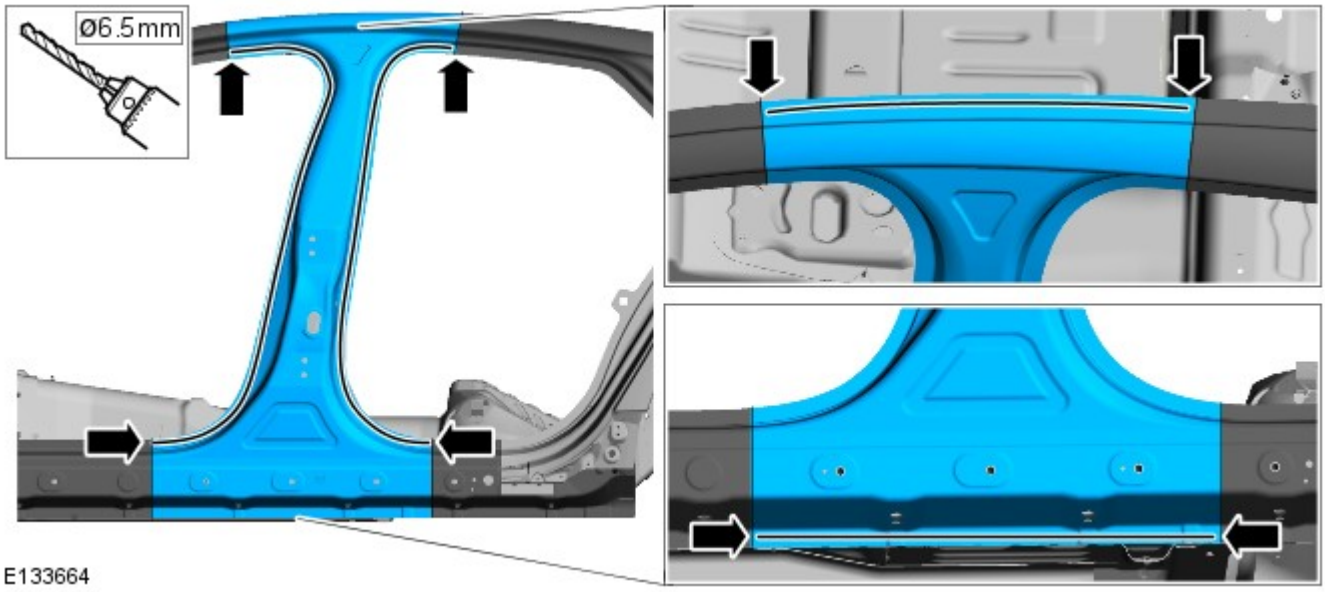
10. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: The new panel should be cut in approximately 5mm inside the service cuts.

Cut through the new panel and the old panel as indicated.

11. NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

Where the pitch of the removed self piercing rivets is 25mm or less, or there is no access for the ESN50, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the new rocker panel and B-pillar outer panel is installed.



12. Remove the new panel

13. Remove the old panel remnants.

14. NOTE: The backing plates should be an interference fit.

Fabricate backing plates from the old rocker panel and B-pillar outer panel remnant. Debur and offer up the backing plates to the rocker panel and B-pillar outer panel. If correct proceed to next step, if not, rectify and recheck before proceeding.

15. Remove the backing plates.

16. Fabricate run-on/run-off tabs from the old rocker panel and B-pillar outer panel remnant.

17. Debur the run-on/run-off tabs.

18. Trim, clean and prepare the central NVH component.

19. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

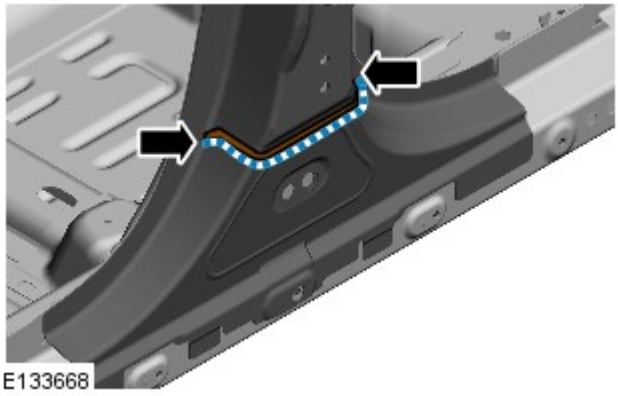
20. Using a Roloc fine bristle disc, clean and prepare the old and new panel joint surfaces.

21. NOTE: The backing plates are installed with an interference fit.

Install and align the backing plates to the vehicle.

22. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

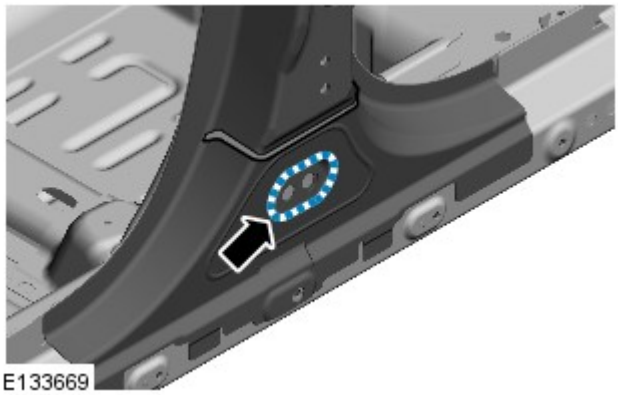
23. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.



E133668

24. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the central NVH component as indicated.



E133669

25. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the B-pillar reinforcement as indicated.

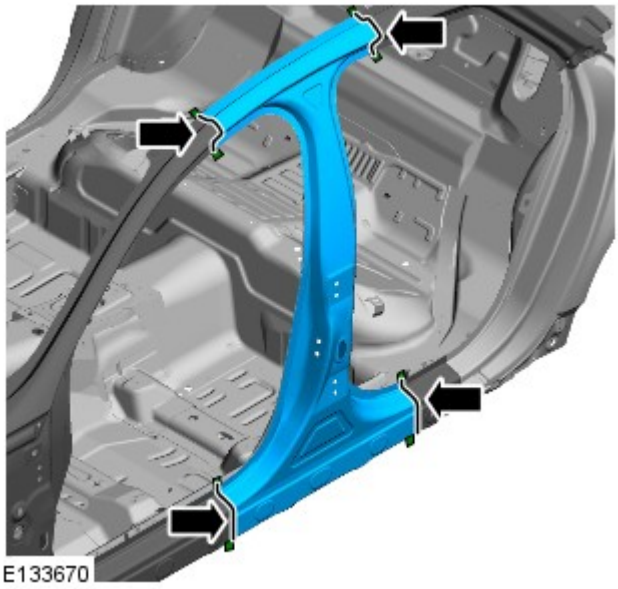
26. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

27. Offer up the new panel, align and clamp into position.

28. Tack weld the run-on/run-off tabs to all MIG butt joints.

29. MIG weld the MIG butt joints.

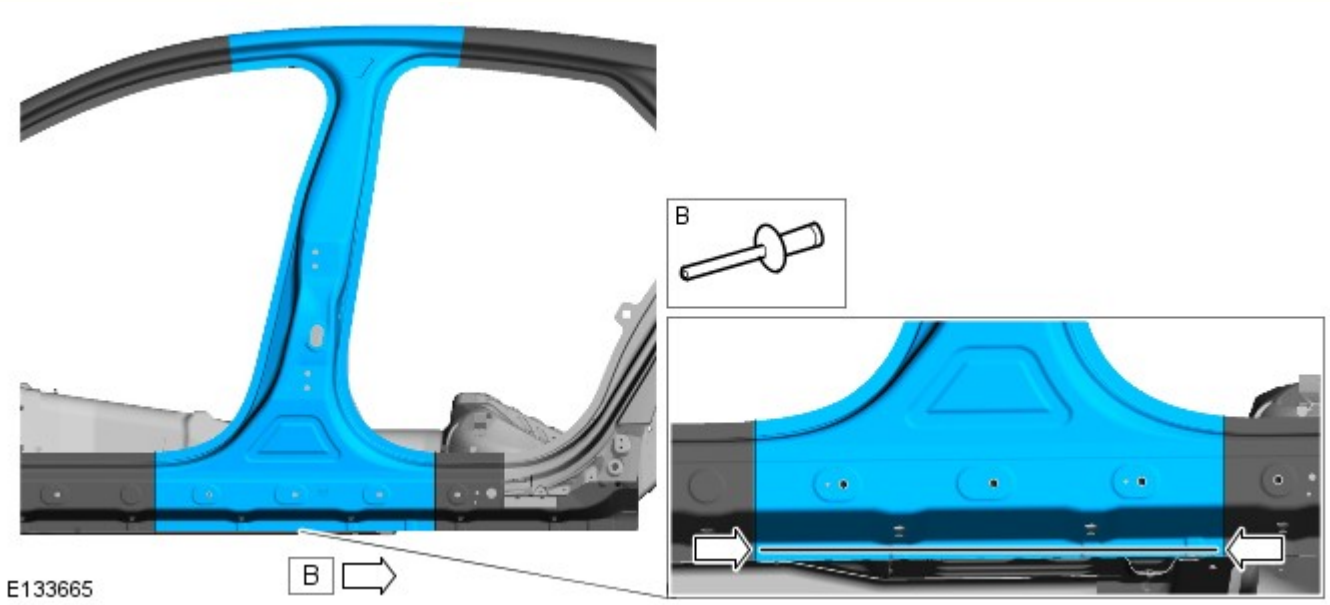


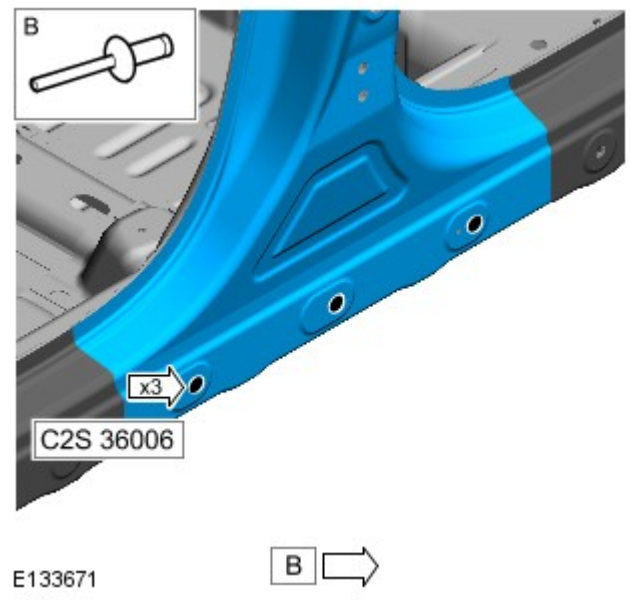
E133670

30. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008





31. Using the Genesis G4, install the Hemloks as indicated.

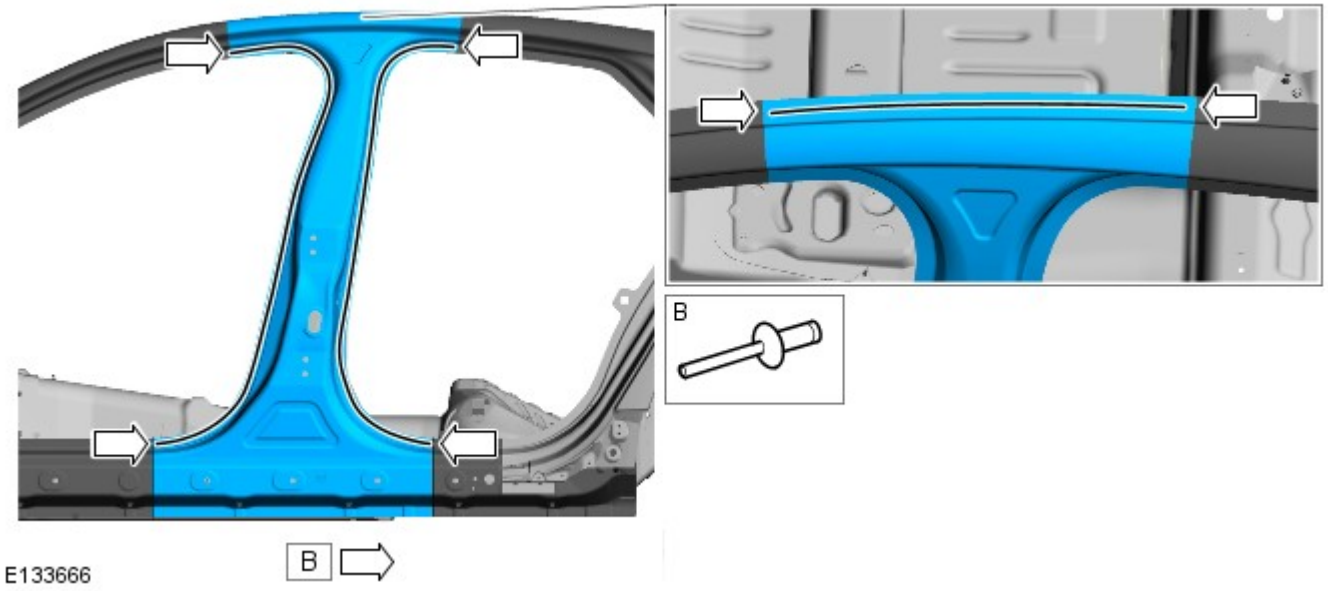
32. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install any remaining Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



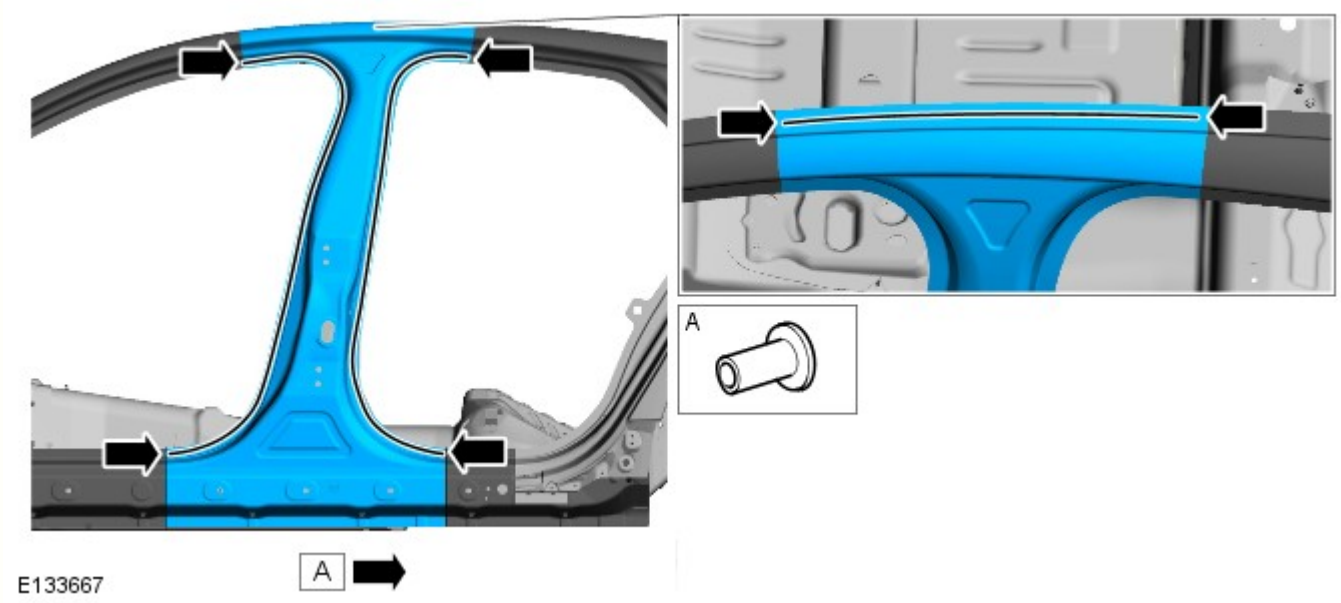
33. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595



34. Remove any excess adhesive.

35. Remove the run-on/run-off tabs.

36. Dress the welded joints.

37. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

38. The installation of associated panels and components is the reversal of removal procedure.

Published: 23-Apr-2015

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?

- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).
- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Country	Phone	Fax
Austria	+800-291714	+800-291694

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

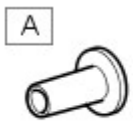
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

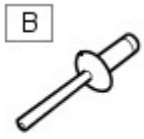
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

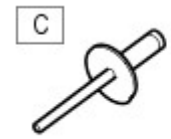
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

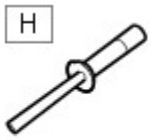
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

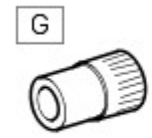
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme

Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

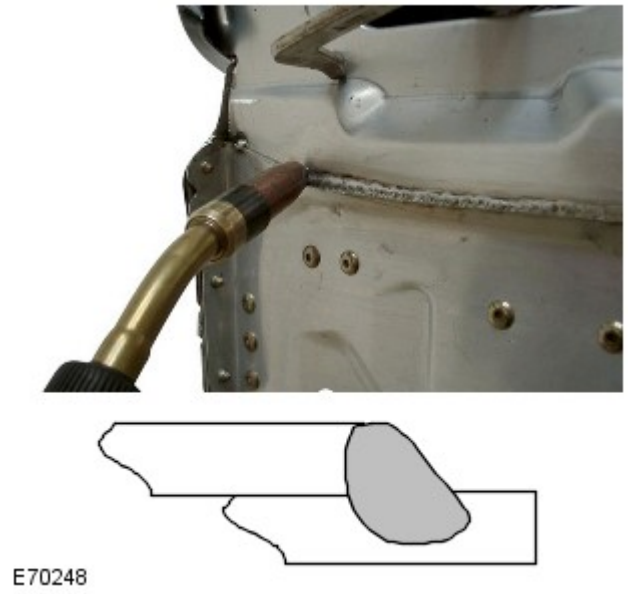
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

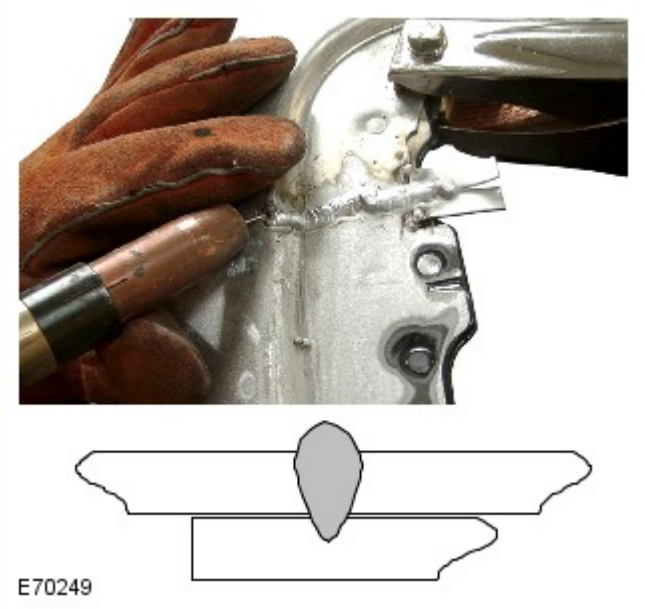
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

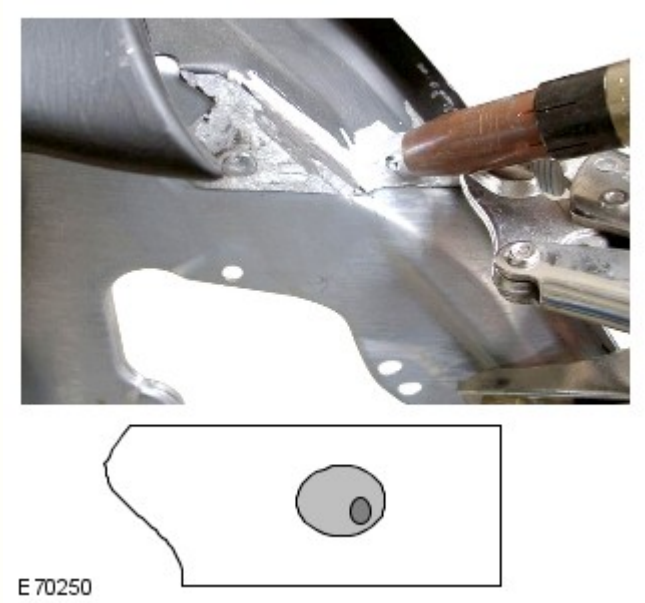
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

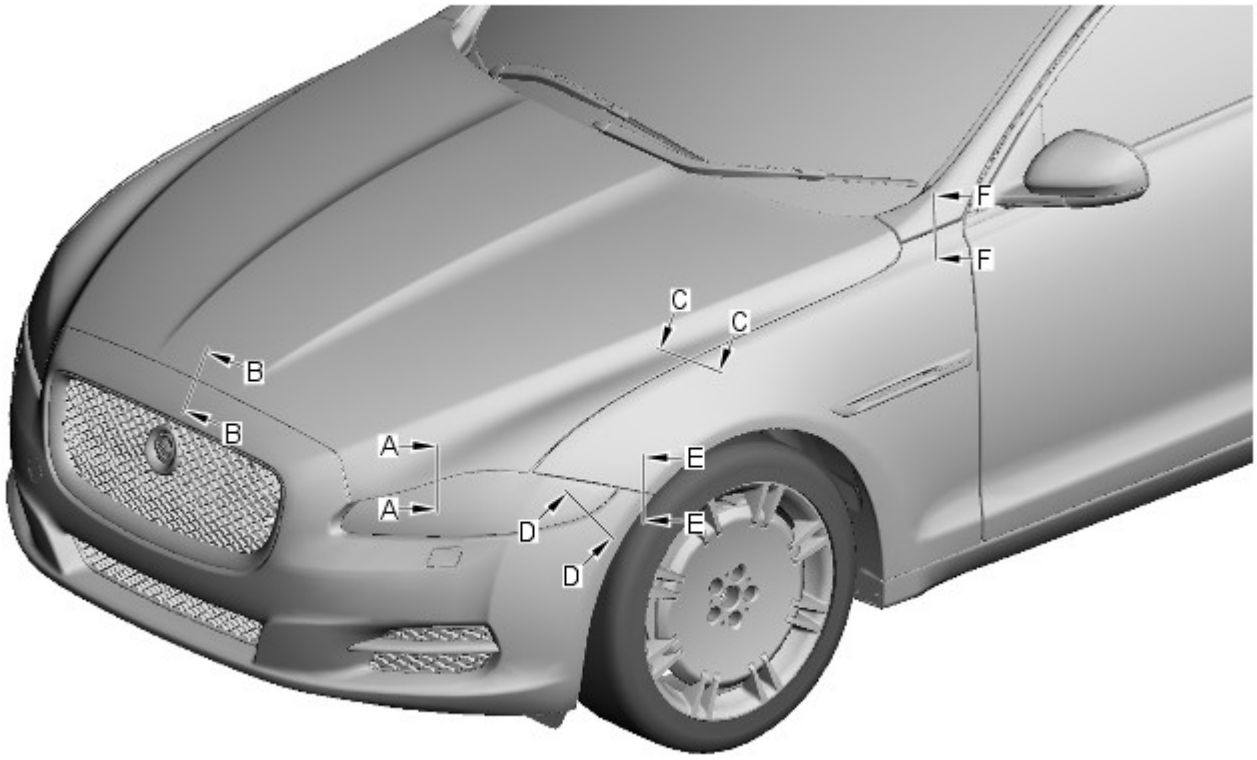
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

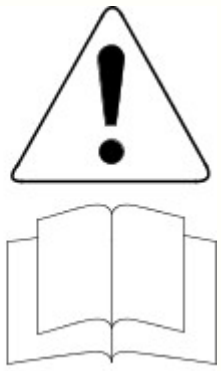
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

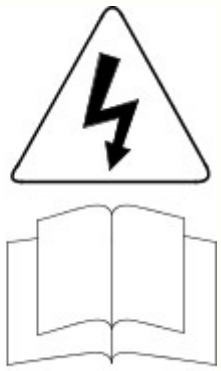
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



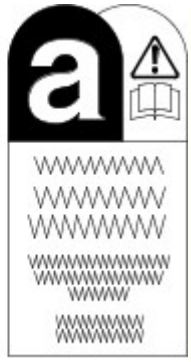
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



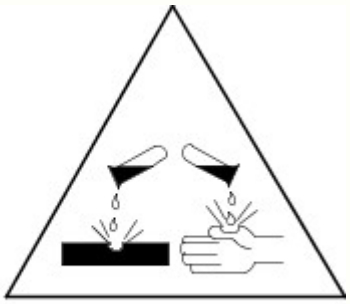
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Side Panel Sheet Metal Repairs - Rocker Panel and B-Pillar Outer Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The rocker panel and B-pillar outer panel is a category A repair.

2. NOTE: The rocker panel and B-pillar outer panel is manufactured from aluminium alloy 6111-T4.

The rocker panel and B-pillar outer panel is serviced as a separate welded, bonded and riveted panel.

3. The rocker panel and B-pillar outer panel is replaced in conjunction with:
- Front door.
- Rear door
- Headliner
- Windshield glass remove and install
- Roof opening panel frame
- Roof glass front
- Roof glass rear

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

6. Disconnect the generator electrical connectors.

7. Remove the roof opening panel frame.
For additional information, refer to: Roof Opening Panel Frame (501-17 Roof Opening Panel, Removal and Installation).

8. Remove the front door.
For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

9. Remove the rear door.
For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

10. Remove the rear door upper and lower hinges from the B-pillar.

11. Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

12. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20B Supplemental Restraint System, Removal and Installation).

13. Remove the rocker panel outer moulding.

14. Remove the front safety belt retractor.
For additional information, refer to: Front Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

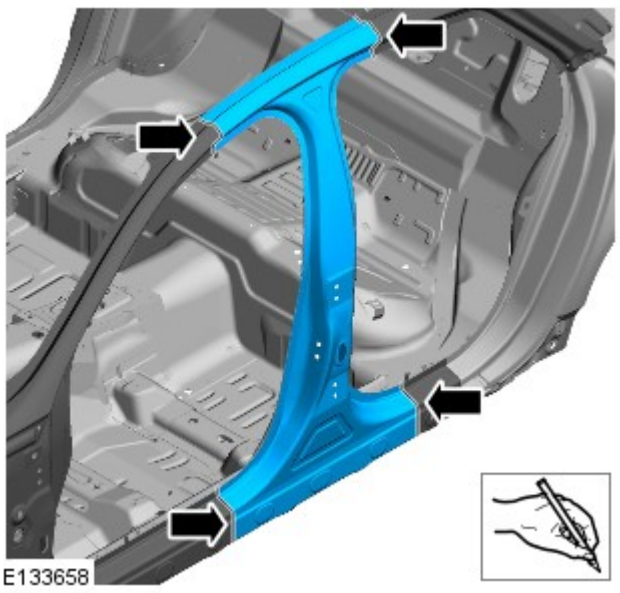
15. Remove the safety belt shoulder height adjuster.
For additional information, refer to: Safety Belt Shoulder Height Adjuster (501-20A Safety Belt System, Removal and Installation).

16. Release the floor covering and position it to one side.

17. Remove the underfloor splash shield.

18. Remove any remaining miscellaneous components from the repair area as necessary.

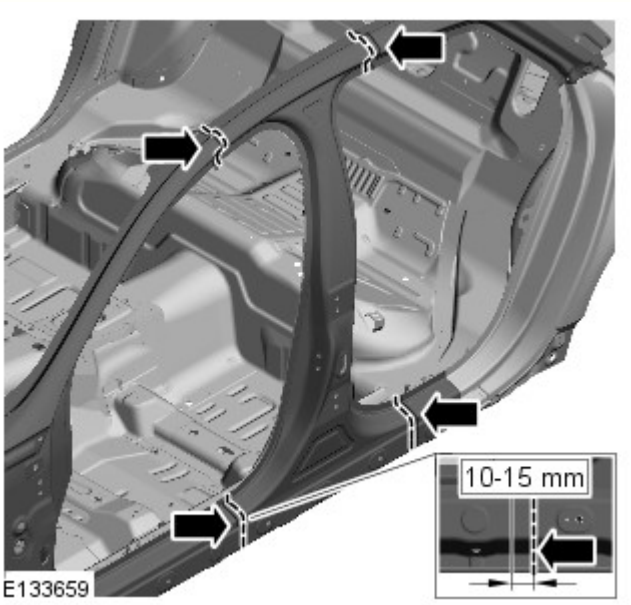
19. Release the inner rocker panel wiring harness and position to one side.



20. NOTE: The points marked on the vehicle are for reference only, do not cut the panels in these locations.

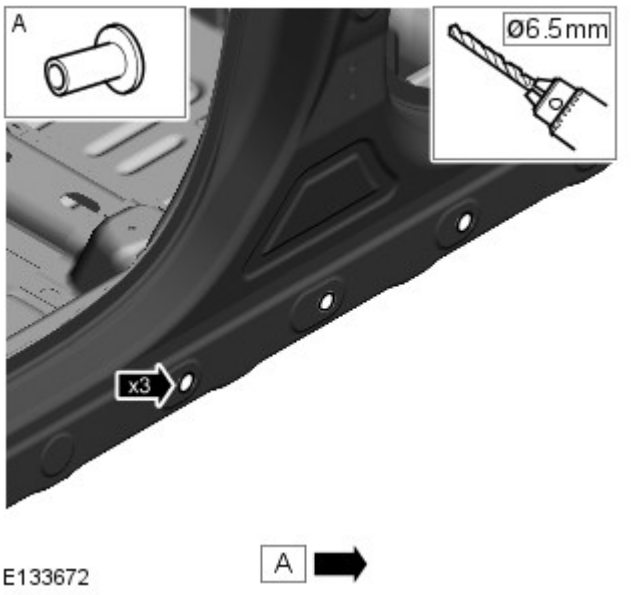
Offer up the new panel and clamp into position over the old panel. Mark the position of the new panel service cuts onto the vehicle as indicated.

21. Remove the new panel.



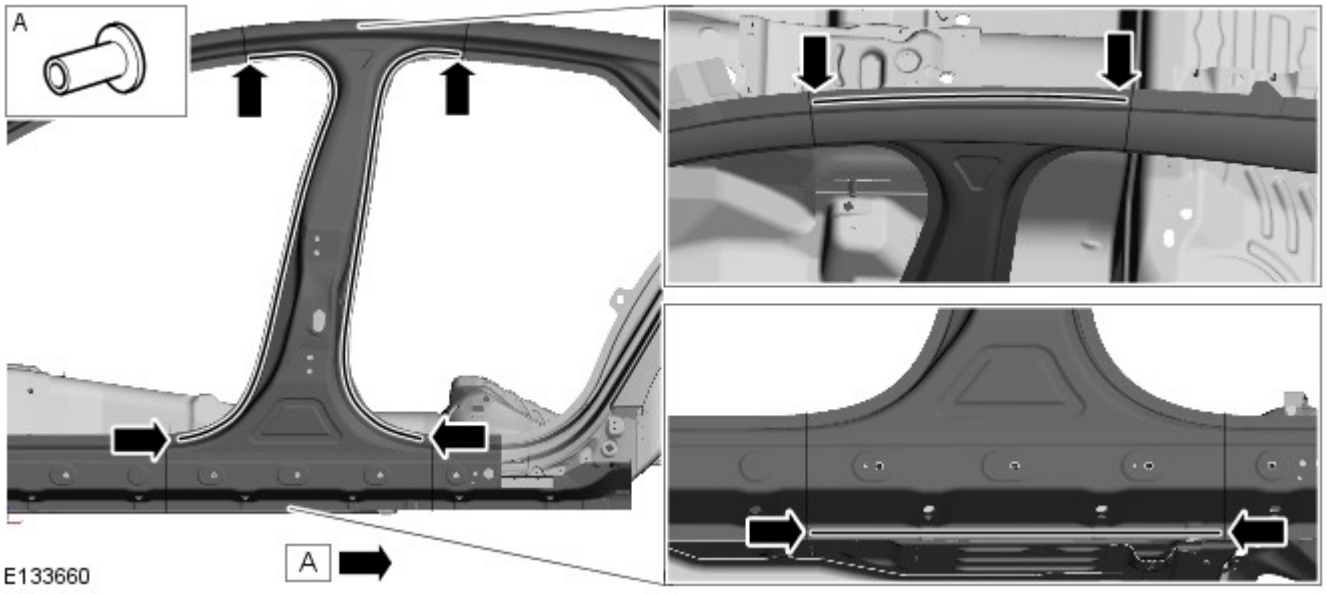
22. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

Cut the old rocker panel and B-pillar outer panel 10-15mm inside the previously marked positions as indicated.



23. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets.

24. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.



25. NOTE: Retain the old panel remnant as it may be used as a template and to fabricate backing strips and run-on/run off tabs.

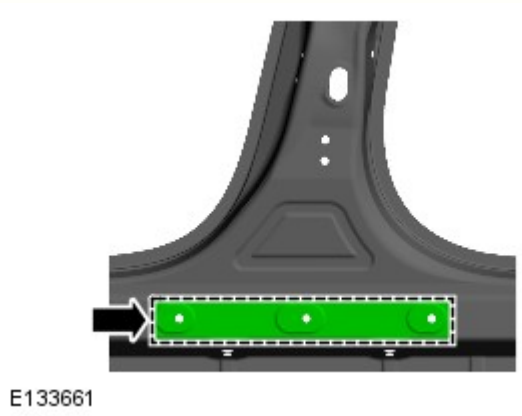
Separate the joints and remove the old panel, also releasing it from the central noise, vibration and harshness (NVH) component.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

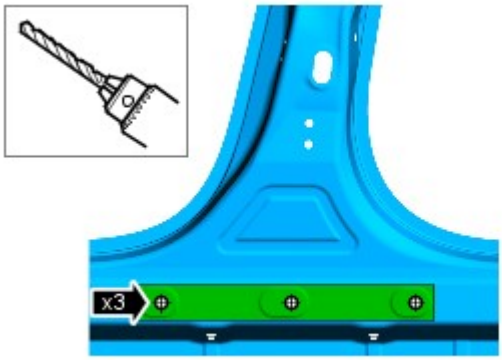
3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.



4. Cut a template from the old rocker panel and B-pillar outer panel remnant as indicated.

5. Clean and dress the template.

6. Offer up, align and clamp the template in place on the new rocker panel and B-pillar outer panel service panel. Drill through the template into the new panel at the points indicated.

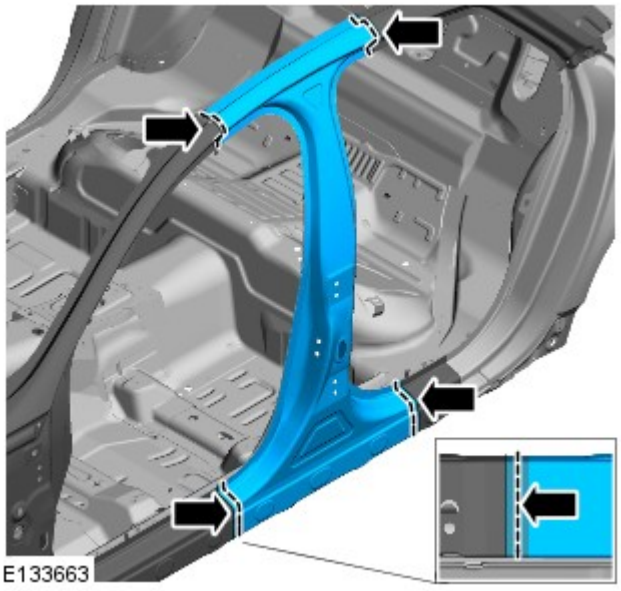


E133662

7. Remove the template.

8. Debur the drilled holes in the new panel.

9. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



E133663

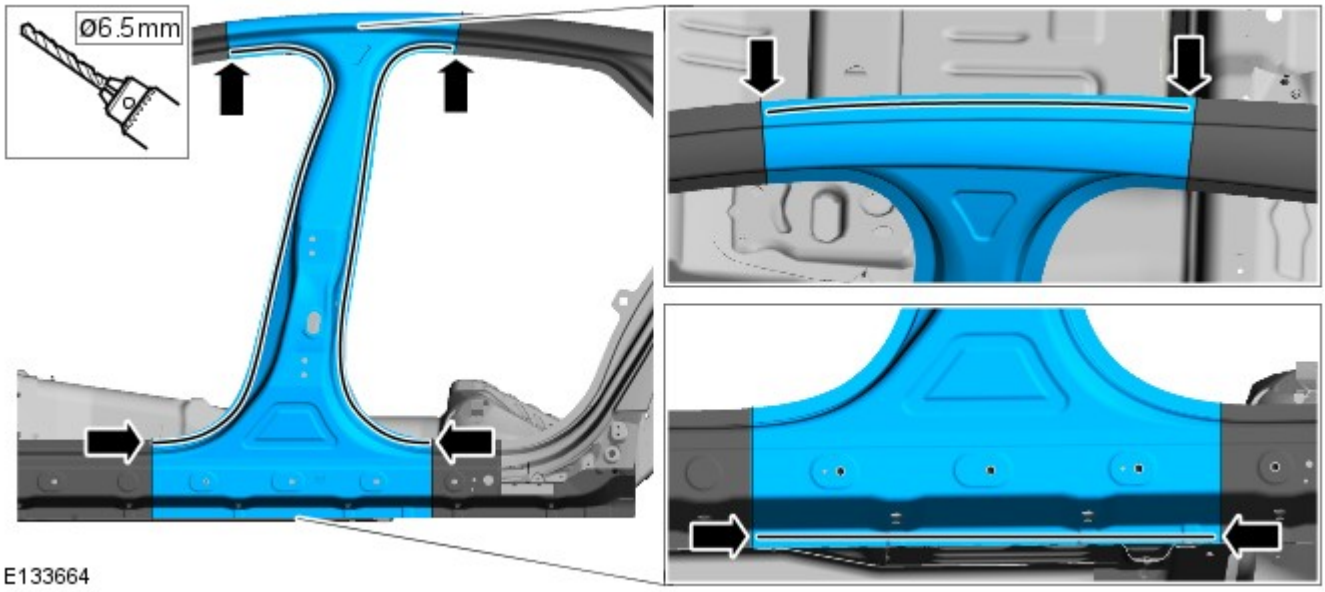
10. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: The new panel should be cut in approximately 5mm inside the service cuts.

Cut through the new panel and the old panel as indicated.

11. NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

Where the pitch of the removed self piercing rivets is 25mm or less, or there is no access for the ESN50, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the new rocker panel and B-pillar outer panel is installed.



12. Remove the new panel

13. Remove the old panel remnants.

14. NOTE: The backing plates should be an interference fit.

Fabricate backing plates from the old rocker panel and B-pillar outer panel remnant. Debur and offer up the backing plates to the rocker panel and B-pillar outer panel. If correct proceed to next step, if not, rectify and recheck before proceeding.

15. Remove the backing plates.

16. Fabricate run-on/run-off tabs from the old rocker panel and B-pillar outer panel remnant.

17. Debur the run-on/run-off tabs.

18. Trim, clean and prepare the central NVH component.

19. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

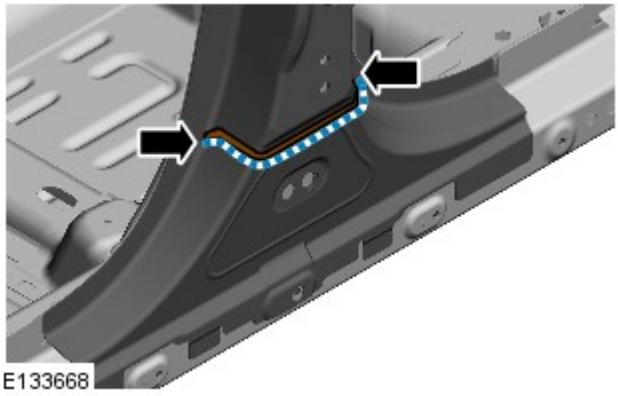
20. Using a Roloc fine bristle disc, clean and prepare the old and new panel joint surfaces.

21. NOTE: The backing plates are installed with an interference fit.

Install and align the backing plates to the vehicle.

22. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

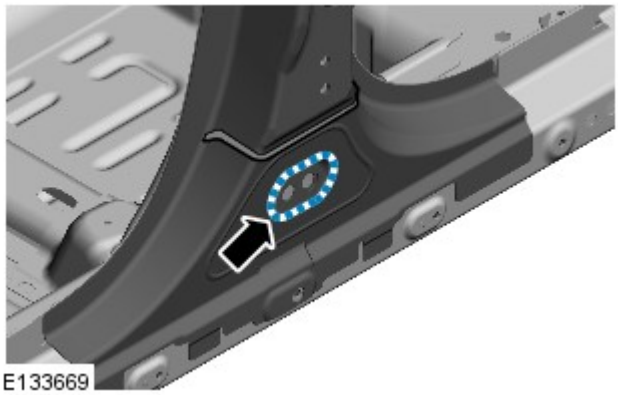
23. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.



E133668

24. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the central NVH component as indicated.



E133669

25. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the B-pillar reinforcement as indicated.

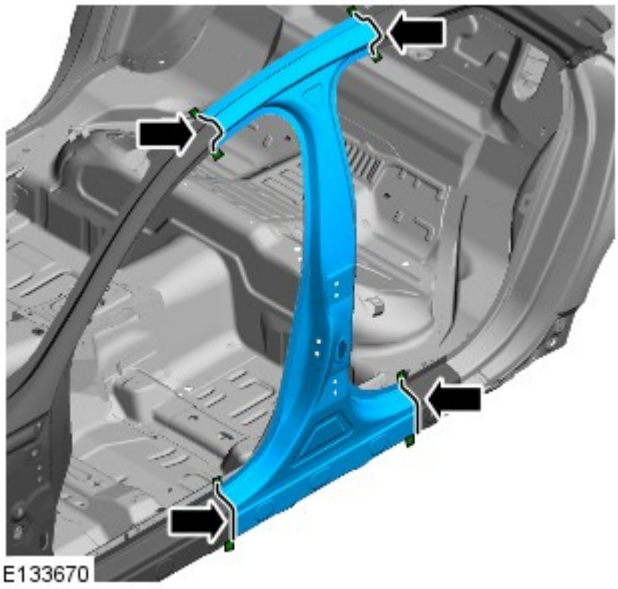
26. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

27. Offer up the new panel, align and clamp into position.

28. Tack weld the run-on/run-off tabs to all MIG butt joints.

29. MIG weld the MIG butt joints.

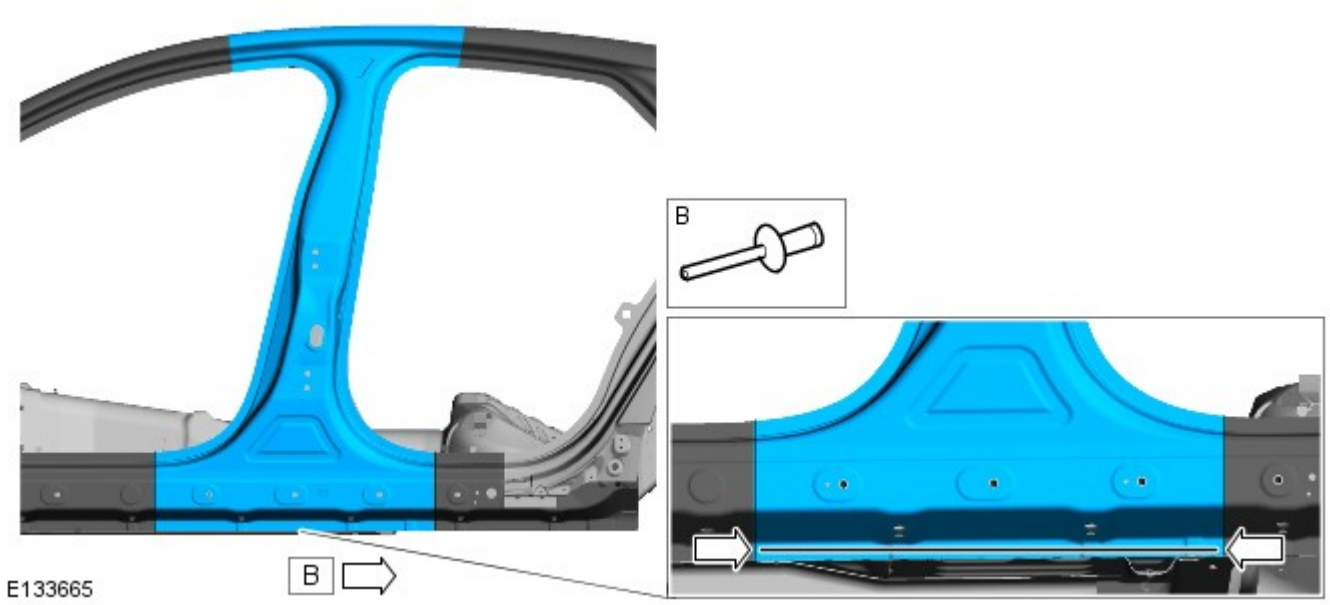


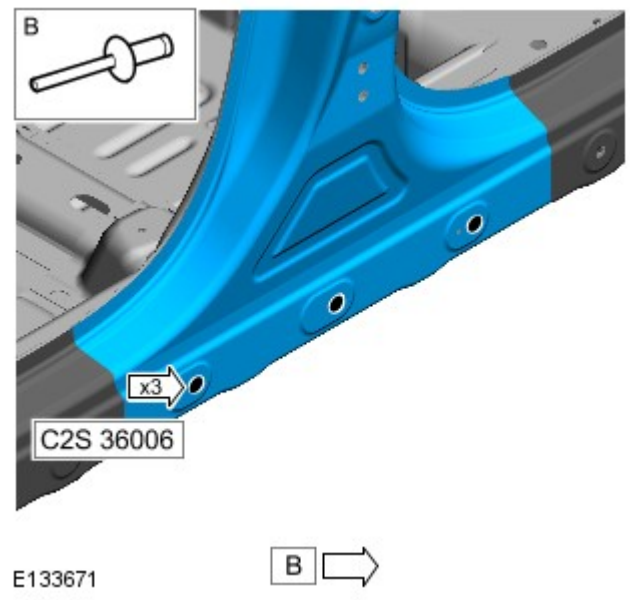
E133670

30. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008





31. Using the Genesis G4, install the Hemloks as indicated.

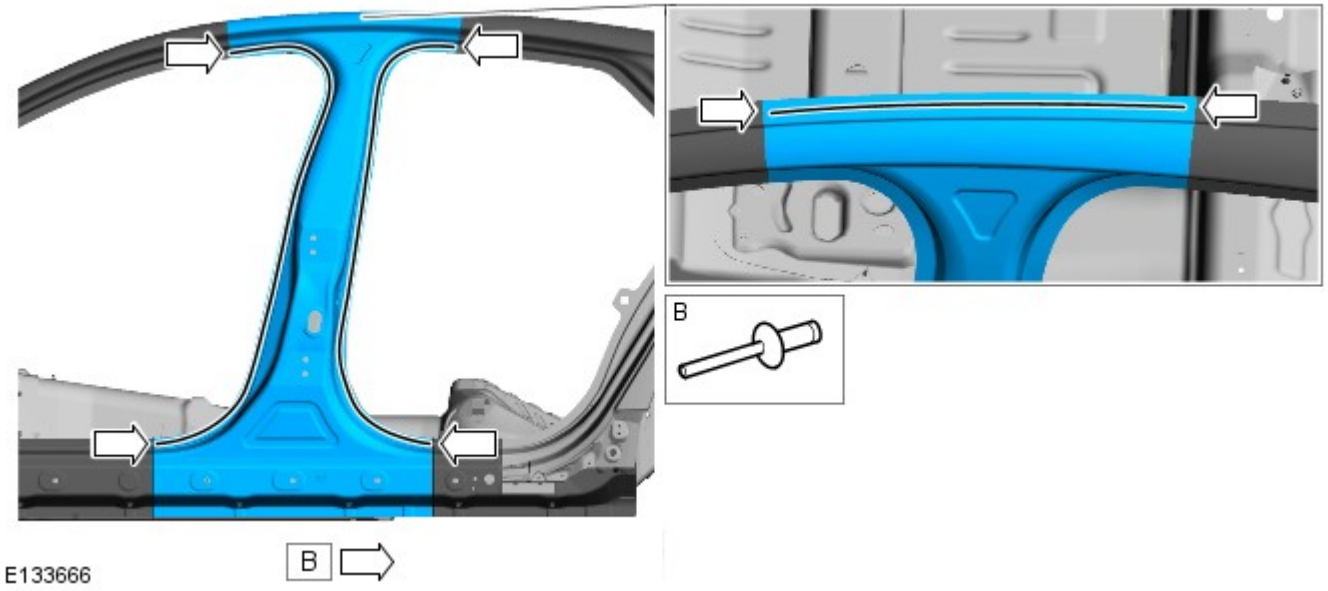
32. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install any remaining Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



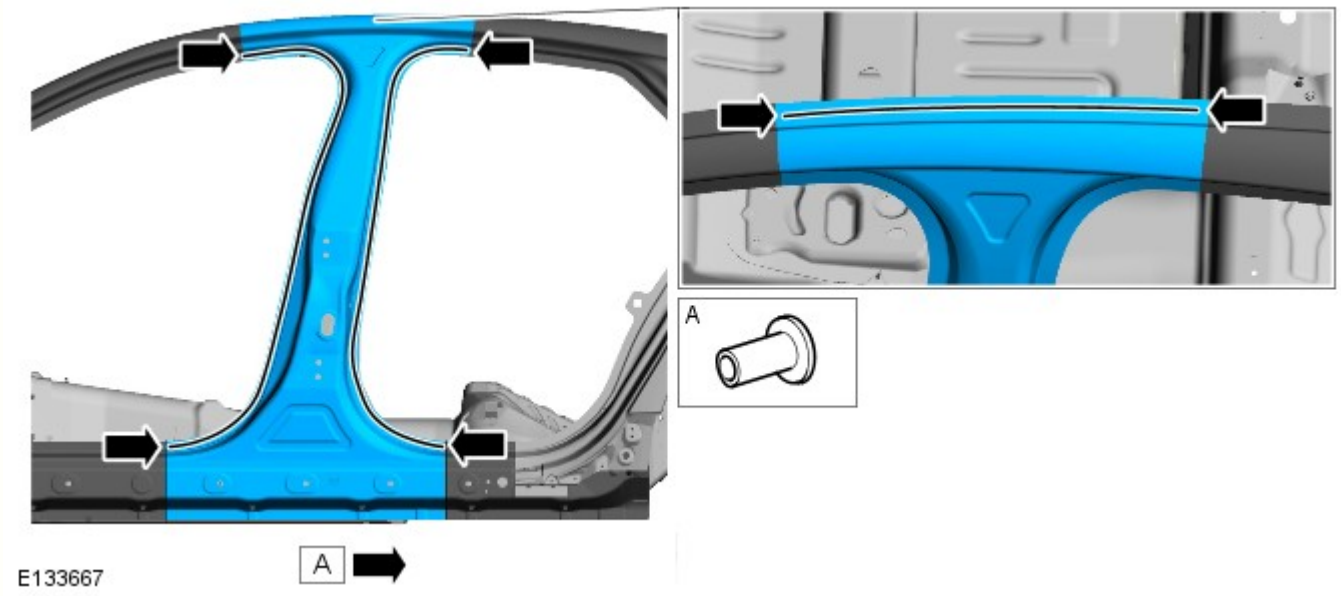
33. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595



34. Remove any excess adhesive.

35. Remove the run-on/run-off tabs.

36. Dress the welded joints.

37. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

38. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Battery, Mounting and Cables - Battery Disconnect and Connect

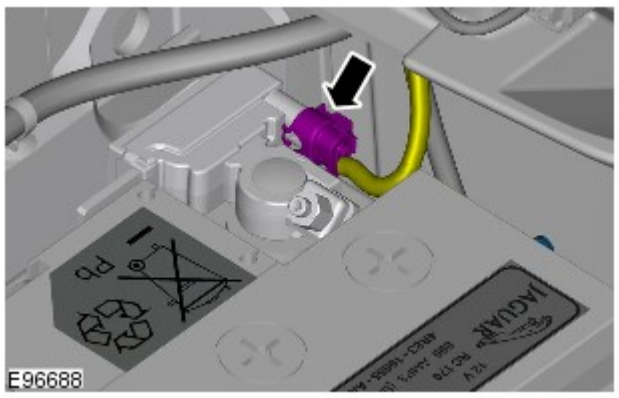
General Procedures

Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

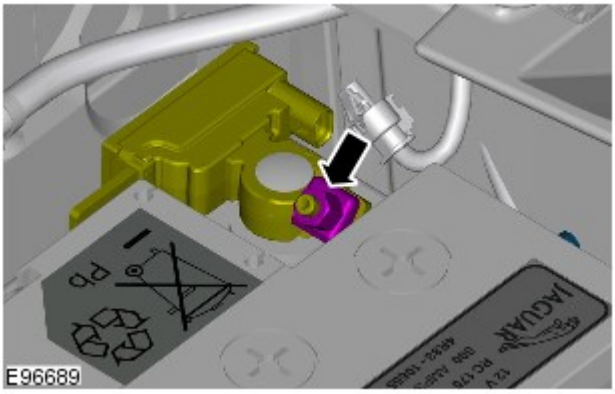
2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.



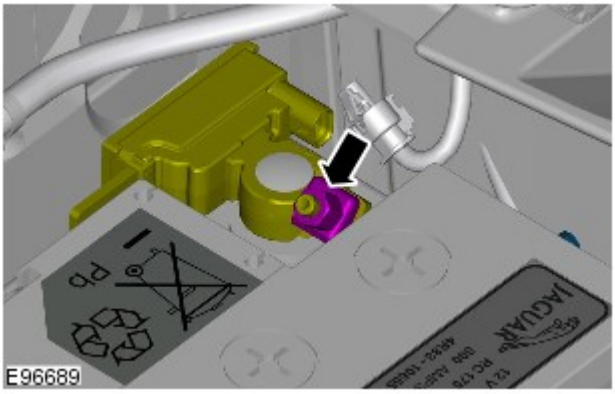
4. CAUTION: Take extra care not to damage the wiring harness.

5.

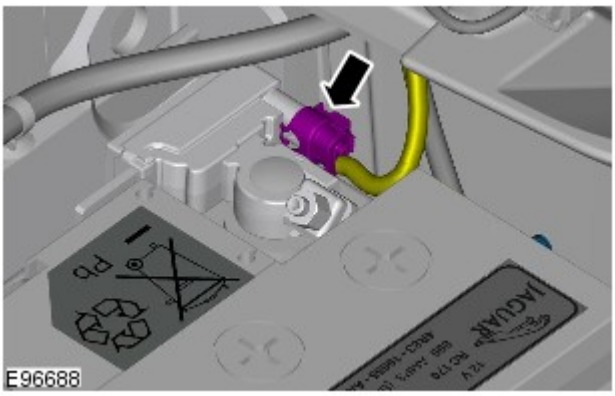


Connect

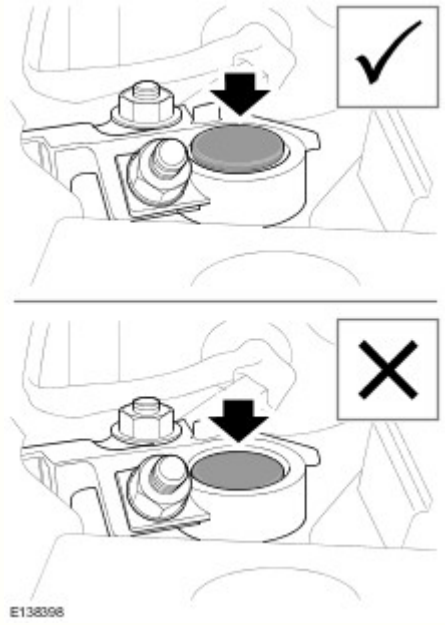
1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.



4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Seating - Front Seat

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

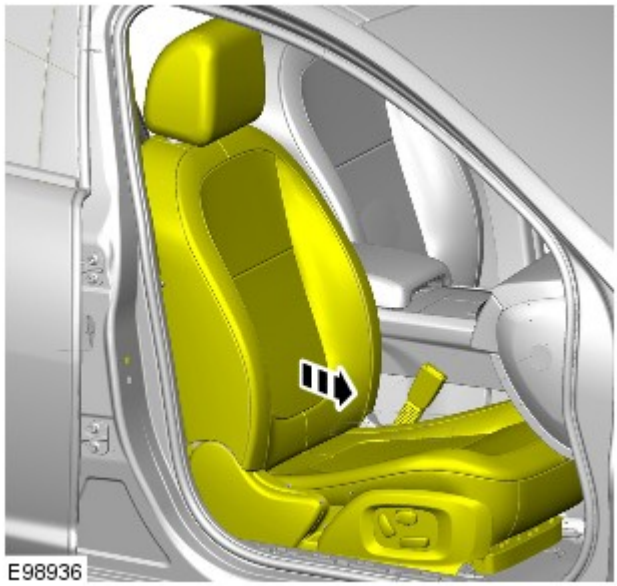
To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

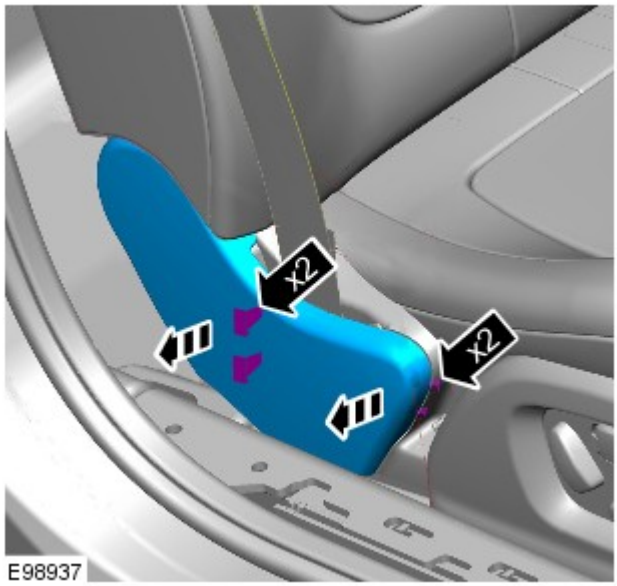
Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

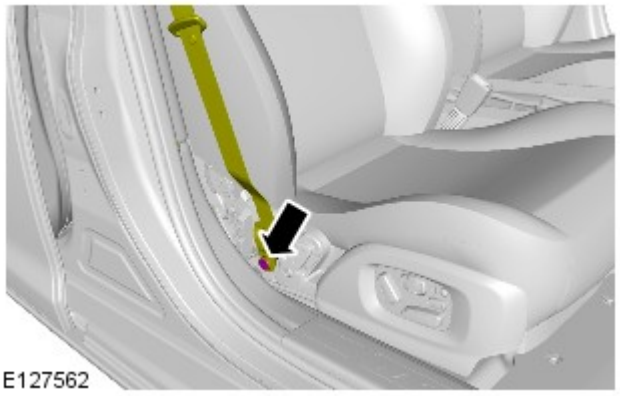
1. Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

2.

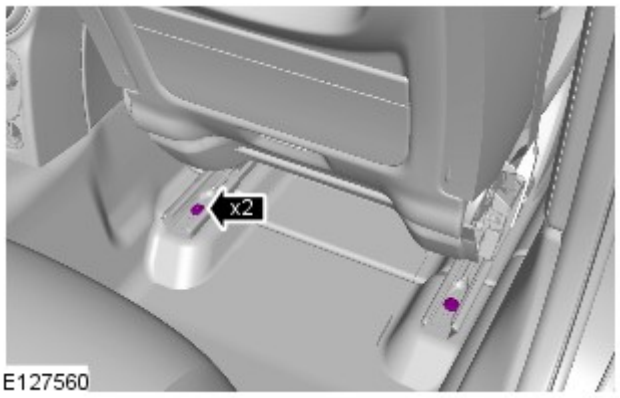


3.

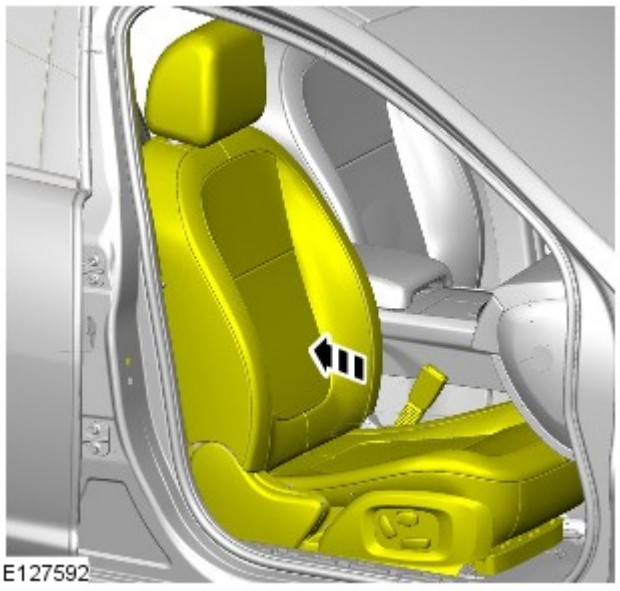




4. *Torque:* 40 Nm

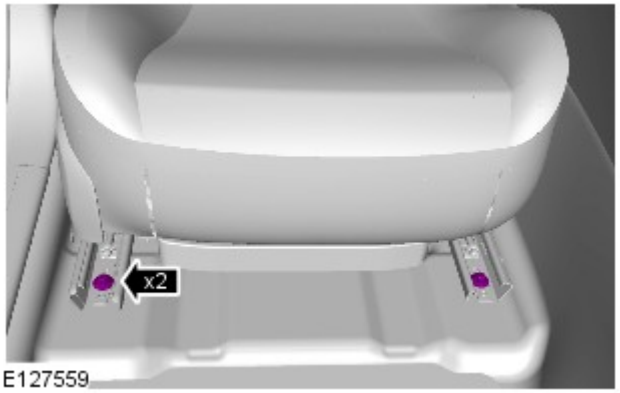


5. *Torque:* 47 Nm



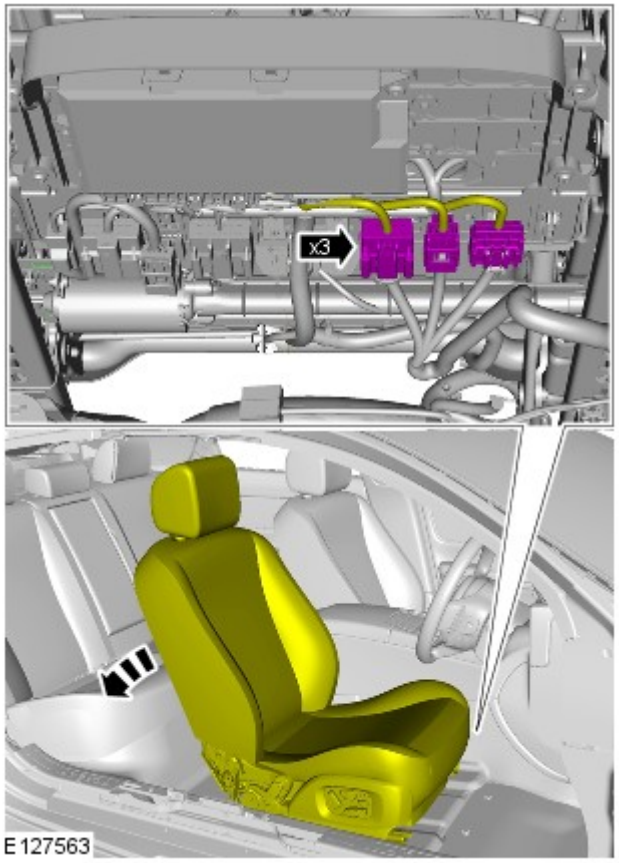
6.

7. *Torque:* 47 Nm



E127559

8. Reposition the front seat to the central position.



E127563

9.

E127561

10. CAUTIONS:

Protect the surrounding paintwork to avoid damage.

Protect the surrounding trim to avoid damage.

NOTE: This step requires the aid of another technician.

Installation

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).

- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety

- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Country	Phone	Fax

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

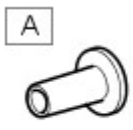
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

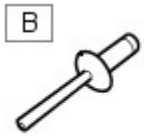
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

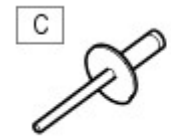
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

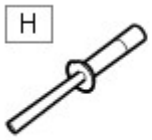
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

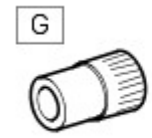
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

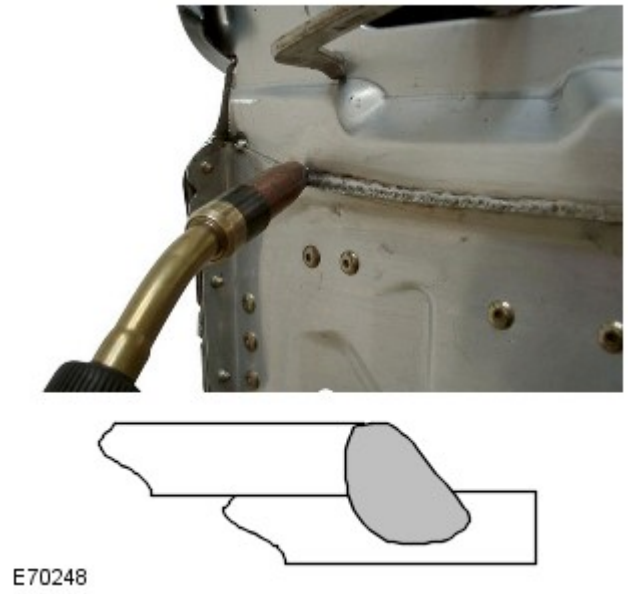
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

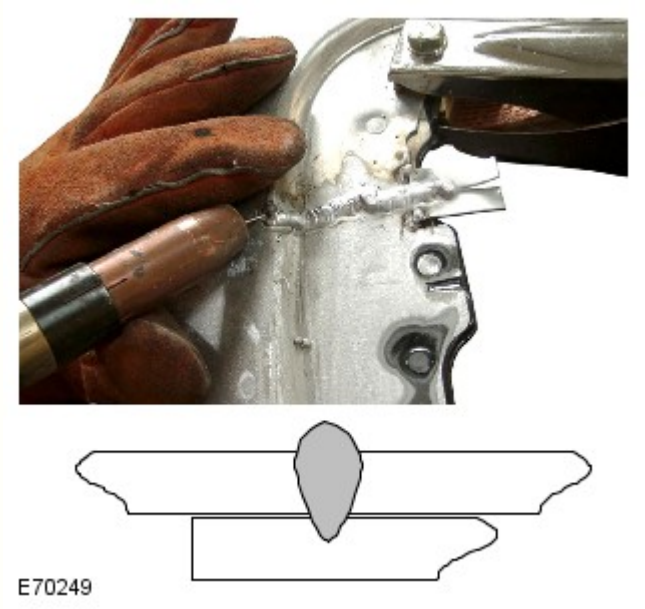
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

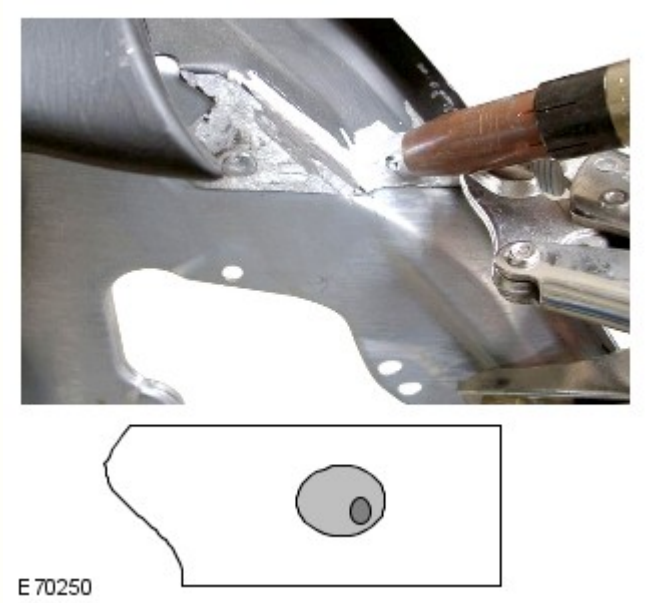
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

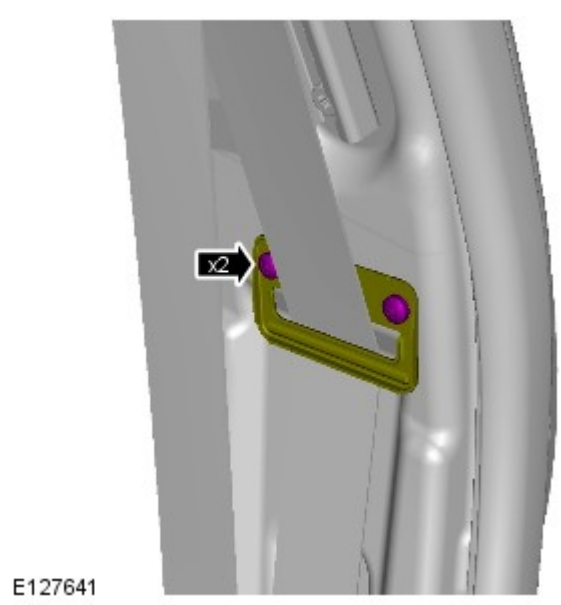
Safety Belt System - Front Safety Belt Retractor

Removal and Installation

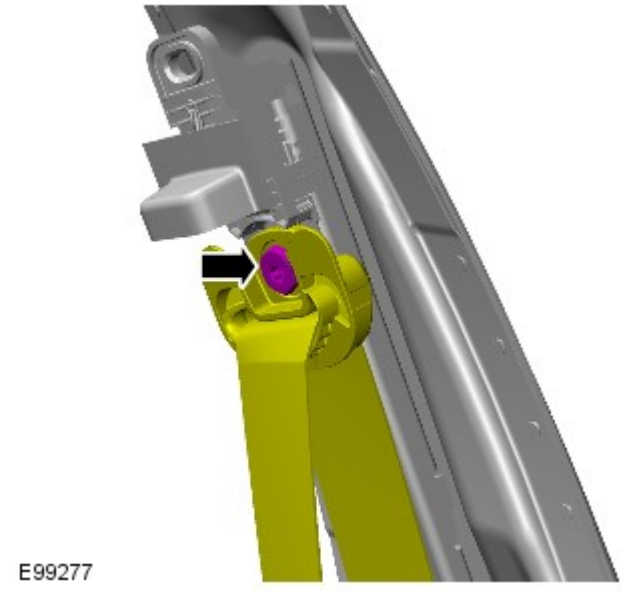
Removal

NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



2. *Torque:* 9 Nm



3. CAUTIONS:

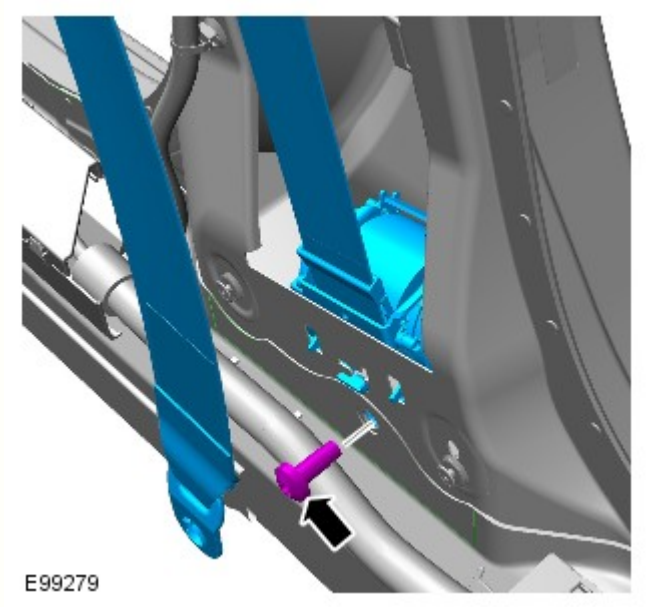
Discard the bolt.

Make sure that a new bolt is installed.

Torque: 40 Nm

4. CAUTIONS:

Discard the bolt.



Make sure that a new bolt is installed.

Torque: 40 Nm

Installation

1. CAUTION: Fixings must be started by hand to avoid damaging threads.

To install, reverse the removal procedure.

Published: 05-Apr-2012

Roof Opening Panel - Roof Opening Panel Frame

Removal and Installation

Removal

CAUTIONS:

Always protect the interior components when removing body glass.

Protect the surrounding paintwork to avoid damage.

Measure all gaps between the glass roof panels before prior to removal to help aid installation.

NOTES:

The cutting blades used in this procedure are from the standard BTB glass removal kit.

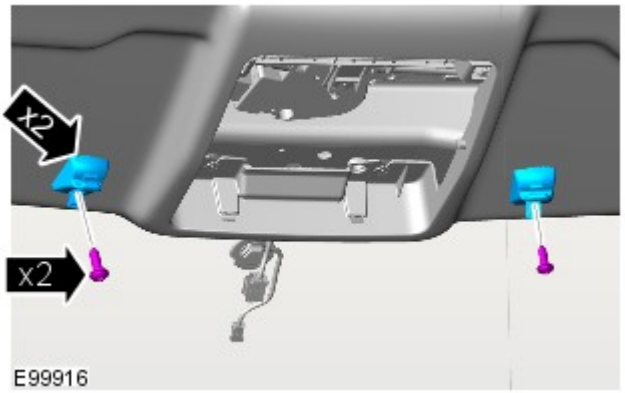
In addition to the standard BTB glass removal kit, cutting blades WK29L and WK30L will be required.

1. NOTE: The procedure must be carried out on both sides.

Refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2. NOTE: The procedure must be carried out on both sides.

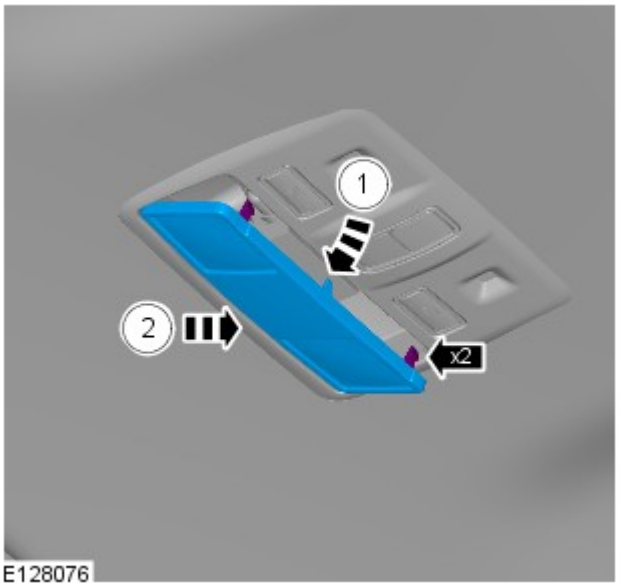
Refer to: Sun Visor (501-05 Interior Trim and Ornamentation, Removal and Installation).



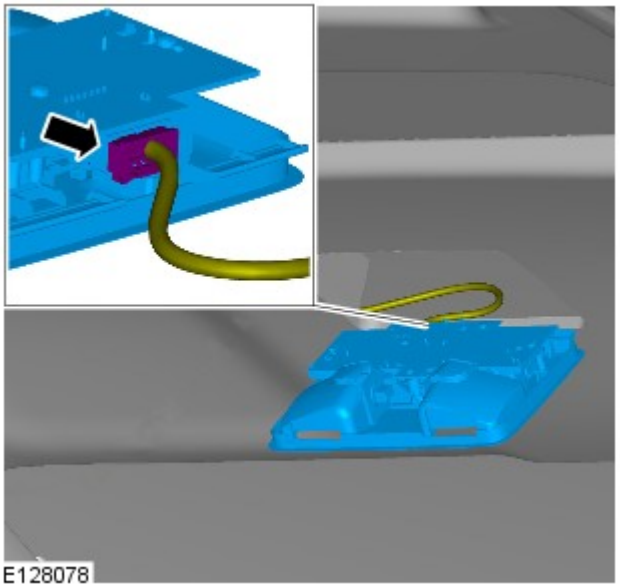
3. *Torque:* 2 Nm

4. NOTE: The procedure must be carried out on both sides.

Refer to: C-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



5.



6.

7.

8. CAUTION: Note the fitted position of the component prior to removal.

NOTES:

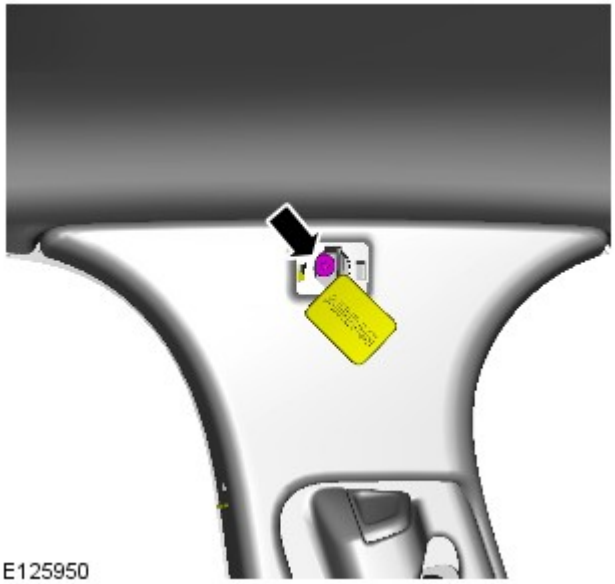
Right-hand shown, left-hand similar.

The procedure must be carried out on both sides.

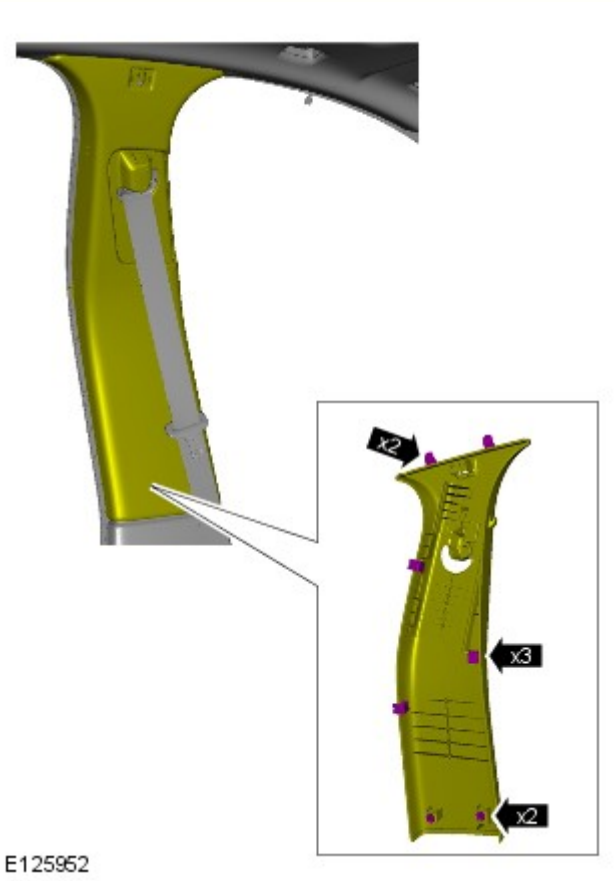
Torque: 2 Nm

9. NOTE: The procedure must be carried out on both sides.

Torque: 6 Nm



10. NOTE: The procedure must be carried out on both sides.



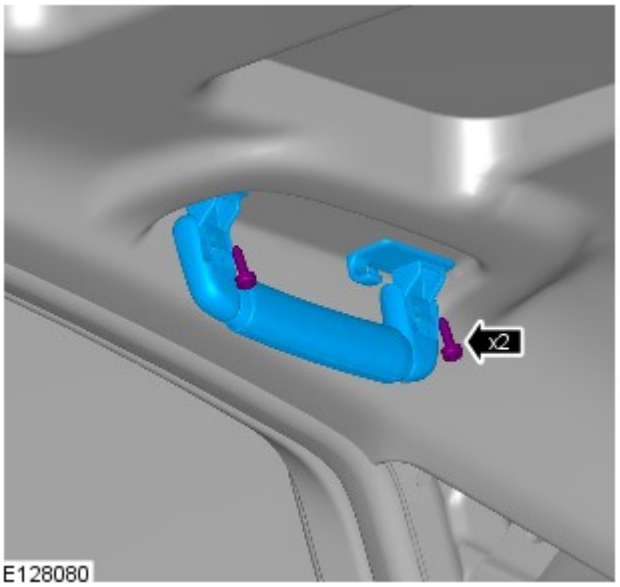
11. CAUTION: Note the fitted position of the component prior to removal.

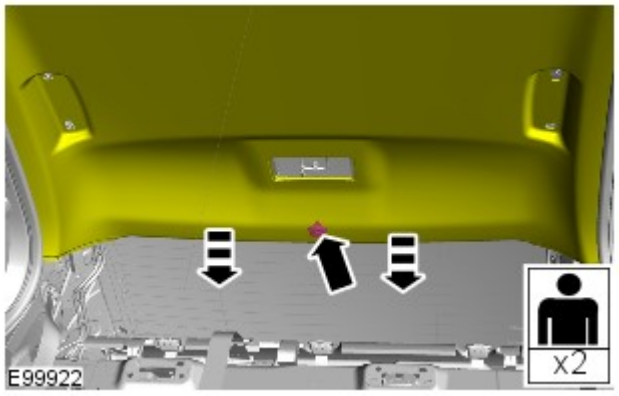
NOTES:

Right-hand shown, left-hand similar.

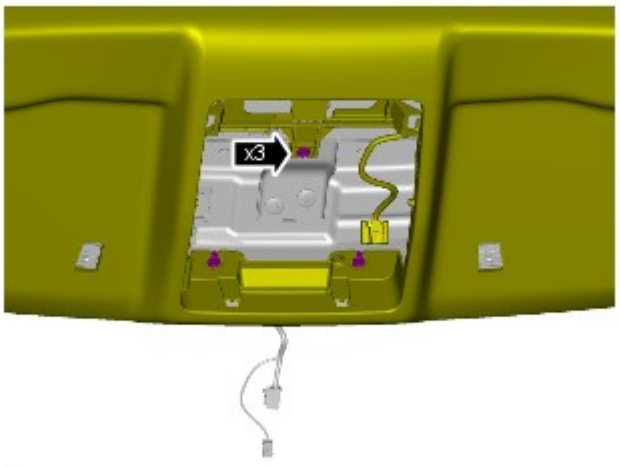
The procedure must be carried out on both sides.

Torque: 2 Nm





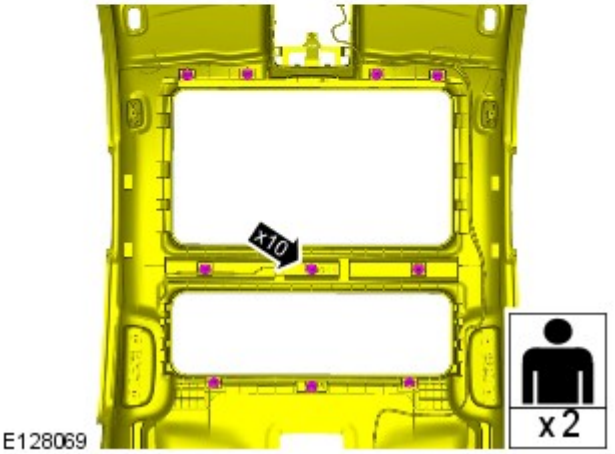
12. WARNING: This step requires the aid of another technician.

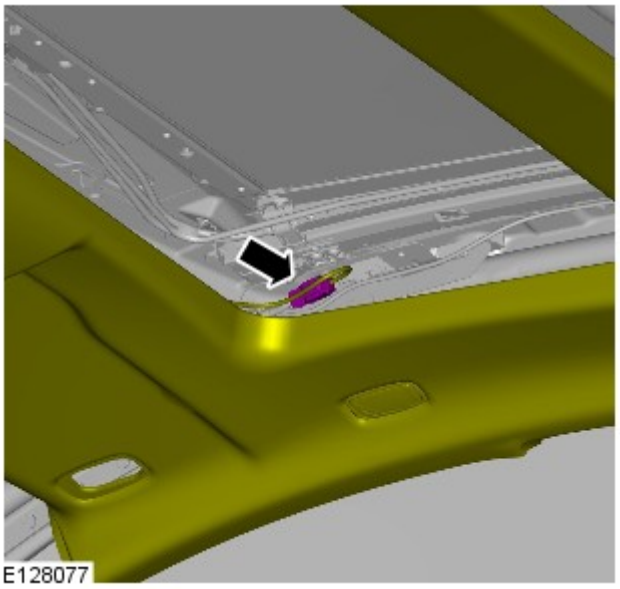


13. WARNING: This step requires the aid of another technician.

CAUTION: Note the fitted position of the component prior to removal.

14. NOTE: This step requires the aid of another technician.

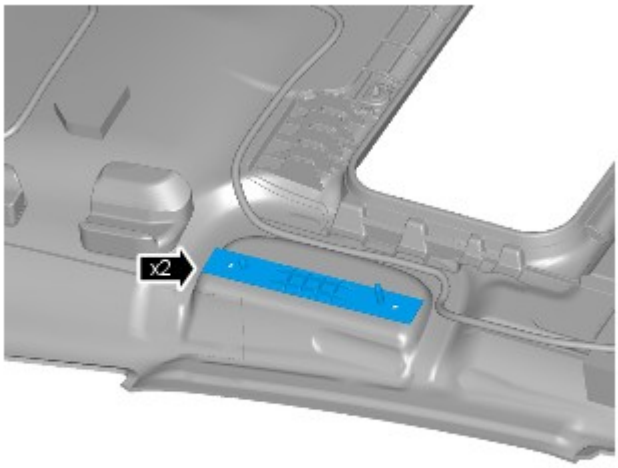




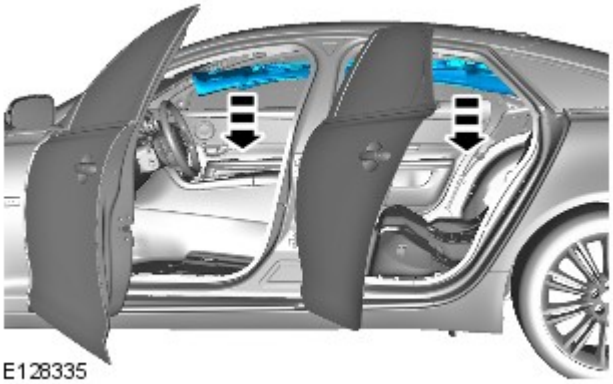
15. NOTE: This step requires the aid of another technician.

16. CAUTION: Note the fitted position of the component prior to removal.

NOTE: Right-hand shown, left-hand similar.



E128068



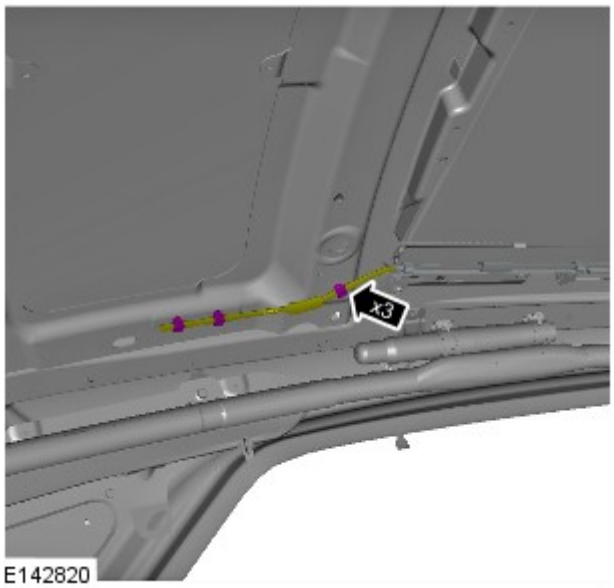
E128335

17. CAUTION: Protect the surrounding trim to avoid damage.

NOTE: Lower and reposition the headliner to aid access.

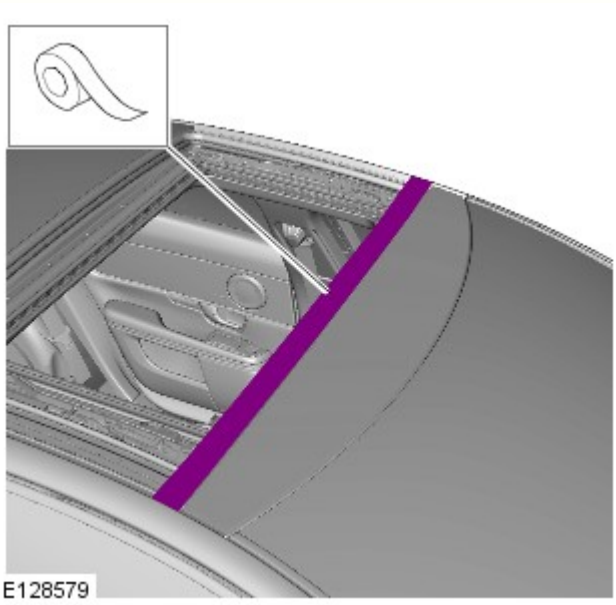
18. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

19. Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

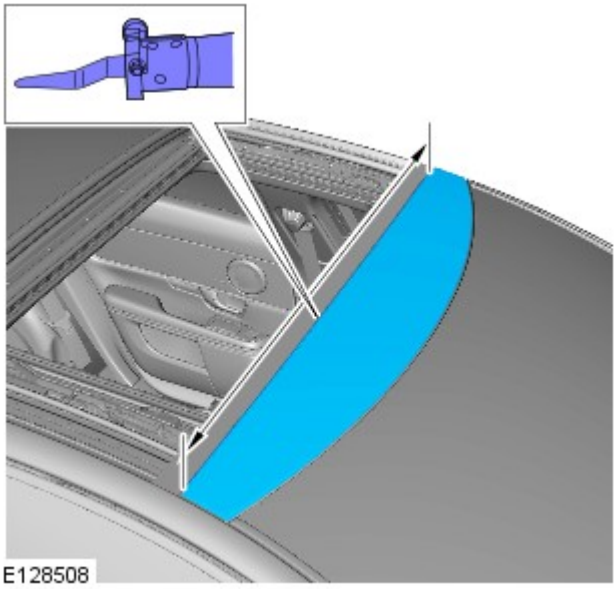


E142820

20. NOTE: The procedure must be carried out on both sides.

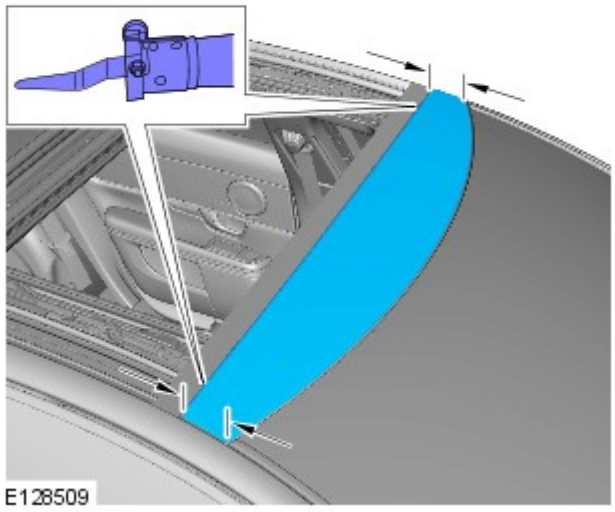


21. CAUTION: Use suitable tape to protect the roof opening panel weather strip.



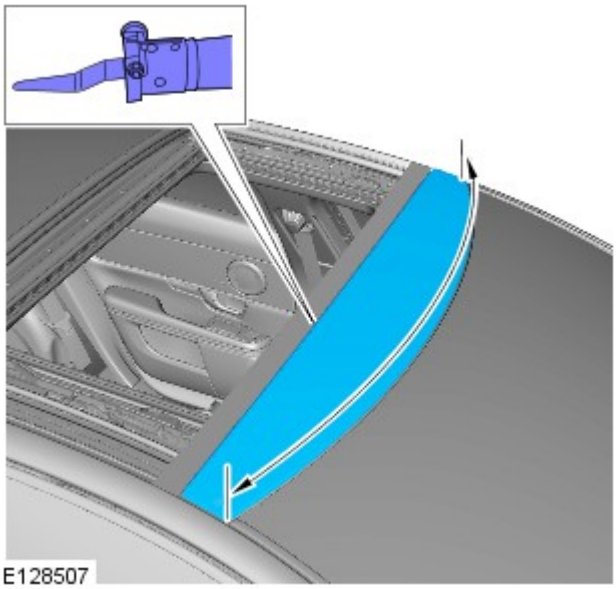
22. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

- Use a WK24ZS blade, cutting with the flat side against the body.



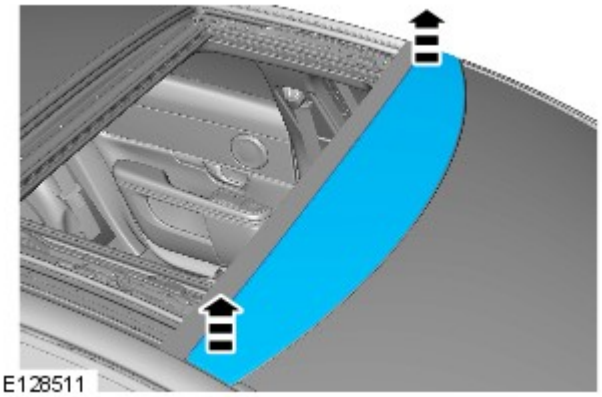
23. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, set to 75 mm to control the cutting depth.

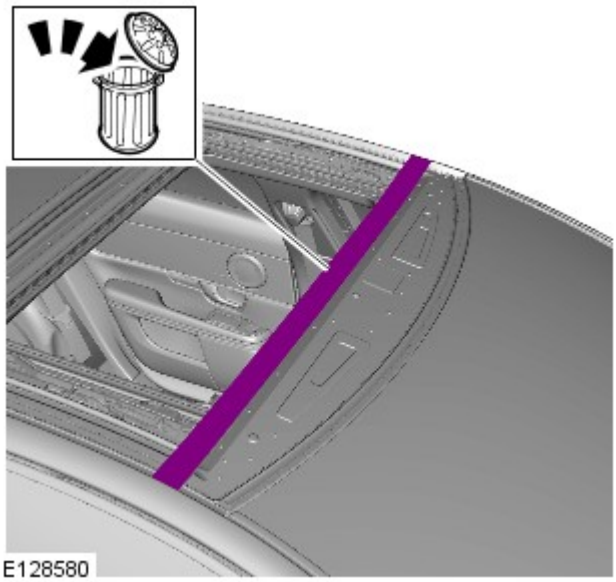


24. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use a WK2S blade, cutting with the flat side against the body. Use a WK11DW5 controller arm, the depth of the cut will vary from 75 mm to 160 mm as the glass widens towards the centre.

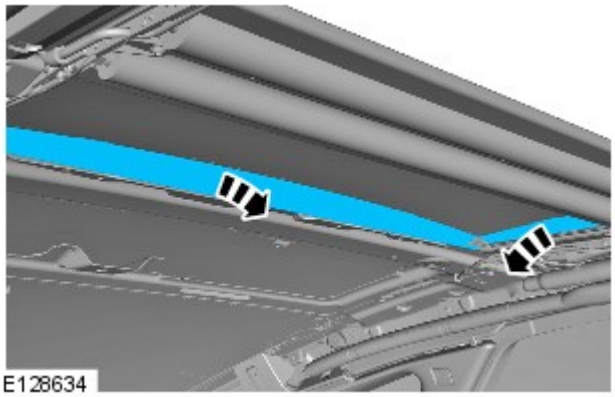


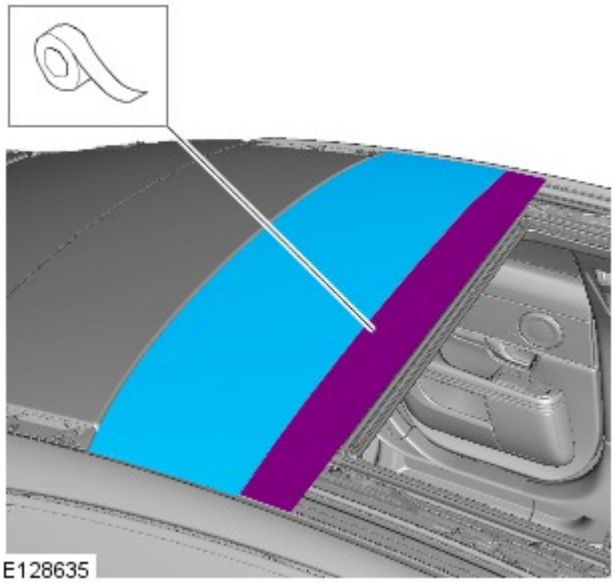
25.



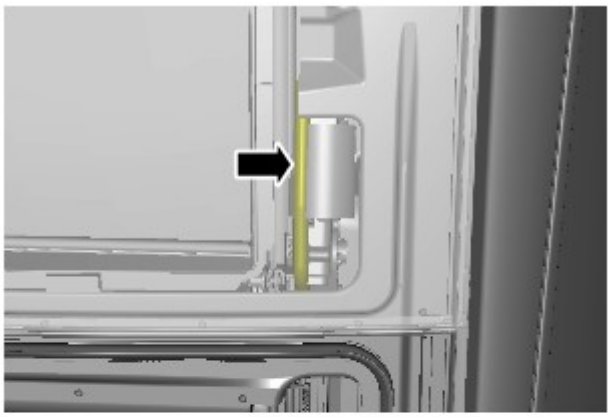
26. NOTE: Remove the tape.

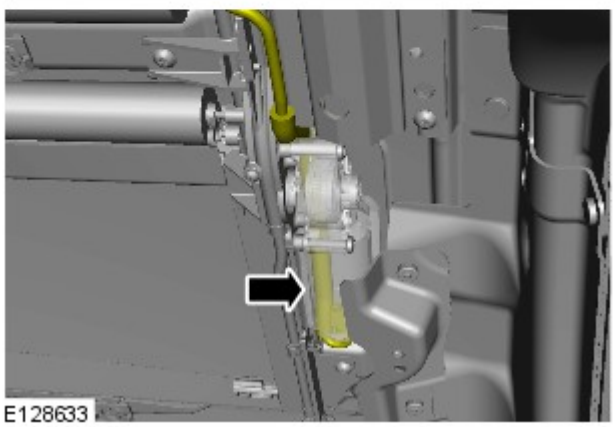
27.





28. CAUTION: Use suitable tape to protect the roof opening panel weather strip.

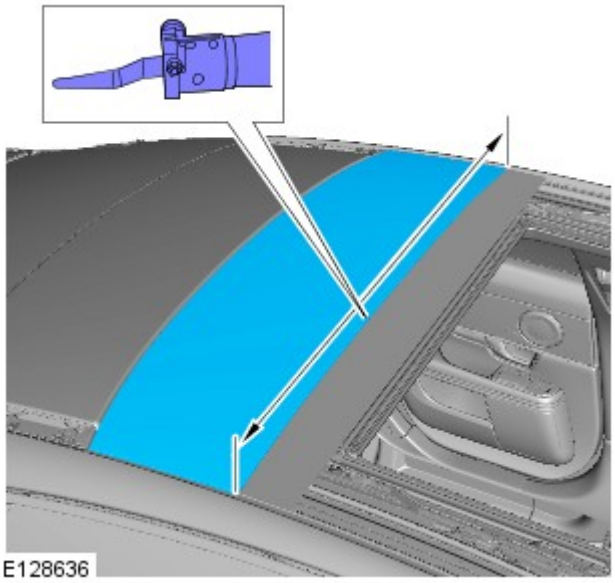




29. CAUTIONS:

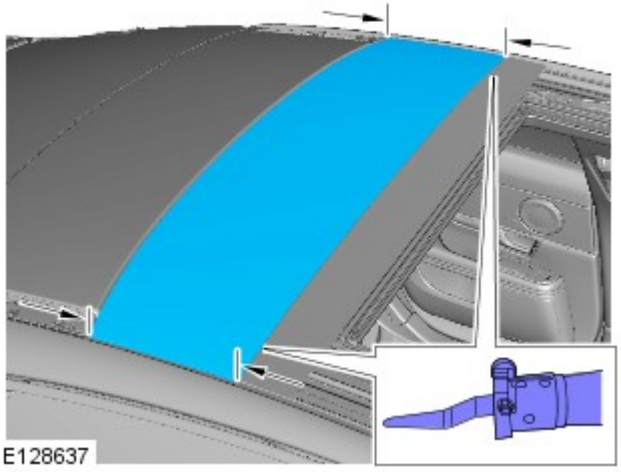
Use suitable tape to protect the roof opening panel blind motor wiring harness.

Use suitable tape to protect the bodywork around the roof aperture.



30. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

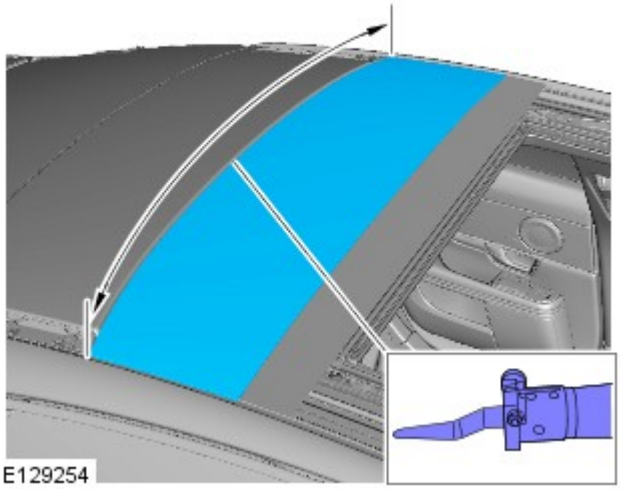
Use a WK2S blade, cutting with the flat side against the body.



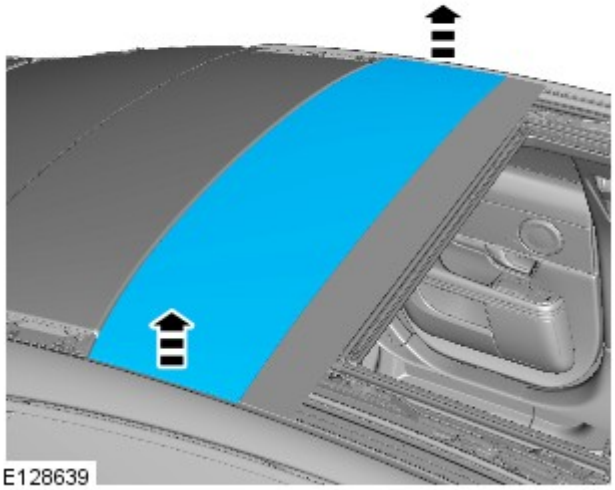
31. CAUTION: A metal strip should be installed between the bottom of the blade and the taped-down components. This will reduce friction and allow the blade to cut easier.

Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.

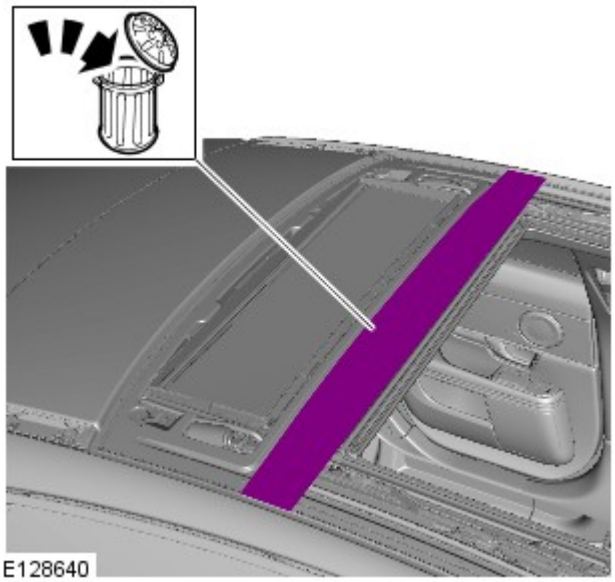
32. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



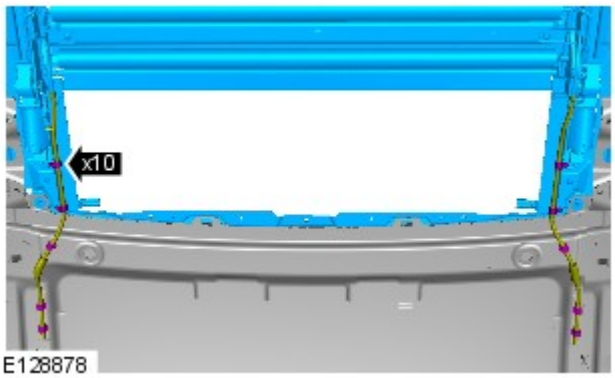
33.



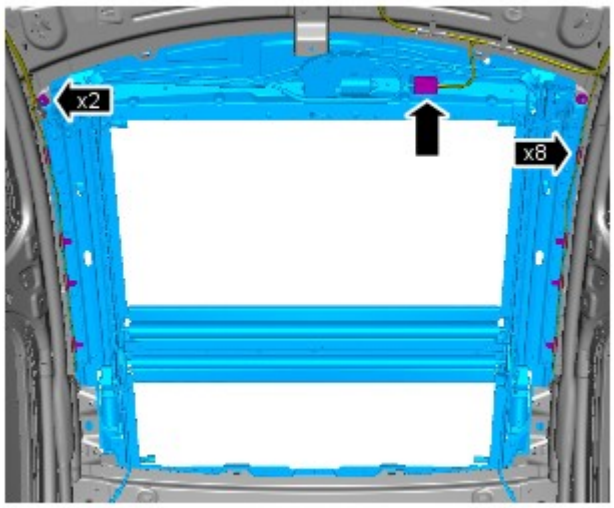
34. NOTE: Remove the tape.



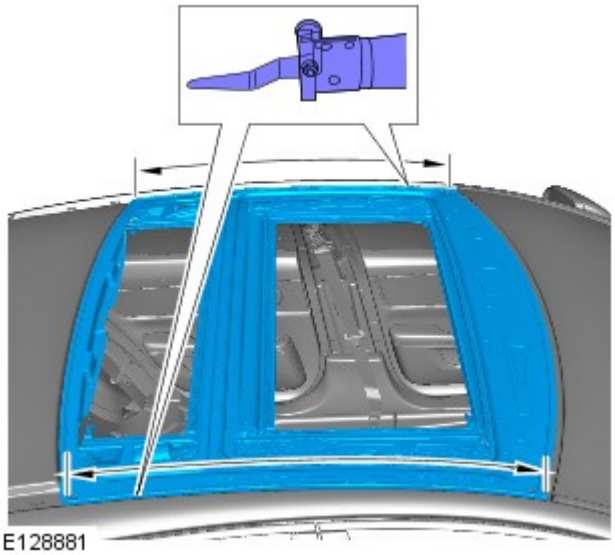
35.



36. CAUTION: Take extra care not to damage the wiring harnesses.

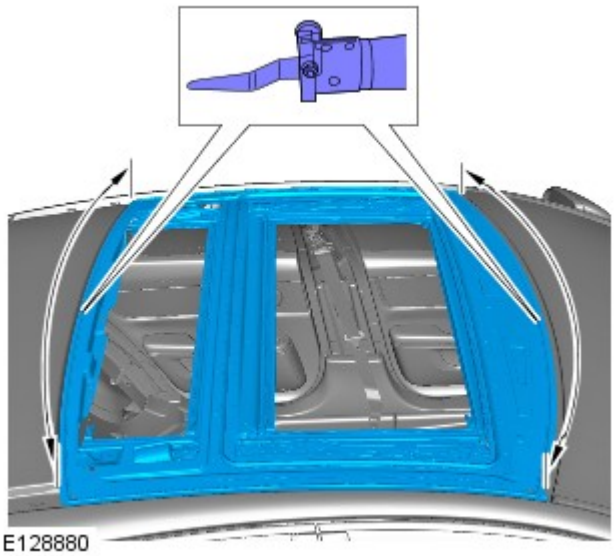


E129217



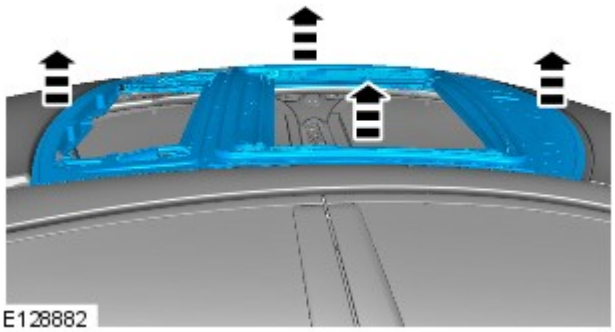
E128881

37. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



E128880

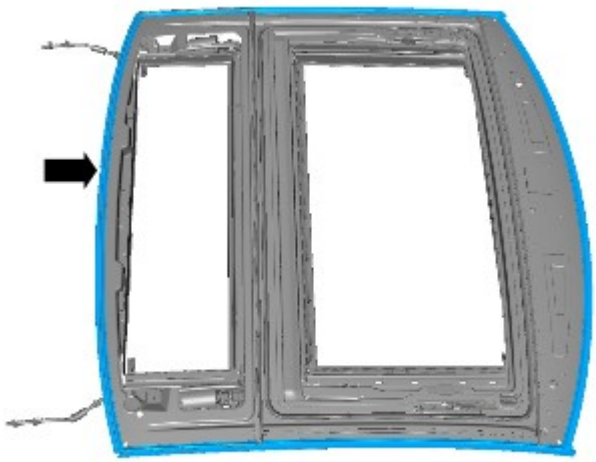
38. Use either a left facing WK29L blade or a right facing WK30L blade, cutting with the flat side against the body.



E128882

39. NOTE: This step requires the aid of another technician.

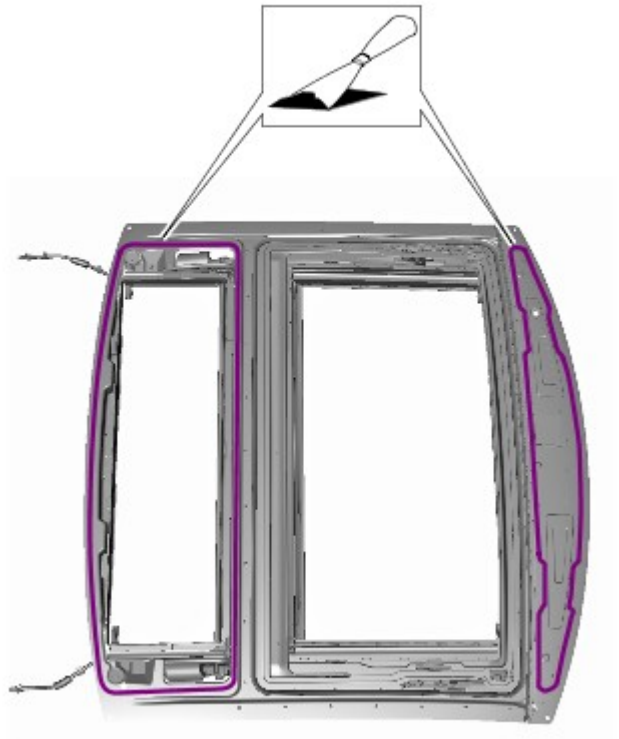
40.



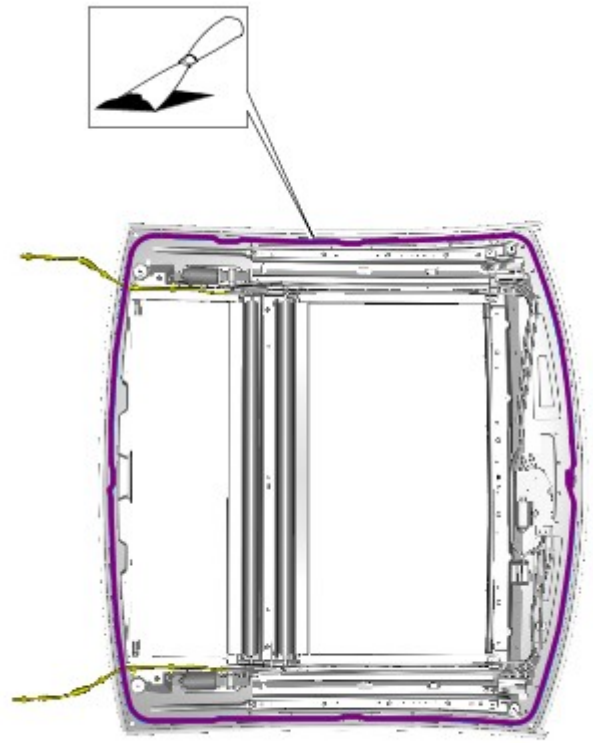
E128883

41. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

Prepare the glass roof cassette flange and trim the PU adhesive in accordance with the instructions included with the PU adhesive kit.

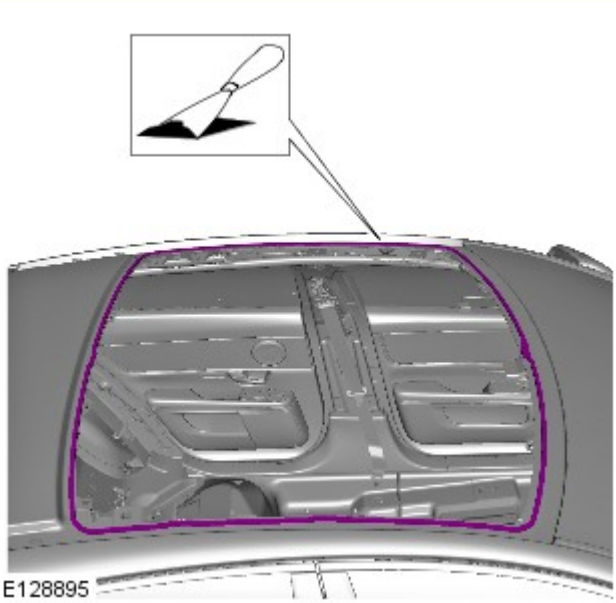


E128896



E128894

42. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

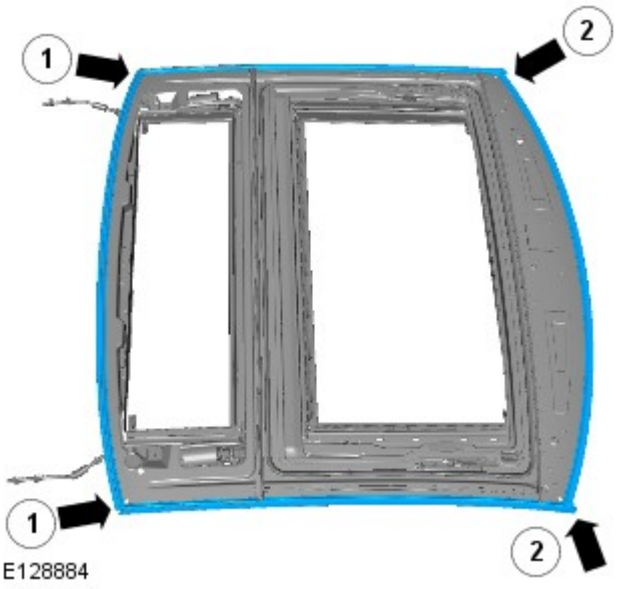


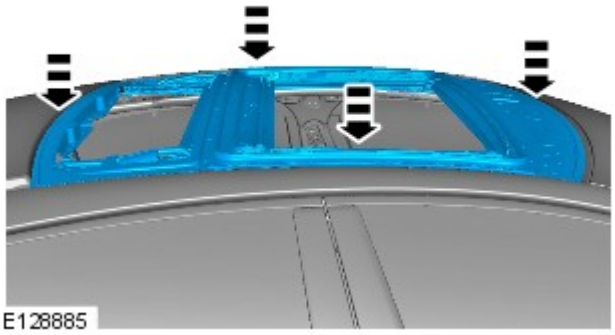
E128895

43. CAUTION: Make sure that the mating faces are clean and free of corrosion and foreign material.

Installation

1. Fit the cassette frame edge seal back corners first, then fit the front corners, as the sequence depicts in the graphic.





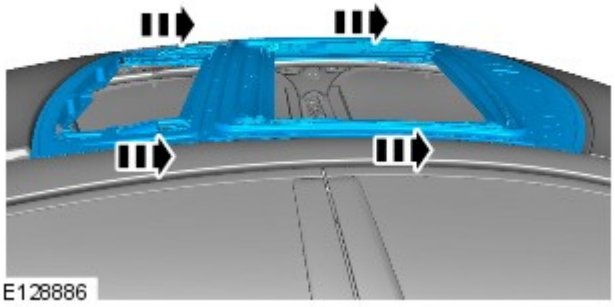
2. CAUTION: Make sure that the component is correctly located on the locating dowels.

NOTES:

This step requires the aid of another technician.

Install new spacers.

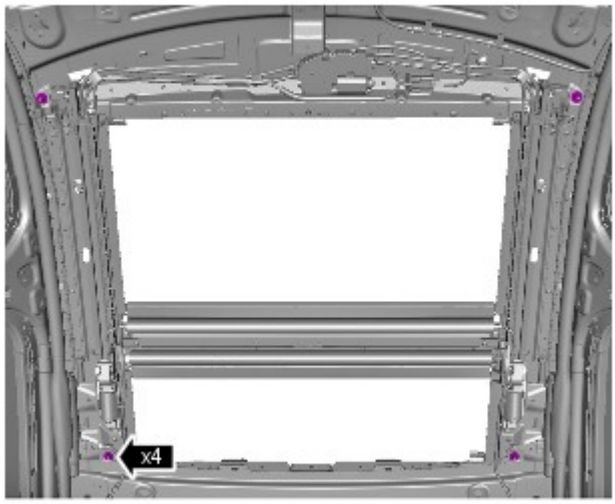
Make sure that the cassette frame edge seal is in contact with the cant rail evenly across both sides of the vehicle. It is critical that the cassette is central.



3. With the 4 installation pins correctly located into the holes in the cant rail assemblies, push the cassette fully forward towards the front of the vehicle.

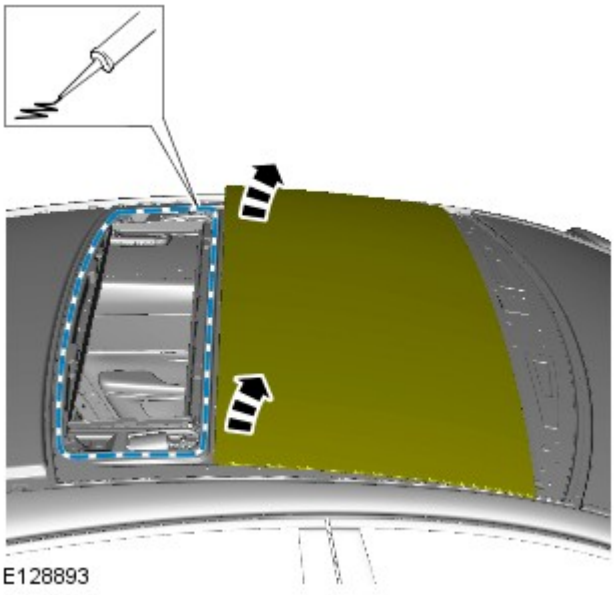
4. CAUTION: Only tighten the nuts finger-tight at this stage.

Install the 2 new nuts to the rear of the cassette frame to ensure correct alignment to the body.



E128887

5. Refer to: Roof Opening Panel Glass (501-17 Roof Opening Panel, Removal and Installation).

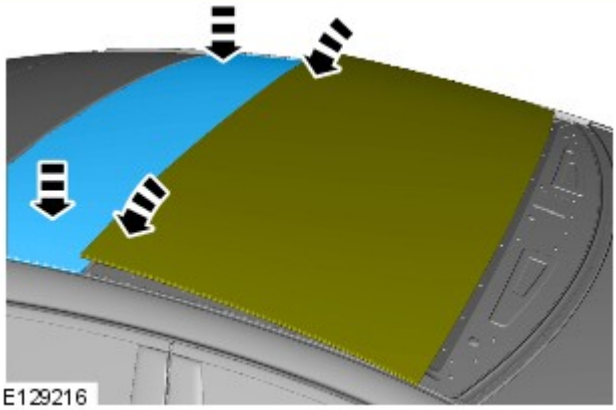


E128893

6. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

- Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.
- Using the mechanical adjuster on the roof opening panel motor, wind the motor until the glass is slightly raised from the cassette frame edge seal, to aid the installation of the rear glass panel.



E129216

7. NOTES:

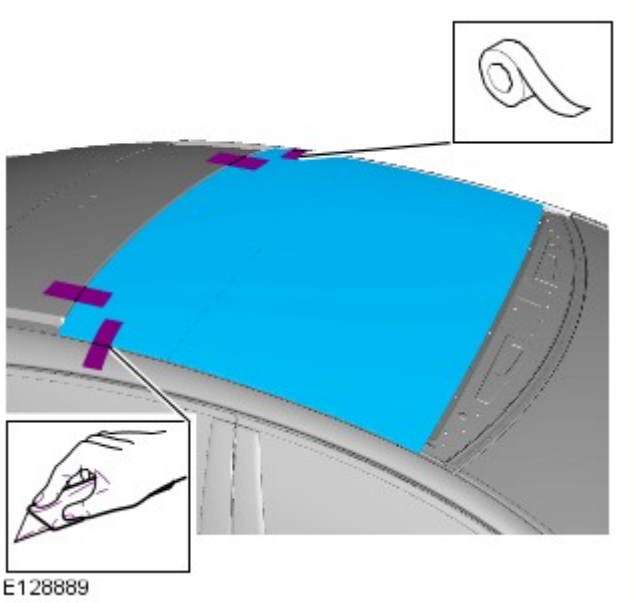
With the sunroof closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

With the sunroof closed, check the alignment of the rear glass roof panel to the sunroof glass panel. The glass should be central in its aperture. Profile of rear glass roof panel to body: front edge, set flush or up to 1.0 mm (0.040 inch) low; rear edge, set flush or up to 1.0 mm (0.040 inch) high.

- Using the mechanical adjuster on the roof opening panel motor, wind the motor until the glass is sitting flush against the cassette frame edge seal.
- Make sure the component is aligned with the measurements taken prior to removal. Failure to

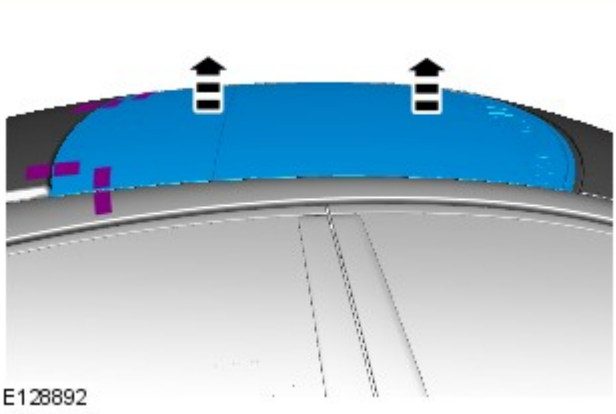
follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature of the glass.

8. Refer to: Roof Opening Panel Alignment (501-17 Roof Opening Panel, General Procedures).



E128889

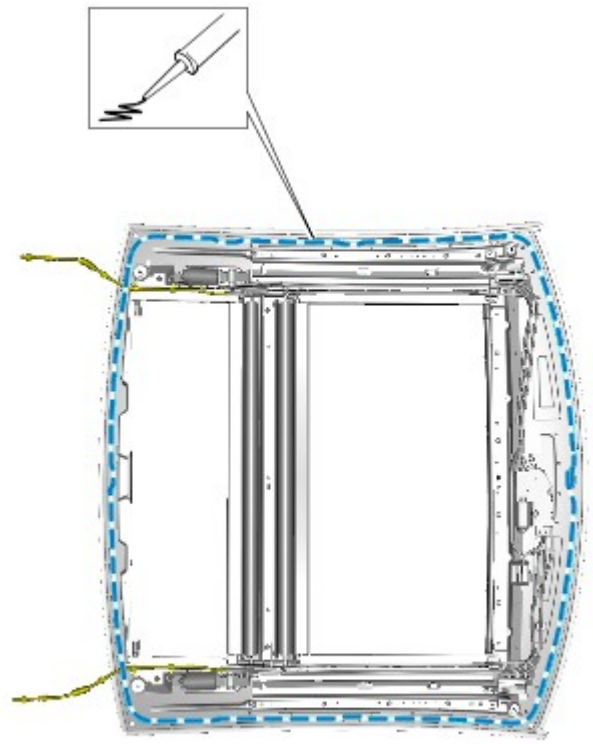
9.
- Apply tape to the rear corners of the glass roof to create alignment markings to aid installation.



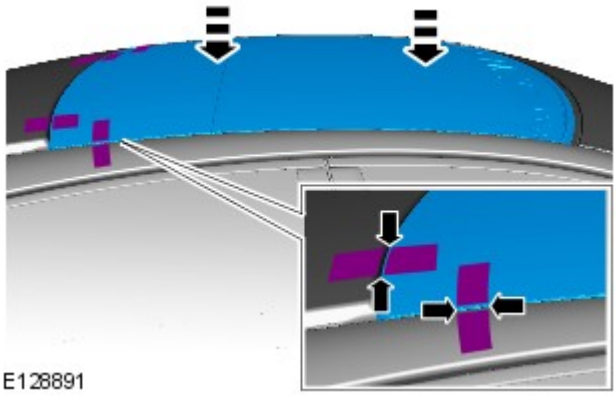
E128892

10. NOTE: This step requires the aid of another technician.

11. CAUTION: Touching the adhesive surface will impair rebonding.



E128888



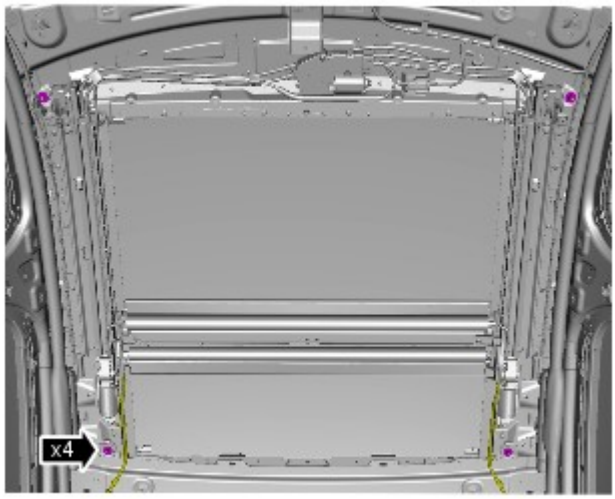
E128891

12. CAUTION: The component must be aligned with the installation markings.

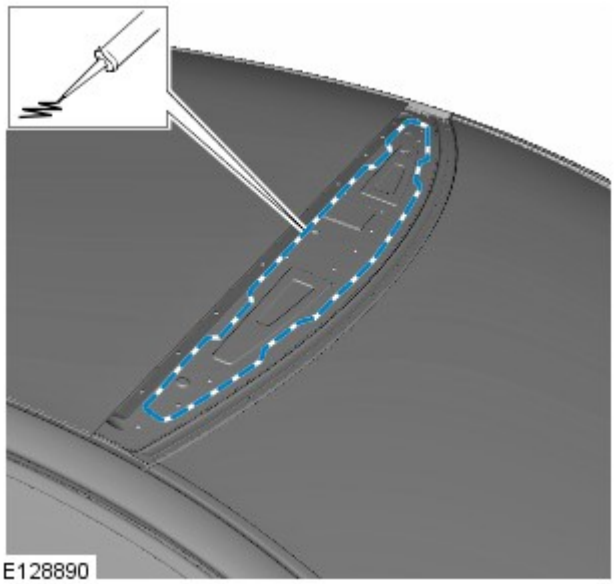
NOTE: This step requires the aid of another technician.

Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.

13. *Torque:* 9 Nm



E128934

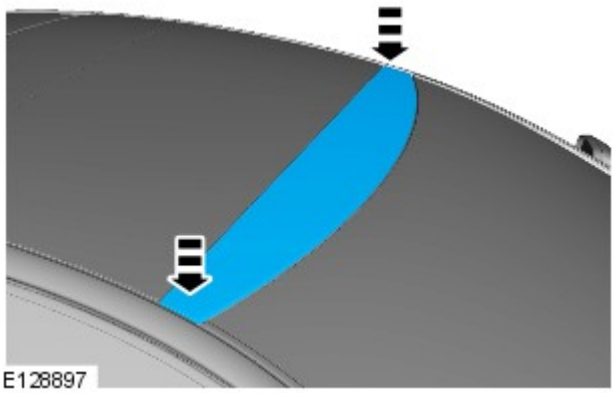


E128890

14. CAUTION: Touching the adhesive surface will impair rebonding.

NOTE: Install new spacers.

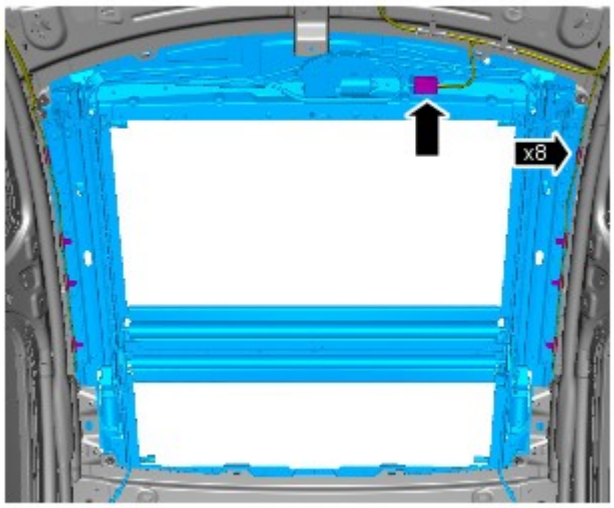
Prepare the PU adhesive in accordance with the instructions included with the PU adhesive kit.



E128897

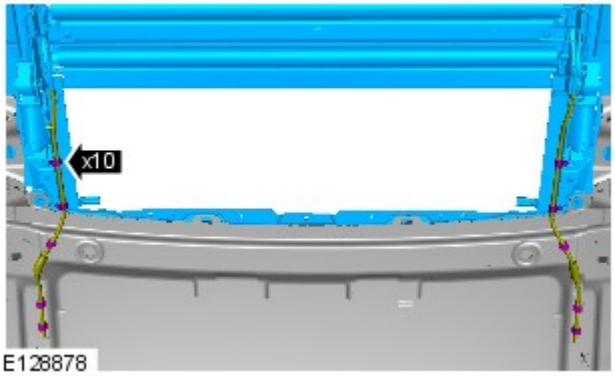
15.
- Make sure the component is aligned with the measurements taken prior to removal. Failure to follow this instruction may result in damage to the glass panels during operation of the roof opening panel.
- Use suitable weights or straps, apply a downward pressure to the glass to achieve the correct curvature of the glass.

16.



E128935

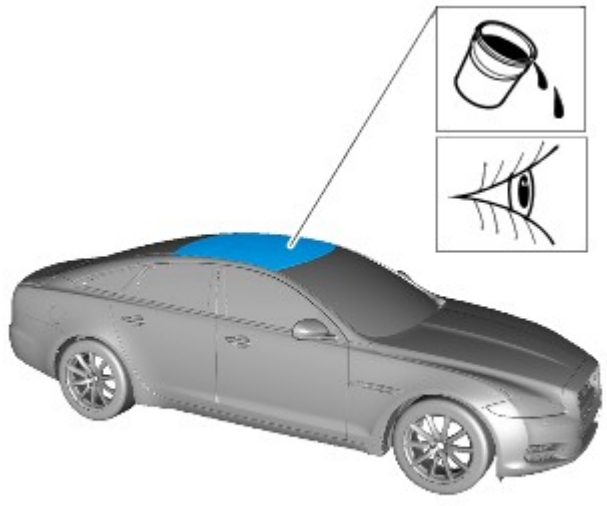
17.



E128878

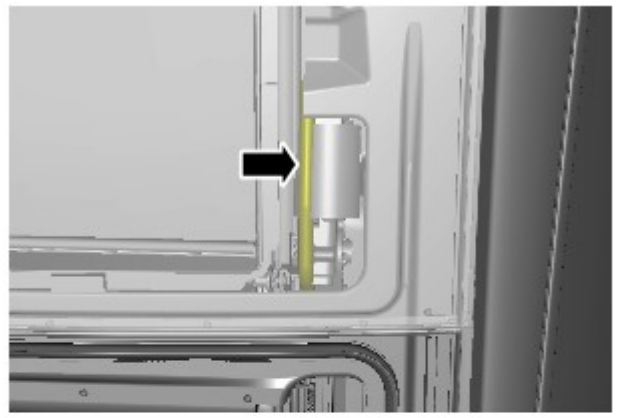
18. CAUTION: Make sure that no excess sealant residue is evident.

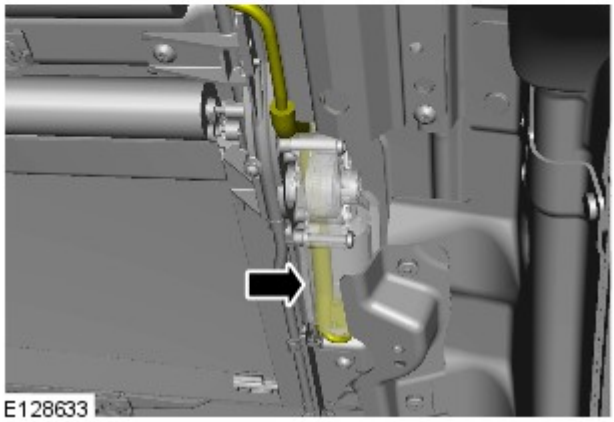
- If water is used as a means for the leak check, then allow sealant to dry before testing.
- Spray water around the windshield glass, mark any area that leaks. Dry the windshield glass and sealant before applying additional sealant.
- Spray water around the roof area and mark any area that leaks. Dry the roof glass and sealant before applying additional sealant.



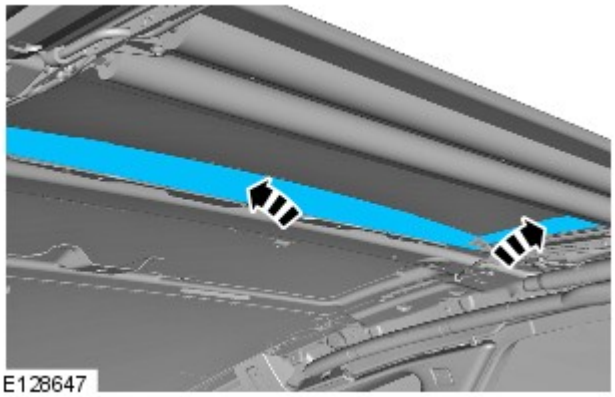
E128899

19. NOTE: Remove the tape.





20.



21. CAUTION: Protect the surrounding trim to avoid damage.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

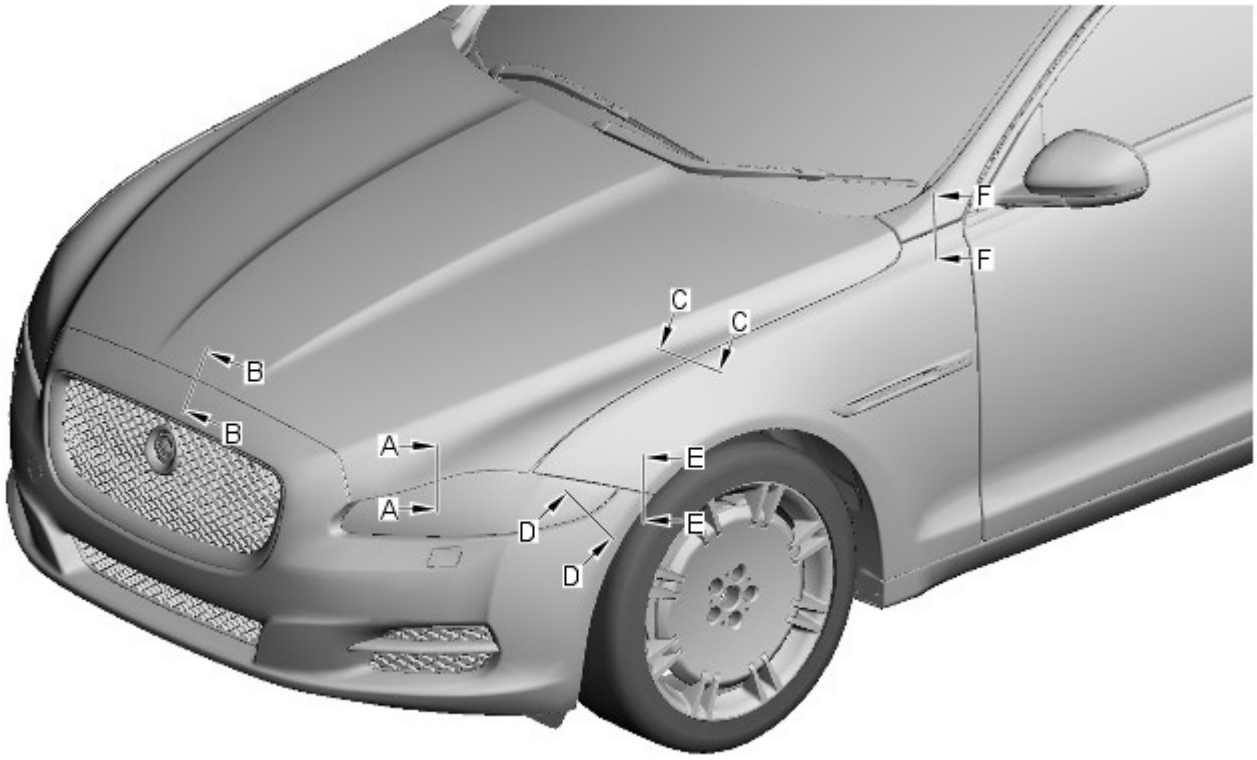
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0

F-F	Luggage compartment lid to rear lamp assembly	3.5 ± 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

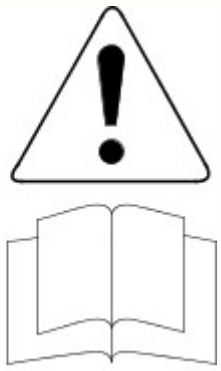
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

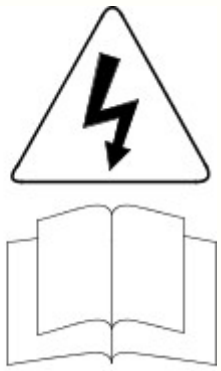
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



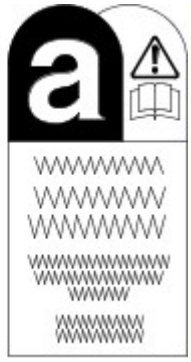
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



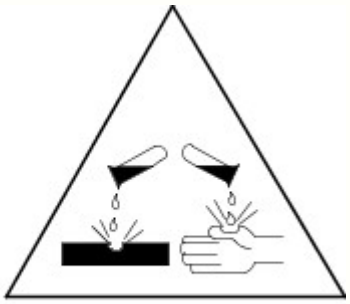
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Published: 10-Feb-2012

Supplemental Restraint System - Side Air Curtain Module

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Take extra care when handling supplemental restraint system (SRS) components.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2. Refer to: Interior Rear View Mirror (501-09 Rear View Mirrors, Removal and Installation).

3. Refer to: Overhead Console (501-12 Instrument Panel and Console, Removal and Installation).

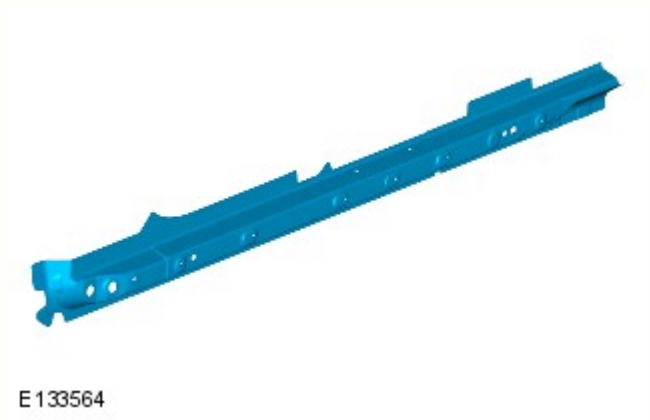
Side Panel Sheet Metal Repairs - Rocker Panel Inner Reinforcement

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The rocker panel inner reinforcement is a category A repair.



E133564

2. NOTE: The rocker panel inner reinforcement is manufactured from aluminium alloy 5754-NG.

The rocker panel inner reinforcement is serviced as a separate rivetted and bonded panel.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The rocker panel inner reinforcement is replaced in conjunction with:

- Front bumper cover
- Rear bumper cover
- Front door
- Rear door
- Front fender
- Hood
- Hood hinge
- Luggage compartment lid
- Hood latch panel
- Fender apron panel closing panel
- Quarter panel
- A-pillar outer panel
- A-pillar reinforcement
- Rocker panel and b-pillar outer panel
- B-pillar reinforcement
- Rocker panel
- Headliner
- Windshield glass remove and install
- Rear window glass
- Instrument panel upper section
- Roof opening panel frame
- Roof glass front
- Roof glass rear

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Remove the B-pillar reinforcement.
For additional information, refer to: B-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

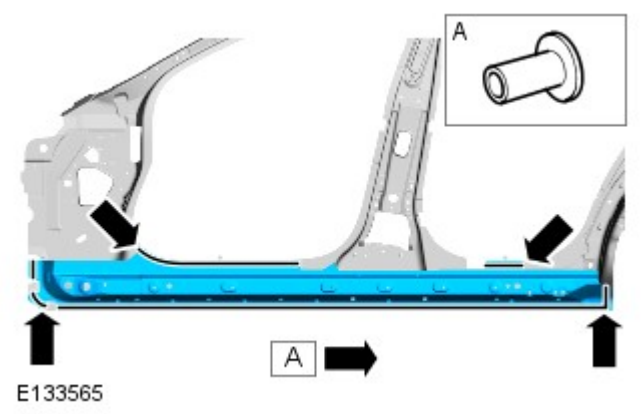
7. Remove the A-pillar reinforcement.
For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

8. Remove the rocker panel.
For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

9. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

10. Remove any remaining miscellaneous components from the repair area as necessary.

11. Prior to removal, mark the position of the rocker panel inner reinforcement in relation to adjacent panels, for ease of alignment on installation.



12. Using the ESN50, remove any remaining self piercing rivets from the areas indicated.

13. NOTE: Remove and retain the noise, vibration and harshness (NVH) component, if it is to be reused.

Separate the joints and remove the old panel, also releasing the NVH component if required.

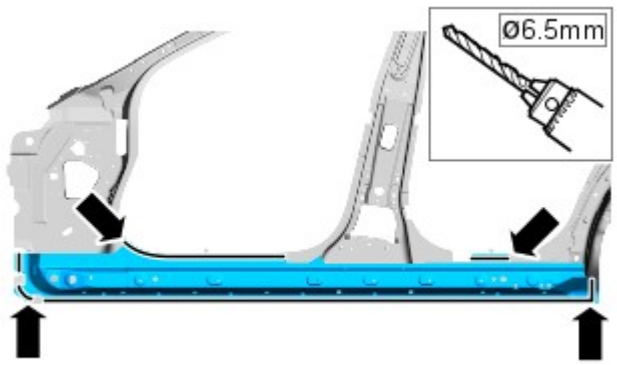
Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.

4. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



E133566

NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

Where the pitch of the removed self piercing rivets is 25mm or less, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the outer panel is installed.

6. Remove the new panel.

7. Debur the drilled holes in the new panel.

8. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces, also removing any adhesive residue.

9. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

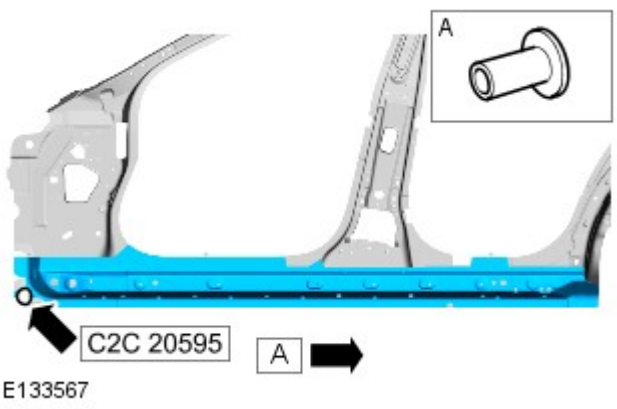
10. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

11. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the vehicle.

12. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of other panels. These joints must be left clamped until the adhesive has cured.

Offer up the new panel, align and clamp into position. If correct proceed to next step, if not, rectify and recheck before proceeding.

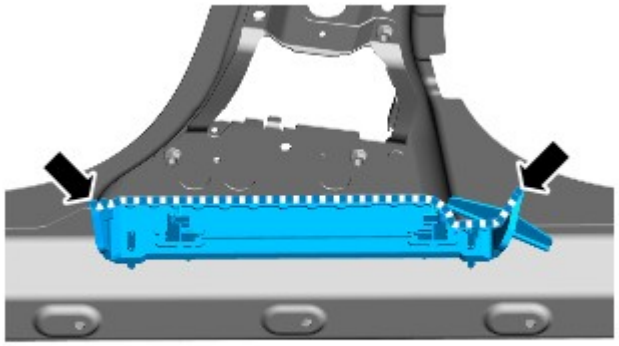


E133567

13. Using the ESN50, install the self piercing rivet as indicated.

14. Remove any excess adhesive.

15. Trim, clean and prepare the NVH component.



E133568

16. Apply semi-rigid sealer to the NVH component and install to the new panel.

17. The installation of associated panels and components is the reversal of removal procedure.

Published: 11-May-2011

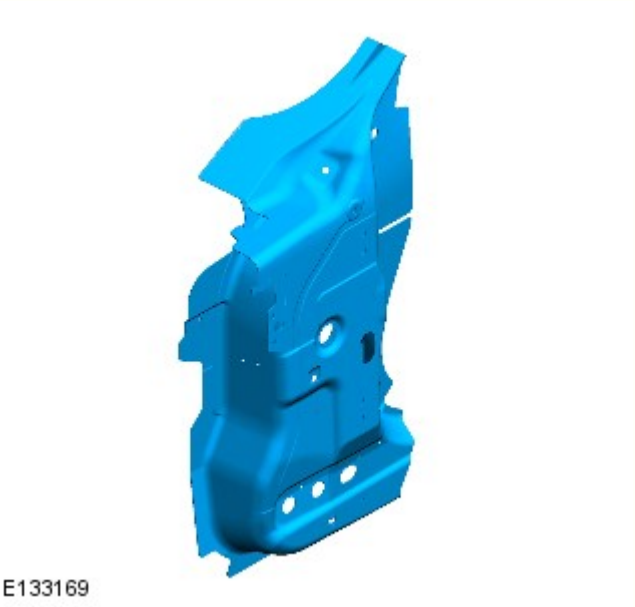
Side Panel Sheet Metal Repairs - A-Pillar Reinforcement

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation or, is being replaced in combination with panels other than those listed.

1. The A-pillar reinforcement is a category A repair.



E133169

2. NOTE: The A-pillar reinforcement is manufactured from aluminium alloy 5754-NG.

The A-pillar reinforcement is serviced as a separate rivetted and bonded panel, it includes its inner reinforcements.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The A-pillar reinforcement is replaced in conjunction with:
- Front bumper cover
- Hood
- Hood hinge
- Front door
- Front fender

- Hood latch panel
- A-pillar outer panel
- Fender apron panel closing panel
- Headliner
- Windshield glass remove and install
- Instrument panel upper section

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information, Description and Operation) / Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) / Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Remove the fender apron panel closing panel.
For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

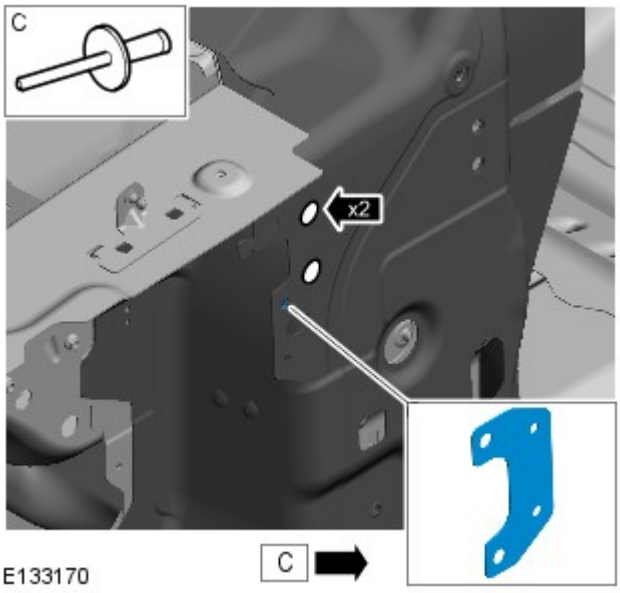
8. Remove the A-pillar outer panel.
For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

9. Remove the hood hinge.
For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

10. Release the A-pillar wiring harness and position it to one side.

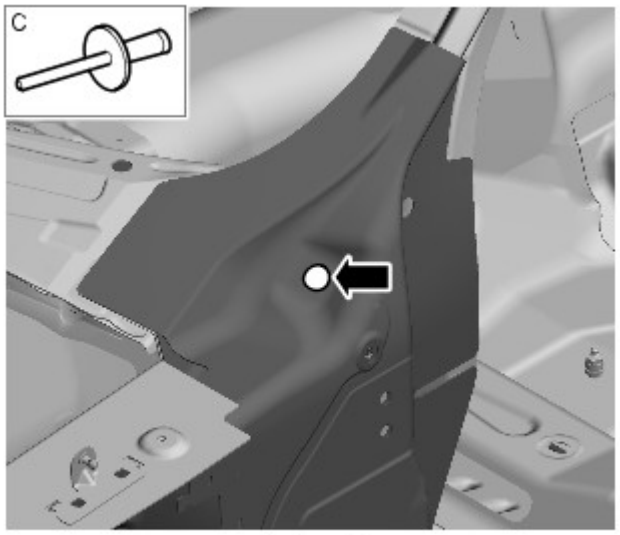
11. Remove any remaining miscellaneous components from the repair area as necessary.

12. Prior to removal, mark the position of the A-pillar reinforcement in relation to adjacent panels, for ease of alignment on installation.



13. NOTE: If the fender apron panel closing panel bracket is to be installed, it is not necessary to remove it. Retain if being re-used.

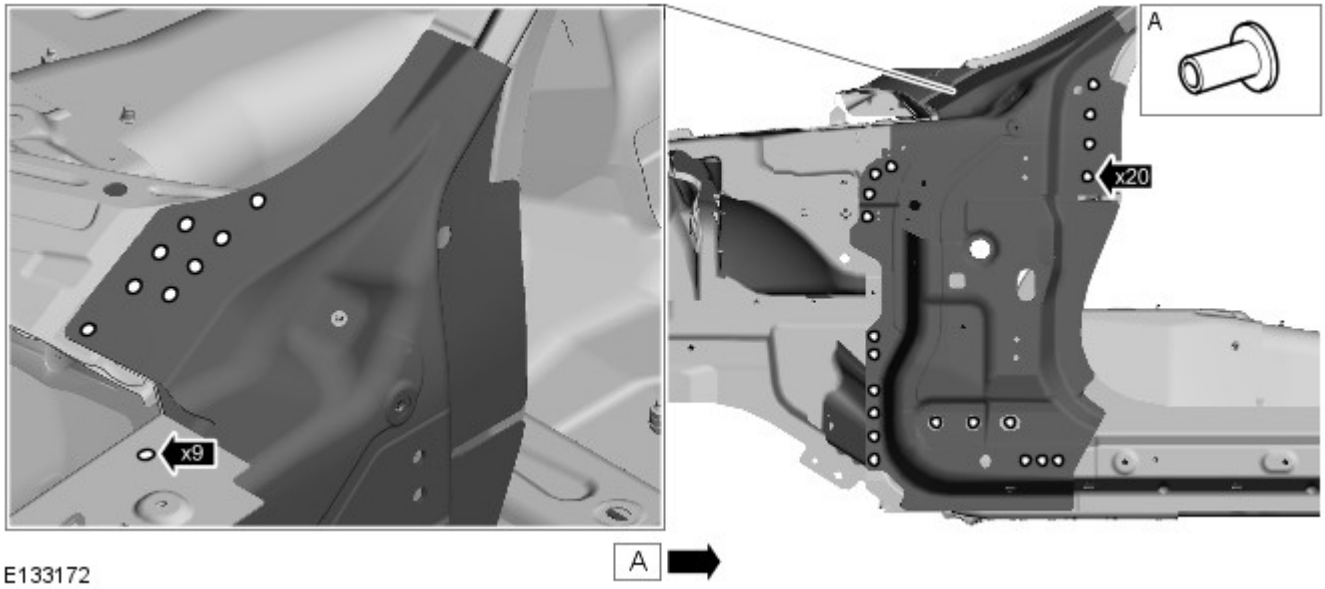
Remove the Monobolts, to release the fender apron panel closing panel bracket as indicated.



E133171

14. Remove the Monobolt as indicated.

15. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets.



E133172

16. NOTES:

Retain the old panel as it will be used as a template.

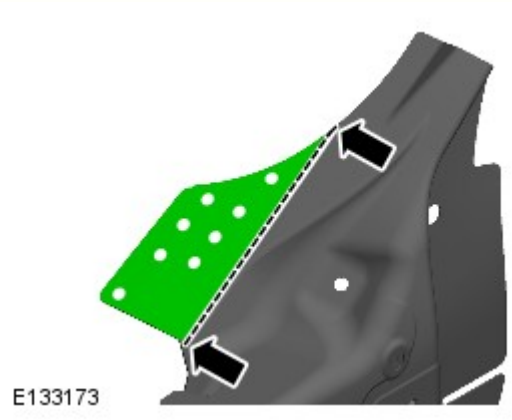
Remove and retain the noise, vibration and harshness (NVH) components, if they are to be reused.

Separate the joints and remove the old panel, also releasing the inner NVH component.

Installation

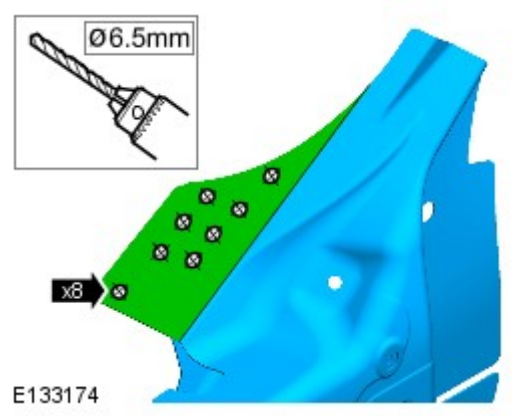
1. Remove rivet remnants.

2. Dress flanges where necessary.



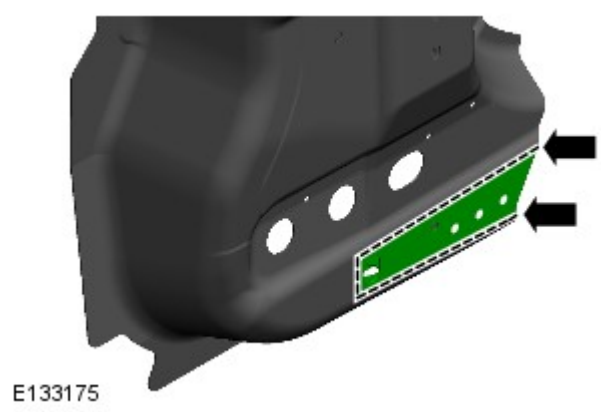
3. Cut a template from the old A-pillar reinforcement panel remnant as indicated.

4. Clean and dress the template.



5. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

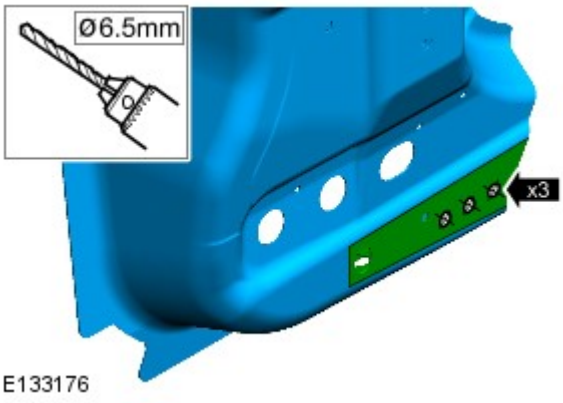
6. Remove the template.



7. Cut a template from the old A-pillar reinforcement panel remnant as indicated.

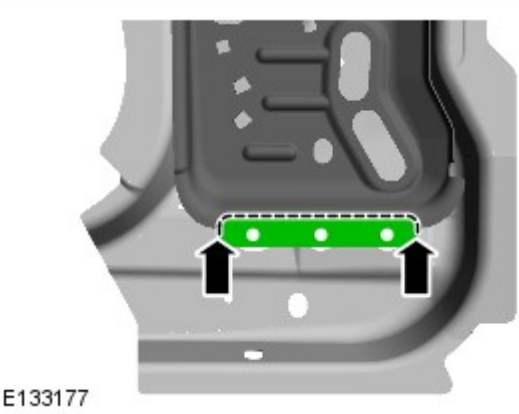
8. Clean and dress the template.

9. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.



E133176

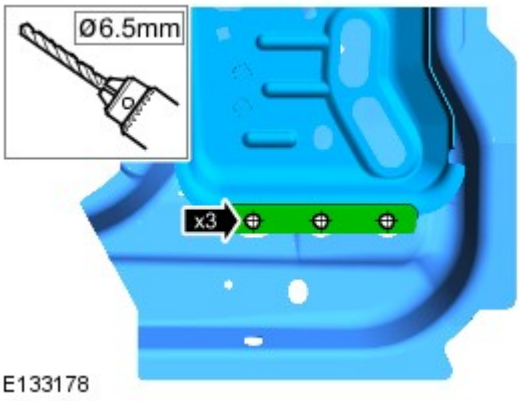
10. Remove the template.



E133177

11. Cut a template from the old A-pillar reinforcement panel remnant as indicated.

12. Clean and dress the template.



E133178

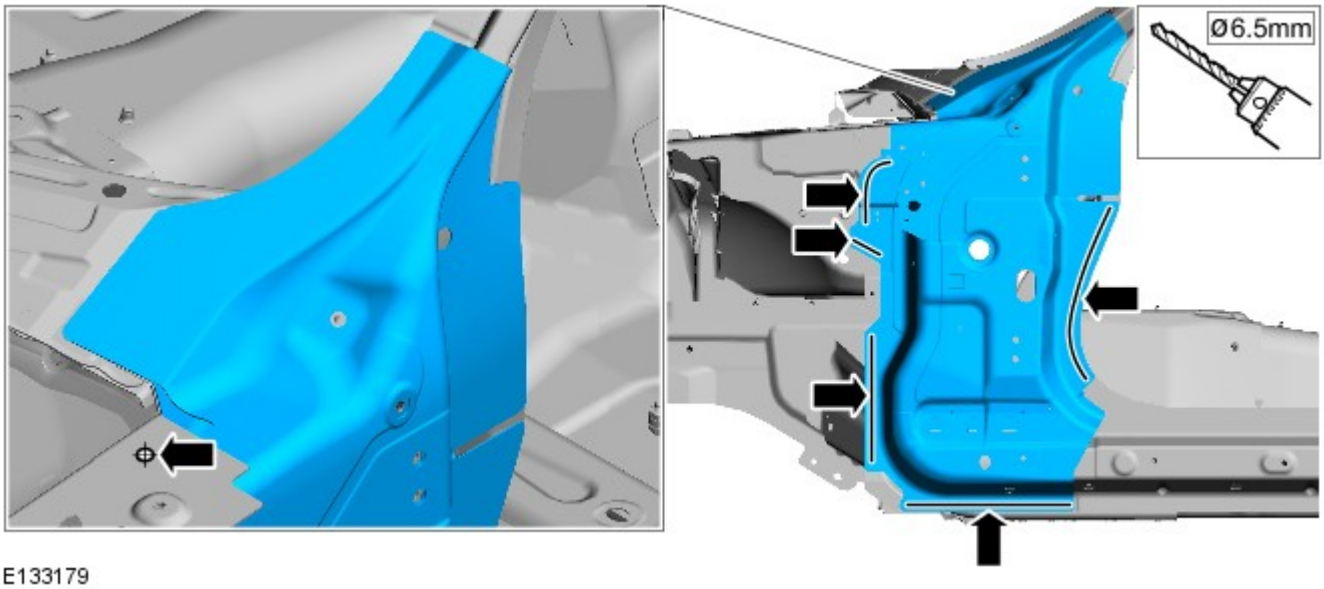
13. Offer up, align and clamp the template in place on the new A-pillar reinforcement service panel. Using a 6.5mm Cryobit drill bit, drill through the template into the new panel at the points indicated.

14. Remove the template.

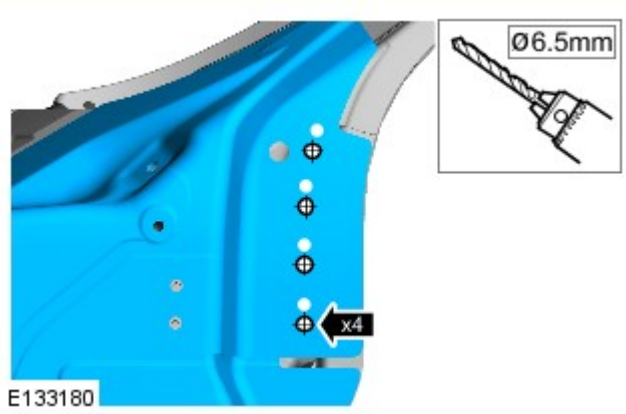
15. Debur the drilled holes in the new panel.

16. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

17. Using a 6.5mm Cryobit drill bit, drill holes through the removed self piercing rivet location holes in the areas as indicated.



E133179



E133180

18. Using the old panel for reference, mark and measure out the position of the removed self piercing rivet locations, as indicated. Using a 6.5mm Cryobit drill bit, drill holes below these locations at the points where Hemloks are to be installed as indicated.

19. Remove the new panel.

20. Debur the drilled holes in the new panel.

21. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces.

22. Trim, clean and prepare the NVH components.

23. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

24. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.

25. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the inner NVH component and install it to the new A Pillar Reinforcement, then apply semi-rigid sealer to the exposed edge of the NVH component for installation to the vehicle.

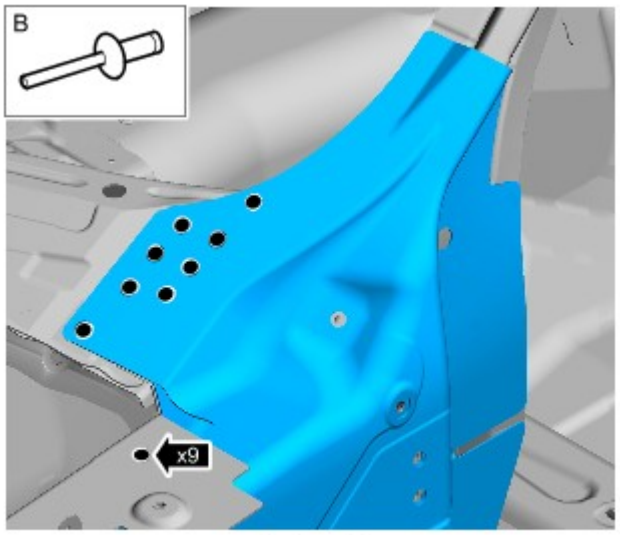
26.

NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

27. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

Offer up the new panel, align and clamp into position.

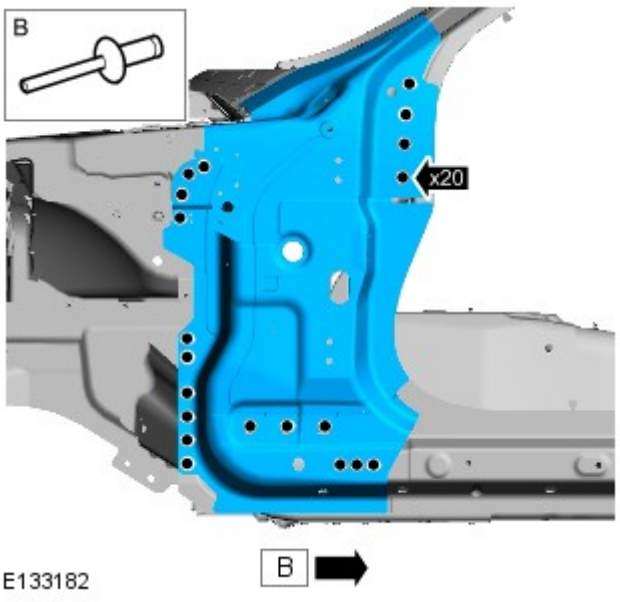


E133181

28. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



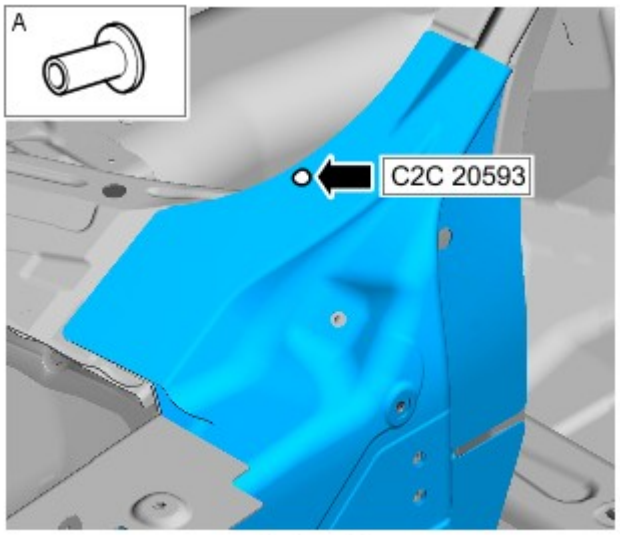
E133182

29. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

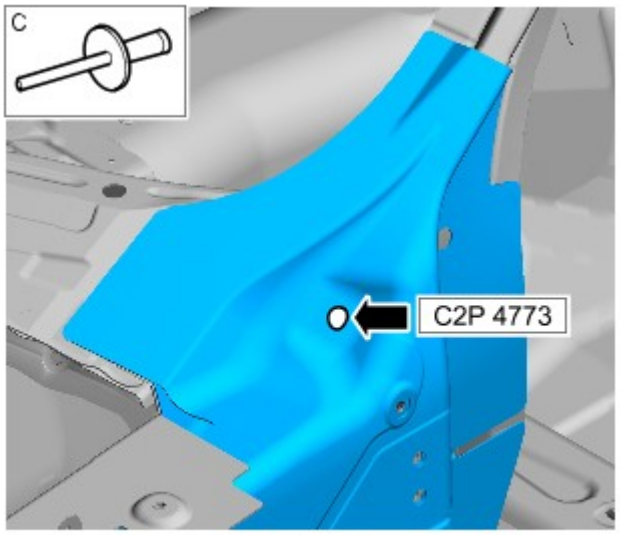
Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

30. Using the ESN50, install the self piercing rivet as indicated.

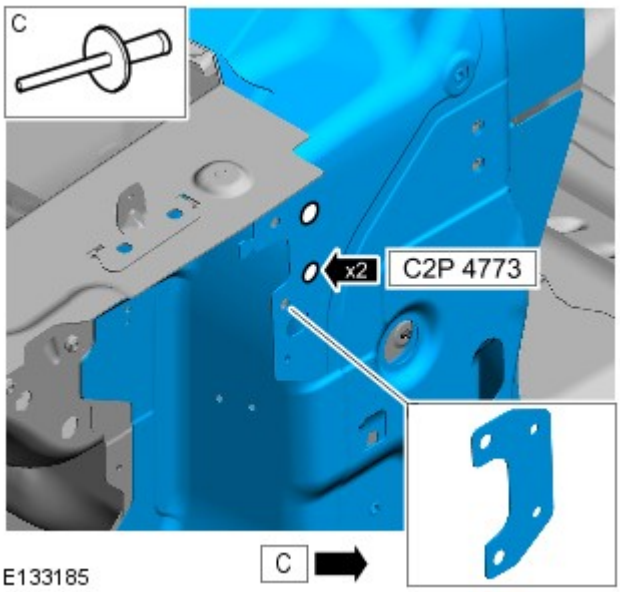


E133183



E133184

31. Using the Genesis G4, install the Monobolt.



E133185

32. Using the Genesis G4, install the Monobolts to the fender apron panel closing panel bracket as indicated.

33. Apply semi-rigid sealer to the outer lower NVH component and install it to the new A Pillar Reinforcement.

34. Remove any excess adhesive.

35. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

36. The installation of associated panels and components is the reversal of removal procedure.

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Side Panel Sheet Metal Repairs - B-Pillar Reinforcement

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The B-pillar reinforcement is a category A repair.

2. NOTE: The B-pillar reinforcement is manufactured from aluminium alloy 6111-T4.

   The B-pillar reinforcement is serviced as a separate riveted and bonded panel, it includes its inner reinforcements.

3. In this procedure, to make sure the vehicle is correctly aligned, it must be placed on an approved alignment jig.

4. The B-pillar reinforcement is replaced in conjunction with:
- Front door.
- Rear door
- Rocker panel and B-pillar outer panel
- Headliner
- Windshield glass remove and install
- Roof opening panel frame
- Roof glass front
- Roof glass rear

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

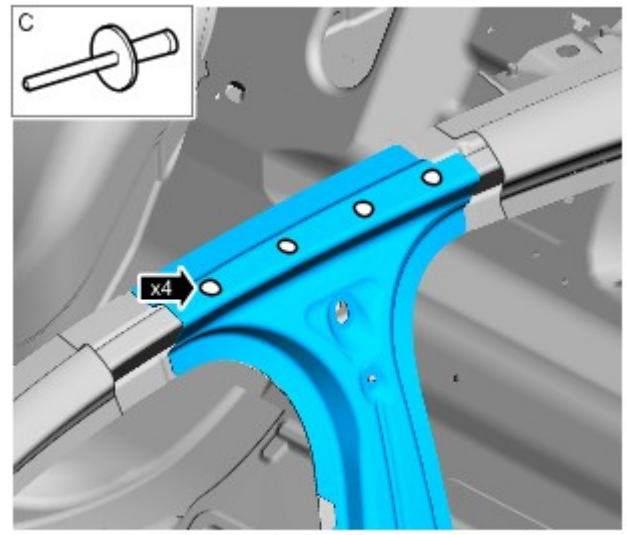
6. Remove the rocker panel and B-pillar outer panel.
For additional information, refer to: Rocker Panel and B-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

7. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

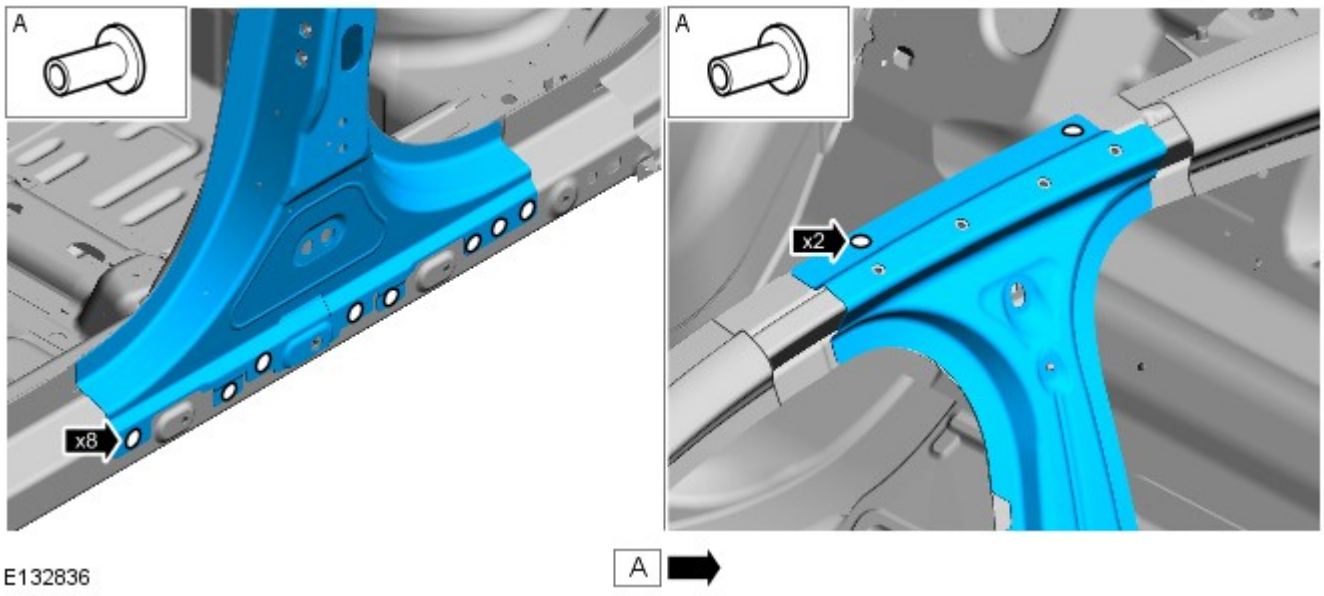
8. Remove any remaining miscellaneous components from the repair area as necessary.

9. Prior to removal, mark the position of the B-pillar reinforcement in relation to adjacent panels, for ease of alignment on installation.

10. Remove the Monobolts as indicated.



11. Using a 6.5mm Cryobit drill bit, remove the self piercing rivets as indicated.



12. NOTES:

Retain the old panel as it will be used as a template.

Remove and retain the central noise, vibration and harshness (NVH) component, if it is to be reused.

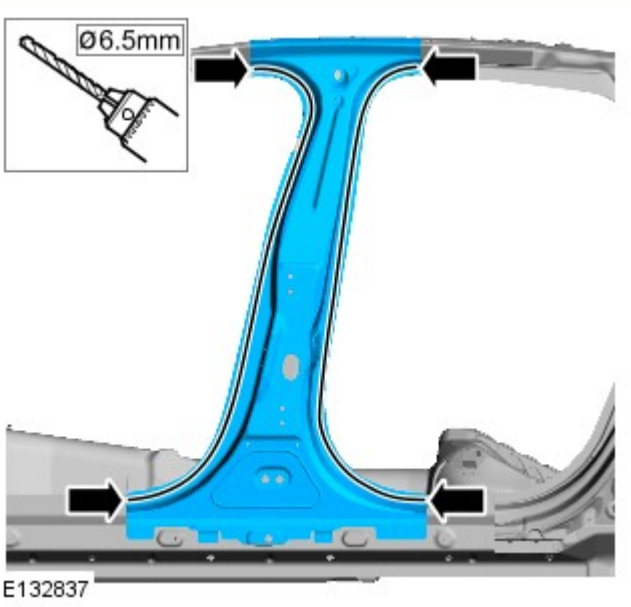
Separate the joints and remove the old panel, also releasing it from the lower NVH component.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

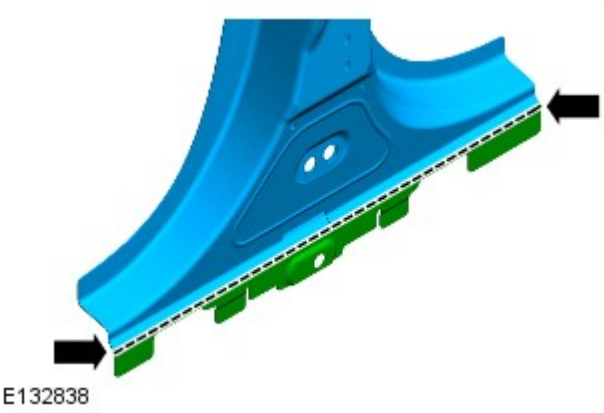
3. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.



4. NOTE: New self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

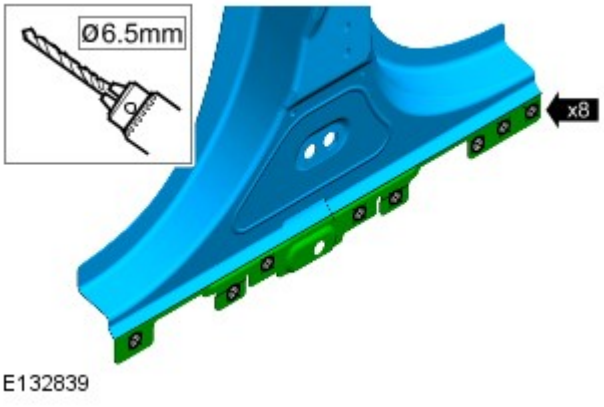
Where the pitch of the removed self piercing rivets is 25mm or less, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the outer panel is installed.

5. Remove the new panel.



6. Cut a section from the lower part of the old panel to be used as a template as indicated.

7. Debur the template.



8. Offer up, align and clamp the template to the new panel. Using a 6.5mm Cryobit drill bit, drill holes through the template into the new panel, ready for Hemloks to be installed.

9. Remove the template from the new panel.

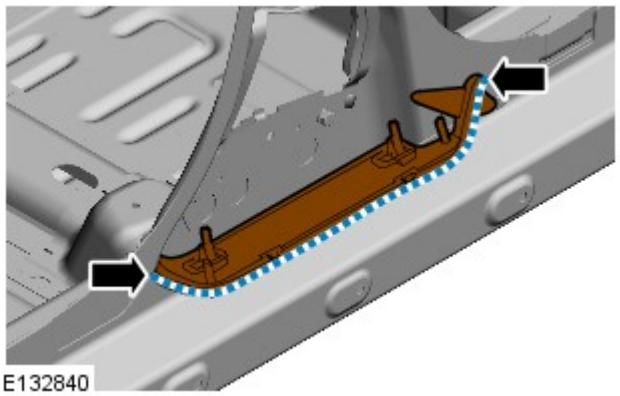
10. Debur the drilled holes in the new panel.

11. Using a Roloc fine bristle disc, clean and prepare the old and new panel surfaces.

12. Trim, clean and prepare the NVH components.

13. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

14. Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.



15. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the lower NVH component.

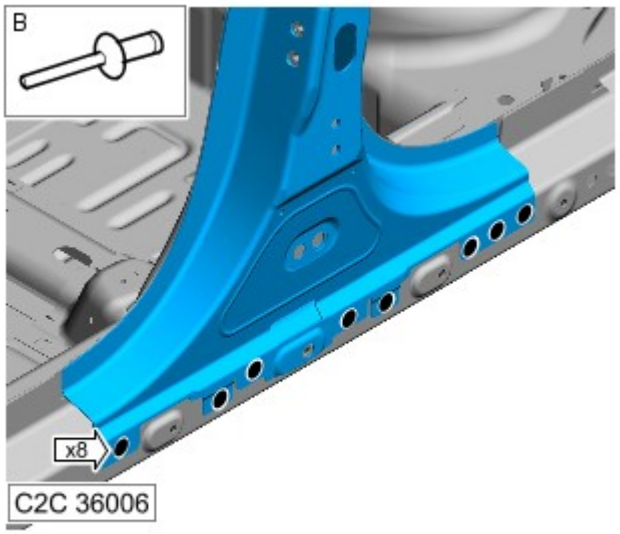
16. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

17. CAUTION: Make sure any panel joints containing adhesive are fully clamped to avoid any separation prior to the installation of external panels. These joints must be left clamped until the adhesive has cured.

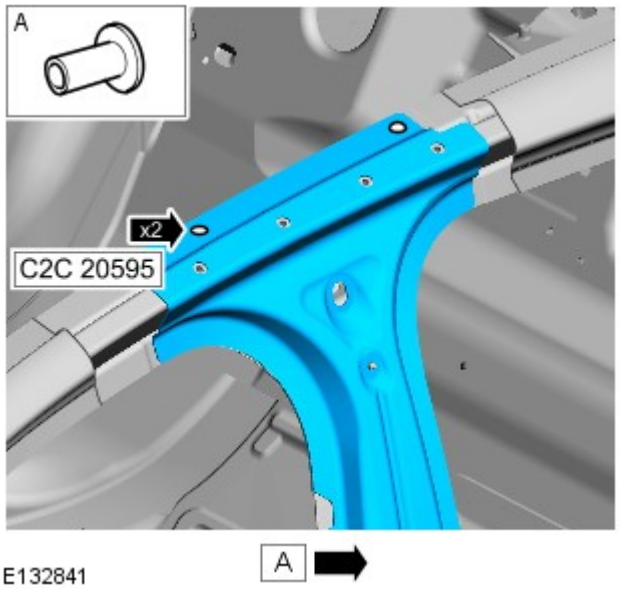
Offer up the new panel, align and clamp into position.

18. Using the Genesis G4, install the Hemloks.



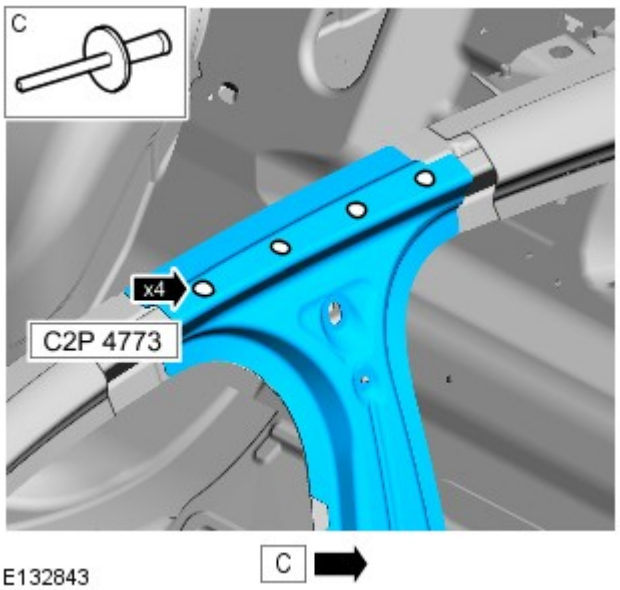
E132842

19. Using the ESN50, install the self piercing rivets as indicated.

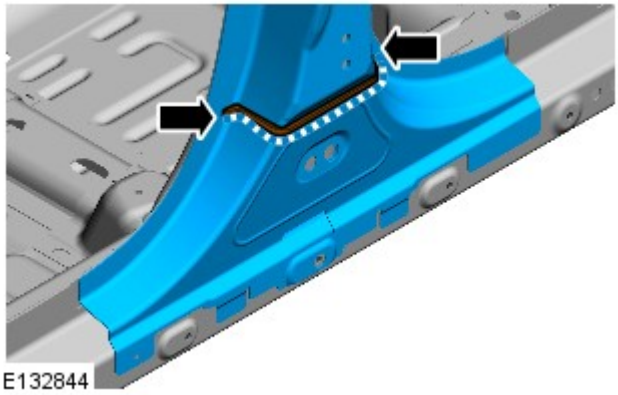


E132841

20. Using the Genesis G4, install the Monobolts.



E132843



21. Apply semi rigid to the central NVH component and install.

22. Remove any excess adhesive.

23. The installation of associated panels and components is the reversal of removal procedure.

Published: 17-Feb-2012

Battery, Mounting and Cables - Battery Disconnect and Connect

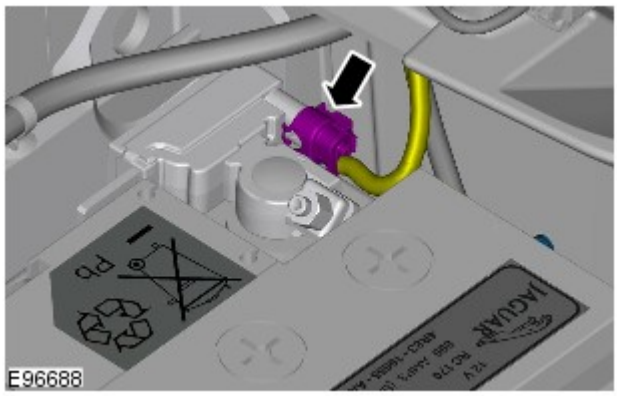
General Procedures

Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

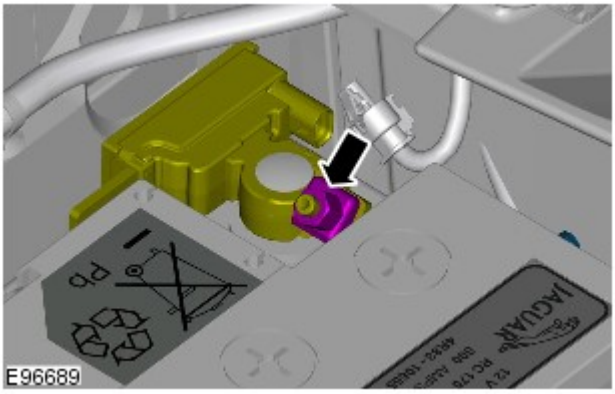
2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.



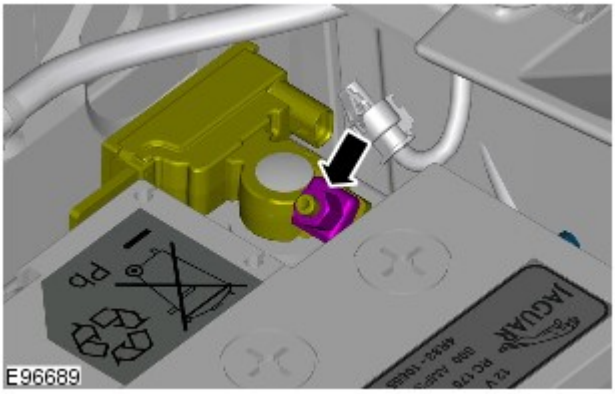
4. CAUTION: Take extra care not to damage the wiring harness.

5.

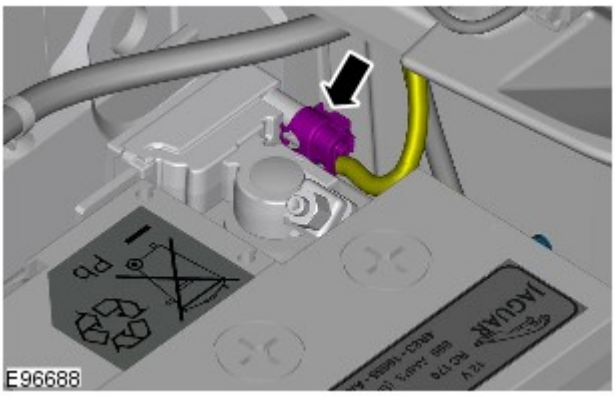


Connect

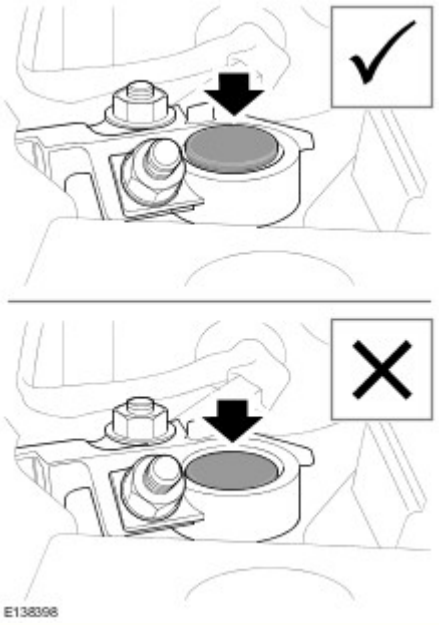
1. *Torque:* 6 Nm



2.



3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.



4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places

particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel

- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).
- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).

- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).

- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).

- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning

- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual

- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety
- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A

- Category B

All approved equipment is available on a Worldwide basis from:

Country	Phone	Fax
Austria	+800-291714	+800-291694
Belgium (flemish)	00800-36733731	00800-36733292

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During	Yes - **caution** material sensitive to heat.	Yes - **must** be heated to maintain original alloy properties. Ideal

Repair	Range: 140 - 160°C Ideal panel temperature: **150°C**	panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

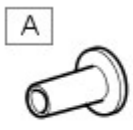
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

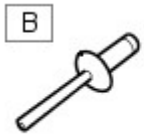
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

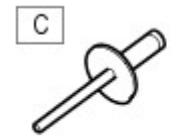
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

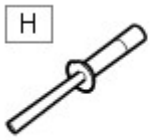
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

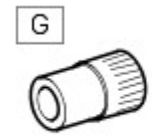
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

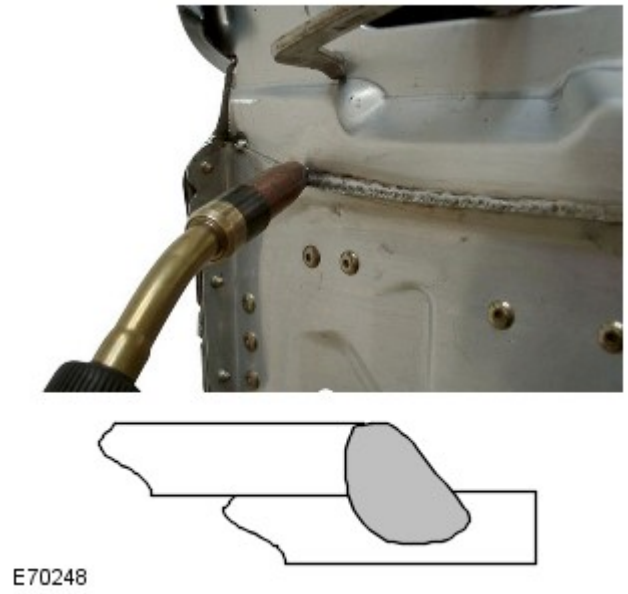
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

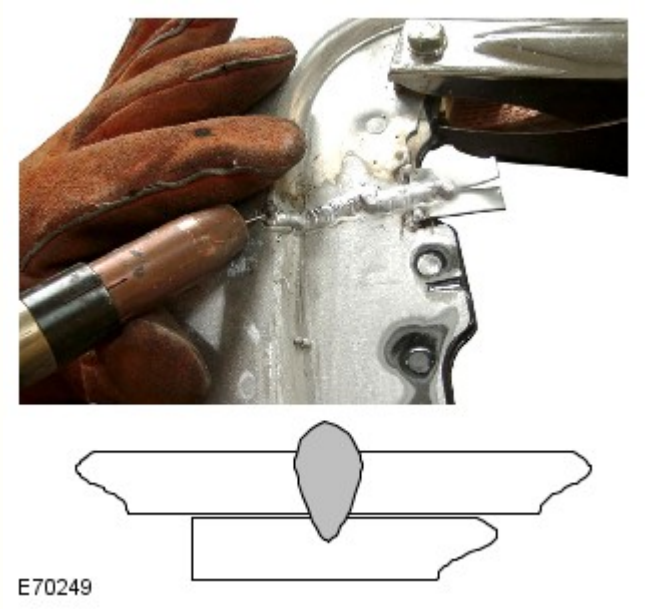
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

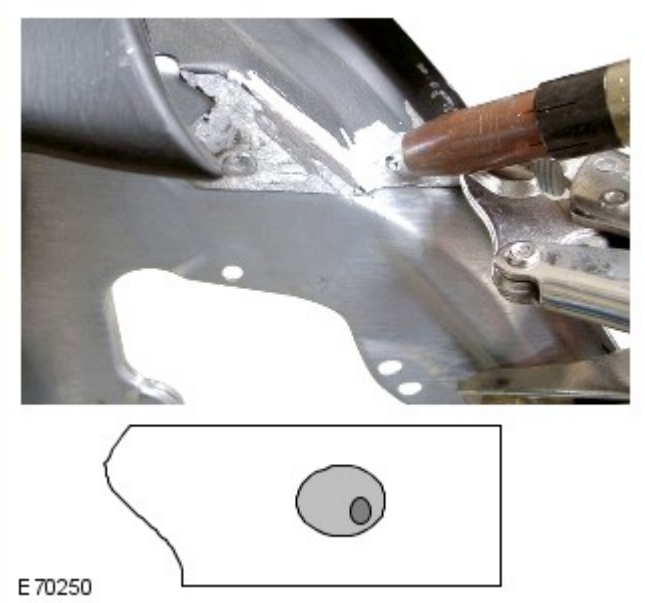
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

B-G (long wheel base)	Front subframe, LH front fixing hole	Rear subframe, RH front fixing hole	3419.9

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

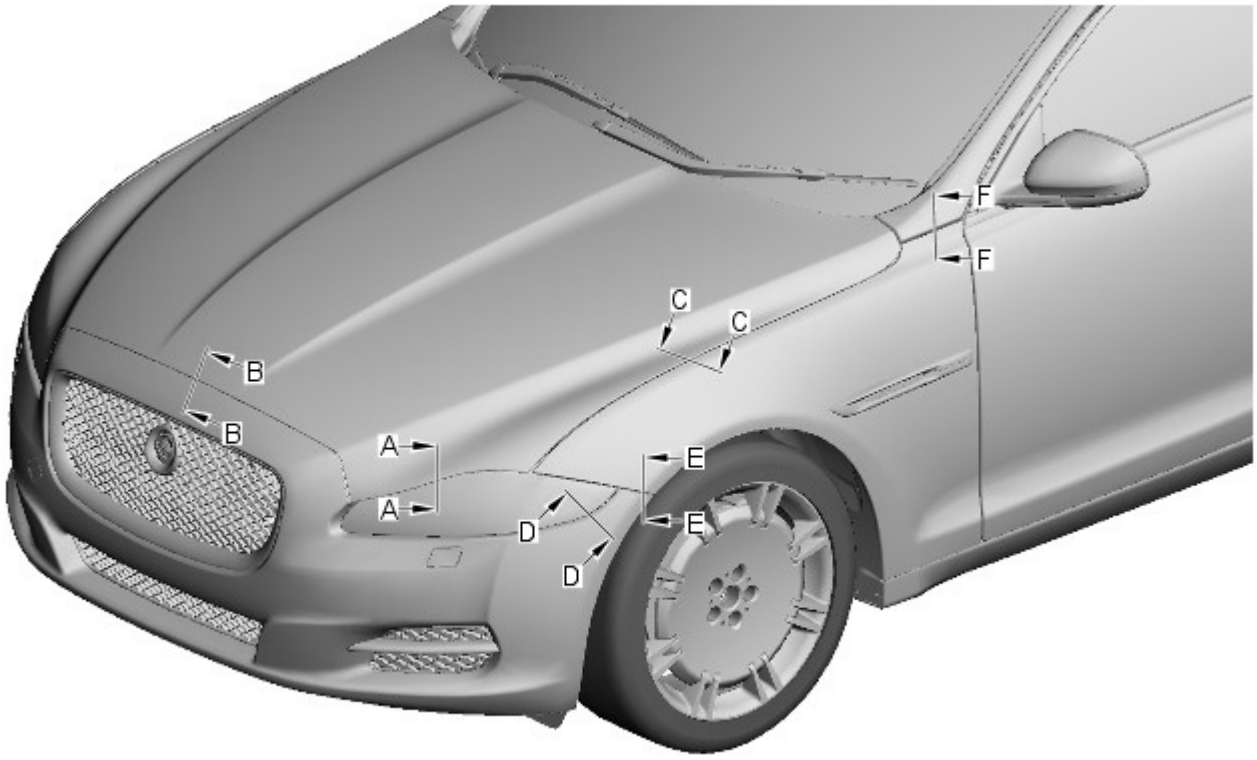
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

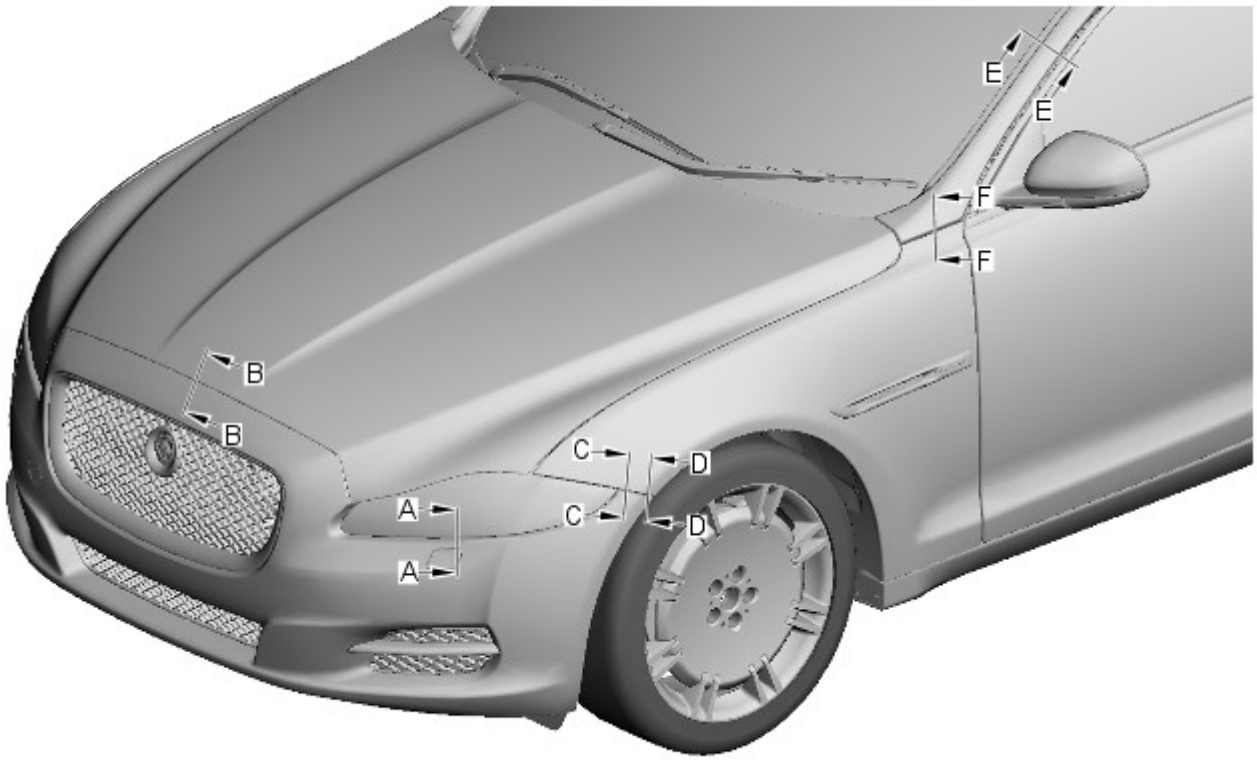
The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Hood to front fender	3.5 ± 1.0
D-D	Front bumper cover to headlamp	1.0 ± 0.5
E-E	Front fender to front bumper cover	0.0 + 1.0
F-F	Front fender to A-pillar	3.5 ± 1.0



E133472

A-A	Front bumper cover to headlamp	1.0 ± 0.5
B-B	Hood to front bumper cover	3.5 ± 1.0
C-C	Front bumper cover to front fender	0.0 + 1.0

Published: 11-May-2011

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules

- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

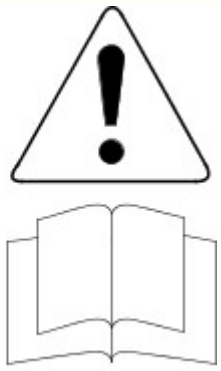
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

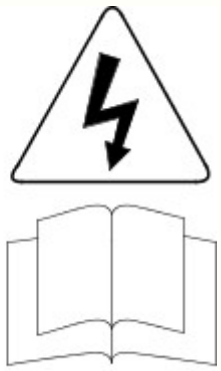
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



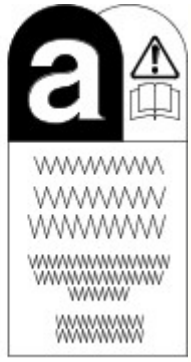
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



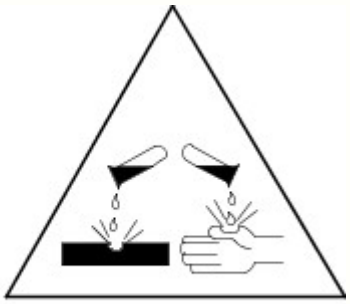
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Side Panel Sheet Metal Repairs - Rocker Panel

Removal and Installation

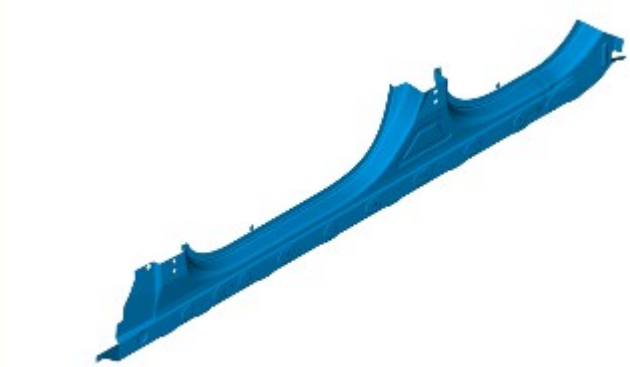
Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The rocker panel is a category A repair.

2. NOTE: The rocker panel is manufactured from aluminium alloy 6111-T4.

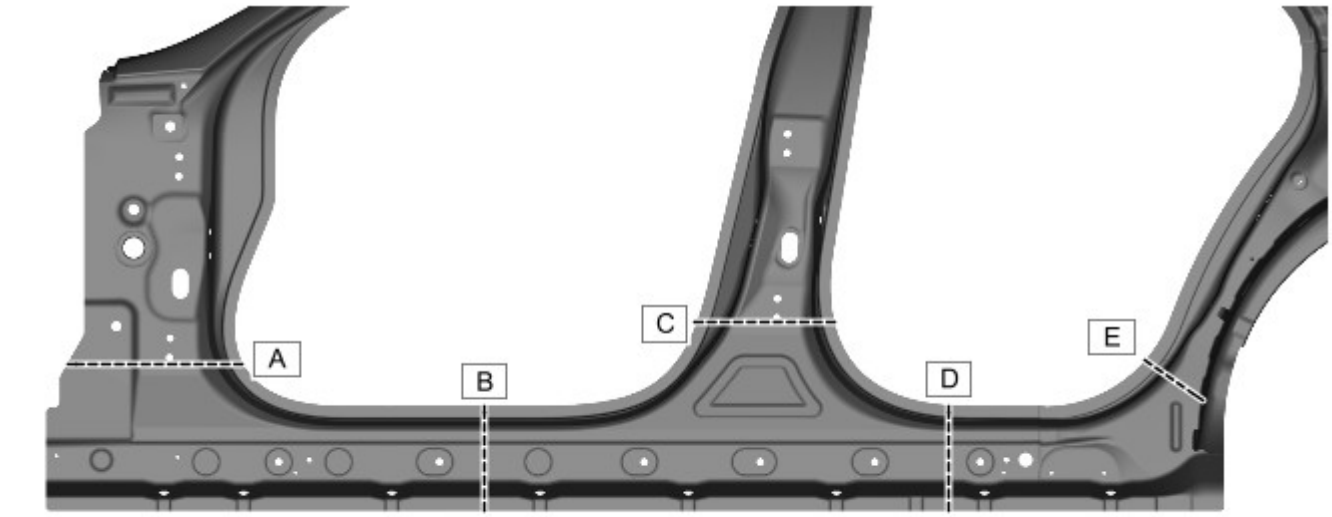
   The rocker panel is serviced as a separate riveted and bonded panel.



E133715

3. This procedure identifies the method for the replacement of the rocker panel in full. The following graphic and table identify possible alternative sections of the rocker panel that can be performed dependant on the extent of damage to the vehicle, and/or the replacement of associated panels. Where an alternative section is selected, some steps within this procedure may not be necessary.

Panel sections available	Cut locations
Rocker panel (full panel)	A + C + E
Rocker panel front section	A + C + D
Rocker panel rear section	B + C + E
Rocker panel dogleg section	D + E



E133717

4. The rocker panel is replaced in conjunction with:
- Front bumper cover
- Front fender
- Front door
- Rear door
- Quarter panel
- Rear bumper cover
- Rear bumper
- Luggage compartment lid
- Luggage compartment lid hinge
- Rear window glass

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) / Body Repairs (501-25A Body Repairs - General Information,

Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Disconnect the generator electrical connectors.

8. Remove the quarter panel.
For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

9. Remove the front fender.
For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

10. Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

11. Remove the front wheel and tire.
For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

12. Remove the A-Pillar trim panel.
For additional information, refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

13. Remove the B-Pillar lower trim panel.
For additional information, refer to: B-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Release the floor covering and position it to one side.

15. Remove the B-Pillar upper trim panel.
For additional information, refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

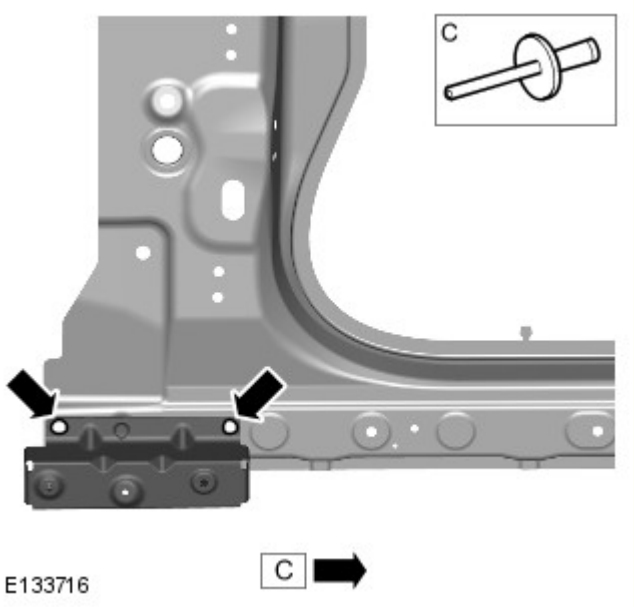
16. Remove the front safety belt retractor.
For additional information, refer to: Front Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

17. Remove the C-Pillar side impact sensor.
For additional information, refer to: C-Pillar Side Impact Sensor (501-20B Supplemental Restraint System, Removal and Installation).

18. Release the rocker panel wiring harness and position it to one side.

19. Remove any remaining miscellaneous components from the repair area as necessary.

20.



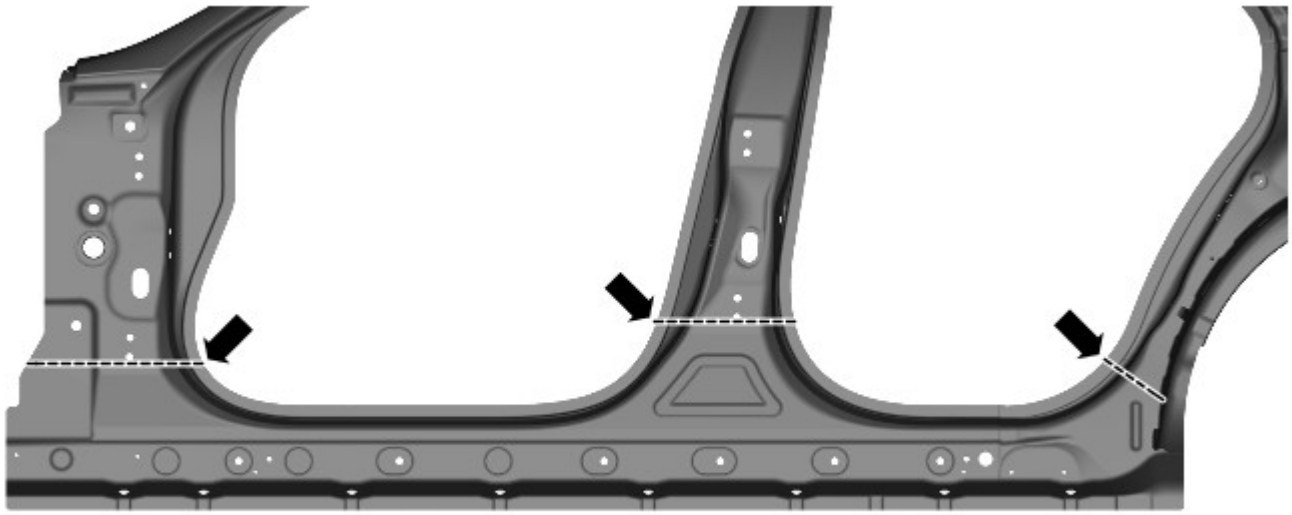
NOTE: If the front fender lower mounting bracket is undamaged, retain for re-use on installation.

Remove the monobolts as indicated.

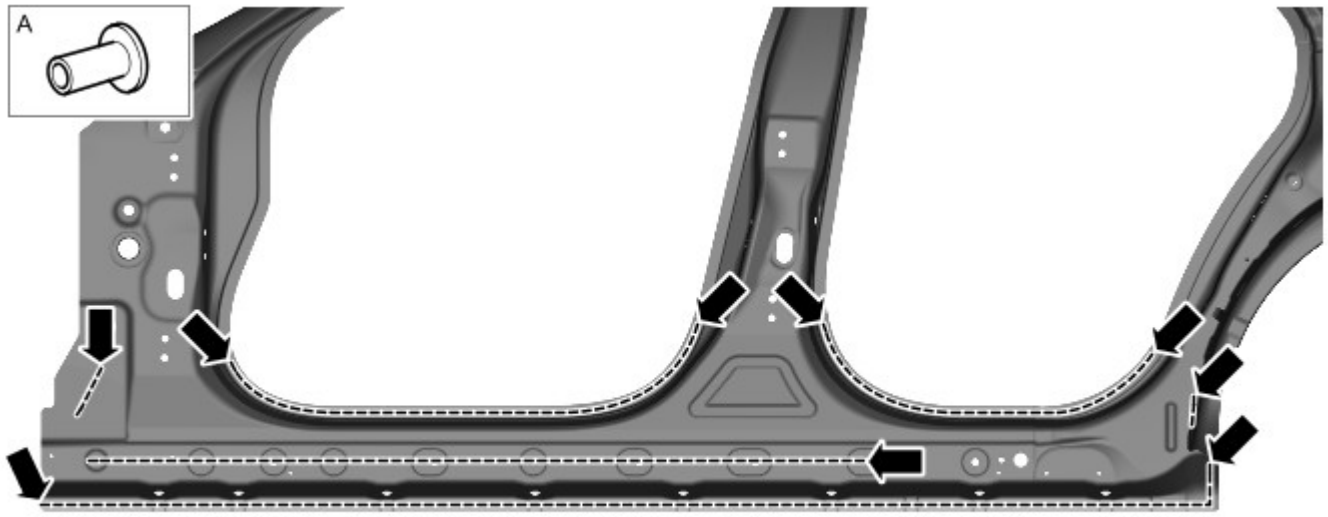
21. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Using the new panel for reference, mark and cut the old panel in the areas as indicated.



22. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets in the areas indicated.



23. NOTE: Retain the old panel remnant as it will be used in installation.

Separate the joints and remove the old panel, also releasing the noise, vibration and harshness (NVH) components.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.

4. Using the old panel for reference, trim the excess from the new panel to allow for an overlap in the areas of the MIG butt joints

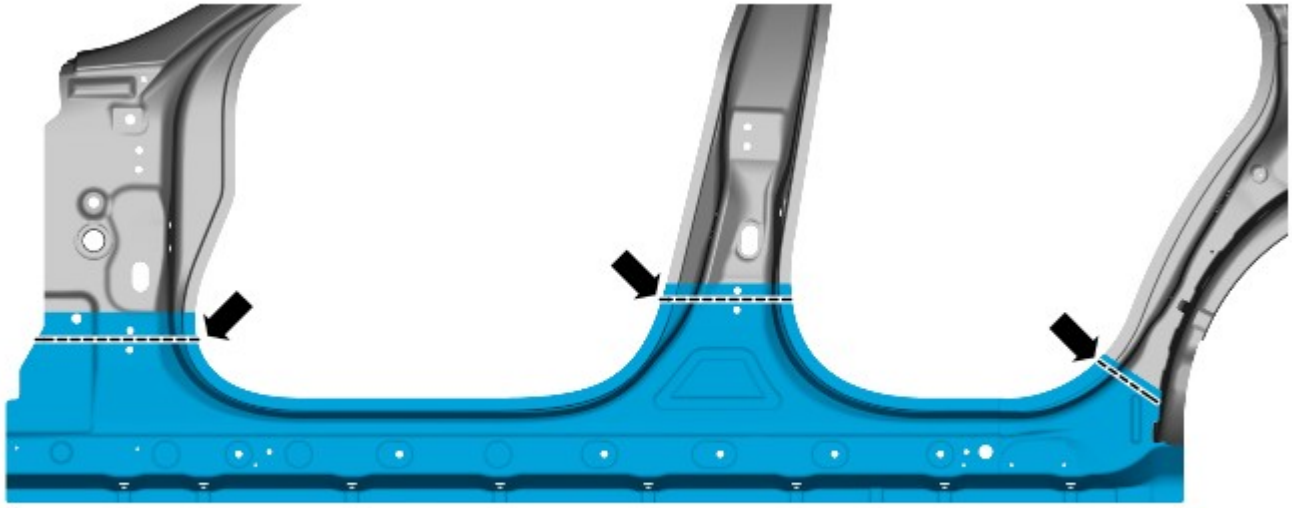
5. Debur the new panel.

6. Trim, clean and prepare the NVH components.

7. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

8. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

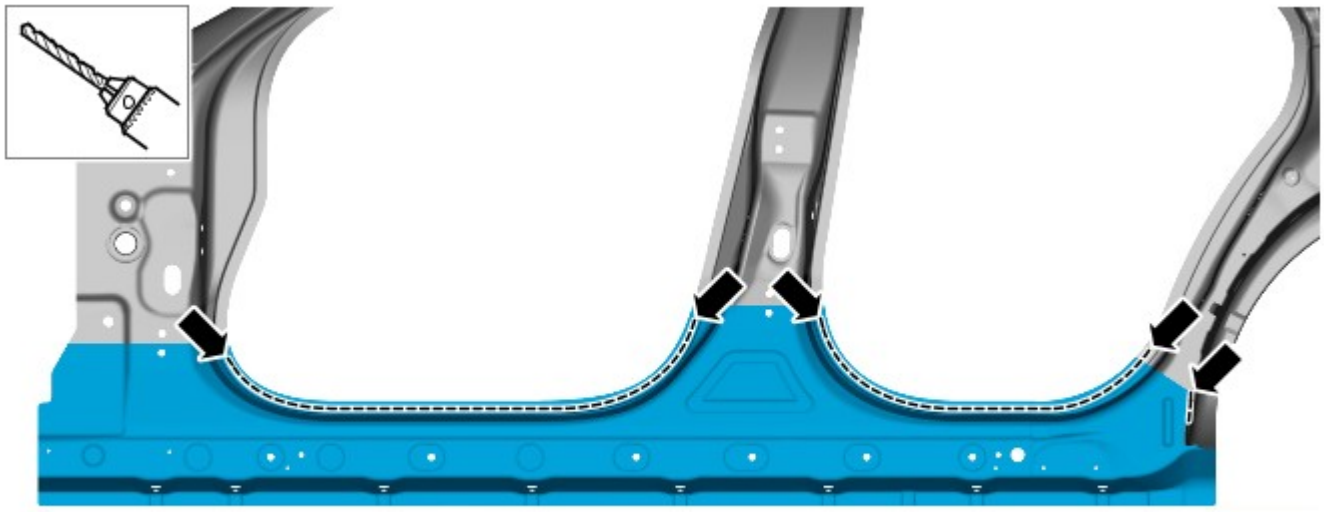
Cut through the new panel and the old panel as indicated.



E133720

9. NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

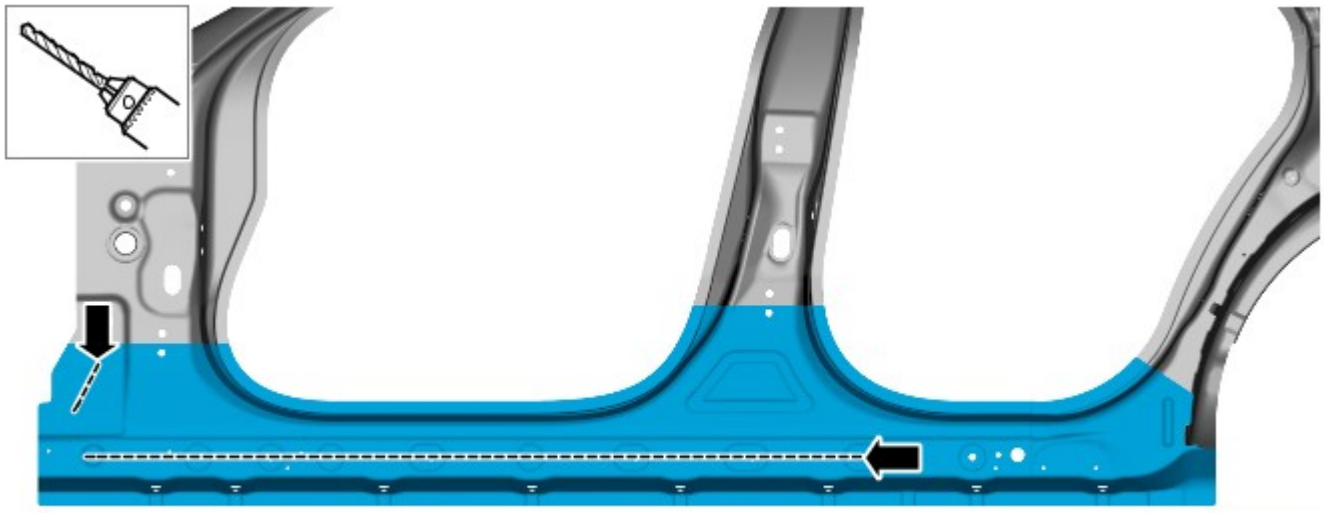
Where the pitch of the removed self piercing rivets is 25mm or less, or there is no access for the ESN50, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the new rocker panel is installed.



E133721

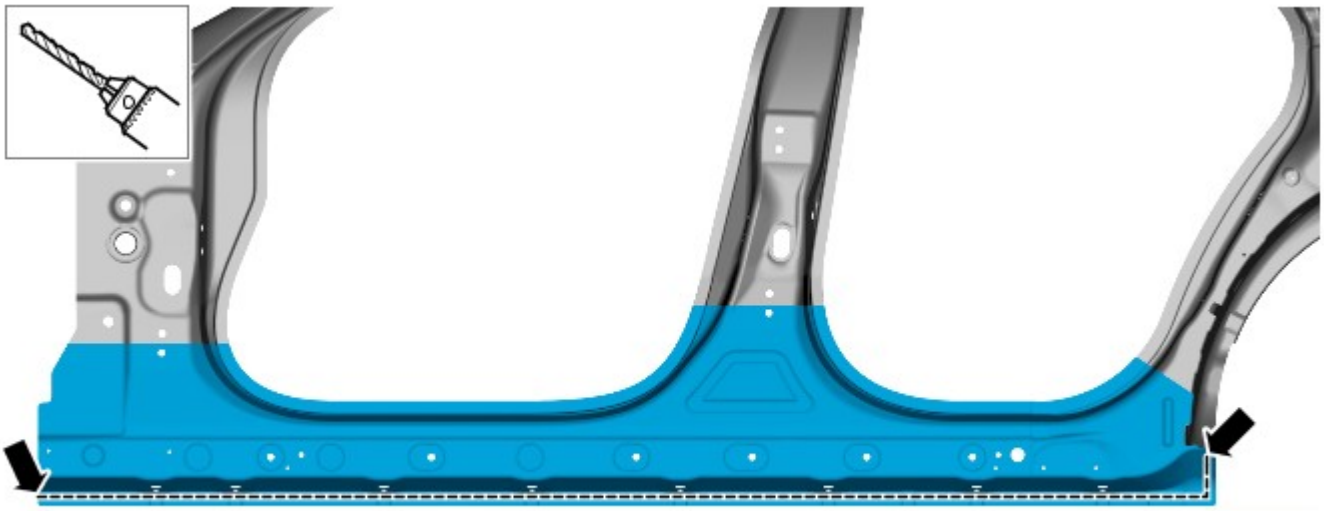
10. NOTE: The Hemloks will be installed adjacent to the original self piercing rivet location holes.

Using the old panel for reference, measure the positions of the removed self piercing rivet locations and mark these onto the new panel. Using a 6.5mm Cryobit drill bit, drill holes adjacent to these locations at the points where Hemloks are to be installed as indicated.



E133722

11. Using a 6.5mm Cryobit drill bit, drill through the removed self piercing rivet holes of the old panel, into the new panel, at the points where Hemloks are to be installed as indicated.



E133723

12. Remove the new panel

13. Remove the old panel remnants and any remaining self piercing rivets.

14. NOTE: The backing plates should be an interference fit.

Fabricate backing plates from the old rocker panel remnant. Debur and offer up the backing plates to the rocker panel. If correct proceed to next step, if not, rectify and recheck before proceeding.

15. Remove the backing plates.

16. Fabricate run-on/run-off tabs from the old rocker panel remnant.

17. Debur the run-on/run-off tabs.

18. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

19. Using a Roloc fine bristle disc, clean and prepare the old and new panel joint surfaces.

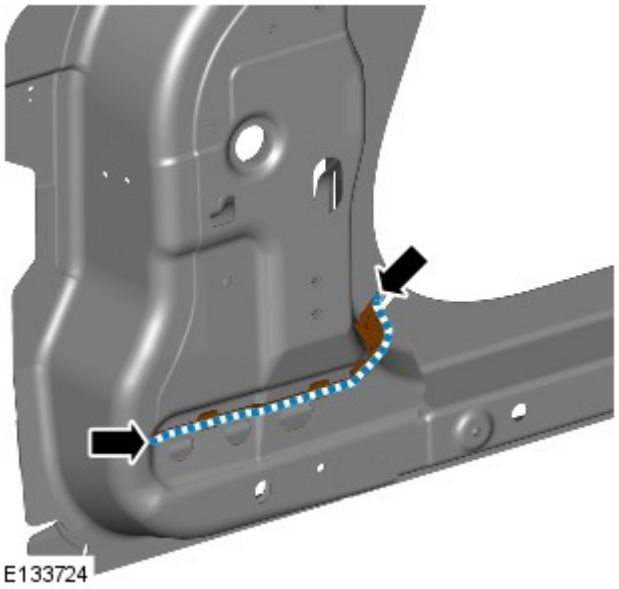
20. NOTE: The backing plates are installed with an interference fit.

Install and align the backing plates to the vehicle.

21. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

22. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

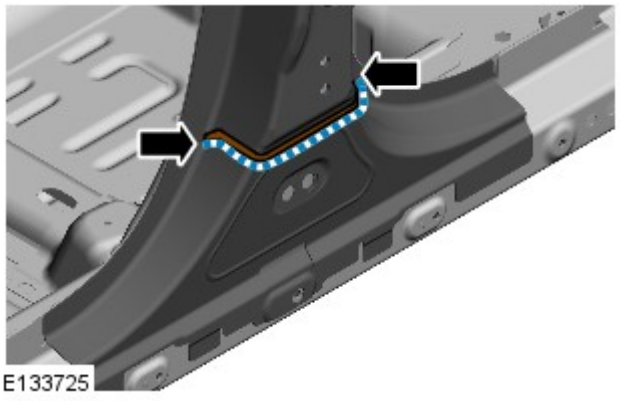
Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.



E133724

23. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the A-pillar reinforcement as indicated.

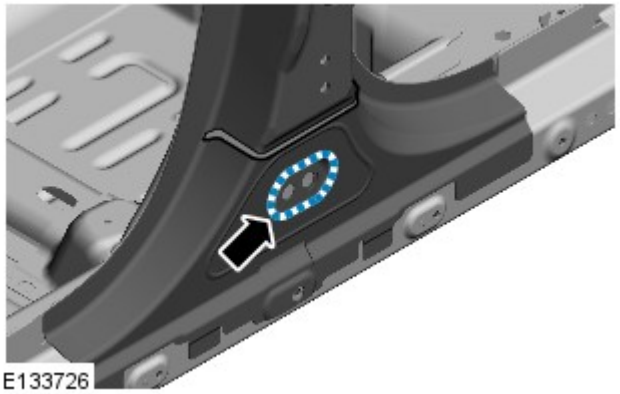


E133725

24. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the B-pillar reinforcement as indicated.

25.



E133726

NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the B-pillar reinforcement as indicated.

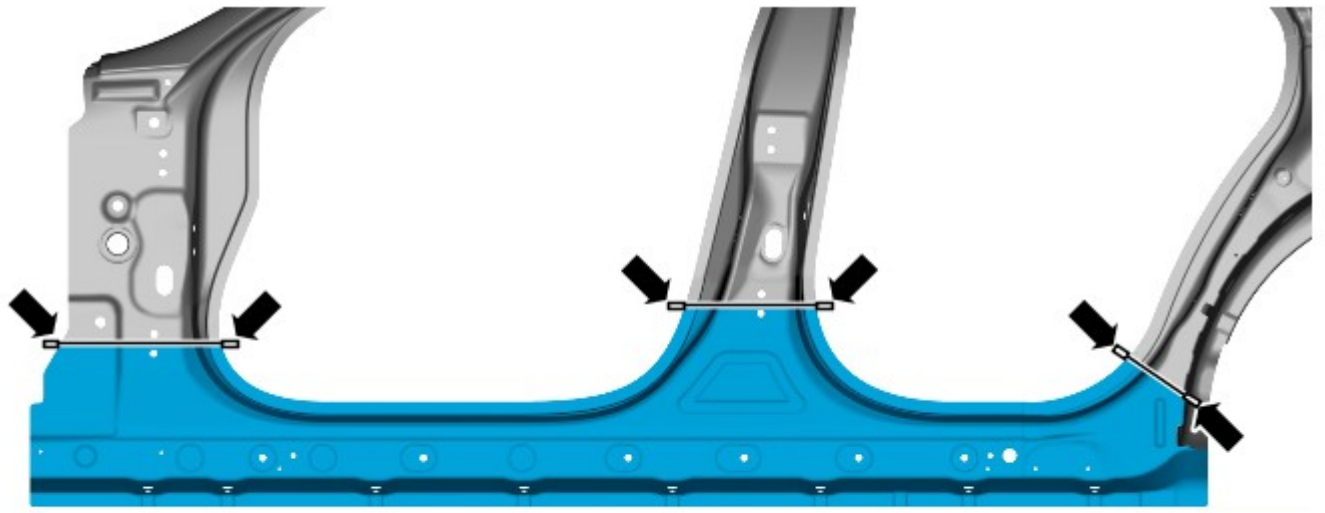
26. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

27. Offer up the new panel, align and clamp into position.

28. Tack weld the run-on/run-off tabs to all MIG butt joints.

29. MIG weld the MIG butt joints.

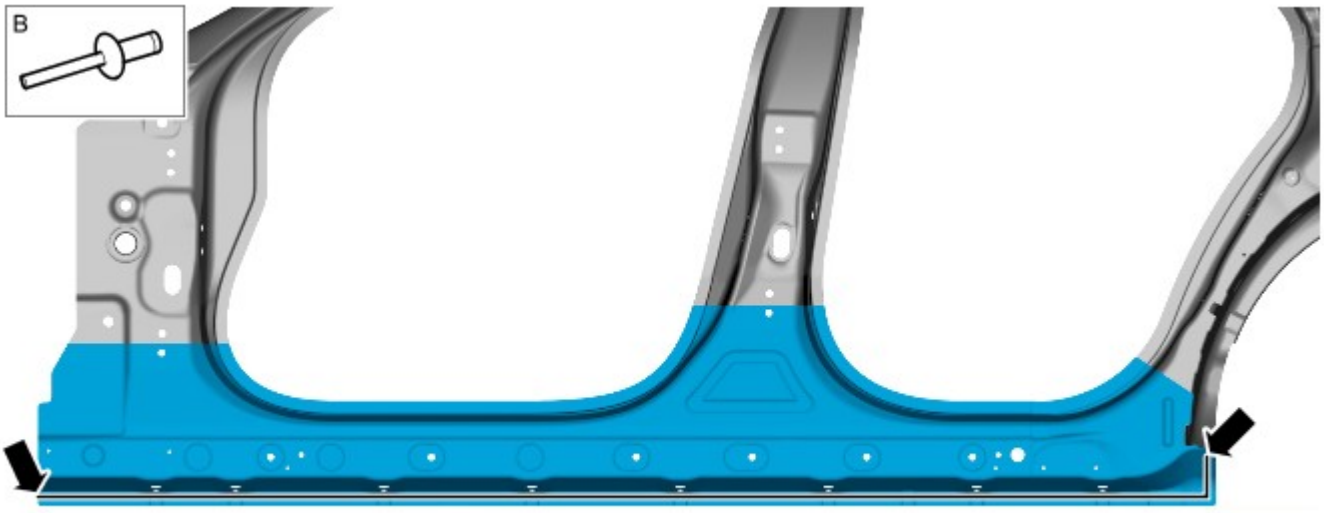


E133727

30. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

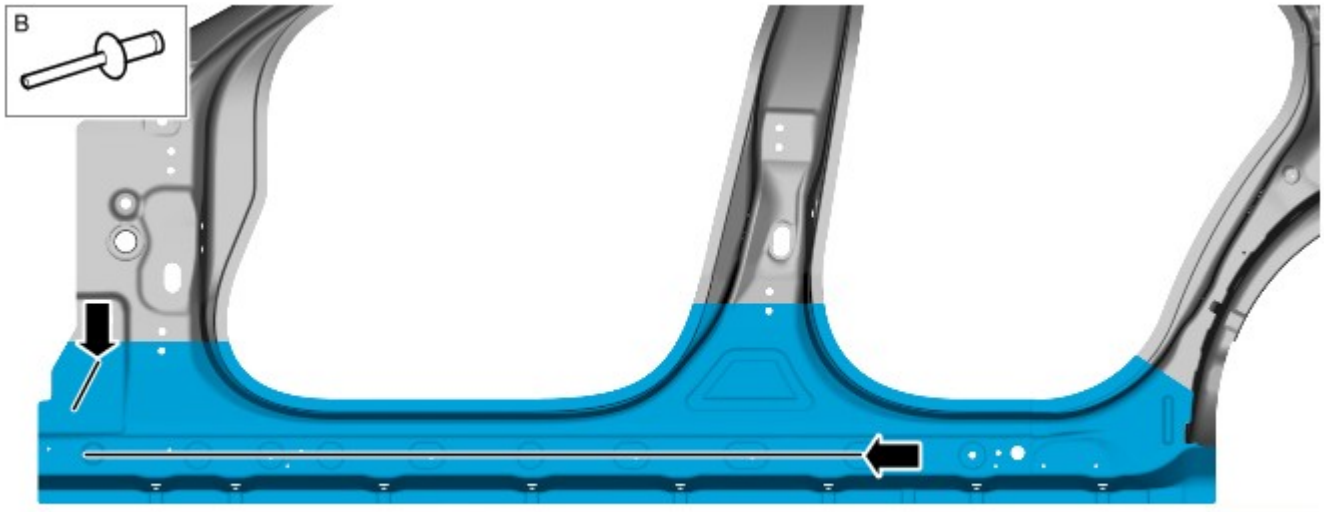


E133836

31. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



E133728

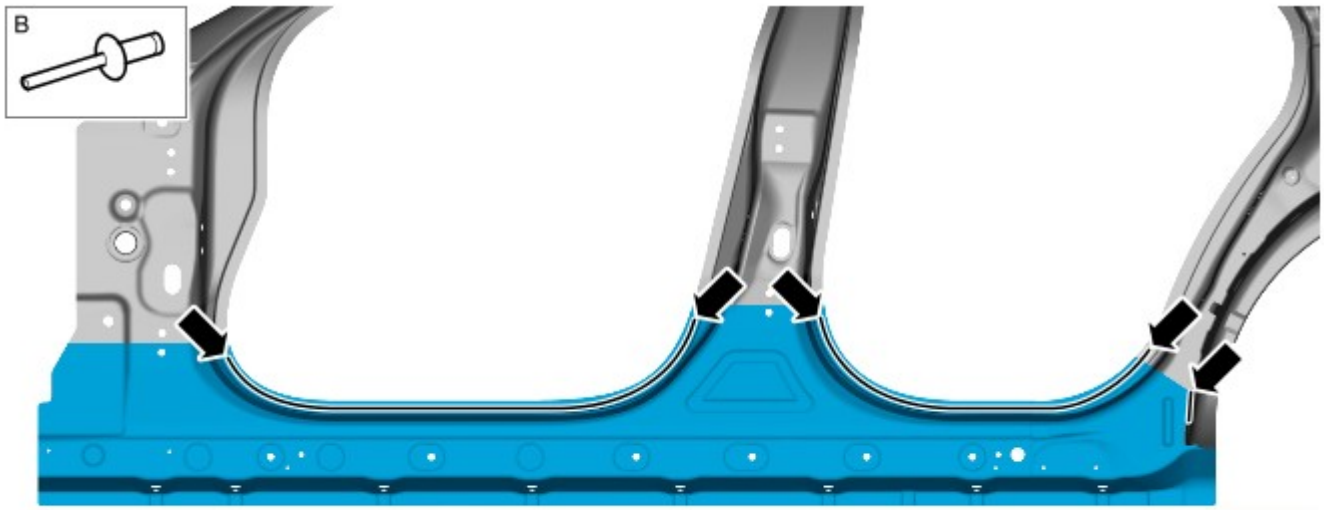
32. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



E133729

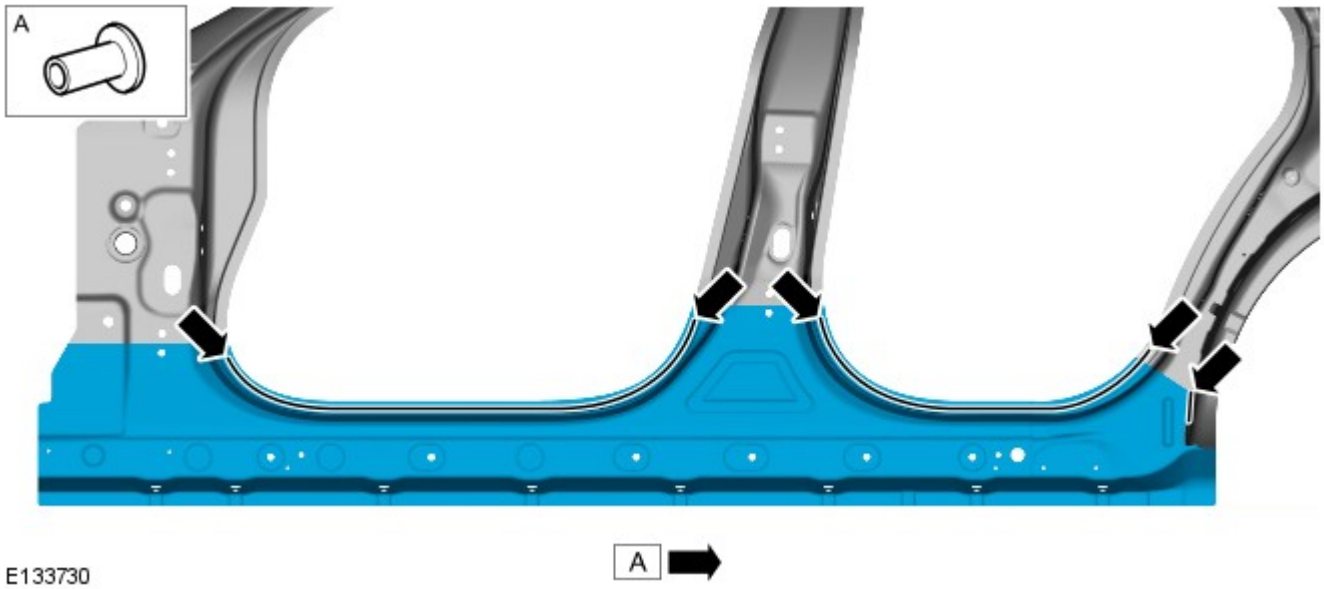
33. NOTES:

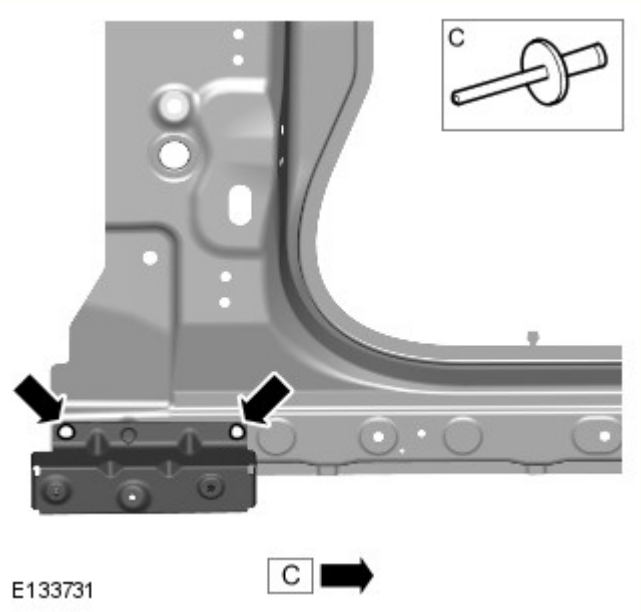
Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595





34. Using the Genesis G4, install the Monobolts to the front fender lower mounting bracket as indicated.

35. Remove any excess adhesive.

36. Remove the run-on/run-off tabs.

37. Dress the welded joints.

38. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

39. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

40. The installation of associated panels and components is the reversal of removal procedure.

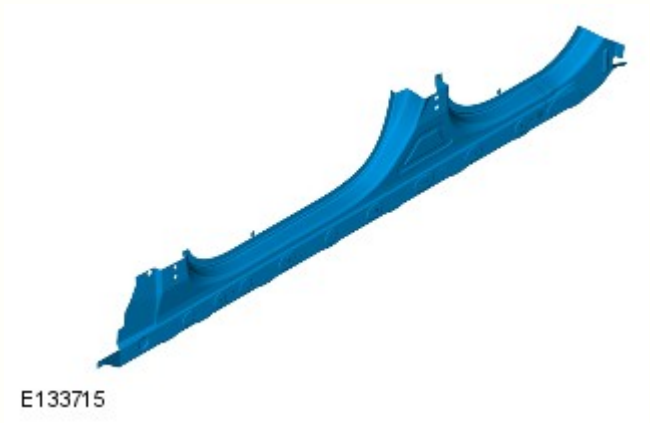
Side Panel Sheet Metal Repairs - Rocker Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being replaced in isolation, or, is being replaced in combination with panels other than those listed.

1. The rocker panel is a category A repair.

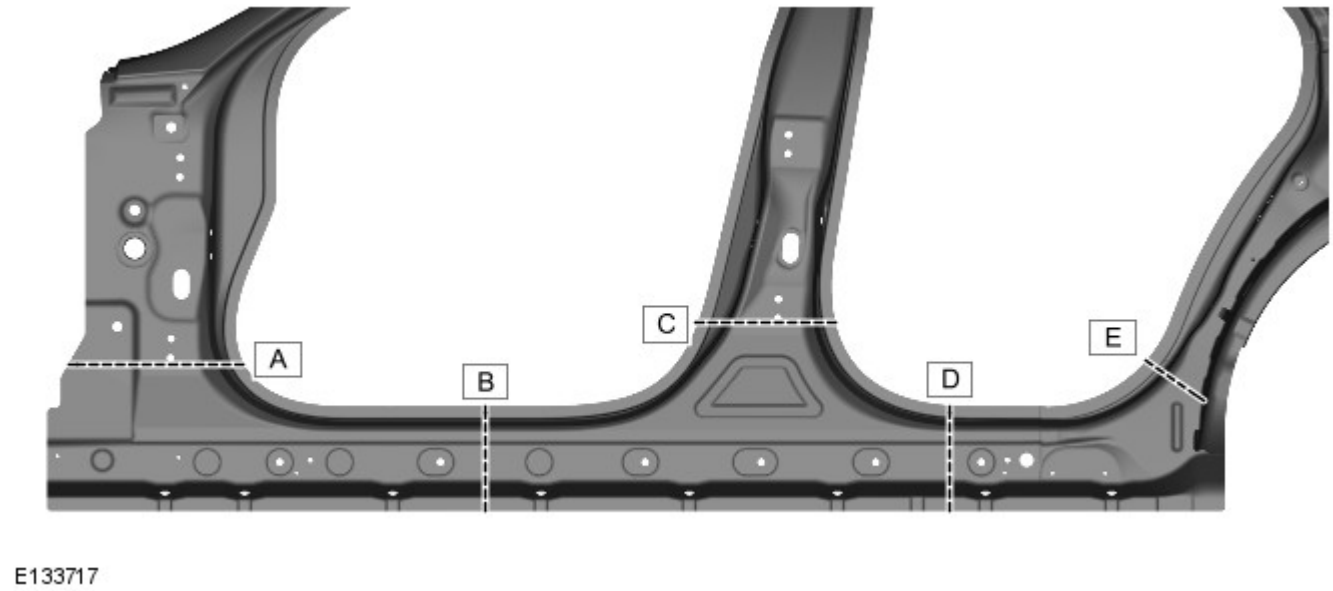


2. NOTE: The rocker panel is manufactured from aluminium alloy 6111-T4.

The rocker panel is serviced as a separate riveted and bonded panel.

3. This procedure identifies the method for the replacement of the rocker panel in full. The following graphic and table identify possible alternative sections of the rocker panel that can be performed dependant on the extent of damage to the vehicle, and/or the replacement of associated panels. Where an alternative section is selected, some steps within this procedure may not be necessary.

Panel sections available	Cut locations
Rocker panel (full panel)	A + C + E
Rocker panel front section	A + C + D
Rocker panel rear section	B + C + E
Rocker panel dogleg section	D + E



4. The rocker panel is replaced in conjunction with:
   - Front bumper cover
   - Front fender

- Front door
- Rear door
- Quarter panel
- Rear bumper cover
- Rear bumper
- Luggage compartment lid
- Luggage compartment lid hinge
- Rear window glass

5. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. Disconnect the generator electrical connectors.

8. Remove the quarter panel.
For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

9. Remove the front fender.
For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).

10. Remove the front seat.
For additional information, refer to: Front Seat (501-10 Seating, Removal and Installation).

11. Remove the front wheel and tire.
For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

12. Remove the A-Pillar trim panel.
For additional information, refer to: A-Pillar Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

13. Remove the B-Pillar lower trim panel.
For additional information, refer to: B-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Release the floor covering and position it to one side.

15. Remove the B-Pillar upper trim panel.
For additional information, refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

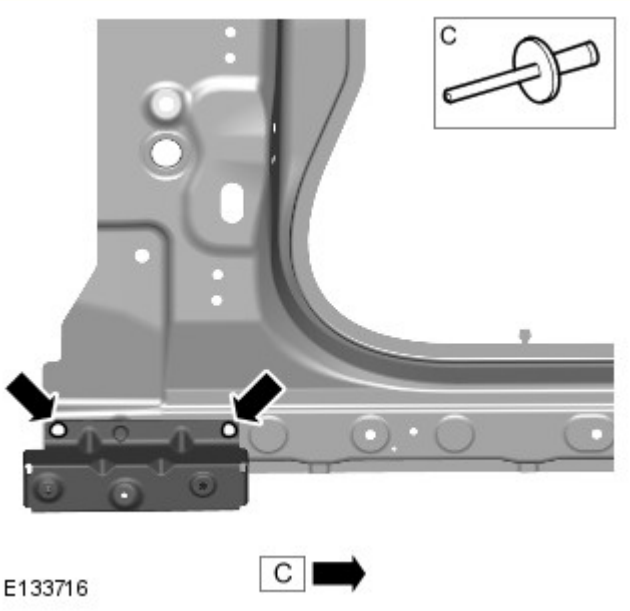
16. Remove the front safety belt retractor.
For additional information, refer to: Front Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

17.

Remove the C-Pillar side impact sensor.
For additional information, refer to: C-Pillar Side Impact Sensor (501-20B Supplemental Restraint System, Removal and Installation).

18. Release the rocker panel wiring harness and position it to one side.

19. Remove any remaining miscellaneous components from the repair area as necessary.



E133716

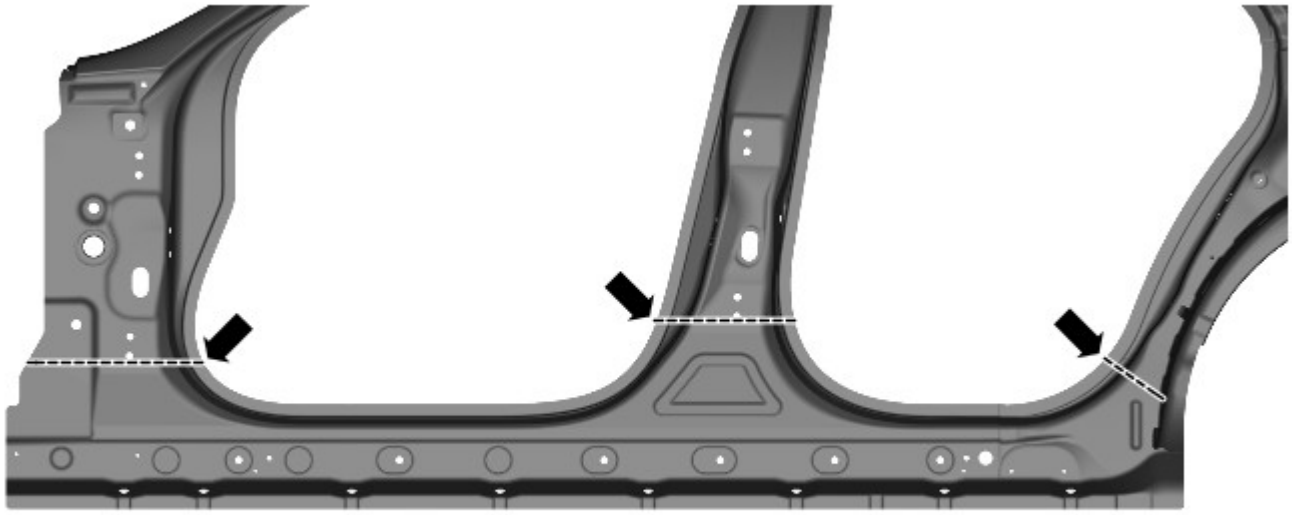
20. NOTE: If the front fender lower mounting bracket is undamaged, retain for re-use on installation.

Remove the monobolts as indicated.

21. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

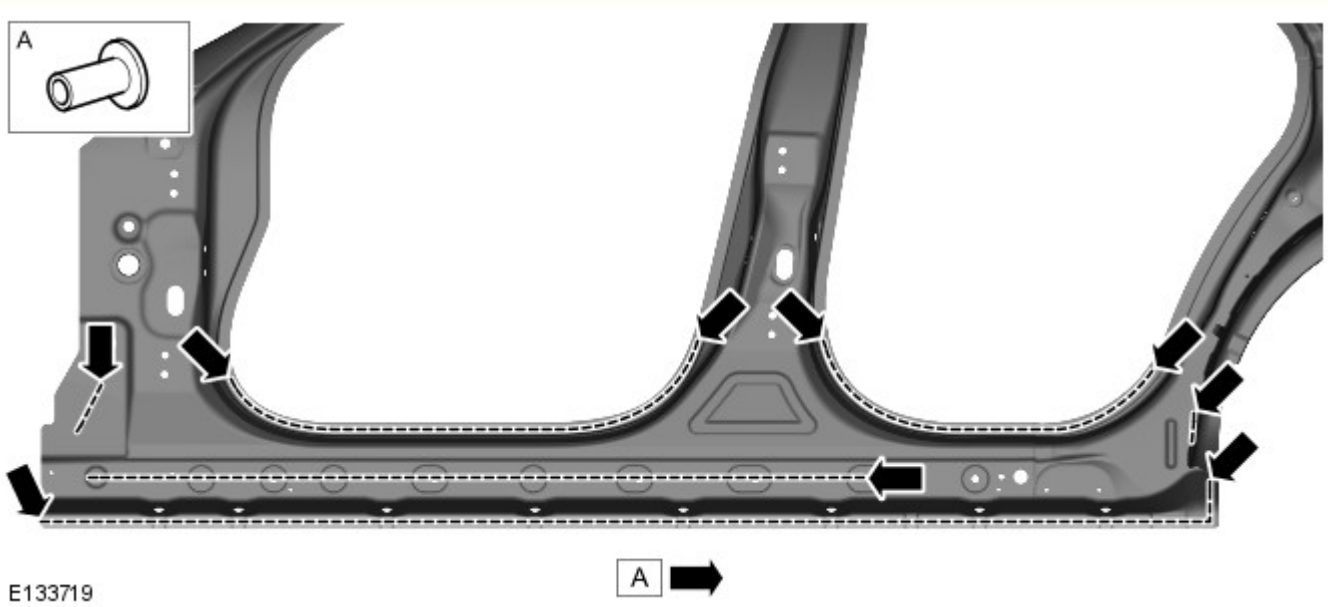
NOTE: If necessary, cut locations can be adjusted to avoid self piercing rivets.

Using the new panel for reference, mark and cut the old panel in the areas as indicated.



E133718

22. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets in the areas indicated.



23. NOTE: Retain the old panel remnant as it will be used in installation.

Separate the joints and remove the old panel, also releasing the noise, vibration and harshness (NVH) components.

Installation

1. Remove rivet remnants.

2. Dress flanges where necessary.

3. Using a Roloc fine bristle disc, clean and prepare the panel surfaces, also removing any adhesive residue.

4. Using the old panel for reference, trim the excess from the new panel to allow for an overlap in the areas of the MIG butt joints

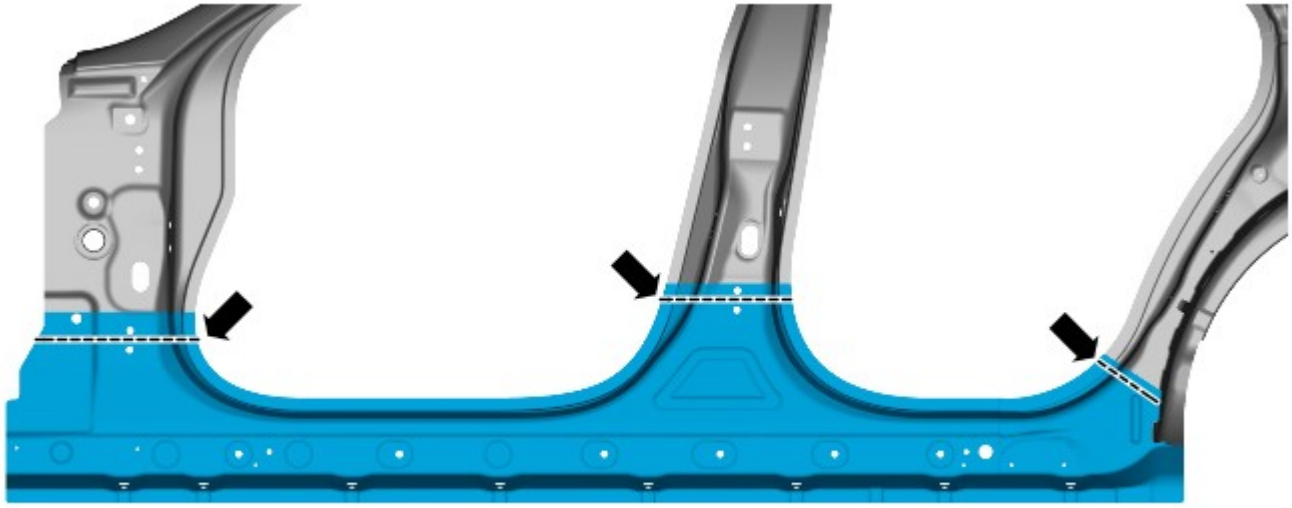
5. Debur the new panel.

6. Trim, clean and prepare the NVH components.

7. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

8. CAUTION: Care should be taken not to cut through into inner panels or reinforcements.

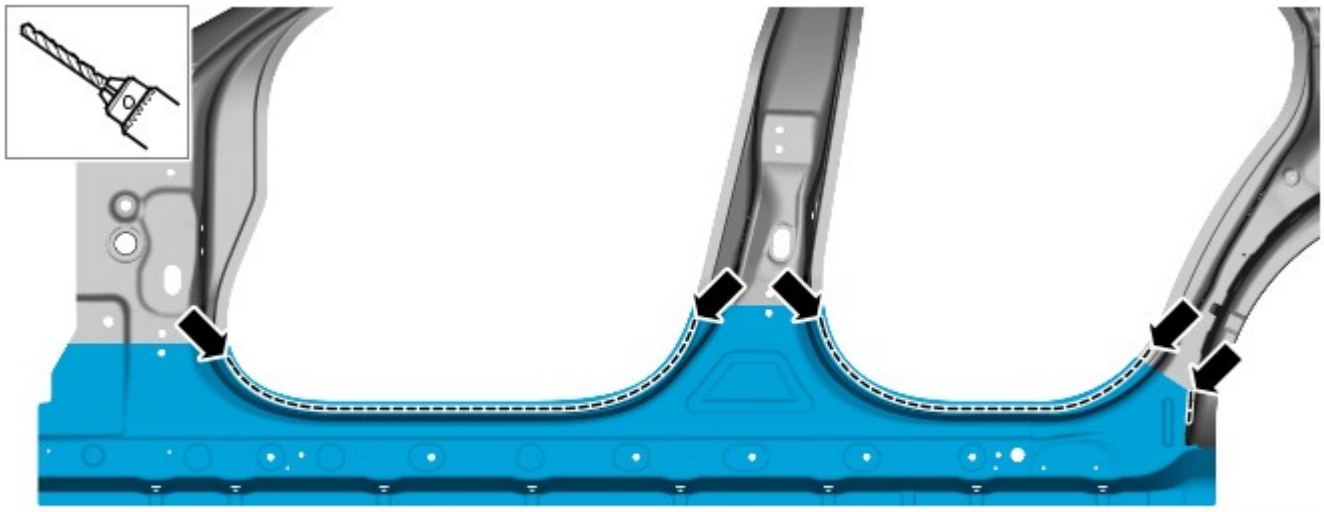
Cut through the new panel and the old panel as indicated.



E133720

9. NOTE: Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

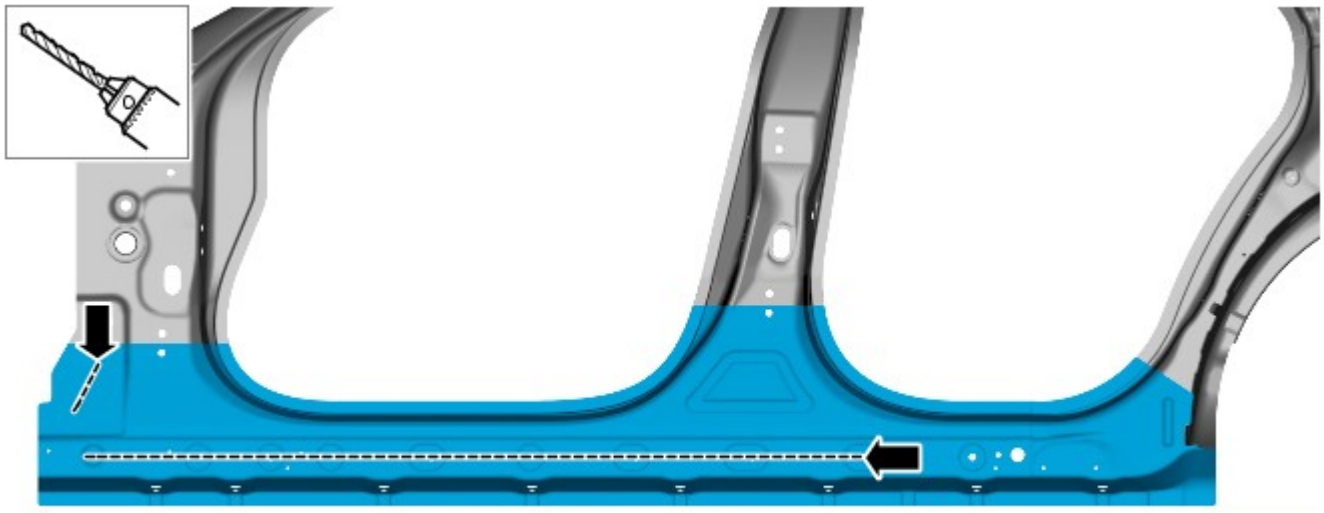
Where the pitch of the removed self piercing rivets is 25mm or less, or there is no access for the ESN50, use a 6.5mm Cryobit drill bit to drill through the removed self piercing rivet holes of the old panel, into the new panel. Hemloks will be installed in these locations when the new rocker panel is installed.



E133721

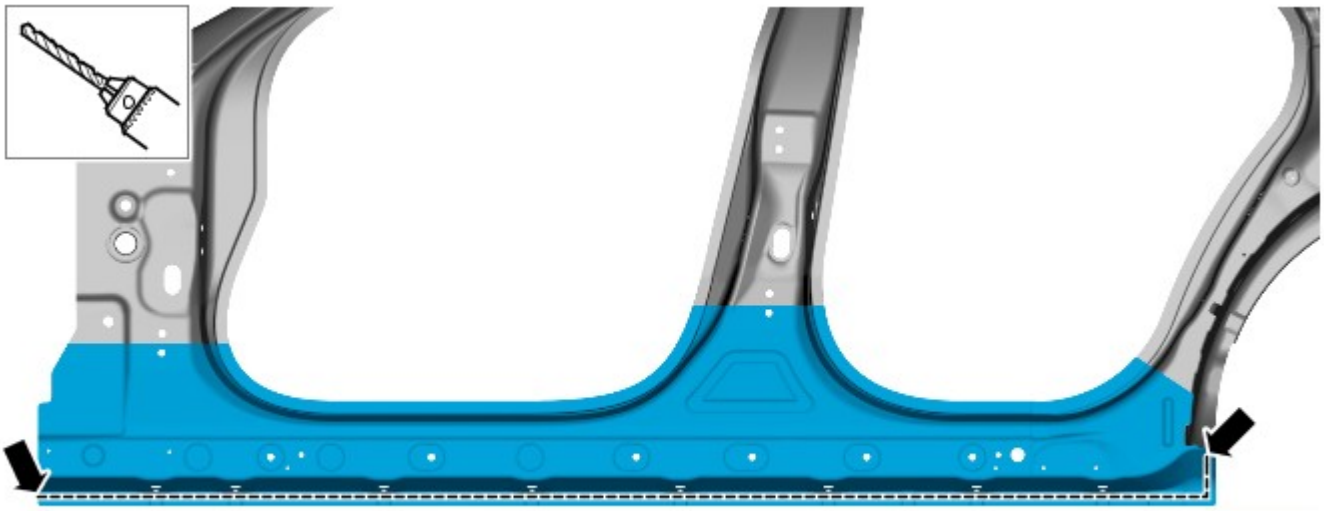
10. NOTE: The Hemloks will be installed adjacent to the original self piercing rivet location holes.

Using the old panel for reference, measure the positions of the removed self piercing rivet locations and mark these onto the new panel. Using a 6.5mm Cryobit drill bit, drill holes adjacent to these locations at the points where Hemloks are to be installed as indicated.



E133722

11. Using a 6.5mm Cryobit drill bit, drill through the removed self piercing rivet holes of the old panel, into the new panel, at the points where Hemloks are to be installed as indicated.



E133723

12. Remove the new panel

13. Remove the old panel remnants and any remaining self piercing rivets.

14. NOTE: The backing plates should be an interference fit.

Fabricate backing plates from the old rocker panel remnant. Debur and offer up the backing plates to the rocker panel. If correct proceed to next step, if not, rectify and recheck before proceeding.

15. Remove the backing plates.

16. Fabricate run-on/run-off tabs from the old rocker panel remnant.

17. Debur the run-on/run-off tabs.

18. Using a Roloc fine bristle disc, clean and prepare the backing plates and run on/run off tabs.

19. Using a Roloc fine bristle disc, clean and prepare the old and new panel joint surfaces.

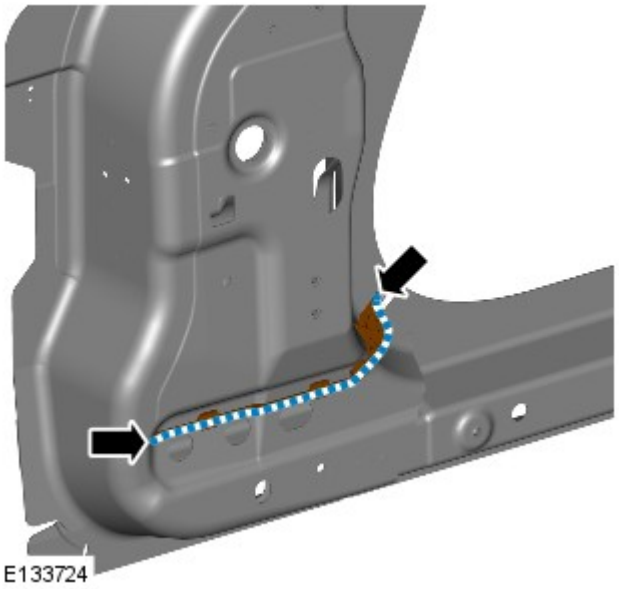
20. NOTE: The backing plates are installed with an interference fit.

Install and align the backing plates to the vehicle.

21. Pyrosil the joints at the points where 3M 8115 adhesive is to be applied.

22. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

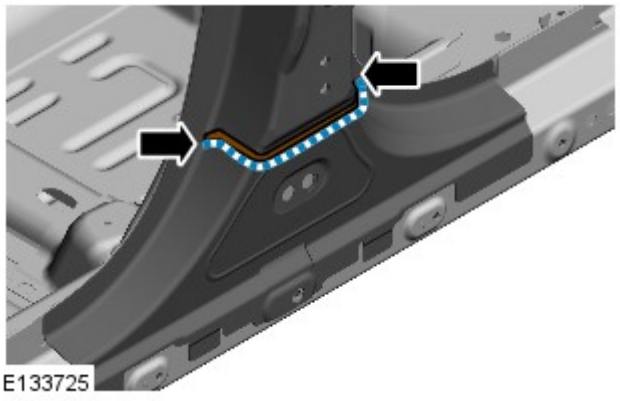
Apply the coupling agent where 3M 8115 adhesive is to be applied and allow to dry.



E133724

23. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the A-pillar reinforcement as indicated.

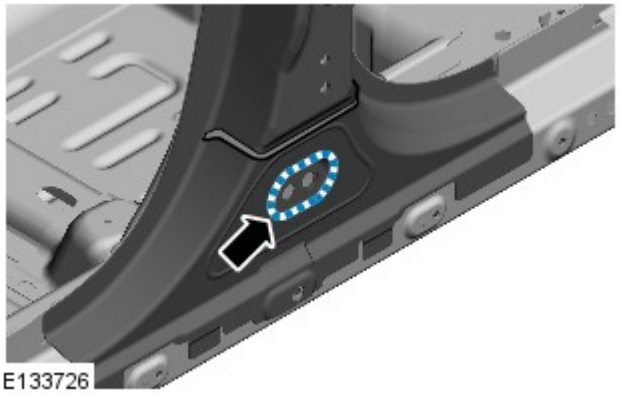


E133725

24. NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the B-pillar reinforcement as indicated.

25.



E133726

NOTE: Do not apply semi-rigid sealer in the areas where 3M 8115 adhesive is to be applied.

Apply semi-rigid sealer to the NVH component on the B-pillar reinforcement as indicated.

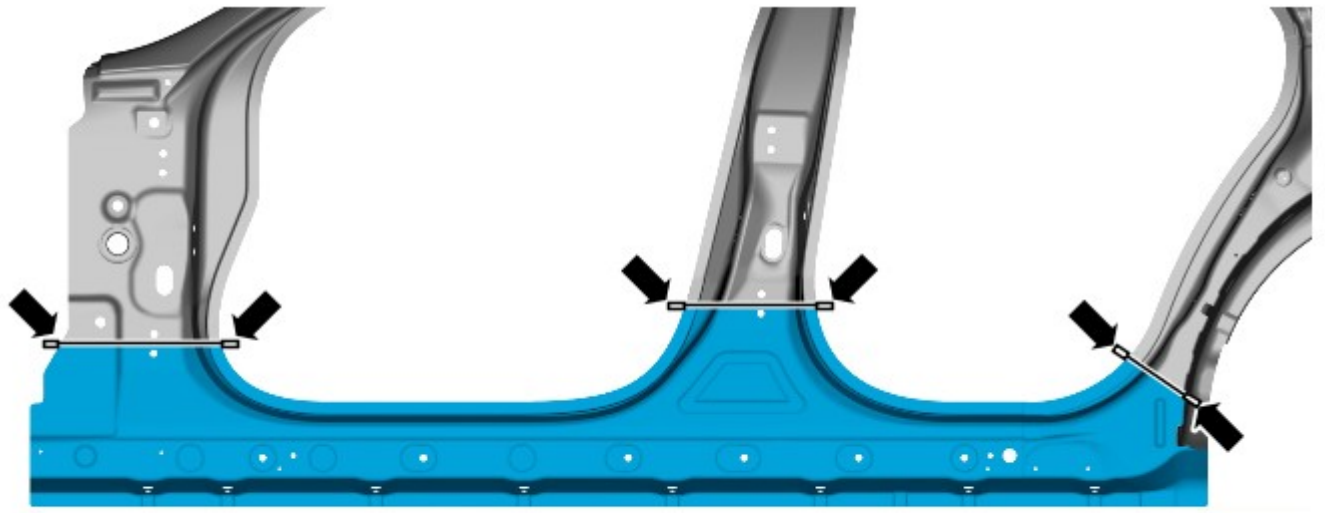
26. NOTE: Make sure a continuous bead of adhesive surrounds fixing holes. Do not apply adhesive in the vicinity of the MIG welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to all joints.

27. Offer up the new panel, align and clamp into position.

28. Tack weld the run-on/run-off tabs to all MIG butt joints.

29. MIG weld the MIG butt joints.

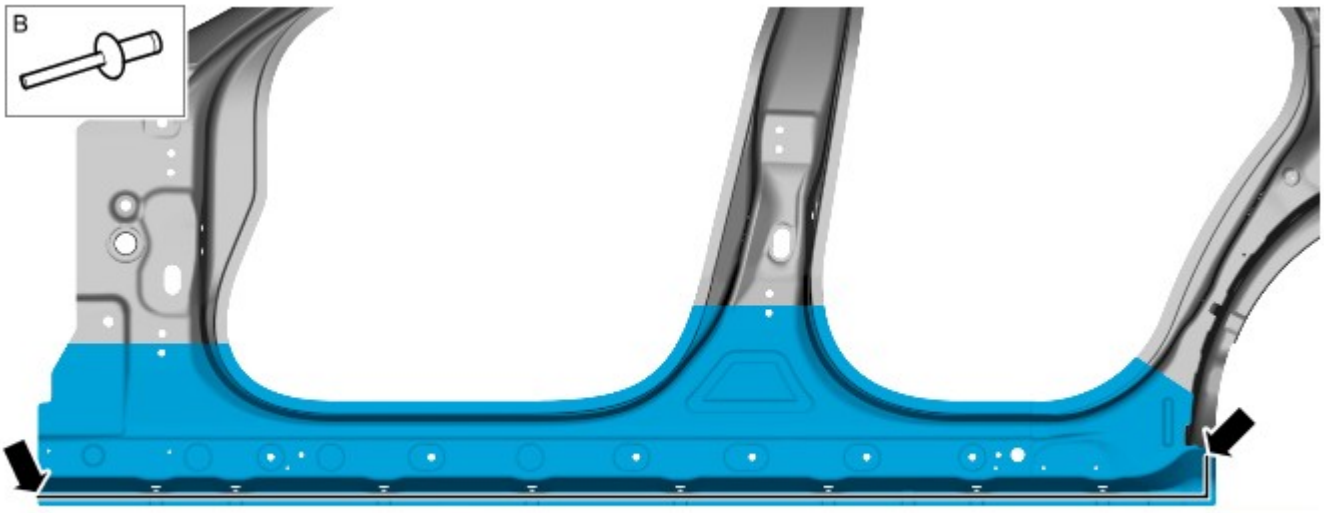


E133727

30. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008

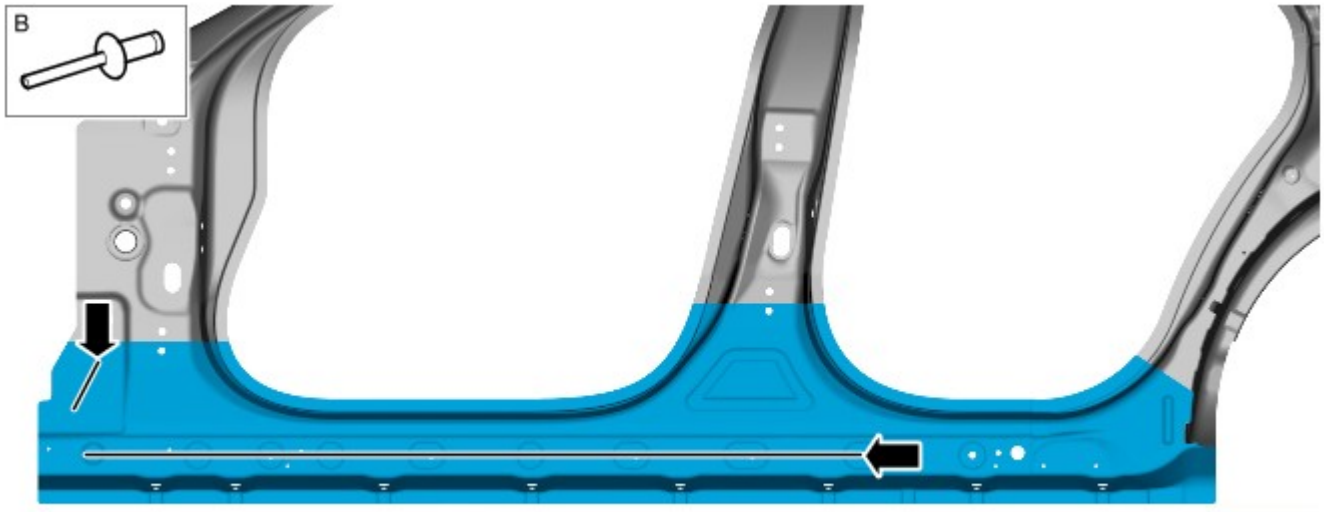


E133836

31. NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



E133728

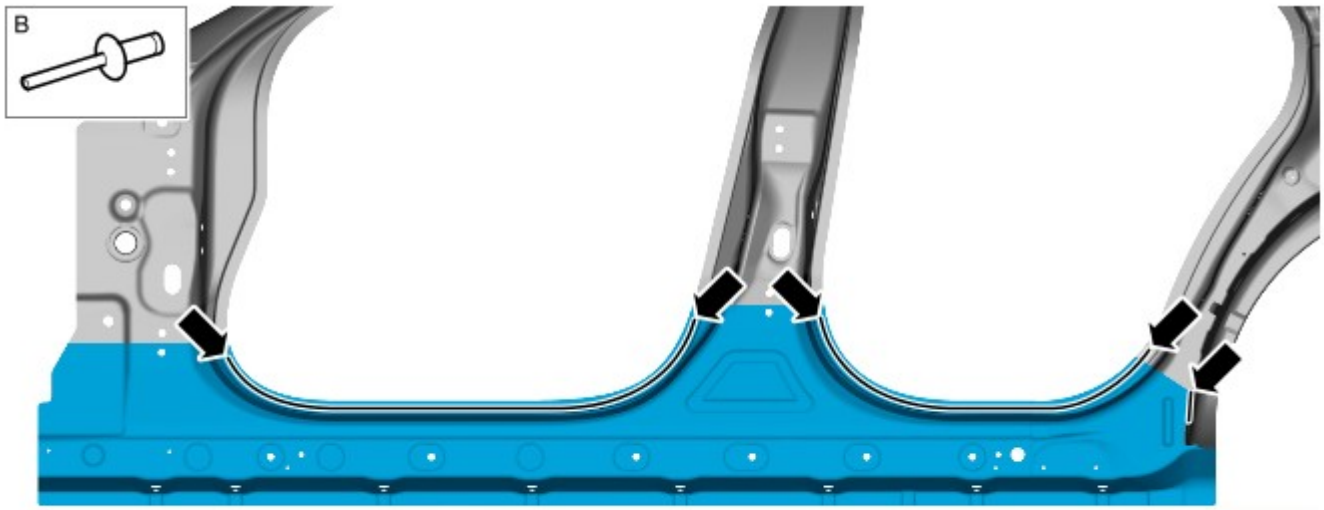
32. NOTES:

Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the Genesis G4, install the Hemloks in the areas as indicated.

Hemlok Rivet Size	Material Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.0mm	C2S 45252
6.4mm x 15.0mm	2.8mm - 4.8mm	C2C 36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C 36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C 36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C 22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C 36008



E133729

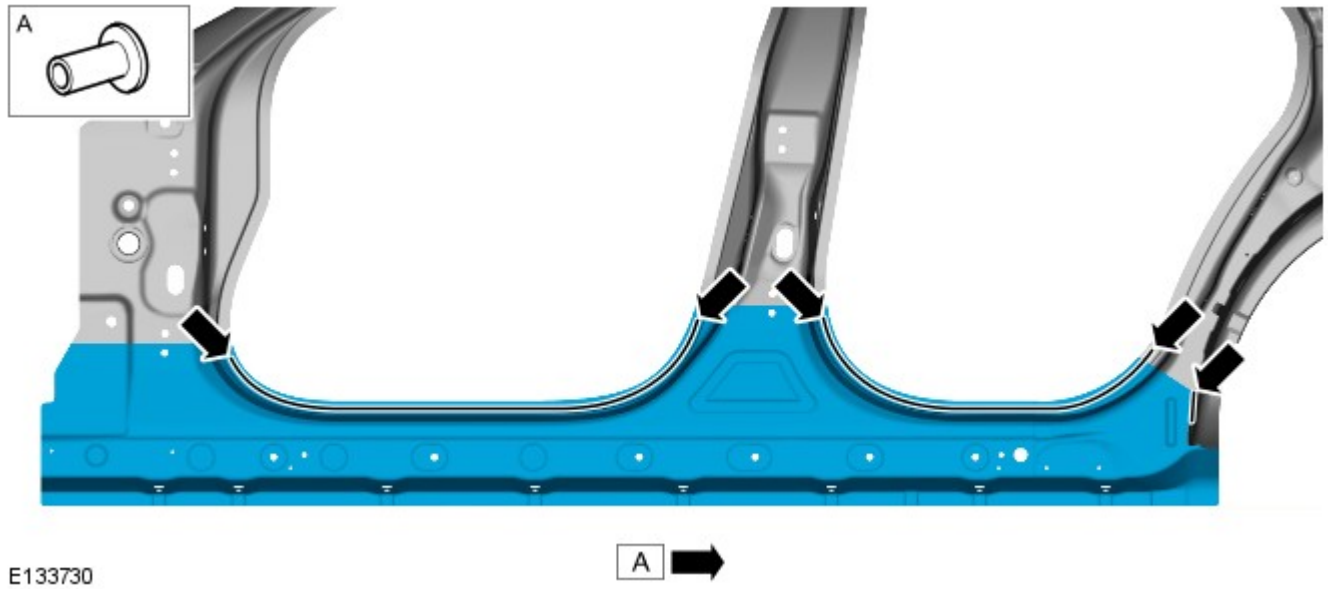
33. NOTES:

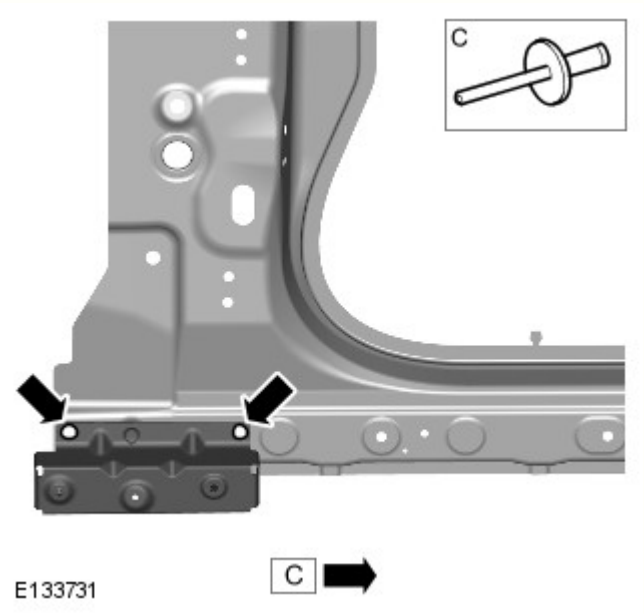
Replacement self piercing rivets should be installed adjacent to the removed originals wherever possible. If the pitch between the centres of removed self piercing rivets is less than 25mm, Hemloks should be installed in the hole created by the removed self piercing rivet(s).

It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Using the ESN50, install the self piercing rivets in the areas as indicated.

Self Piercing Rivet Size	Material Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595





34. Using the Genesis G4, install the Monobolts to the front fender lower mounting bracket as indicated.

35. Remove any excess adhesive.

36. Remove the run-on/run-off tabs.

37. Dress the welded joints.

38. Carry out a non destructive crack inspection on the MIG butt joints. If correct proceed to next step, if not, rectify and recheck before proceeding.

39. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

40. The installation of associated panels and components is the reversal of removal procedure.

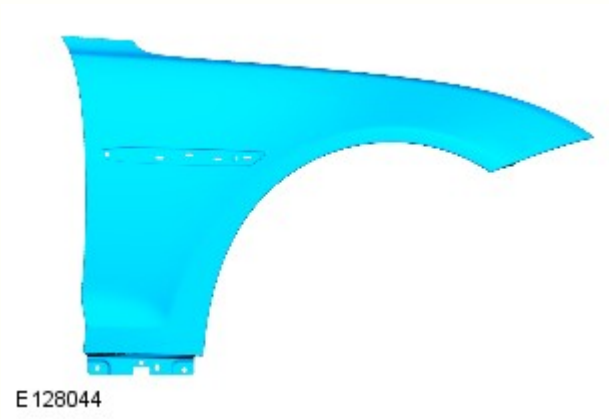
Front End Sheet Metal Repairs - Front Fender

Removal and Installation

Removal



E128044

1. The front fender is a category B repair.

2. NOTE: The front fender is manufactured from aluminium alloy 6111-T4.

   The front fender is serviced as a separate bolt-on panel.

3. The front fender is replaced in conjunction with:
   - Front bumper cover

     NOTE: Removal of the front door allows access to the front fender retaining bolts.

   - Front door

4. WARNING: The front fender and its associated components form part of the pedestrian protection system, it is essential that any repair or replacement operations do not affect the safe working of the system.

   For additional information relating to the pedestrian safety system please see the following:
   For additional information, refer to: Pedestrian Protection System (501-20C Pedestrian Protection System, Description and Operation).

5. For additional information relating to this repair procedure please see the following:
   For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
   Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
   Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
   Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

6. Disconnect the battery ground cable.
   For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

7. If the right-hand front fender is to be repaired, remove the windshield washer reservoir.
   For additional information, refer to: Windshield Washer Reservoir (501-16 Wipers and Washers, Removal and Installation).

8. Remove the headlamp assembly.
   For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation) /

Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

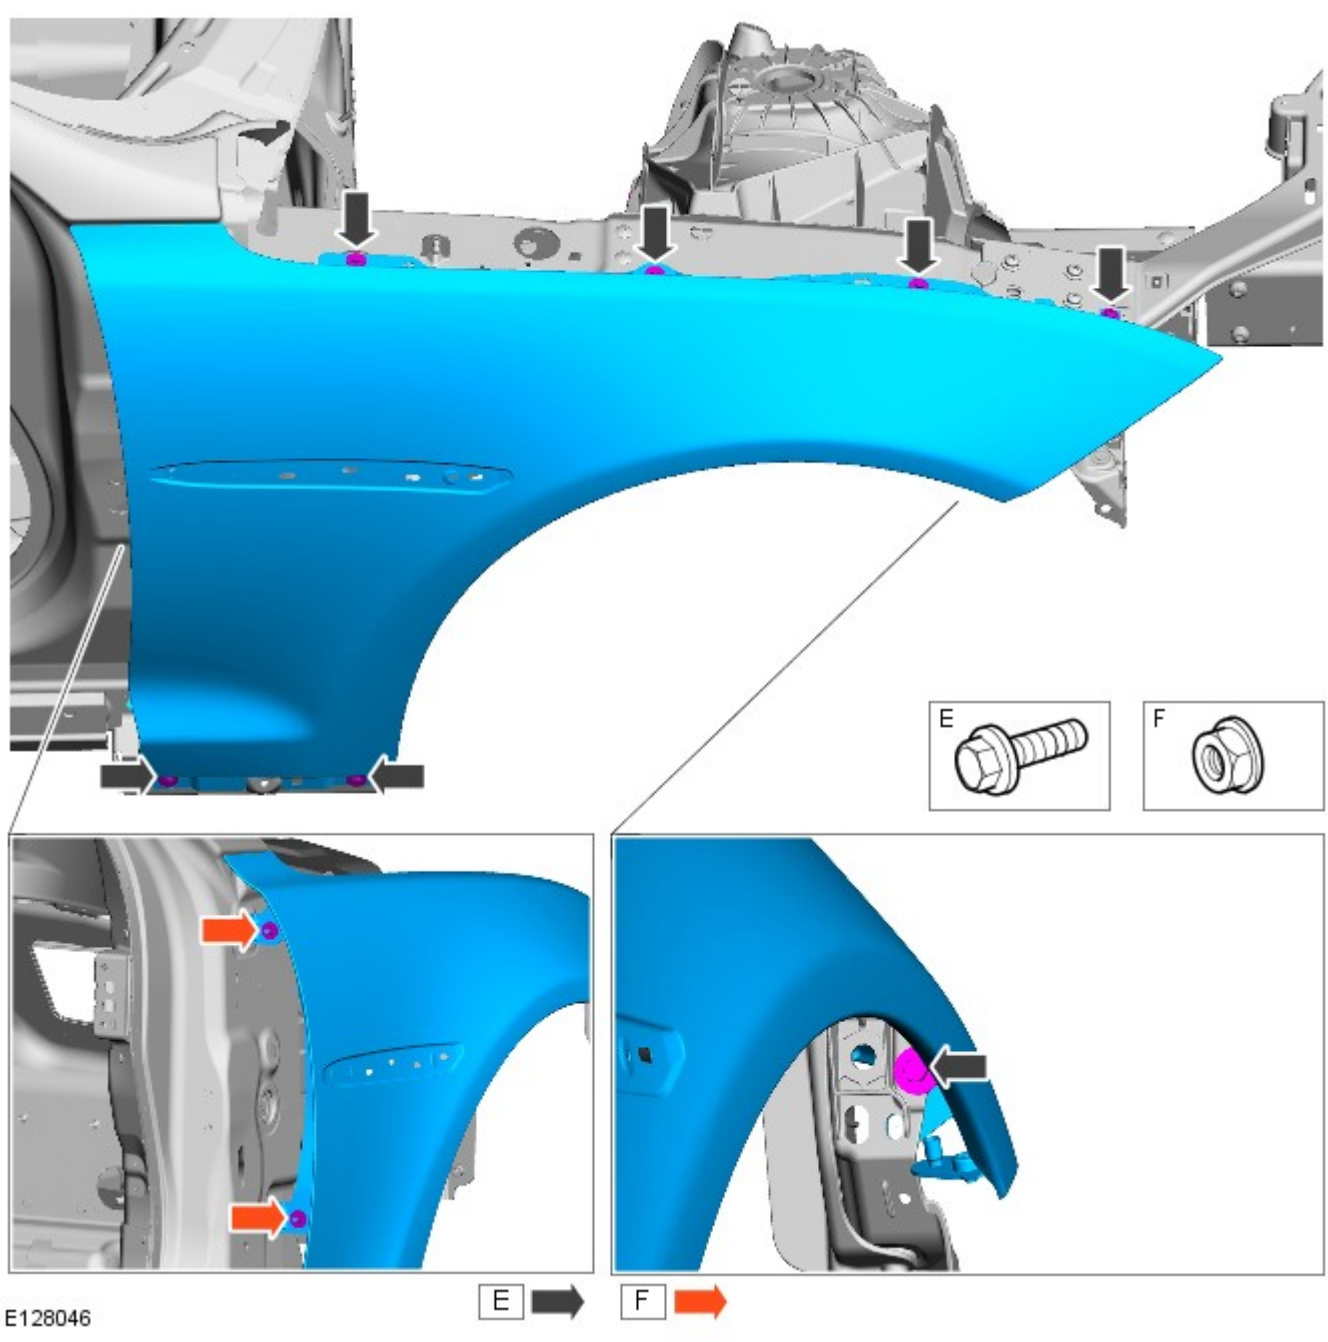
9. Remove the rocker panel outer moulding.

10. Remove the front door.
For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

11. Remove the plastic trim covering the front fender upper rear retaining nut.

12. NOTE: If necessary, remove and retain the front fender to A-pillar mounting brackets.

Remove the front fender retaining bolts.

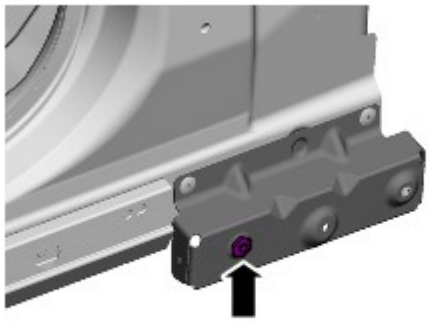


13. NOTE: Do not disassemble further if the component is removed for access only.

Remove the front fender moulding.

Installation

1. Clean and prepare the panel joint surfaces where the sealer adhesive is to be applied.



E128048

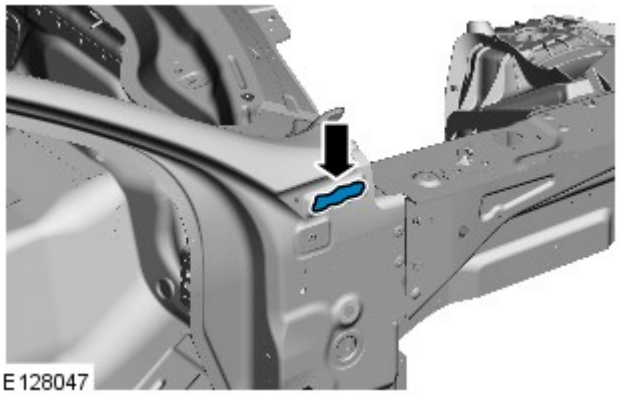
2. NOTES:

If necessary, install the front fender to A-pillar mounting brackets to the front fender.

To aid alignment of the front fender to the front door, there is an adjustable mounting in the rocker panel where the front fender mounts.

Offer up the front fender and the front door. Check alignment, if correct proceed to next step, if not rectify and recheck before proceeding.

3. Remove the front fender and the front door.



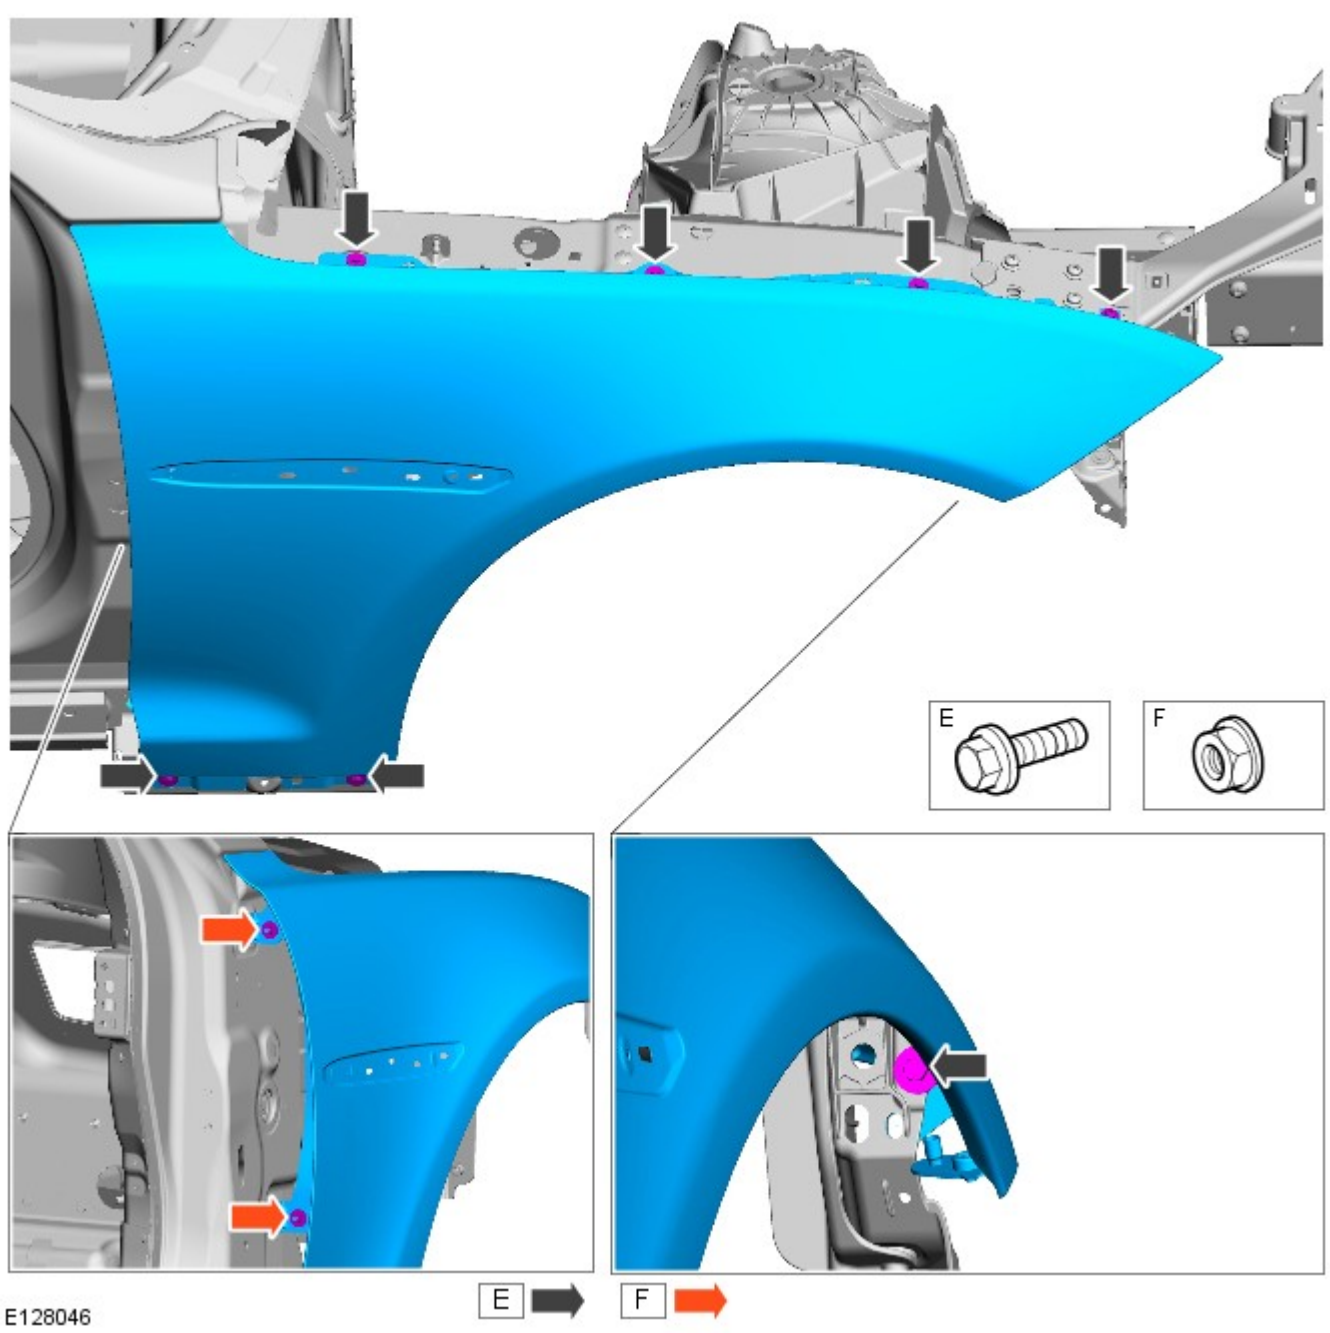
E128047

4. Apply sealer adhesive to the noise, vibration and harshness (NVH) components.

5. Offer up the front fender and the front door. Check alignment, if correct proceed to next step, if not rectify and recheck before proceeding.

NOTE: Bolts are pre-coated to inhibit galvanic corrosion and can be reused only if the coating is not damaged.

- Tighten to 10 Nm.



6. Remove the front door.

7. Install the plastic trim covering the front fender upper rear retaining nut.

8. The installation of associated panels and components is the reversal of removal procedure.

Wheels and Tires - Wheel and Tire

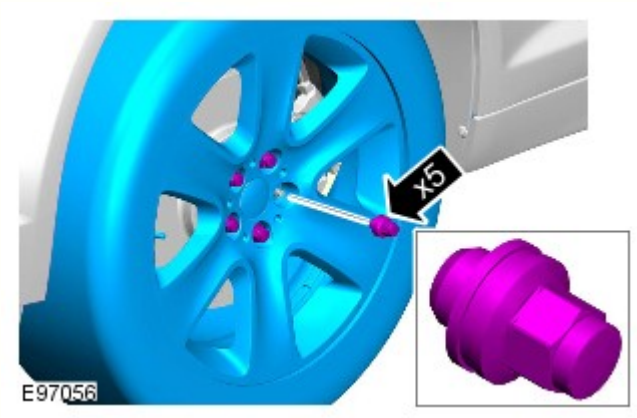
Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

1. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

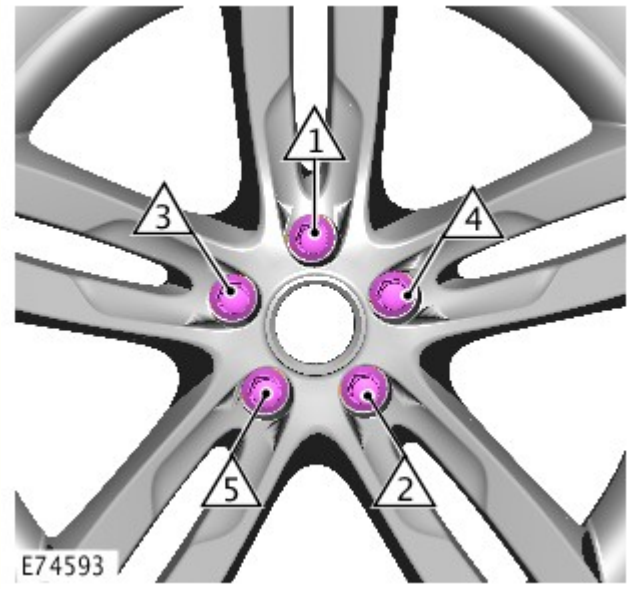


2. CAUTION: Using power tools may result in damage to the wheel nuts. Make sure the wheel nuts are released using hand tools only.

Remove the wheel and tire.

Torque: 125 Nm

Installation



1. CAUTIONS:

Apply a small amount of grease to the hub and wheel mating surfaces before installation. Make sure the grease does not come into contact with the vehicles braking components and the wheel stud threads. Failure to follow these instructions may result in personal injury.

Using power tools may result in damage to the wheel nuts. Make sure the wheel nuts are installed using hand tools only.

Install the wheel and tire.

Supplemental Restraint System - C-Pillar Side Impact Sensor

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. Make the air bag supplemental restraint system (SRS) safe.

   Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

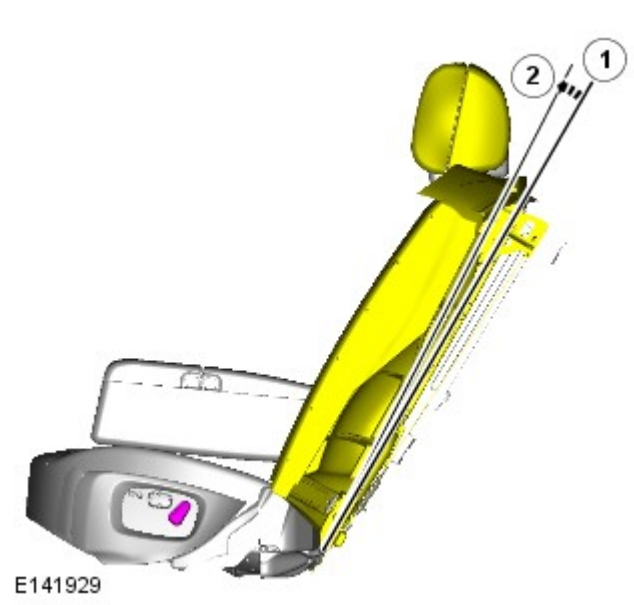
2. WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Refer to: Rear Scuff Plate Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

Vehicles with split rear seat backrest

NOTE: If equipped.



4. Fully recline the rear seat backrest, then adjust it slightly back up to aid access.

Body Shell Replacement Times

NOTES:

The following information shows the total time taken to replace a vehicles body shell. The time has been calculated using a base model variant. For example a two wheel drive vehicle without a roof opening panel.

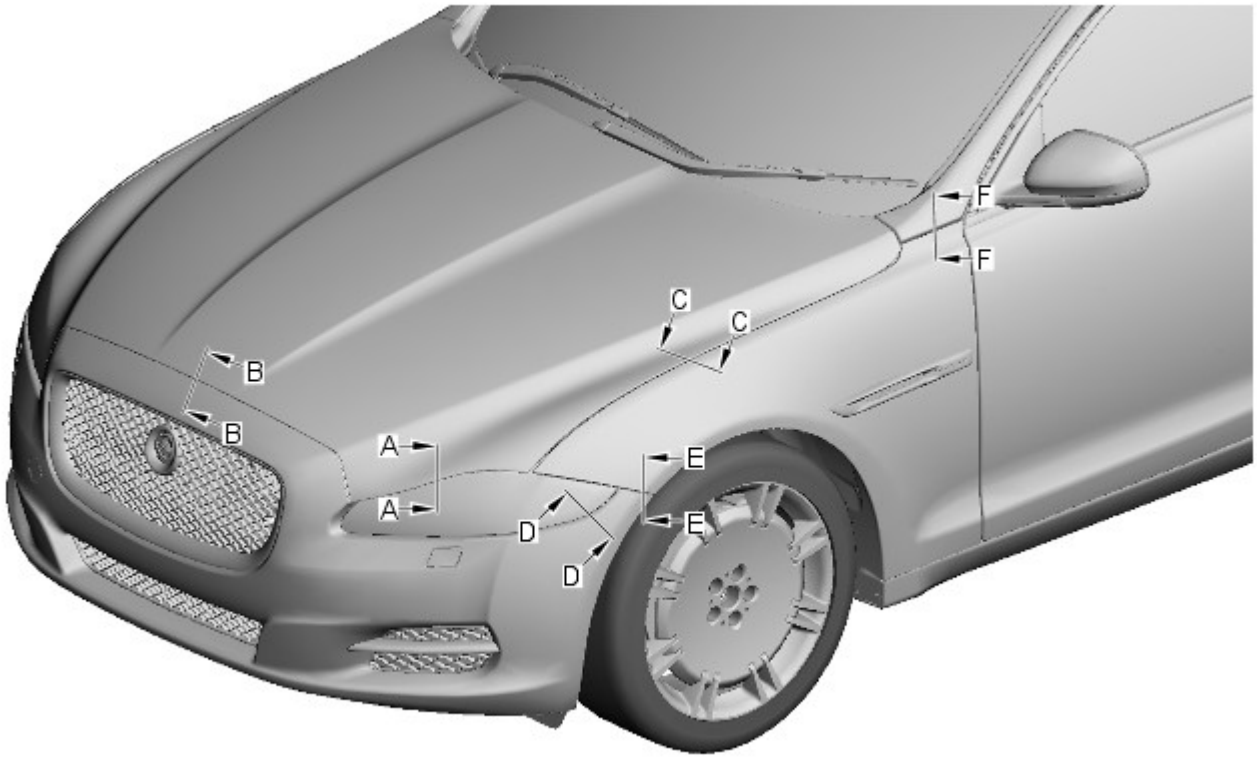
The times include all mechanical, electrical and trim (MET) items but do not include wheel alignment or paint times.

Vehicle Variant	Time
Jaguar XJ	89.9

Gap and Profile measurements

The following information is to be used as a guide to assist the technician in installing exterior body panels and trim items so as to achieve a correctly aligned and cosmetically acceptable vehicle.

NOTE: All dimensions shown are in millimetres, (mm).



E133471

A-A	Hood to headlamp	6.0 ± 1.0

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

Corrosion Protection

General

The application of additional corrosion protection following body repair is not necessary and not recommended. However, it is important to be aware of **galvanic corrosion** and take steps to prevent its occurrence.

Galvanic Corrosion

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles.

Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment, (Pyrosil), and adhesive bonding.

The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium.

Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed.

The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Where the original equipment surface protection (paint), is removed it must be repainted to the recommended standard.

Only Jaguar Land Rover Limited original bodywork components and Jaguar Land Rover Limited approved repair materials, (sealer, paint, etc), are to be used for bodywork repairs.

Battery, Mounting and Cables - Battery Disconnect and Connect

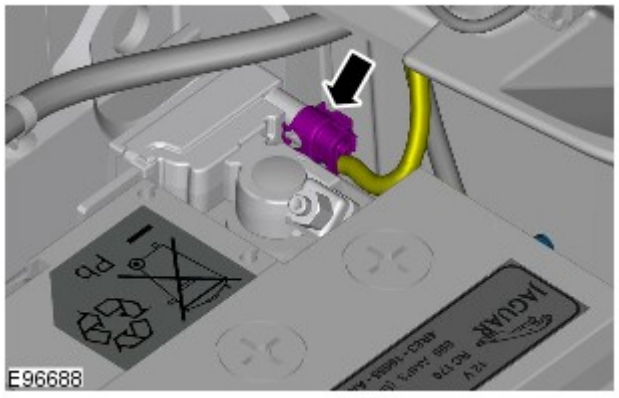
General Procedures

Disconnect

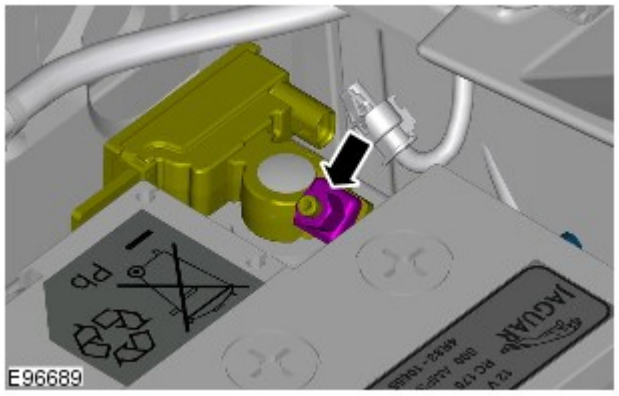
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

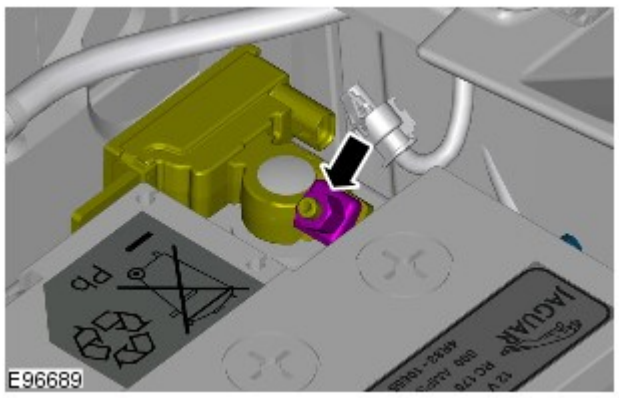


4. CAUTION: Take extra care not to damage the wiring harness.



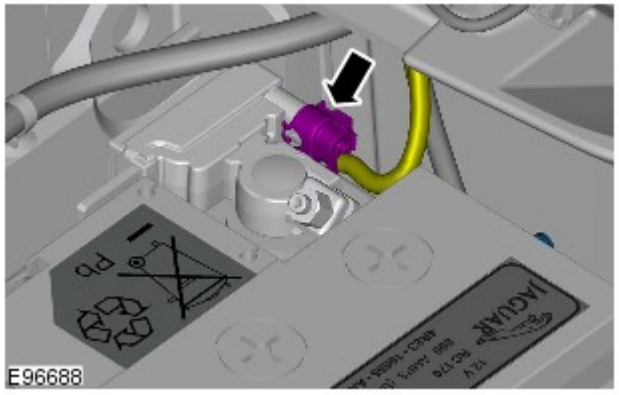
5.

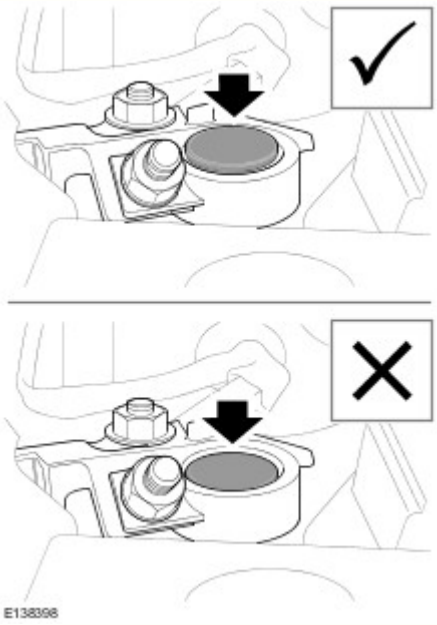
Connect



1. *Torque:* 6 Nm

2.





3. NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Contents

This document includes technical data and information for the all new Jaguar XJ aluminium range. The information contained within is valid at the time of production and incorporates:

- Who should use this information?
- Category A and B definition
- Accident damage and diagnosis
- Impact effects on the body
- Planning a repair
- Estimating
- Identifying the correct Jaguar Approved Body Repair Facilities
- Obtaining spare parts
- Equipment
- Aluminium information
- Galvanic corrosion and housekeeping
- Panel replacement times
- Fixings
- Bonding
- Materials
- Aluminium Welding
- Tolerances and gap specification
- Body alignment

The methods described for panel replacement operations have been obtained from a study of physical repair operations.

In line with Jaguars continuous improvement programme, information and data contained will be updated periodically.

All activities described within are based on the use of genuine Jaguar Parts, tools and approved materials.

Who should use this information?

The information and repair methods listed are designed as an aid for Jaguar Approved Body Repair Facilities achieving the Jaguar approved Bodyshop Operating Standards. The relevant section should be read completely before commencing any repairs. Only technicians who have successfully completed the approved XJ aluminium range training programme should work on the model. Jaguar Approved Bodyshop Operating Standards require that the skills of technicians be regularly assessed and that any training needs identified are addressed within a reasonable time. This information complements the Jaguar training programme.

The authorised repair network is divided into category A and B. The following describes the process required to identify category A or B damage.

Definition of category A and B

Category A

NOTE: Specific equipment and facilities are required to carry out Category A repairs, see the equipment section of this manual.

Damage that requires panel(s) to be replaced with any one or combination of the following procedures:

- Welded panel
- Bonded panel
- Panel secured with fixings

The following list identifies Category A procedures:

Category A procedures

- Fender apron closing panel front section
  For additional information, refer to: Fender Apron Closing Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel
  For additional information, refer to: Fender Apron Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel closing panel
  For additional information, refer to: Fender Apron Panel Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Fender apron panel front section
  For additional information, refer to: Fender Apron Panel Front Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member
  For additional information, refer to: Front Side Member (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member and suspension top mount assembly
  For additional information, refer to: Front Side Member and Suspension Top Mount Assembly (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel
  For additional information, refer to: Front Side Member Closing Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member closing panel section
  For additional information, refer to: Front Side Member Closing Panel Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member section
  For additional information, refer to: Front Side Member Section (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front side member to deformation element bracket
  For additional information, refer to: Front Side Member To Deformation Element Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Suspension top mount
  For additional information, refer to: Suspension Top Mount (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Roof panel
  For additional information, refer to: Roof Panel (501-28 Roof Sheet Metal Repairs, Removal and Installation).

- A-pillar outer panel
  For additional information, refer to: A-Pillar Outer Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- A-pillar reinforcement
  For additional information, refer to: A-Pillar Reinforcement (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Rocker panel rear section
  For additional information, refer to: Rocker Panel (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).
- Back panel
  For additional information, refer to: Back Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel
  For additional information, refer to: Quarter Panel (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Quarter panel lower extension
  For additional information, refer to: Quarter Panel Lower Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear floor side extension
  For additional information, refer to: Rear Floor Side Extension (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member closing panel section
  For additional information, refer to: Rear Side Member Closing Panel Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear side member section
  For additional information, refer to: Rear Side Member Section (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Rear wheelhouse outer
  For additional information, refer to: Rear Wheelhouse Outer (501-30 Rear End Sheet Metal Repairs, Removal and Installation).
- Spare wheel well
  For additional information, refer to: Spare Wheel Well (501-30 Rear End Sheet Metal Repairs, Removal and Installation).

Category B

Damage associated to bolt on panel(s) that are replaced, or light surface damage to exterior cosmetic panels.

The following list identifies Category B procedures:

Category B procedures

- Front bumper cover
  For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).
- Front bumper
  For additional information, refer to: Front Bumper (501-19 Bumpers, Removal and Installation).
- Side member deformation element
  For additional information, refer to: Side Member Deformation Element (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood
  For additional information, refer to: Hood (501-02 Front End Body Panels, Removal and Installation).
- Hood hinge
  For additional information, refer to: Hood Hinge (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel
  For additional information, refer to: Hood Latch Panel (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Hood latch panel mounting panel
  For additional information, refer to: Hood Latch Panel Mounting Bracket (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front fender
  For additional information, refer to: Front Fender (501-27 Front End Sheet Metal Repairs, Removal and Installation).
- Front door
  For additional information, refer to: Front Door (501-03 Body Closures, Removal and Installation).

- Rear door
  For additional information, refer to: Rear Door (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid
  For additional information, refer to: Luggage Compartment Lid (501-03 Body Closures, Removal and Installation).
- Luggage compartment lid hinge
  For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).
- Rear bumper cover
  For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).
- Rear bumper
  For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

Accident damage and diagnosis

General notes:

- Exact diagnosis of the extent of the damage enables proper repair planning
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or methods are used in these areas then this can pose a fundamental threat to vehicle safety

Hidden damage:

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts
- Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect

Impact effects on the body

It is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar. This results in deformations in the area of the roof and the door rocker panel.

Planning a repair

The following decisions have to be made before the repairs are started

- Does the vehicle need to be put on a body repair jig?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- Which body parts need to be renewed?
- Which body parts can be repaired?

Battery care standards

To ensure that the correct maintenance actions are carried out before and during a repair.
For additional information, refer to: Battery Care Requirements (414-00 Battery and Charging System - General Information, Description and Operation).

Estimating

The authorised repair network is divided into category A and B. This section describes the process required to identify category A or B damage. Should damage be identified as category A the vehicle should be referred to the nearest category A facility.

In line with the Jaguar continuous improvement programme, information and data contained in this manual will be updated through Jaguar technical bulletins.

The estimating process

Step 1:

Visual inspection, assess overall vehicle condition. Has damage travelled, distorting internal structural panels?

This is a visual check of the complete vehicle.

Possible indicators:

- Panel misalignment
- Panel gaps no longer uniform
- Hinged panels catch on locks
- Exterior cosmetic panels show signs of stress distortion
- Customer describes unusual driving characteristics post incident

If structural distortion is visible, vehicle body alignment should be checked/corrected on a body repair jig, refer to category A facility.

If no visual indications of damage transfer, go to Step 2.

Step 2:

If no visual signs indicate distortion to internal structural panels, but the customer is concerned with unusual driving characteristics post incident, and there is no damage to the suspension. Vehicle body alignment should be checked using four-wheel alignment geometry equipment.

If structural distortion is identified refer to category A facility.

Step 3:

If there is no sign or concern regarding vehicle body alignment, focus on the local area of damage.

Do any of the panels require replacement?

If no, go to Step 4.

If yes, are any of the panels secured with:

- Bonding adhesive?
- Fixings?
- Weld?

If yes, refer to category A facility.

Step 4

Do any of the panels require welding i.e. ripped or torn aluminium panel?

If no, go to Step 5.

If yes, refer to category A facility.

Step 5

Can the damage be repaired by hand using serrated spoon, dolly, file and/or hot air?

If no, refer to category A facility.

Identifying the correct Jaguar Approved Body Repair Facilities

Through extensive research, Jaguar has identified the most appropriate method to rectify aftermarket damage. It is key to safety and vehicle integrity that only the approved methods, materials and equipment are used.

Issues that could arise from the use of non approved methods, materials and equipment include:

- Warranty invalidation
- Safety

- Galvanic corrosion

Therefore category A damage should always be referred to a category A Jaguar Approved Body Repair Facility.

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc
- Establish all of the metal parts that need to be renewed
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc

Equipment

All Jaguar approved body repair facilities are expected to be equipped in line with Jaguar Body and Paint Centre of Excellence Operating Standards.

The approved body equipment for the all new XJ aluminium range is listed as either:

- Category A
- Category B

All approved equipment is available on a Worldwide basis from:

Aluminium information

The design of the modern motor vehicle attempts to overcome two conflicting needs:

- Fuel economy - lighter, aerodynamic and fuel sensitive technology
- High levels of comfort - this often equates to higher specifications and more accessories

Aluminium alloy is the ideal material to meet these demands; it provides a lighter vehicle body with improved rigidity. aluminium is different from traditional steel, with the correct knowledge and suitable tools it is easily repaired.

There are two aluminium alloys discussed in this manual, the attributes detailed in the following table should be considered when deciding to repair or replace:

	6111	5754
Material Description	6000 Series is a Magnesium/Silicon/Copper aluminium alloy	5000 Series is an aluminium alloy with Magnesium content
Location on Vehicle	This alloy is used mainly in the outer body panels. Thickness: 0.9 - 2.0mm	Internal structural panels Thickness: 1.0 - 3.0mm
Attributes	High dent resistance	Strength and durability
Repairability	Yes - Light damage only	NOTE: All repairs to 5754 are restricted to Category A Jaguar approved Body Repair Facilities only. Yes - Light damage only. Limited straightening is acceptable
Heat During Repair	Yes - **caution** material sensitive to heat. Range: 140 - 160°C Ideal panel temperature: **150°C**	Yes - **must** be heated to maintain original alloy properties. Ideal panel temperature: **250°C**
Notes	Equipment: Hot air gun. Use panel temperature indicator strips	Equipment: Heat inducer. Use panel temperature indicator strips. Heat must be applied and maintained during the straightening process

Other materials are used in the construction of the all new XJ aluminium range, however, repair of these materials is not covered as they fall outside the scope of this manual.

Steel, (including Bake Hardened (BH) and High Strength Low Alloy (HSLA): Used in seat belt anchorages, hinge reinforcements and various small brackets and mountings.

Magnesium Die Cast Alloy (AM60B): Used in the hood latch panel.

Plastics: Used in the front fender support bracket and for reinforcements in the B-pillar and rear side member.

The following illustrations identify the aluminium alloys and other materials used in body construction.

Galvanic corrosion and housekeeping

Galvanic corrosion is the cross-contamination of dissimilar metals, in this case aluminium and steel. Avoidance of galvanic corrosion is an important issue to be considered in the repair of aluminium bodied vehicles. Precautions to prevent the contamination of exposed bare aluminium surfaces should be taken. Good housekeeping and cleanliness should be adopted throughout repairs and especially prior to welding, pre-treatment and adhesive bonding. The repair environment requires control and protection from dust and debris from conventional steel body repairs. All equipment must be clearly identified and used solely on aluminium. Tools should be kept clean and in good order. Steel fastenings are coated to prevent galvanic corrosion. Fastenings should be examined during repairs and where damaged or suspect must be renewed. The use of graphite, penetrating oil, or copper based anti-seize compounds upon the steel fixings is not recommended.

Panel replacement times

Panel replacement times are available for the following:

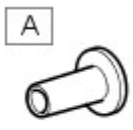
- Front end sheet metal.
  For additional information, refer to: Front End Sheet Metal (501-27 Front End Sheet Metal Repairs, Description and Operation).
- Side panel sheet metal.
  For additional information, refer to: Side Panel Sheet Metal (501-29 Side Panel Sheet Metal Repairs, Description and Operation).
- Rear end sheet metal.
  For additional information, refer to: Rear End Sheet Metal (501-30 Rear End Sheet Metal Repairs, Description and Operation).
- Roof sheet metal.
  For additional information, refer to: Roof (501-28 Roof Sheet Metal Repairs, Description and Operation).

Fixings

There are five groups of fixings used on the all new XJ aluminium range, other than conventional nuts and bolts. It is important that the correct procedures are followed for the removal and replacement of these fixings and, where applicable, the correct tools are used.

- Self-Piercing Rivet (SPR)
- Hemlok (rivet)
- Monobolt (rivet)
- Countersunk Monobolt (rivet)
- Torx Screw and Rivnut

Self-Piercing Rivet (SPR)



E74390

Self-Piercing Rivets are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

NOTE: It is important to identify and select the correct size fixing by referencing this table prior to installation.

Size	Stack	Jaguar Service Number
4.8mm x 5.0mm	3.0mm	C2C 20589
4.8mm x 7.0mm	4.0mm	C2C 20590
4.8mm x 8.0mm	5.0mm	C2C 20591
4.8mm x 8.5mm	5.5mm	C2C 20592
4.8mm x 9.0mm	6.0mm	C2C 20593
4.8mm x 9.5mm	6.5mm	C2C 20594
4.8mm x 11.0mm	8.0mm	C2C 20595

Removal

The ESN50 is the approved removal tool for Self Piercing Fixings. The ESN50 can be used with an optional, larger, 200mm C frame for improved access. Where tool access is impossible, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The ESN50 is the approved installation tool for Self Piercing Fixings. Where the original panel is being refitted, the new fixings should be placed adjacent to the original. Only where the ESN50 cannot be used, or there is insufficient space on the panel, should the fixings be replaced with Hemloks, unless the repair method dictates otherwise.

E72041

Using the ESN50

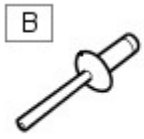
Make sure there is access for the ESN50 on both sides of the fixing to be removed/installed, including the optional C frame if required.

Removal: Align the plunger and anvil over the fixing and depress the trigger. Depressing the trigger will allow the plunger to act on the fixing and remove it from the panel.

NOTE: Prior to replacing a self piercing fixing, a test, using identical materials from waste panels, should be performed, to make sure that all settings are correct and an acceptable joint has been achieved.

Installation: Load new fixing into ESN50. Align the ESN50 over the fixing position and depress the trigger. As the trigger is depressed the ESN50 will clamp itself onto the work piece and install the fixing.

Hemlok (rivet)



E74391

NOTE: It is important to identify and select the correct size fixing by referencing the following table prior to installation.

Hemloks are available in various sizes dependant on the size of the stack of panels to which they are fitted. A stack refers to the combined gauge of the panels being Rivetted. The following table identifies the sizes and part numbers available:

Size	Stack	Jaguar Service Number
6.4mm x 13.7mm	1.5mm - 3.5mm	C2C-45252

6.4mm x 15.0mm	2.8mm - 4.8mm	C2C-36006
6.4mm x 17.0mm	4.8mm - 6.8mm	C2C-36026
6.4mm x 19.0mm	6.8mm - 8.8mm	C2C-36024
6.4mm x 20.0mm	7.5mm - 9.5mm	C2C-22613
6.4mm x 21.0mm	8.8mm - 10.8mm	C2C-36008
6.5mm x 24.0mm	2.0mm - 9.5mm	C2P-4773
3.2mm x 12.00mm	3.2mm-12.0mm	C2P-14332

Removal

Hemloks are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

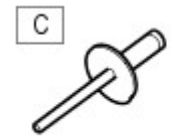
The Genesis G4 is the approved installation tool for Hemloks. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using a Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Check that you have the correct size Hemlok for replacement and insert it into the Genesis G4. Use the weight of the Genesis G4 to apply light pressure as the Hemlok is inserted into its hole. Depress the trigger which will tighten the Hemlok in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Monobolt (rivet)



E74392

Description	Jaguar Service Number
Monobolt (C)	C2P-4773

Removal

Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

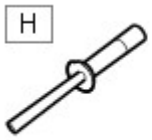
The Genesis G4 is the approved installation tool for Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit and all debris has been removed.

E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Monobolt into the Genesis G4, (there is only one size of Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Monobolt is inserted into its hole. Depress the trigger which will tighten the Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Countersunk Monobolt (rivet)



E74398

Description	Jaguar Service Number
Countersunk Monobolt (H)	C2P-14332

Countersunk Monobolts are used in replacement where a Self-Piercing Rivet, (SPR), cannot be replicated and where a Hemlok cannot be used because a flush surface is required.

Removal

Countersunk Monobolts are not used in production, however, if a previous repair has been carried out they may be present. Remove the centre of the fixing using a 4mm punch - in some instances it may be necessary to loosen the centre using a hardened centre punch. Once the centre has been removed, drill out the remnant using a 6.5mm Cryobit drill bit. Remove all debris.

Installation

The Genesis G4 is the approved installation tool for Countersunk Monobolts. Prior to replacement make sure the fixing hole has been drilled to 6.5mm, using Cryobit drill bit, the hole has been countersunk, using a countersink drill bit and all debris has been removed.

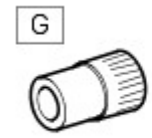
E72044

Using the Genesis G4

Make sure the fixing hole has been drilled to 6.5mm and all debris has been removed. Insert a new Countersunk Monobolt into the Genesis G4, (there is only one size of Countersunk Monobolt used on the all new XJ aluminium Range). Use the weight of the Genesis G4 to apply light pressure as the Countersunk Monobolt is inserted into its hole. Depress the trigger which will tighten the Countersunk Monobolt in the hole, the wasted stud will be ejected into the Genesis G4 once a pre-determined pressure is reached.

Torx Screw and Rivnut

E74399



E74397

A Torx Screw and Rivnut are used where the fitment of a Hemlok would give a poor cosmetic appearance. There are also occasions where the Torx Screw and Rivnut replaces a Monobolt, where there is no access for the Genesis G4. The Rivnut acts as the thread.

Description	Jaguar Service Number
Rivnut (G)	C2C 10348
Torx Screw (J)	C2G 1964

Removal

The removal of the Torx Screw is carried out using a T30 Torx Driver. The Rivnut is not an original fixing.

Installation

E72042

The Torx Screw is installed using a T30 Torx Driver. The Rivnut is installed using the Wurth HES412 Rivet Nut Thread Setter, (Part No: 964948900).

Bonding

This section provides information on the bonded joints used in repair throughout the all new XJ aluminium body. The following topics are covered:

- Equipment
- Materials
- Bonding Pre Treatment
- Bonding Application

It is a pre-requisite that any person undertaking any repairs which involve panel bonding has attended Jaguar Approved Training and has achieved the correct skill level to undertake these processes. Bonding is classed as a Category 'A' repair.

E74991

Equipment

The approved bonding equipment consists of:

- Pyrosil gas applicator kit
- Approved two-pack adhesive applicator

Bonding Pre Treatment

Pre-treating the panels to be bonded, as described in this section, promotes the improved adhesion of the bonding adhesive.

The pre-treatment is carried out using the approved "Pyrosil kit". The kit contains all of the equipment required to perform the pre-treatment process.

E72043

CAUTION: Bonding without pre-treatment will reduce the performance of the joint.

The pre-treatment application is a two stage process:

- Chemical application via a flame
- Coupling Agent

Performing the Pre-treatment Application

CAUTION: Apply caution when using a naked flame. Remove all risk of combustion. Do not overheat the alloy. Move the flame over the work piece at a constant velocity.

The application is colourless and has no visual indication.

- Remove any original adhesive, or E-Coat from new panels
- Clean surface to be treated using approved pre-cleaner/degreaser
- Using the Pyrosil torch, pass the flame, (use the blue tip which is the oxidisation flame), across the surface of the joint
- Immediately brush coupling agent (primer) onto panel surface and allow to dry

CAUTION: Apply the bonding adhesive immediately after the pre-treatment process.

Bonding Application

The approved bonding adhesive is supplied in a two pack cartridge.

A two-pack cartridge gun with a disposable mixing nozzle is used for the application of the adhesive.

NOTE: The curing process of the adhesive begins once mixed and has a working time of approx 30 minutes.

Apply a 5mm "zig zag" bead directly to either the replacement panel or vehicle structure.

Make sure a continuous bead of adhesive surrounds fixing holes.

On completion the mixing nozzle must be discarded. Make sure an air tight seal is provided for the cartridges.

Materials

The materials listed in this section are those approved to be used on the all new XJ aluminium range in conjunction with the repairs shown in this manual.

If any of these items are not available check with the supplier/manufacturer of these products for a superseded equivalent.

Approved Materials

Consumable	Material	Supplier
Weld Crack Penetrant	Rocol	Jaguar Equipment Programme
Weld Crack Developer	Rocol	Jaguar Equipment Programme
Weld Crack Cleaner	Rocol	Jaguar Equipment Programme
Pyrosil coupling agent (primer)	SurAlink GP15	Jaguar Equipment Programme
Pyrosil refill cartridge	Sura - Pyrosil	Jaguar Equipment Programme
Bonding Adhesive	Structural Adhesive DP490	3M
Bonding Adhesive	Structural Adhesive 8115	3M
Cavity Foam	DM4330 Foam	3M
Semi Rigid Sealer	0893-2251	Wurth
Seam Sealer	Terostat 1K PUR 11272C (4500010)	Teroson
Cleaner/De-greaser	08984	3M
Cleaner/De-greaser	3608S	DuPont
MIG Weld Wire (6111)	4043/4047 Filler Wire	Fronius Dealer Network
MIG Weld Wire (5754)	5554 Filler Wire	Fronius Dealer Network
Abrasive Discs	Roloc Bristle Discs 07528	3M
Self Piercing Fixings (all variants)	JEPC	Jaguar Dealer Network
Hemlok Fixings (all variants)	JEPC	Jaguar Dealer Network

Aluminium Welding

Health and Safety

Refer to equipment manufacturers' manual.

Set Up/Equipment Check

Refer to equipment manufacturers operator's manual.

Weld Process

This section provides information on aftermarket aluminium welding for the all new XJ aluminium range. It covers the following areas:

- Equipment: Metal Inert Gas (MIG)
- Materials: Extruded and pressed aluminium sheet alloy.

- Weld Structure: Fusion welding process: Metal Inert Gas (MIG).
- Weld Procedures: Pre-weld, test weld, weld and post weld checks.
- Weld Types: Lap weld, Butt weld, Plug weld.

Equipment

NOTE: Approved equipment is obtained from the Jaguar Equipment Programme, (JEP).

Approved MIG Welder: Fronius 2700 Alu Edition Pulsed MIG Welder

The Fronius 2700 Alu Edition MIG Welder utilises a 100% digitally controlled power source, this produces final weld attributes of:

- Smoothness
- Refinement
- Consistency
- Repeatability

The accuracy of the approved equipment enables the delivery of one droplet of wire per pulse. This enables welding of incredibly thin parent material, i.e 0.6mm sheet can be welded using a 1.2mm filler wire.

The approved MIG welder uses Direct Current, (DC) and does not produce High Frequency, (HF), at start up, (initial arc).

Welder Set Up

NOTE: The user should always refer to the operators manual for detailed instructions.

The following provides an overview of the set-up procedure:

- Health and Safety - read operators manual
- Check correct power supply
- Check gas supply
- Check all equipment parts - safety check
- Attach power cables, connect to supply
- Purge gas bottle, attach
- Attach clamp

Approved equipment obtained from the Jaguar Equipment Programme, (JEP):

- Speedglas with Adflo face shield/weld mask

- Approved fume extractor
- Stainless Steel Brush
- Personal Protection Equipment (PPE)

Materials

Prior to any welding activity, it is necessary to identify the type of material to be welded. The all new XJ aluminium range is constructed from a number of aluminium Alloys, each has different attributes that should be considered prior to the weld process.

Body Materials

The repair methods shown focus on the replacement of:

- Pressed Aluminium Alloy sheet - 6111 - Used in skin-panels
- Extruded Aluminium Alloy - 5754 - Used in structural panels

Weld Wire

The approved weld wires for these alloys are:

- 6111 - 4043 or 4047 filler wire
- 5754 - 5554 filler wire

Weld Structure

The approved aftermarkets weld process is based on Fusion Welding:

- Metal Inert Gas (MIG) Welding

The approved MIG welder uses DC current. The Electrode, (filler wire), is Positive Pole and the work piece is Negative Pole. The arc burns between a melting electrode, (which also acts as the filler wire) and the work piece. The shielding gas is Argon, Helium or a mixture of these, (MIG).

Successful aluminium welding is partly dependent on the removal of surface Oxidisation. Oxide **MUST** be removed prior to welding.The oxide melts at a different temperature:

- Aluminium melting temperature - approximately 660°C
- Aluminium Oxide melting temperature - approximately 2040°C

Weld Procedures

Pre Weld

Prior to starting any weld procedure, the following safety precautions should always be implemented:

- Disconnect the vehicle battery
- Disconnect the generator electrical connectors
- Remove any ECMs within 500mm of the weld area
- Remove the battery before carrying out welding work in its vicinity
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat

The aluminium surfaces **MUST** be cleaned prior to welding. Cleaning will aid penetration and avoid contamination. There are three steps to this process:

1. **Clean surface:**

To remove wax and any other contaminants use a chemical surface cleaner:

- Jaguar approved product: DuPont 3608S
- Alternatively, an Isopropyl based product

2. **Remove Oxide**

This can be achieved through a number of processes:

NOTE: Items used to remove oxide should not be contaminated by use on a steel vehicle.

- Stainless Steel brush
- 80 Grit abrasive paper
- Non-Metallic scuff pad

3. **Remove Oxide Dust**

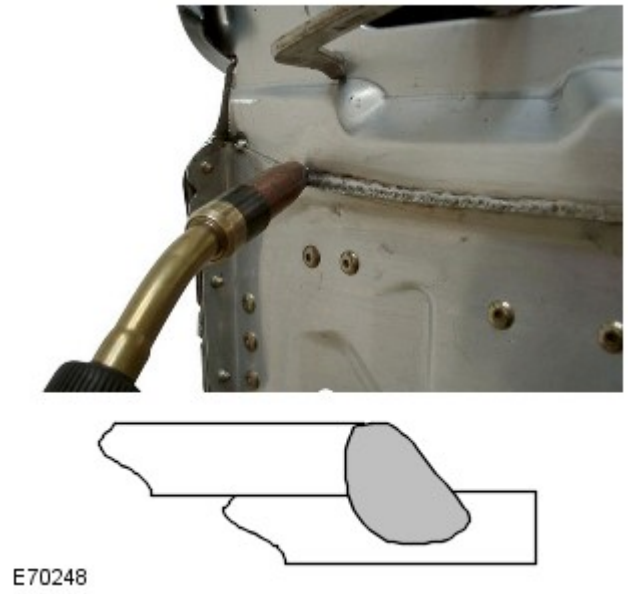
- Remove dust with a lint free cloth

NOTE: Oxide builds up very quickly, therefore, perform steps 2 and 3 immediately prior to welding. If left for a period of time, steps 2 and 3 should be repeated.

Weld Types

The following identifies the three types of joint used in Category A panel replacement. It is not a guide to welding, as all Category A repairers will have staff who are suitably qualified in welding aluminium. This section highlights the key points for each weld type.

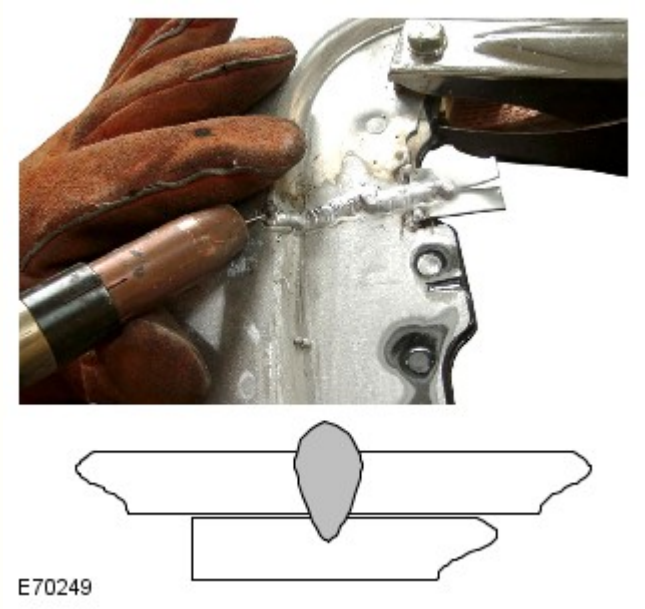
Lap Weld



Key points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs

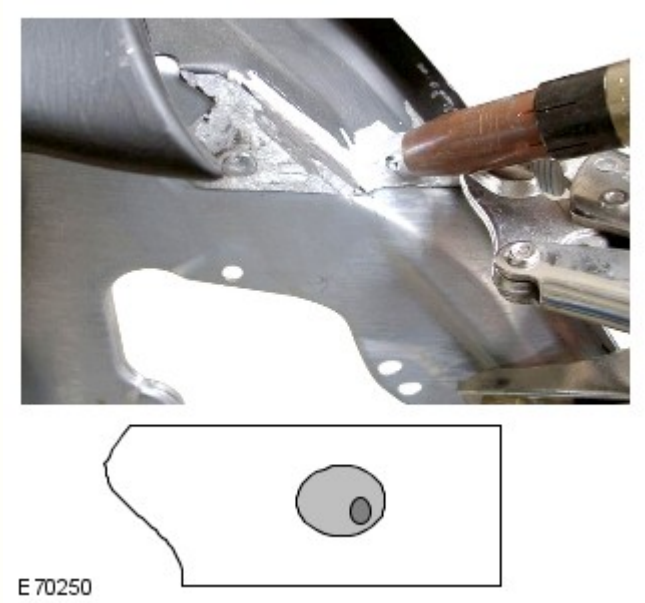
Butt Weld



Key Points:

- Run-In/Out distance of 5mm
- Minimum overall length of 20mm
- Must use Start/Finish tabs
- Nominal penetration of fillet required

Plug Weld



Key Points:

- Hole size 10mm
- Position of MIG nozzle - vertical

Test Weld

A test weld using identical coupons from waste panels should take place prior to working on the vehicle. The test piece is then visually checked and destructively tested to make sure all settings are correct and an acceptable weld has been achieved.

Prior to starting, the following should be checked:

- Gas - Correct for the type of job
- Filler Wire - Correct for the type of material to be welded

An effective weld should demonstrate the following qualities:

- All visible weld surfaces shall be clean, bright and of a uniform profile
- The weld seam should show uniform height and width over its entire length
- There shall be complete fusion between the surfaces of the work piece and the weld metal deposit

Correct level of penetration will be visible at the rear of the coupon as a fine continuous line.

Effective Weld Length

The effective weld length is the weld seam as described in the Body Repair Sections. The effective weld length does not include allowances for the run-in/run-out, or termination defects, (start/stop), of the weld seam. It is permissible that the overall weld length is longer than detailed in the repair section, as the overall weld will include a minimum of 5mm at both the start and the stop of the weld seam, provided the function of the part is not affected, or the weld finishes on the edge of a panel.

Post Weld Checks

Weld inspections take the form of a visual examination, non-destructive and destructive testing.

Visual Examination

A visual examination of fusion welds should be carried out in accordance with the acceptance criteria detailed in the following Imperfections/Defect Levels table.

Imperfection/Defect Levels Table

Defect/Imperfection Type	Details	Limits
Burn-through	Burn holes	Not permitted
Seam offset, sides melted away	Incomplete fusion	Not permitted within effective weld length
Cracks	Any form of cracking is not permitted at any position along the entire length of the weld seam	Not permitted
Fused weld spatter		Limited acceptance. Not permitted on visible surfaces or in areas where functional performance of the part is affected, e.g. mating surfaces, sealing surfaces, etc. In such instances spatter is to be removed. All loosely adherent spatters must be removed
Visible ignition marks	Local melting of parent metal due to arc	Permitted provided functional performance of the component is not affected.
Open end crater	Reduces the cross sectional area of the weld seam	Not permitted
Visual pores		Not permitted
Weld skip	Discontinuity/interruption in weld seam	Not permitted at any position along the entire length of the weld seam

Non Destructive

Dye penetrate testing **MUST** be used for detection of discontinuities, such as cracks, laps, folds, porosity and lack of fusion that are open to the surface of the material. Typical defects include start, (cold start/incomplete fusion) and stop, (crater cracking), defects within a fusion weld run. In addition to this lack of fusion/coalescence at the weld toe, solidification cracks in the weld bead may also be detected.

Non Destructive Crack Inspection Process

Use the product as listed in the Approved Materials Section, this product is supplied within the Category A tool kit. The product is an aerosol applied dye system. It is designed to penetrate the finest cracks and flaws to facilitate detection, the system includes: Cleaner, Penetrant and Developer.

The process is as follows:

- 1. Use the cleaner to de-grease/clean the test area, then wipe with a lint free cloth.
- 2. When the surface is completely dry apply the penetrant. Cover the test area and allow a minimum contact time of 10 minutes.
- 3. Remove excess penetrant from the surface with a lint free cloth wetted with the cleaner.
- 4. Apply a **THIN** film of the developer and leave for a minimum of 10 minutes to draw up the retained dye from flaws or cracks.
- 5. Suspect areas should then be examined under natural or electric light for signs of flaws and/or cracks. Cracks will show up as lines whilst porosity will appear as pin holes.

Destructive Testing

Each test weld should be pulled apart to check the quality and penetration of the weld.

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

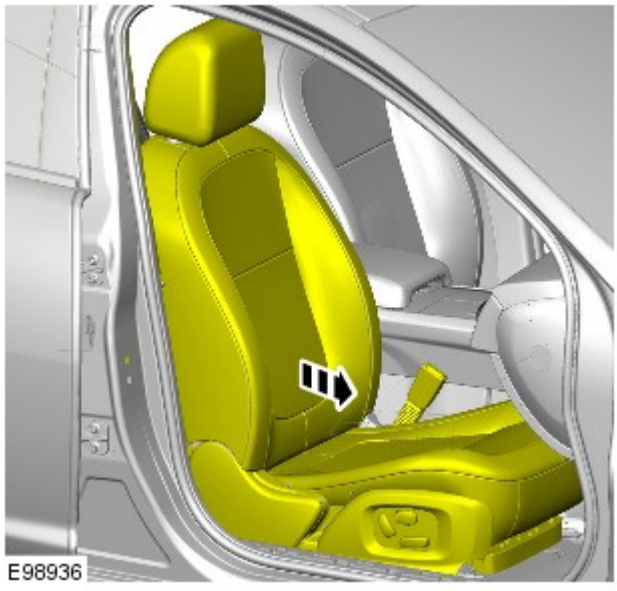
To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

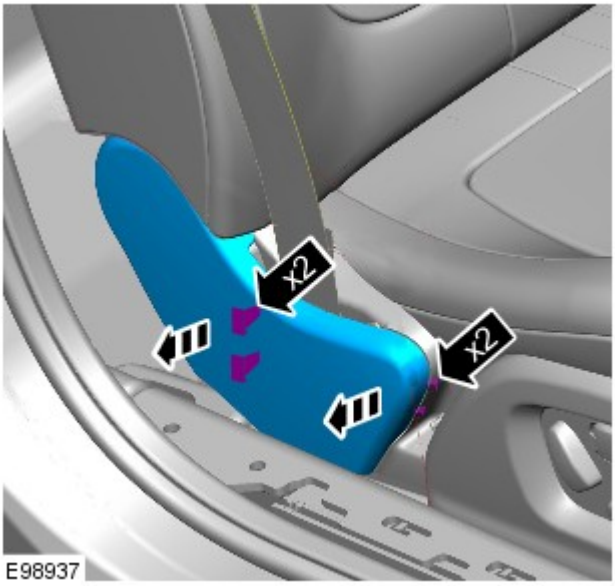
Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

1. Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

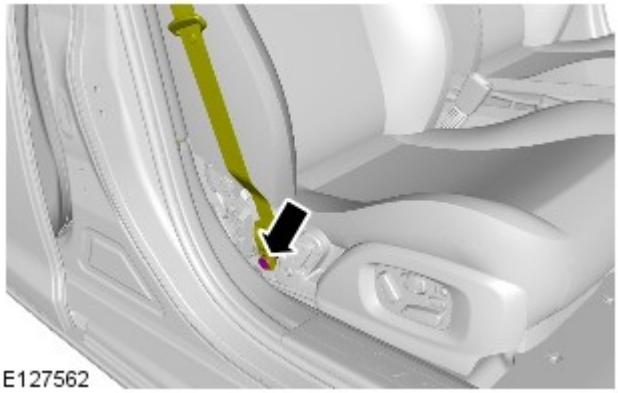
2.



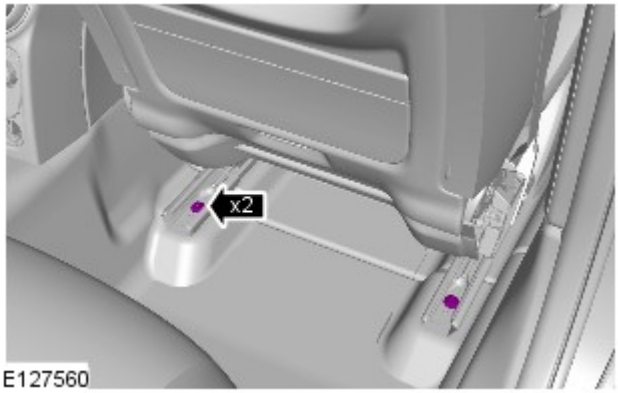
3.



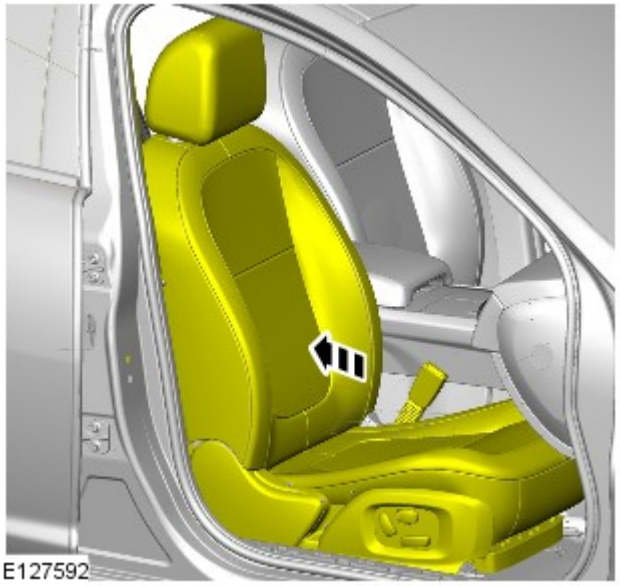
4. *Torque:* 40 Nm



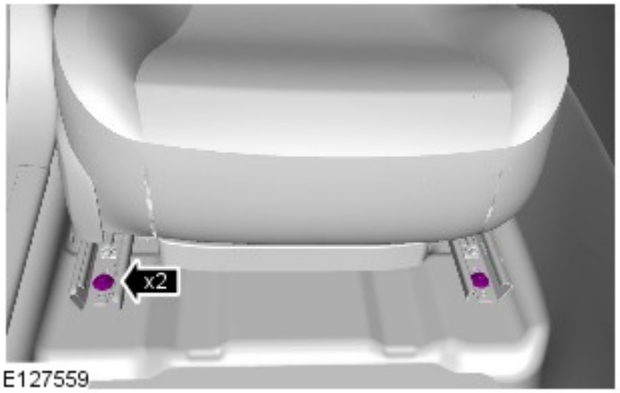
5. *Torque:* 47 Nm



6.

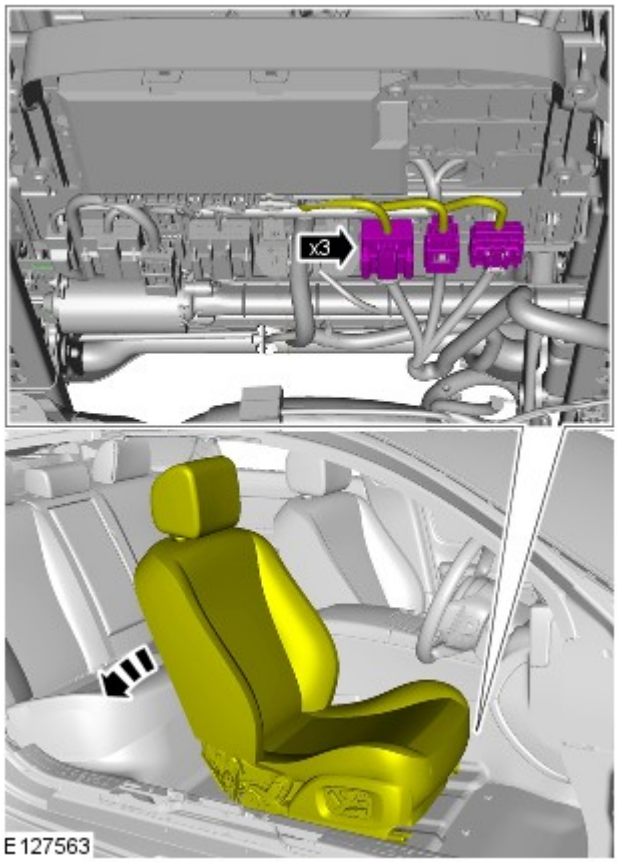


7. *Torque:* 47 Nm



8. Reposition the front seat to the central position.

9.



10. CAUTIONS:

Protect the surrounding paintwork to avoid damage.

Protect the surrounding trim to avoid damage.

NOTE: This step requires the aid of another technician.

Installation

1. To install, reverse the removal procedure.

Published: 11-May-2011

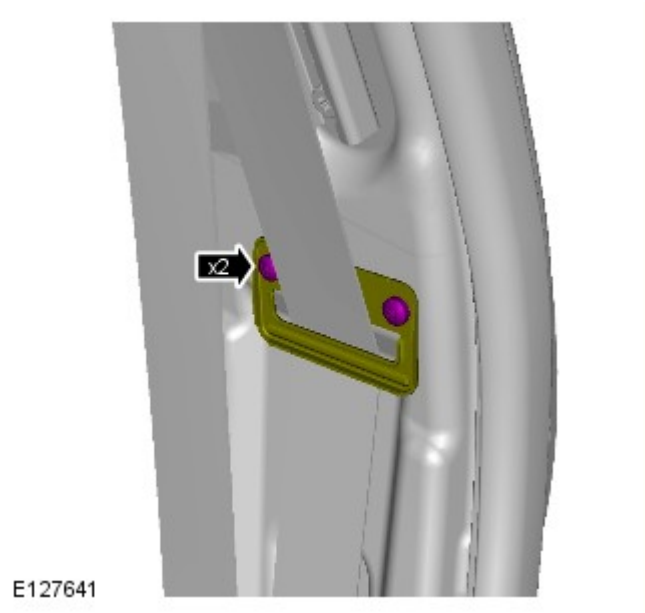
Safety Belt System - Front Safety Belt Retractor

Removal and Installation

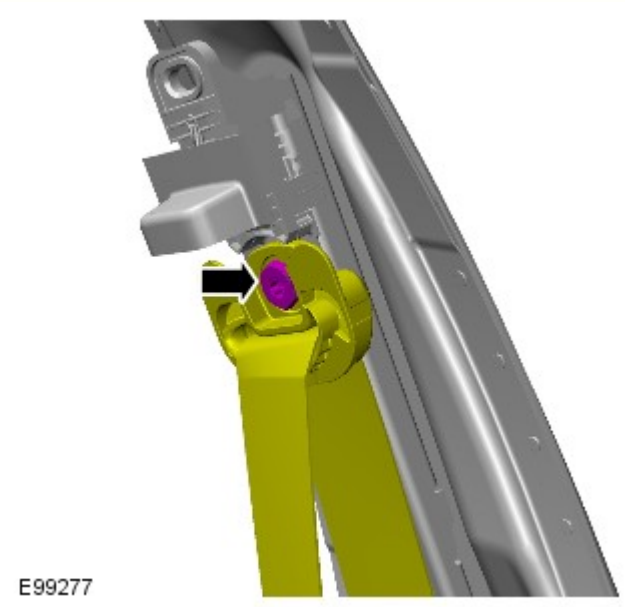
Removal

NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: B-Pillar Upper Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



2. *Torque:* 9 Nm

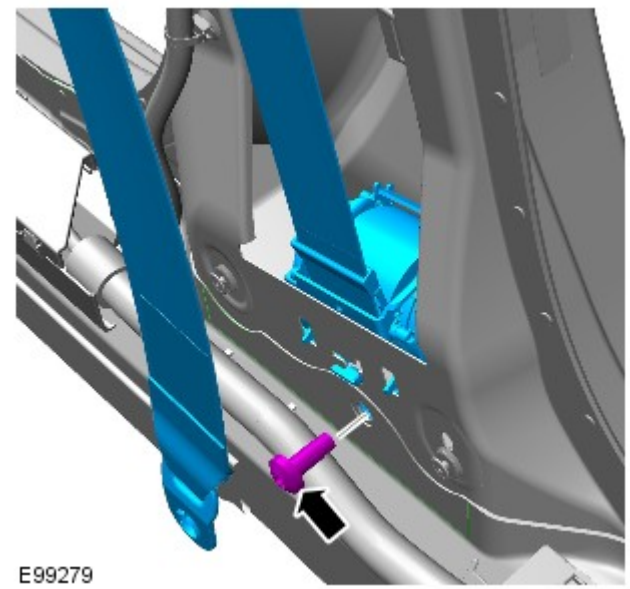


3. CAUTIONS:

Discard the bolt.

Make sure that a new bolt is installed.

Torque: 40 Nm



4. CAUTIONS:

Discard the bolt.

Make sure that a new bolt is installed.

Torque: 40 Nm

Installation

1. CAUTION: Fixings must be started by hand to avoid damaging threads.

To install, reverse the removal procedure.

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

NOTE: The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage

- Do stand to one side when connecting modules
- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes
- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Nots

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Nots

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquified Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable
- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

0-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400º C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

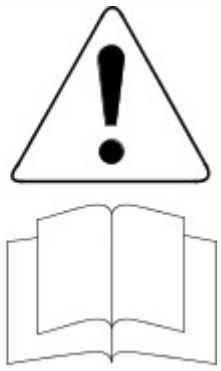
SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

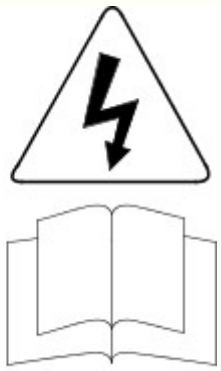
These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.



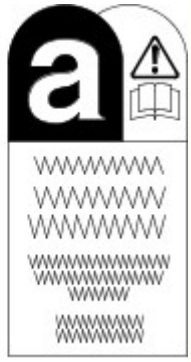
VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.



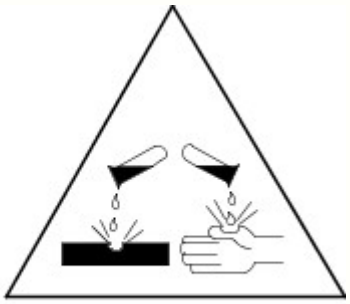
VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.



VUJ0000271

3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.



VUJ0000272

4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO^2 fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

Rear End Sheet Metal Repairs - Quarter Panel

Removal and Installation

Removal

NOTE: The removal and installation steps shown within this procedure may differ depending on whether the panel in question is being installed in isolation or is being installed in combination with panels other than those listed.

1. The quarter panel is a category A repair.

2. NOTE: The quarter panel is manufactured from aluminium alloy 6111-T4.

   The quarter panel is serviced as a separate riveted and bonded panel, it includes the quarter panel lower extension.

E129125

3. The quarter panel is replaced in conjunction with:
   - Rear bumper cover
   - Rear bumper
   - Luggage compartment lid
   - Luggage compartment lid hinge
   - Rear window glass

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: Health and Safety Precautions (100-00 General Information, Description and Operation) /
Body Repairs (501-25A Body Repairs - General Information, Description and Operation) /
Corrosion Protection (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
Body and Frame (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the rear bumper.
For additional information, refer to: Rear Bumper (501-19 Bumpers, Removal and Installation).

6. Remove the rear window glass.
For additional information, refer to: Rear Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

7. Remove the luggage compartment lid hinge.
For additional information, refer to: Luggage Compartment Lid Hinge (501-03 Body Closures, Removal and Installation).

8. Disconnect the battery.
For additional information, refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

9. Disconnect the generator electrical connectors.

10. Remove the rear muffler.
For additional information, refer to: Rear Muffler (309-00 Exhaust System - 3.0L V6 - TdV6, Removal and Installation) /
Rear Muffler (309-00 Exhaust System - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Removal and Installation).

11. Remove the rear muffler heatshields.

12. Remove both the loadspace trim panels.
For additional information, refer to: Loadspace Trim Panel RH (501-05 Interior Trim and Ornamentation, Removal and Installation) /

Loadspace Trim Panel LH (501-05 Interior Trim and Ornamentation, Removal and Installation).

13. Remove the luggage compartment lid weatherstrip.

14. Remove the parcel shelf.
For additional information, refer to: Parcel Shelf (501-05 Interior Trim and Ornamentation, Removal and Installation).

15. Remove the B-Pillar lower trim panel.
For additional information, refer to: B-Pillar Lower Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

16. Remove the C-Pillar side impact sensor.
For additional information, refer to: C-Pillar Side Impact Sensor (501-20B Supplemental Restraint System, Removal and Installation).

17. Remove the rear quarter window glass.
For additional information, refer to: Rear Quarter Window Glass (501-11 Glass, Frames and Mechanisms, Removal and Installation).

18. Remove the rear safety belt retractor.
For additional information, refer to: Rear Safety Belt Retractor (501-20A Safety Belt System, Removal and Installation).

19. Remove the rear door striker.

20. Remove the rocker panel outer moulding.

21. Remove the quarter panel splash shield.

22. Remove the forced air extraction grille.

23. Remove the rear bumper cover side retainer.

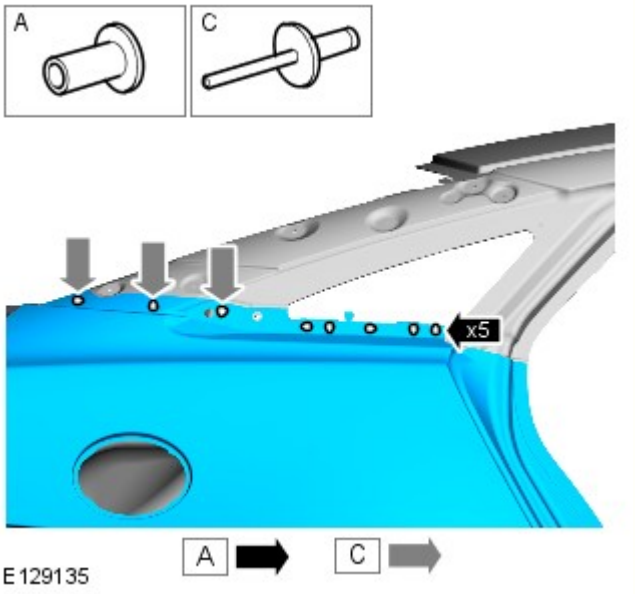
24. If the right-hand quarter panel is to be repaired, remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).

25. If the right-hand quarter panel is to be repaired remove the rear junction box (RJB).
For additional information, refer to: Rear Junction Box (RJB) (418-00 Module Communications Network, Removal and Installation).

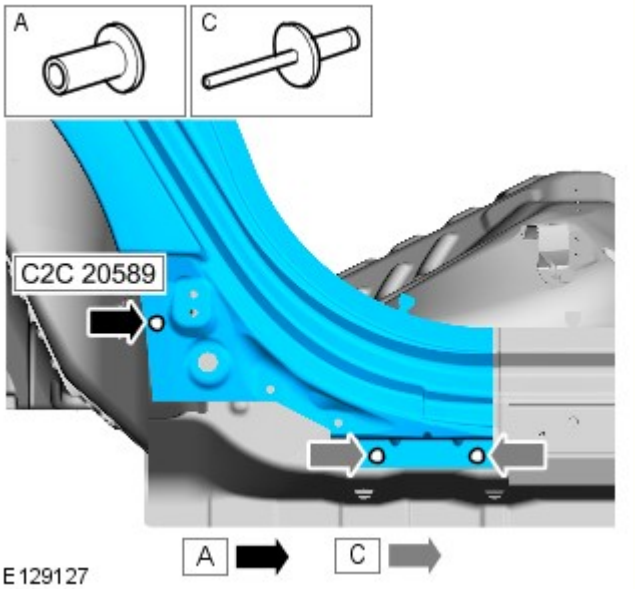
26. If the right-hand quarter panel is to be repaired remove the fuel filler door assembly.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

27. Remove any electrical components in the local area of repair to prevent damage.

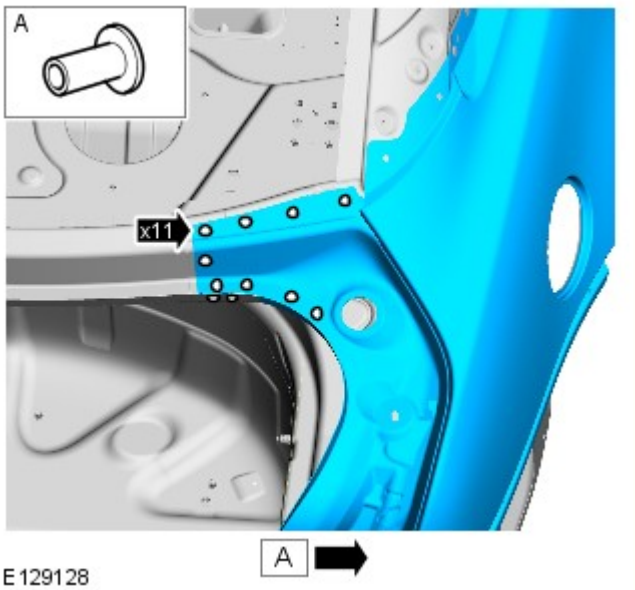
28. Release the back panel and loadspace wiring harness and position it to one side.



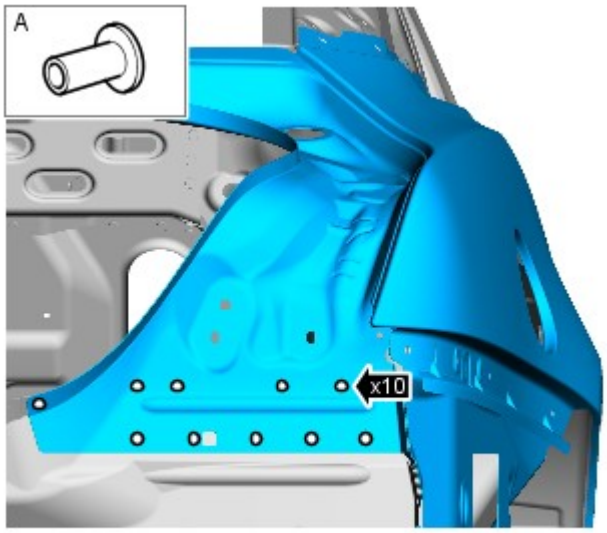
29. Remove the Monobolts from the quarter panel inner. Using the ESN50 remove the self piercing rivets from the quarter panel inner.



30. Remove the Monobolts from the rocker panel. Using the ESN50 remove the self piercing rivet from the rear wheelhouse outer.

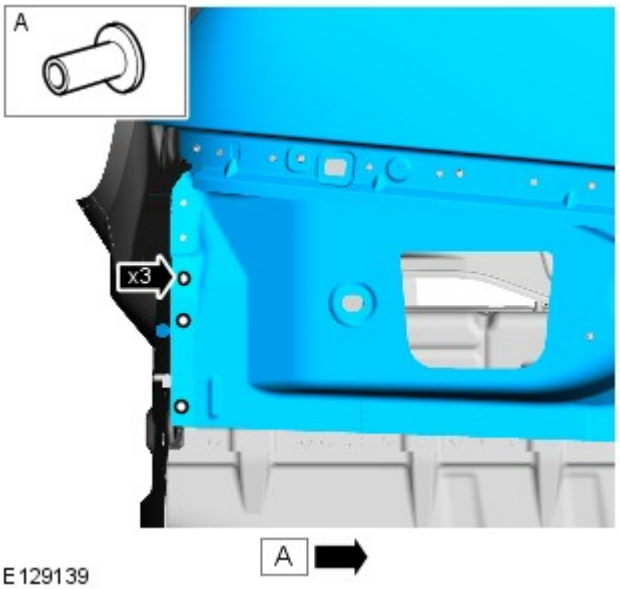


31. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the rear parcel shelf panel.



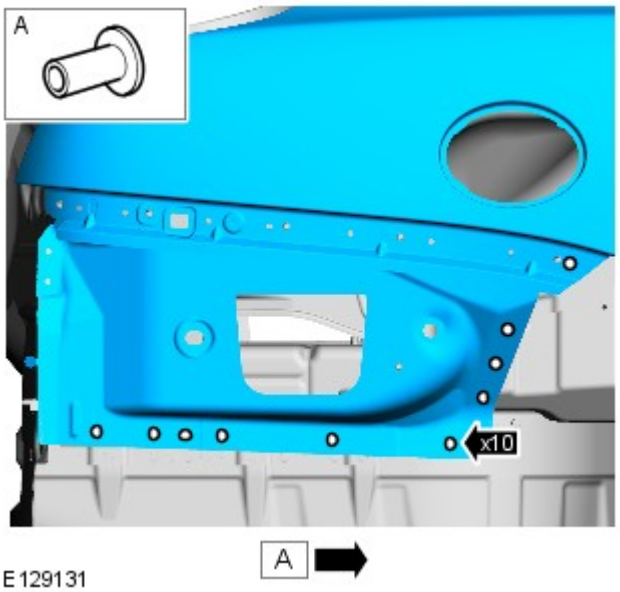
E129129

32. Using a combination of the ESN50 and a 6.5mm Cryobit drill bit, remove the self piercing rivets from the back panel.



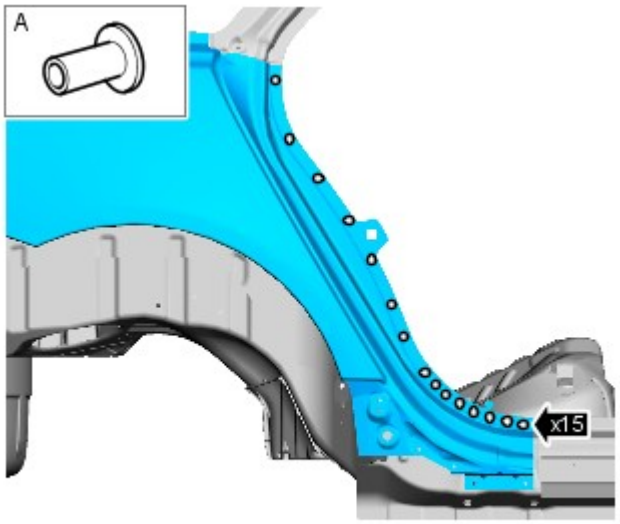
E129139

33. Using the ESN50, remove the self piercing rivets from the back panel.



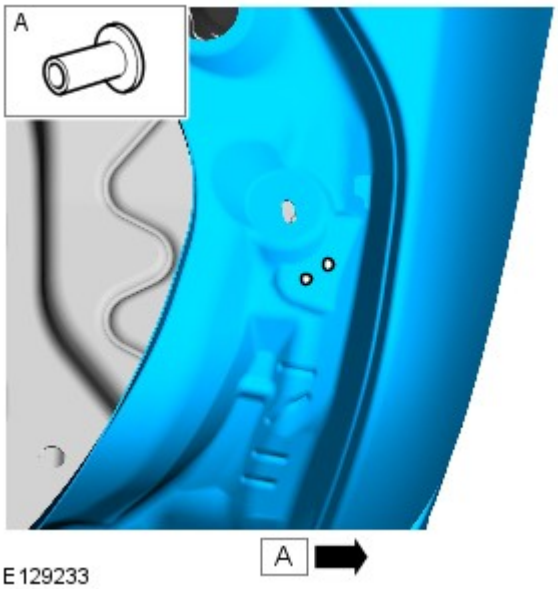
E129131

34. Using the ESN50, the self piercing rivets from the rear floor side extension and rear wheelhouse outer.



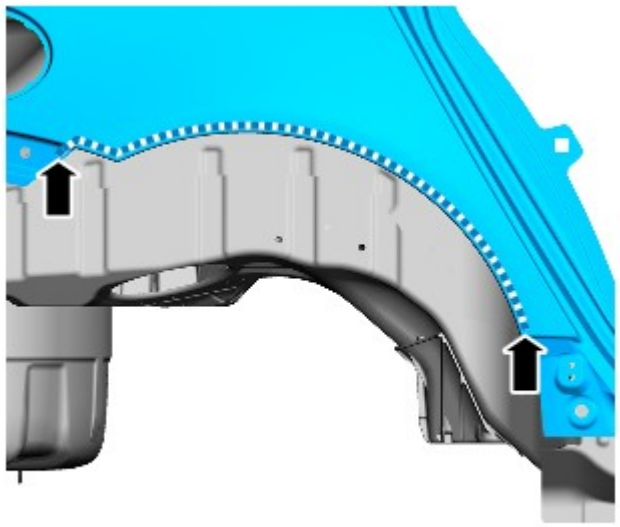
E129132

35. Using the ESN50, remove the self piercing rivets from the rear door aperture.



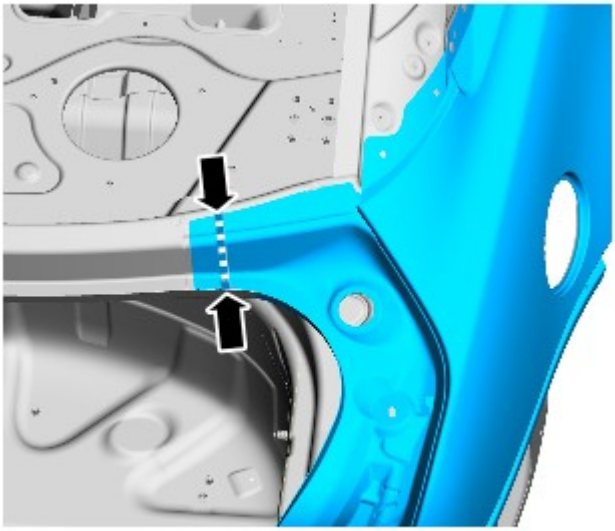
E129233

36. Using the ESN50, remove the self piercing rivets from the junction box and control module mounting panel.



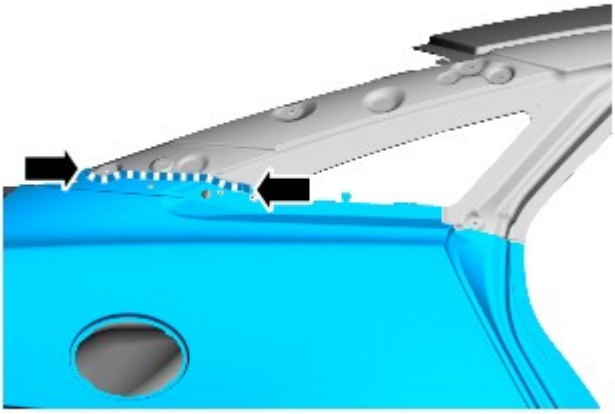
E129134

37. Carefully separate and release the adhesive from the wheelarch outer.



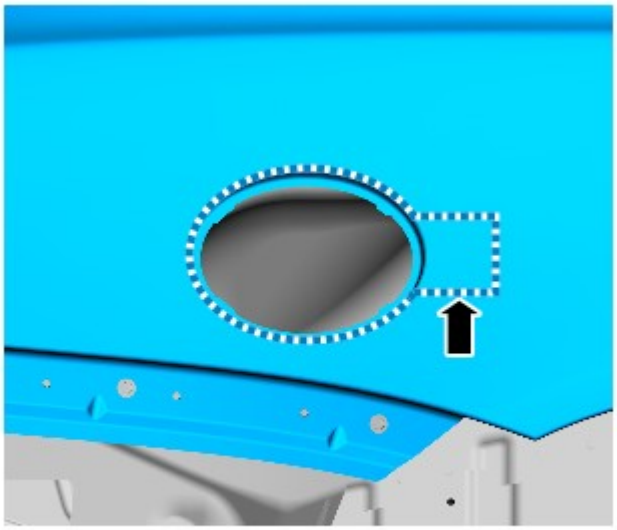
E129717

38. Carefully separate and release the adhesive from the rear parcel shelf panel.



E129743

39. Carefully separate and release the adhesive from the quarter panel inner.



E129133

40. If the right hand quarter panel is to be repaired, carefully separate and release the adhesive from the fuel filler door aperture.

41. Separate the joints and remove the old panel, also releasing the noise, vibration and harshness, (NVH), components.

Installation

1. If necessary, install the NVH components.

2. Remove rivet remnants.

3. Using a Roloc fine bristle disc, remove the adhesive residue.

4. Dress flanges where necessary.

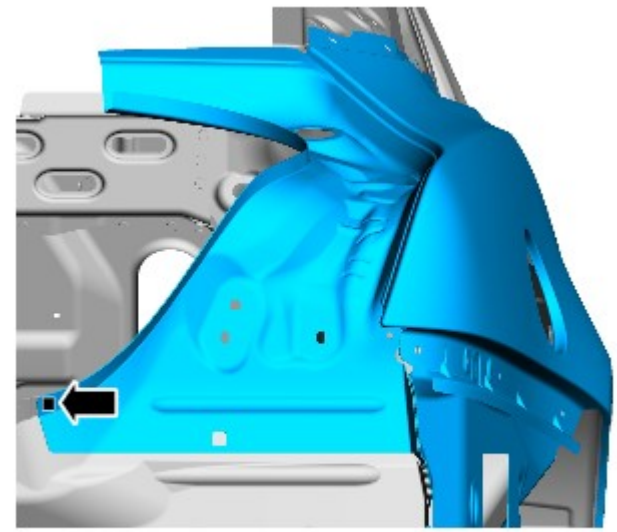
5. Offer up the new panel and clamp into position. Check alignment, if correct proceed to next step, if not, rectify and recheck before proceeding.

6. Using a 6.5mm Cryobit drill bit, drill holes through the old panels into the new panel at the points where Hemloks are to be installed. Where it is not possible to drill, scribe mark the hole locations on the new panel.

7. Remove the transit lug from the new panel.

8. Remove the new panel.

9. Using a 6.5mm Cryobit drill bit, drill holes in the new panel at the scribe marked locations.



E129716

10. Drill 1 10mm hole in the new quarter panel ready for MAG plug welding.

11. Deburr the drilled holes.

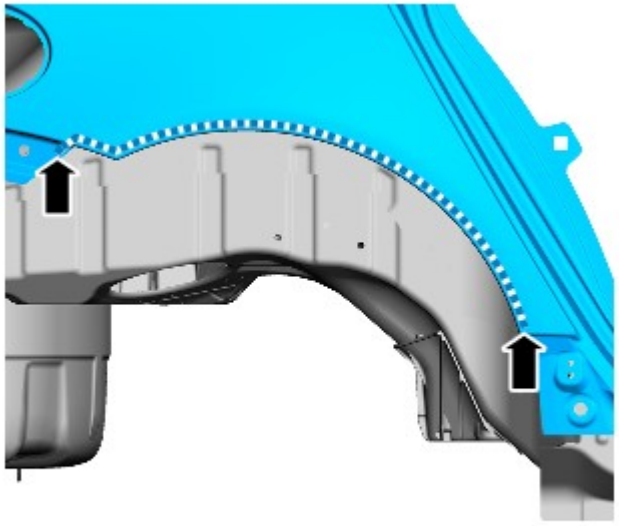
12. CAUTION: Use care not to damage the panel.

Remove seam sealer where applicable.

13. Using a Roloc fine bristle disc, clean and prepare the panel surfaces.

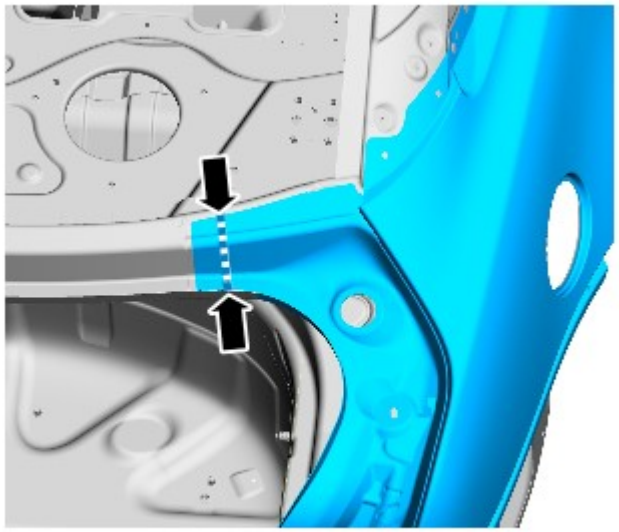
14. Pyrosil the joints.

15. Apply the coupling agent and allow to dry.



E129134

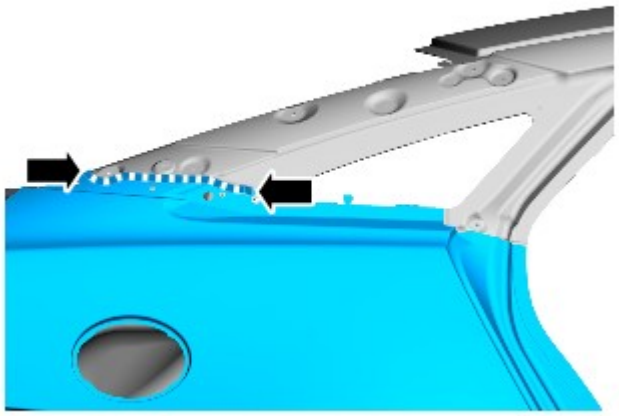
16. Apply semi-rigid sealer to the body at the wheelarch outer.



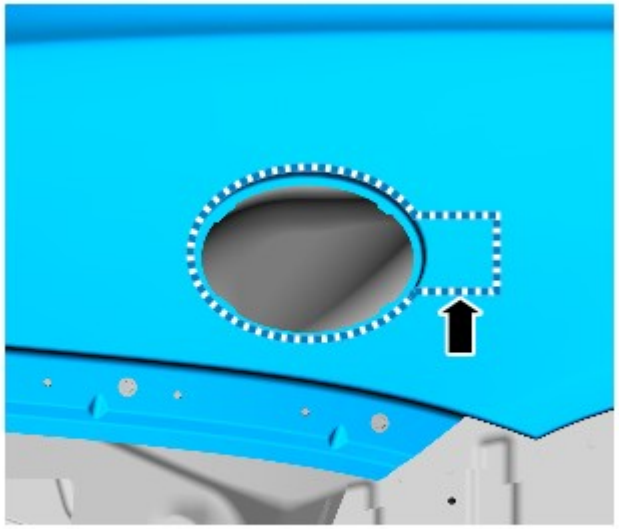
E129717

17. Apply semi-rigid sealer to the body at the rear parcel shelf panel.

18. Apply semi-rigid sealer to the body at the quarter panel inner.



E129743



E129133

19. If the right hand quarter panel is to be repaired, apply semi-rigid sealer to the body at the fuel filler door aperture.

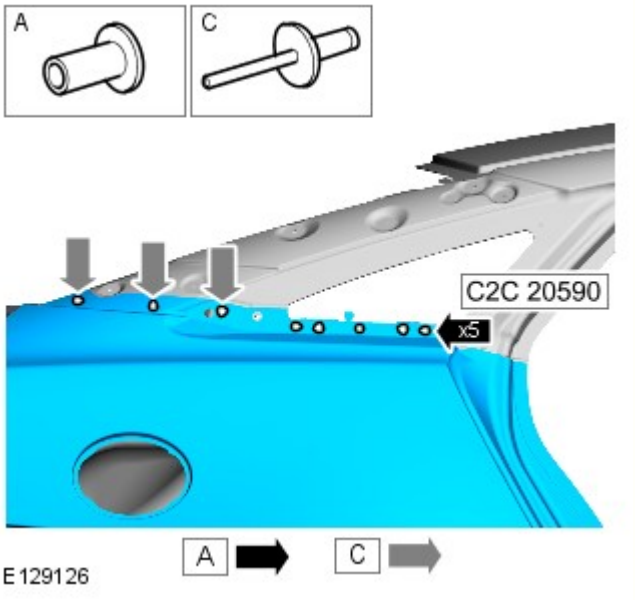
20. Apply semi-rigid sealer to the NVH components.

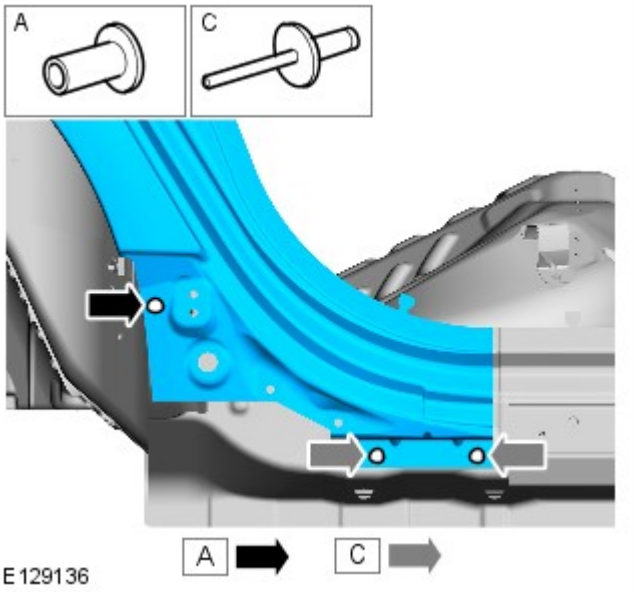
21. NOTE: make sure a continuous bead of adhesive surrounds the fixing holes. Do not apply adhesive in the vicinity of the MIG plug welds.

Apply a 5mm zig zag bead of 3M 8115 adhesive to the body joints.

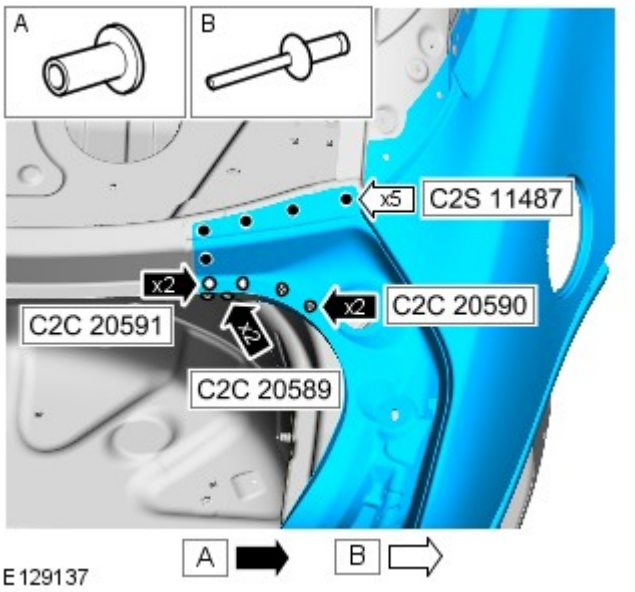
22. Offer up the new panel and clamp into position.

23. Using the Genesis G4, install the Monobolts into the quarter panel inner. Using the ESN50, install the self piercing rivets into the quarter panel inner.

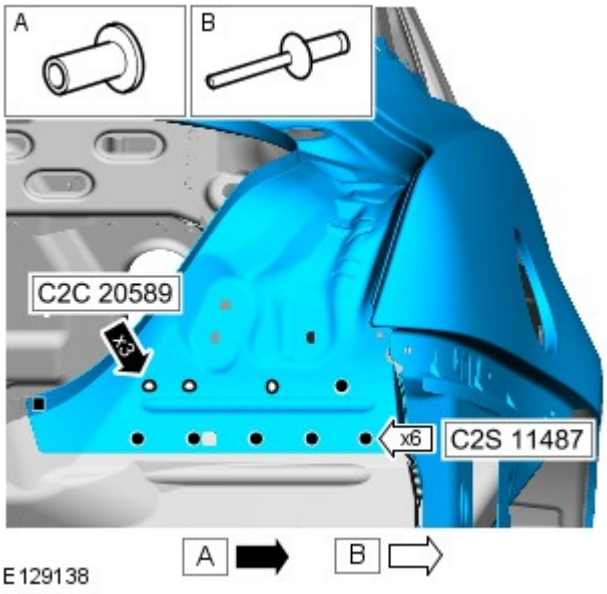




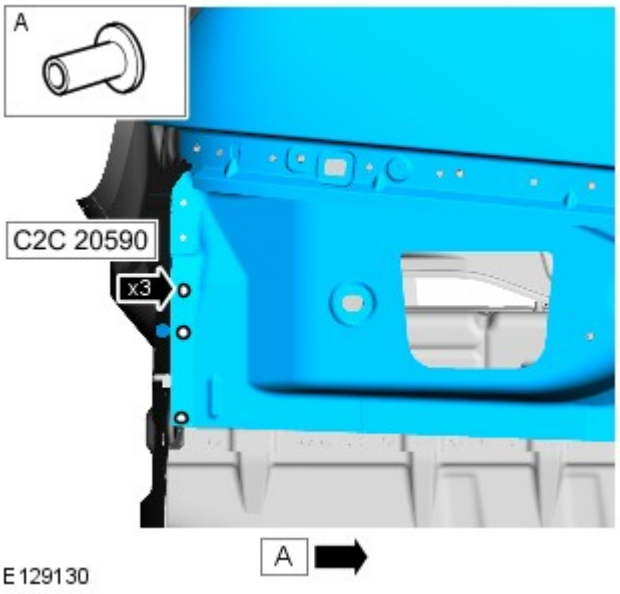
24. Using the Genesis G4, install the Monobolts into the rocker panel. Using the ESN50, install the self piercing rivet into the rear wheelhouse outer.



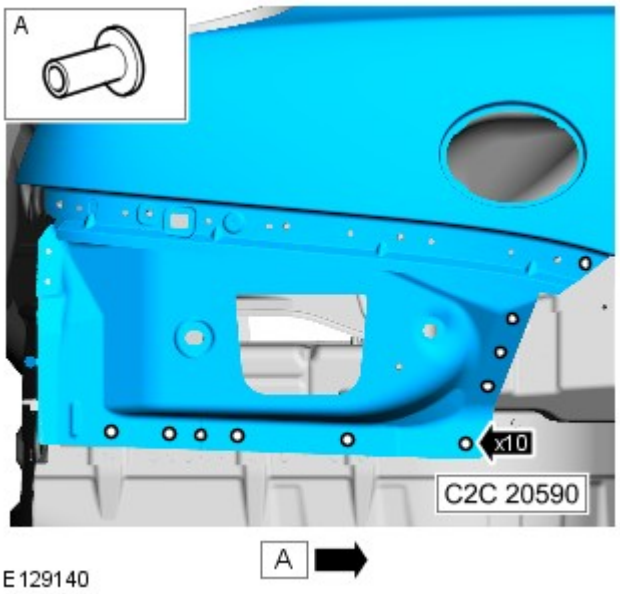
25. Using the Genesis G4, install the Hemloks into the rear parcel shelf panel. Using the ESN50, install the self piercing rivets into the rear parcel shelf panel.



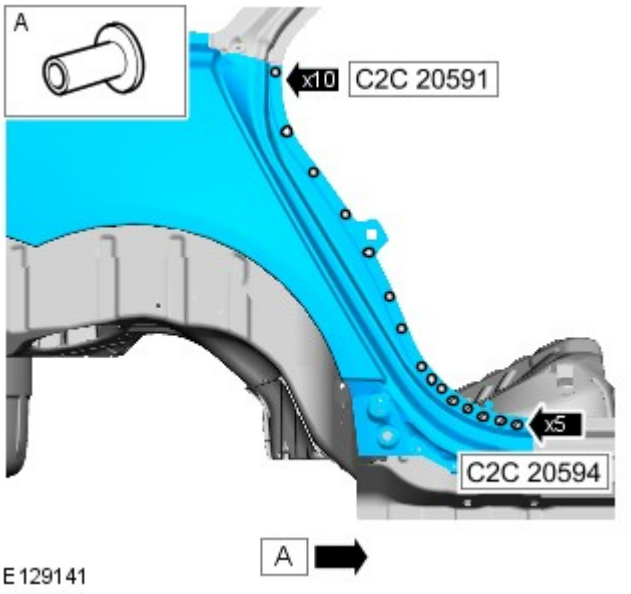
26. Using the Genesis G4, install the Hemloks into the back panel. Using the ESN50, install the self piercing rivets into the back panel.



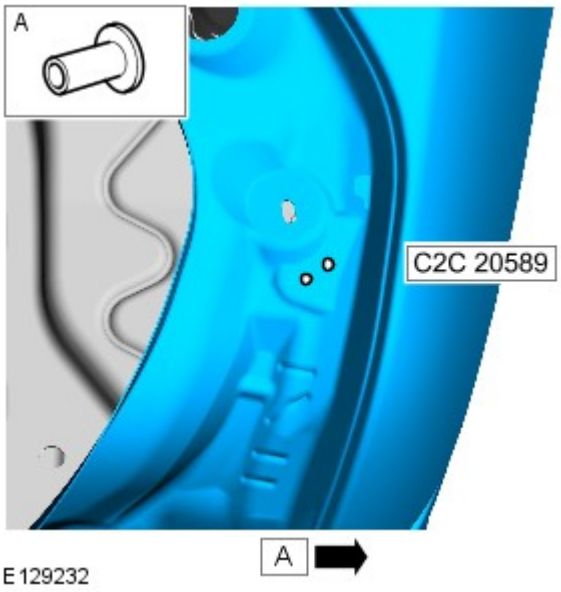
27. Using the ESN50, install the self piercing rivets into the back panel.



28. Using the ESN50, install the self piercing rivets into the rear floor side extension and rear wheelhouse outer.



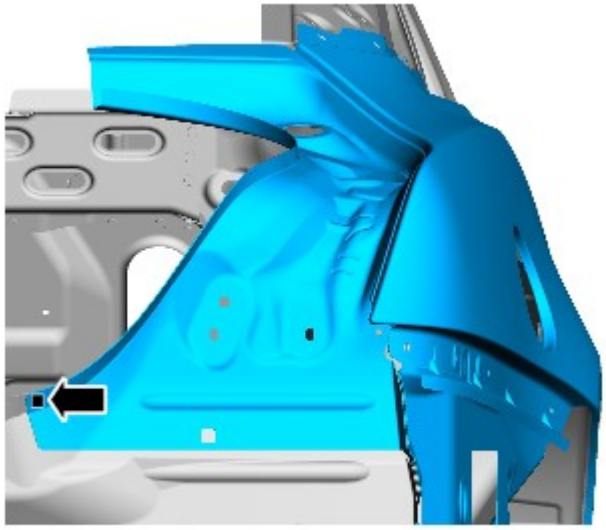
29. Using the ESN50, install the self piercing rivets into the rear door aperture.



30. Using the ESN50, install the self piercing rivets into the junction box and control module mounting panel.

31. Remove any excess adhesive.

32. Install the MIG plug weld into the back panel.



E129716

33. Install the NVH material as indicated.

E129533

34. The installation of associated panels and components is the reversal of removal procedure.

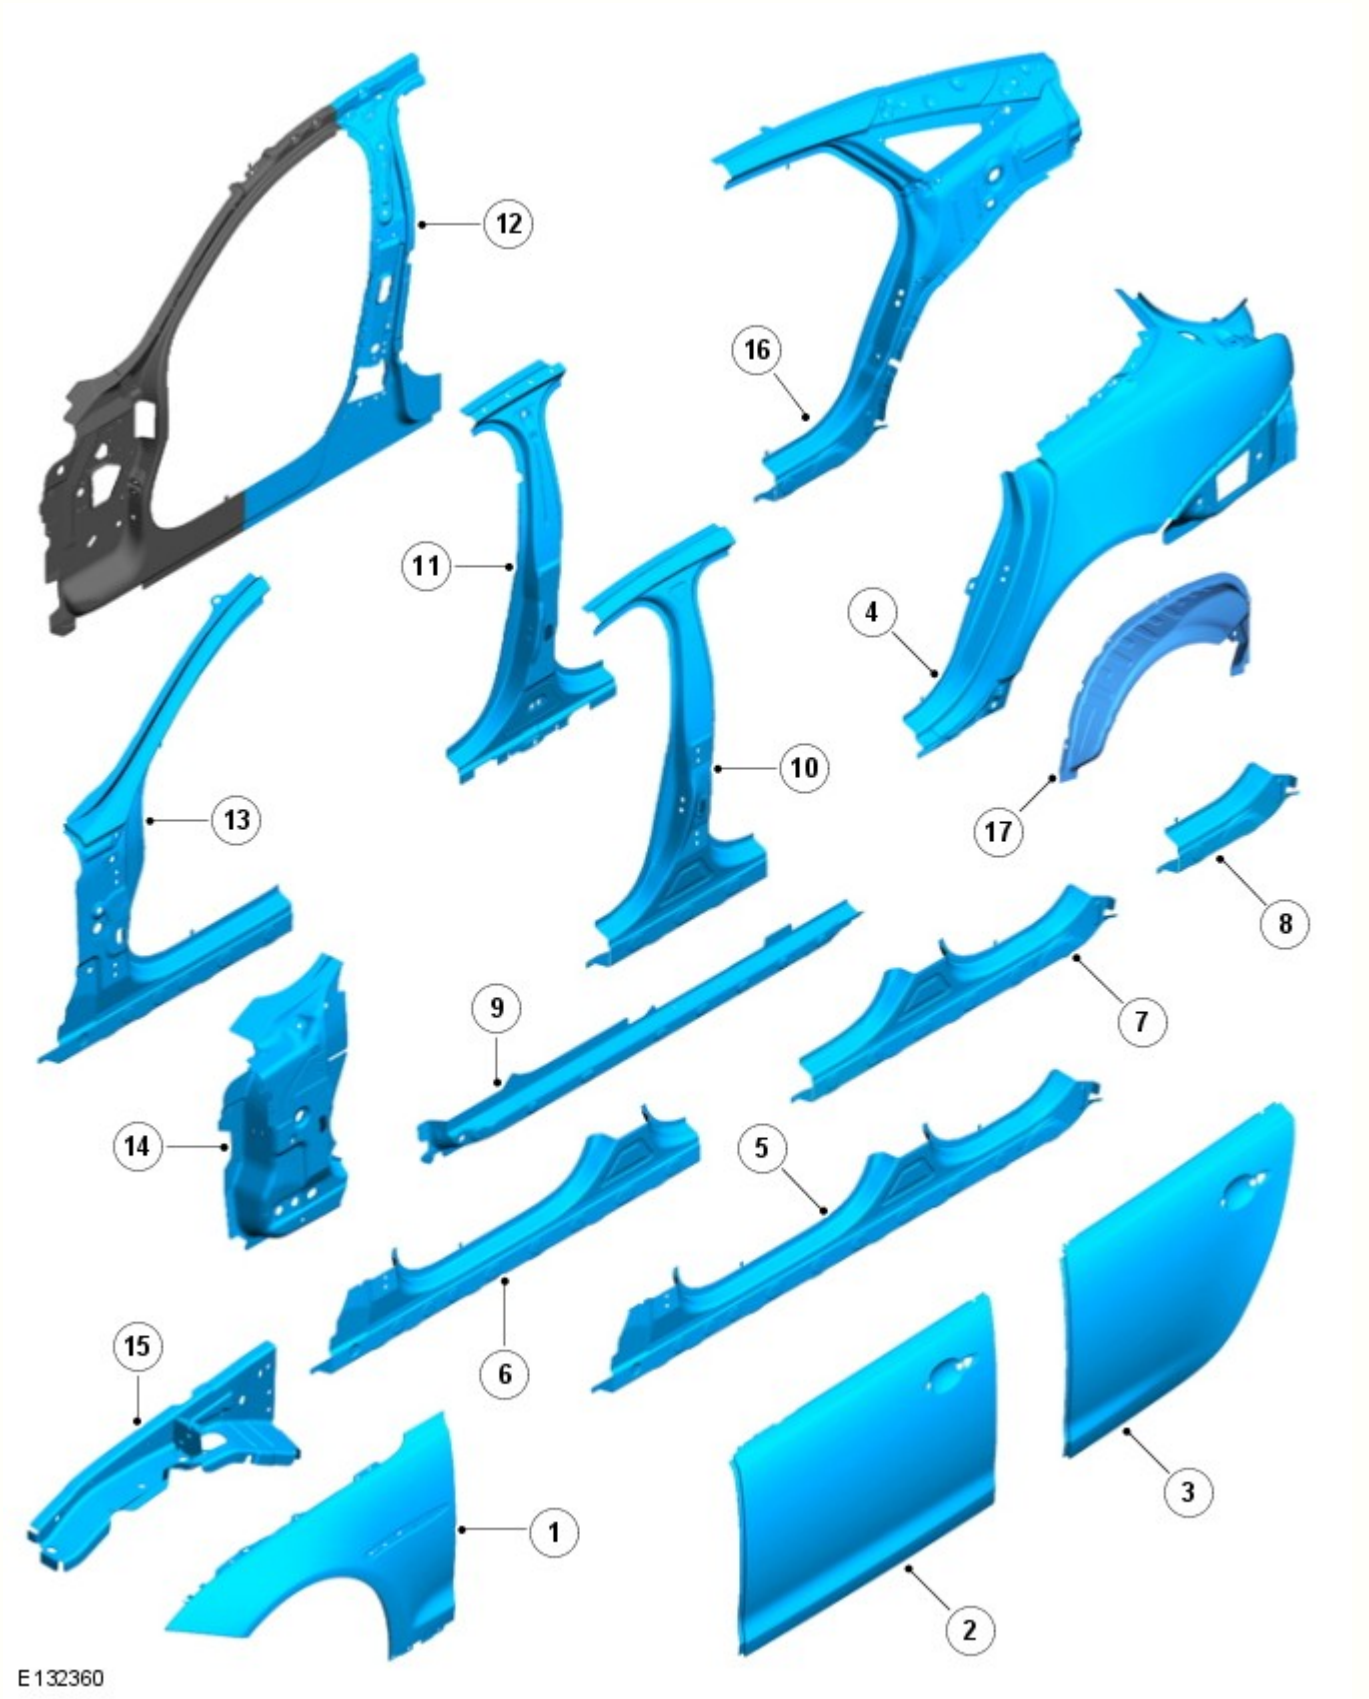
Side Panel Sheet Metal Repairs - Side Panel Sheet Metal

Description and Operation

Side service panels



NOTE: The illustration may indicate either hand of the service panel, the opposite hand will be similar.

Item	Description

1	Front fender
2	Front door
3	Rear door
4	Quarter panel
5	Rocker panel
6	Rocker panel front section (cut from rocker panel)
7	Rocker panel rear section (cut from rocker panel)
8	Rocker panel dogleg section (cut from rocker panel)
9	Rocker panel inner reinforcement
10	Rocker panel and B-pillar outer panel
11	B-pillar reinforcement
12	B-pillar inner panel
13	A-pillar outer panel
14	A-pillar reinforcement
15	Fender apron panel closing panel
16	Inner quarter panel rear section
17	Rear wheelhouse outer

Time schedules, side panels

The following information shows the total time taken to install single panels. This time includes removal of Mechanical, Electrical and Trim, (MET), items, plus paint times based on Metallic Clear Over Base Paint, (blends to adjacent panels are not included).

The times shown are to be used as a guide only.

Single panel times

Panel Description	Hours
A Pillar Outer Panel	23.90
A Pillar Reinforcement	TBC
Rocker Panel & B Pillar Outer Panel	39.80
B Pillar Reinforcement	4.20
Rocker Panel	18.60
Rocker Panel Inner Reinforcement	TBC

Supplemental Restraint System - Air Bag Disposal

General Procedures

Deployed Air Bag

1. WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

Deployed air bag modules are to be disposed of as special waste and must comply with local environmental requirements, if in doubt, contact Authority for disposal requirements.

2. NOTE: The storage, transportation, disposal, and/or recycling of air bag module components must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety, and transportation.

Modules removed and deployed by Jaguar service are to be returned to the importer for disposal.

Undeployed Air Bag — Inoperative

1. WARNING: Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

NOTE: All inoperative air bag modules have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned. Failure to follow this instruction may result in personal injury.

Remove the inoperative driver air bag module or passenger air bag module. For additional information
For additional information, refer to: Driver Air Bag Module (501-20B Supplemental Restraint System, Removal and Installation).
or
For additional information, refer to: Passenger Air Bag Module (501-20B Supplemental Restraint System, Removal and Installation). in this section.

Undeployed Air Bag — Scrapped Vehicle

Remote Deployment

1. WARNINGS:

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Remote deployment is to be carried out outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required. Failure to follow this instruction may result in personal injury.

Do not place the driver or passenger air bag module with the trim cover or deployment door facing down, as the forces of the deploying air bag can cause it to ricochet and cause personal injury. Failure to follow this instruction may result in personal injury.

Equipment required: Universal deployment tool-Part N° 418-135 and 12V Battery.

2. The deployment procedure should be carried out outdoors away from other personnel.

3. Remove any loose debris from around air bag. Make sure that no flammable liquids are present.

4. Disconnect the battery ground and positive cables.

5. Disconnect the relevant air bag module electrical connector.

6. Connect the appropriate adaptor lead to the restraint device.

7. Connect the deployment lead to the adaptor lead. Pass wire of the deployment tool through window, close all doors, leave window with lead for deployment tool open.

8. WARNING: Before proceeding, make sure precautions have been taken to warn personnel of a possible loud noise upon activation. Do not allow anybody to approach closer to restraint device than six meters. Failure to follow this instruction may result in personal injury.

Move as far from restraint device as possible and connect the tool clips to a 12V vehicle battery.

9. WARNING: Do not handle the deployed device immediately after activation - it may be hot. Allow the unit to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat does not create a fire with spilled liquids or other debris. Failure to follow this instruction may result in personal injury.

Deploy the module by depressing both switches on the tool. If activation does not occur, disconnect battery from tool and seek advise from Jaguar Engineering and wait for further instructions.

10. Repeat procedure for all air bags in vehicle.

11. The vehicle is now to be scrapped in the normal manner with modules installed.

Disposal of live air bag modules for all air bags, using tyres

1. Equipment required: Deployment tool 418-S135, Battery (12V), Safety goggles to BS2092 grade 2, Rubber gloves to PrEN 374 class 2, Ear protectors that have been measured to BS.EN 24869, Particulate respirator to EN 149 grade FFP2S

2. The deployment procedure should be carried out outdoors, away from other personnel.

3. Stack four scrap tyres, securing together with heavy gauge wire or cable. while disconnected from any electrical power source, connect deployment harness and place air bag adaptor portion under tyre stack, ready for connection to air bag.

4. WARNING: Power must not be connected during this step. Failure to follow this instruction may result in personal injury.

CAUTION: Make sure the connector is not in contact with the inflator or it will be damaged during the test.

Connect air bag to air bag connector, make sure the locking sleeve is fully engaged. position the air bag with the cover facing upwards.

5. Make sure battery connections of deployment harness are ten meters away from the tyre stack

6. Remove any loose from around the air bag . Make sure that no flammable liquids are present.

7. WARNING: Before proceeding, make sure precautions have been taken to warn personnel of a possible loud noise upon activation. Do not allow anybody to approach closer to restraint device than six meters. Failure to follow this instruction may result in personal injury.

Move as far from restraint device as possible and connect the tool clips to a 12V vehicle battery.

8. WARNING: Do not handle the deployed device immediately after activation - it may be hot. Allow the unit to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat does not create a fire with spilled liquids or other debris. Failure to follow this instruction may result in personal injury.

Deploy the module by depressing both switches on the tool. If activation does not occur, disconnect battery from tool and seek advise from Jaguar Engineering and wait for further instructions.

9. Allow the air bag to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat generated a fire with spilled liquids or other debris.

10. Remove the air bag from the tyre stack and seal in a plastic bag, ready for disposal.

11. In the event of any problems or queries arising from this procedure, contact Jaguar Engineering.

Supplemental Restraint System - Passenger Air Bag Module

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

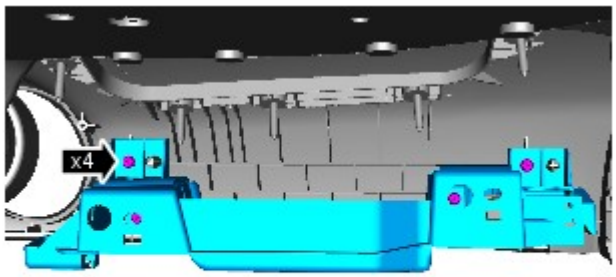
To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

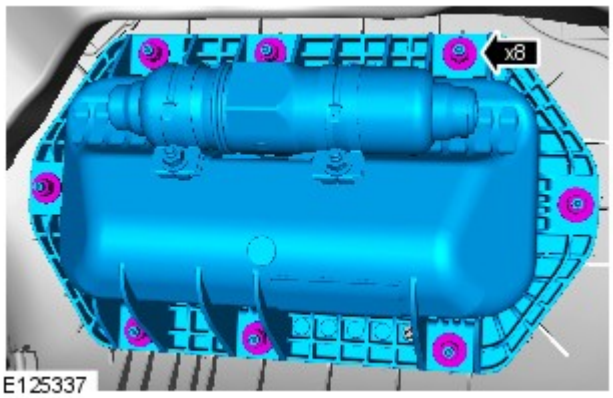
NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Instrument Panel Upper Section (501-12 Instrument Panel and Console, Removal and Installation).



E125333

2. *Torque:* 2.5 Nm



E125337

3. *Torque:* 4.5 Nm

Installation

1. To install, reverse the removal procedure.

Supplemental Restraint System - Driver Air Bag Module

Removal and Installation

Special Tool(s)

	JLR-501-168 Remover, Driver Airbag Module

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

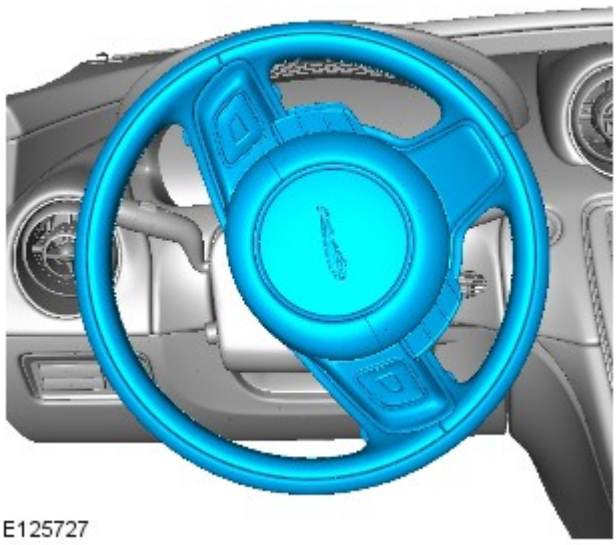
Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

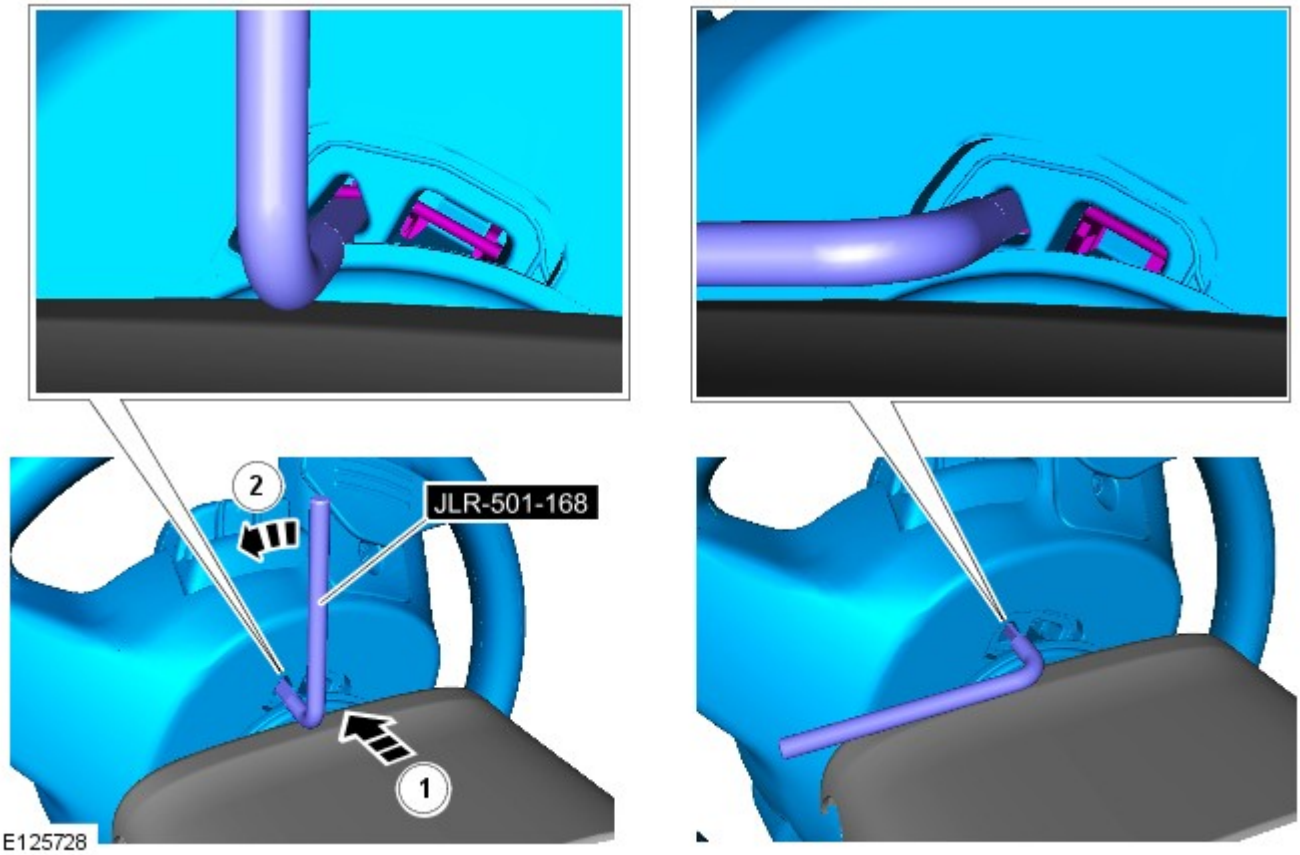
NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

2.



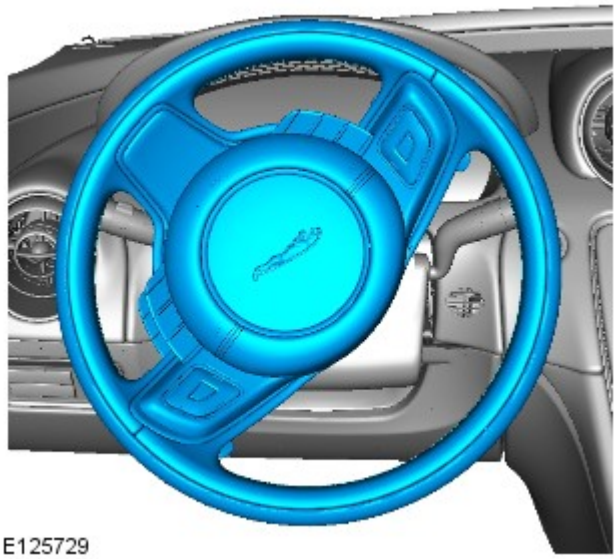
E125727



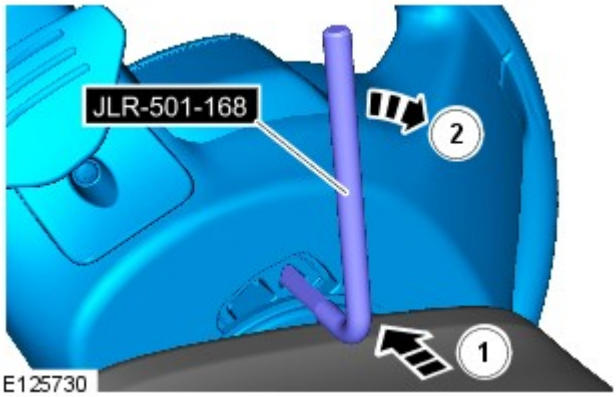
E125728

4. Remove the special tool.

5.



E125729



E125730

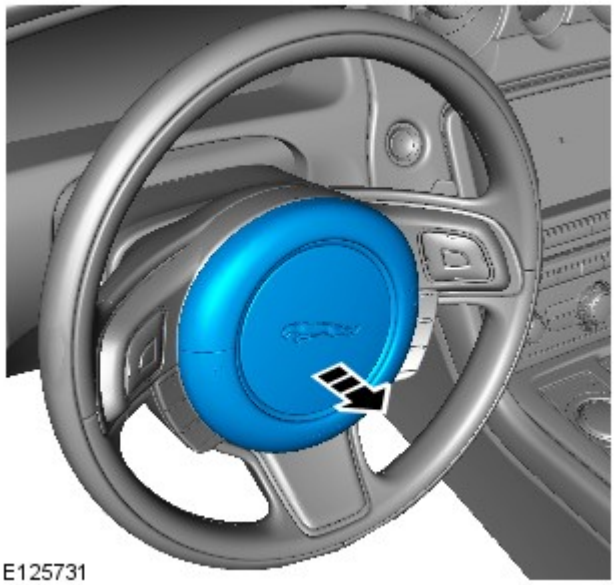
6. NOTES:

Gently pull on the side of the airbag module which has been released until it has been withdrawn sufficiently to clear the spring clip.

An audible click can be heard when the airbag module has been released from each side of the steering wheel.

Special Tool(s): JLR-501-168

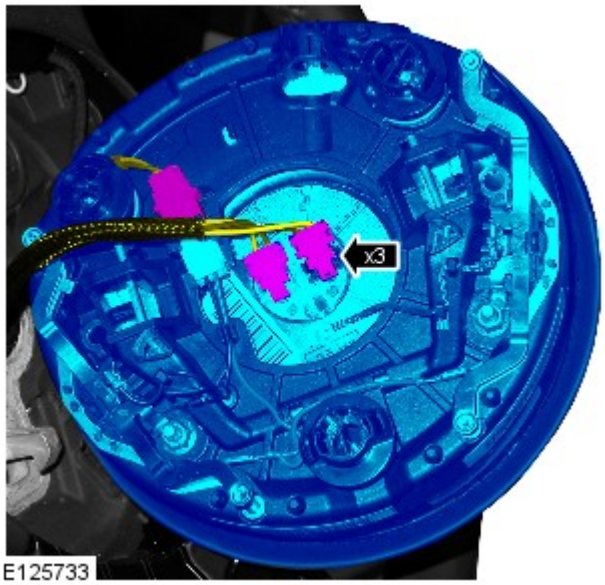
7. Remove the special tool.



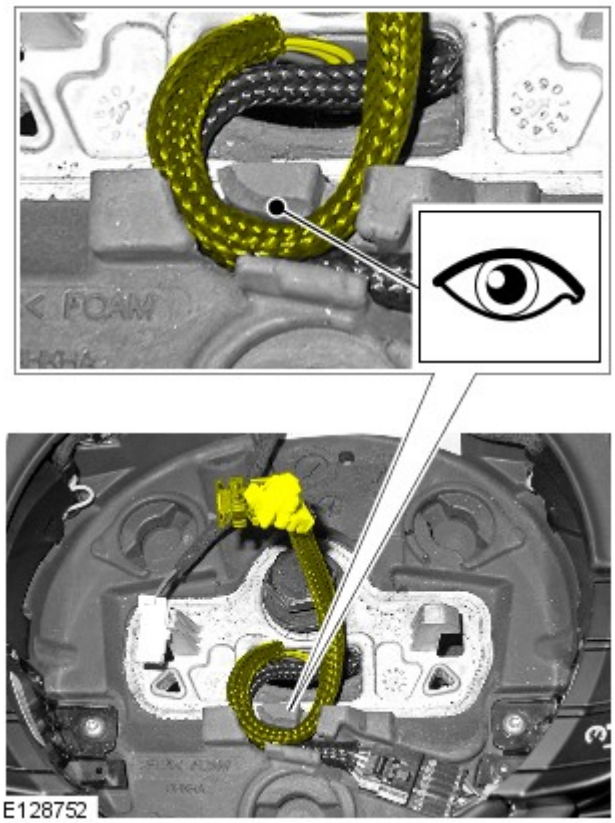
E125731

8. CAUTION: Make sure the wiring harness is installed to its original position.

9. WARNING: Driver air bag module installation can be confirmed by hearing 2 audible clicks, 1 for each clip.



Installation



1. CAUTION: Make sure that the wiring harnesses are correctly routed.

To install, reverse the removal procedure.

Supplemental Restraint System - Air Bag Supplemental Restraint System (SRS)

Diagnosis and Testing

Principle of Operation

For a detailed description of the Supplemental Restraints system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (501-20B Supplemental Restraint System)

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (Description and Operation),
Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (Description and Operation),
Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (Description and Operation).
Given the potential for damage/injury, the preferred method of diagnosis is the manufacturer approved diagnostic system, and even when using this, the following safety information should be followed at all times:

Safety Information

WARNINGS:

To avoid accidental deployment the back-up power supply must be depleted before beginning any work on the SRS system or its components. Failure to follow this instruction may result in personal injury.

Do not use a multimeter to probe an SRS module. It is possible for the power from the metre battery to trigger the activation of the module. Failure to follow this instruction may result in personal injury.

NOTES:

It is advisable not to use a cellular phone or to have a cellular phone in close proximity when working on the SRS system or components.

Given the legal implications of a restraints system failure, harness repairs to Air Bag module circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.

Power Supply Depletion

Before beginning any work on the SRS system or related components:

1. Remove the ignition key.
2. Disconnect the battery leads, ground first.
3. Wait 2 minutes for the power circuit to discharge.

There are comprehensive instructions on the correct procedures for SRS system repairs in the manual. Refer to the relevant section of the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. Verify the customer concern.
   - Confirm the function of the warning lamp (if the warning lamp is inoperative, system faults will be signalled by an audible chime)
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
• Check for the installation of non-standard accessories which may affect or obstruct the function of the SRS system • Check the condition of trim, etc at the SRS system components	• Fuses • Wiring harness • Make sure all electrical connector(s) are engaged correctly on the air bag circuits • Make sure the Restraints Control Module (RCM) is correctly installed • Warning lamp bulb(s)

• Sensor(s) • Pretensioner(s) • Air bag module(s) • Occupant detection/classification sensors • Seat position sensor	• Impact sensor(s) • Buckle sensor(s) • Pretensioner(s) • Air bag module(s) • Air bag deactivation switch • Air bag deactivation warning lamp • Occupant detection/classification sensors • Seat position sensor • Clockspring

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
   - Faults in SRS harnesses would normally mean replacement of the relevant harness. SRS harness repairs are **not** recommended

4. If the cause is not visually evident check the system for any logged Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Restraints Control Module (RCM) (100-00 General Information, Description and Operation) /
Diagnostic Trouble Code (DTC) Index - DTC: Occupant Classification System (OCS) (100-00 General Information, Description and Operation).

Published: 20-Apr-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Occupant Classification System (OCS)

Description and Operation

Occupant Classification System (OCS)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Occupant Classification System module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.

For additional information, refer to: Air Bag Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1193-53	Crash Event Storage Full and Locked - Deactivated	• The vehicle has been involved in a collision	• Confirm if vehicle has been involved in a collision, if so take appropriate repair actions • Clear DTC and retest system
B1A54-01	Occupant Belt Tension Sensor - General electrical failure	• Safety belt tension sensor jammed for more than 3 seconds	• Check safety belt for twists in the webbing or damaged webbing. Ensure no objects are jamming operation of the belt. Remove any external causes of jamming, clear DTC and retest system. If DTC remains suspect belt tension sensor fault • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A54-02	Occupant Belt Tension Sensor - General signal failure	• Wiring harness fault • Control Module Fault	• Refer to the electrical circuit diagrams and check the belt tension sensor signal circuit for short circuit to the pressure sensor signal circuit. Repair wiring as required, clear DTC and retest system. If DTC remains suspect control module internal fault • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A54-11	Occupant Belt Tension Sensor - Circuit short to ground	• Wiring harness fault • Occupant belt tension sensor internal fault • Control Module internal fault	• Refer to the electrical circuit diagrams and check the belt tension sensor signal circuit for short to ground. Repair wiring as required, clear DTC and retest system. If DTC remains suspect occupant belt tension sensor internal fault, check sensor for internal short from signal pin to ground pin • If no fault found with tension sensor suspect control module • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A54-12	Occupant Belt Tension Sensor - Circuit short to battery	• Wiring harness fault • Occupant belt tension sensor internal fault • Control Module internal fault	• Refer to the electrical circuit diagrams and check the belt tension sensor signal circuit for short to power. Repair wiring as required, clear DTC and retest system. If DTC remains suspect occupant belt tension sensor internal fault, check sensor for internal short from signal pin to reference voltage pin • If no fault found with tension sensor suspect control module • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A54-13	Occupant Belt Tension Sensor - Circuit open	• Wiring harness fault • Occupant belt tension sensor internal fault • Control Module internal fault	• Refer to the electrical circuit diagrams and check the belt tension sensor signal circuit for open circuit. Repair wiring as required, clear DTC and retest system. If DTC remains suspect occupant belt tension sensor internal fault • If no fault found with tension sensor suspect control module • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A62-02	Pressure Sensor - General signal failure	• Wiring harness fault • Control Module Fault	• Refer to the electrical circuit diagrams and check the belt tension sensor signal circuit for short circuit to the pressure sensor signal circuit. Repair wiring as required, clear DTC and retest system. If DTC remains suspect control module internal fault • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A62-11	Pressure Sensor - Circuit short to ground	• Wiring harness fault • Pressure sensor internal fault • Control Module internal fault	• Refer to the electrical circuit diagrams and check the pressure sensor signal circuit for short to ground. Repair wiring as required, clear DTC and retest system. If DTC remains suspect pressure sensor internal fault, check sensor for internal short from signal pin to ground pin • If no fault found with pressure sensor suspect control module • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A62-12	Pressure Sensor -	• Wiring harness fault	• Refer to the electrical circuit diagrams and check the pressure sensor signal circuit for short to power. Repair wiring as required, clear DTC and retest system. If DTC remains suspect pressure sensor internal fault

	Circuit short to battery	• Pressure sensor internal fault • Control Module internal fault	• If no fault found with pressure sensor suspect control module • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
B1A62-7A	Pressure Sensor - Fluid leak or seal failure	• Internal sensor fault	• Install a new pressure sensor control module
B1A62-7B	Pressure Sensor - Low fluid level	• Internal sensor fault	• Install a new sensor bladder
U0001-00	High Speed CAN Communication Bus - No sub type information	• Wiring harness fault • Control module fault	• Check other control modules for related DTCs and refer to the relevant DTC index • Check other control modules for related DTCs and refer to the relevant DTC index. Refer to the electrical circuit diagrams and check for short circuit between CAN high and CAN low circuits. Repair wiring fault and perform network integrity test using the manufacturer approved diagnostic system. If no wiring faults are found in the wiring harness suspect an internal fault within a control module • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
U0151-00	Lost Communication With Restraints Control Module - No sub type information	• Wiring harness fault • Power distribution fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Restraints Control Module and Occupancy Classification System Control Module
U0300-00	Internal Control Module Software Incompatible - No sub type information	• Car configuration file stored in Occupancy Classification System Control Module does not match the master car configuration file • Master car configuration file not being transmitted by master control module	• Check all control modules for related DTCs and refer to the relevant DTC index • Check the components installed on the vehicle were installed by the factory or a dealer • Install the original components or a new one as required
U3000-04	Control Module - System internal failures	• Occupancy Classification System control module internal fault	• Install a new control module • Refer to the Warranty Policy and Procedures manual if a module/component is suspect
U3000-51	Control Module - Not programmed	• Occupancy Classification System control module application missing	• Program the control module using the manufacturer approved diagnostic system
U3000-54	Control Module - Missing calibration	• Calibration missing	• Using the manufacturers approved diagnostic system perform the empty seat offset routine. Clear the DTC and retest the system
U3003-16	Battery Voltage - Circuit voltage below	• Battery fault • Charging system fault	• The Occupancy Classification System Control Module has detected a supply voltage below 8 volts • Check the Engine Control Module for charging circuit related DTCs. Refer to the Battery Care Manual and the Workshop Manual and check the vehicle battery and charging circuit performance

	threshold	• Power distribution fault	• If the vehicle battery and charging system are performing correctly check power and ground supplies to the control module. Rectify wiring fault and clear the DTC. Retest the system
U3003-17	Battery Voltage - Circuit voltage above threshold	• Battery fault • Charging system fault	• The Occupancy Classification System Control Module has detected a supply voltage above 18 volts • Check the Engine Control Module for charging circuit related DTCs. Refer to the Battery Care Manual and the Workshop Manual and check the vehicle battery and charging circuit performance • Rectify battery and any wiring faults and clear the DTC. Retest the system

Supplemental Restraint System - Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) - Overview

Description and Operation

OVERVIEW

WARNING: All pyrotechnic devices are dangerous. Before performing any procedures on any pyrotechnic device, read all information contained within the Service Information section of this manual. Refer to: General Service Information (100-00, Description and Operation).

The SRS (supplemental restraint system) provides additional protection for vehicle occupants in certain impact conditions by selective activation of twin stage driver and passenger air bags, side air bags, side air curtains and front safety belt pretensioners. Operation of the system is controlled by a RCM (restraints control module) .

The RCM receives inputs from various sensors around the vehicle to determine which devices, if any, should be activated during an accident. The inputs include those from an occupant monitoring system for the front passenger seat, front and side impact sensors and side pressure sensors.

In all markets except NAS, a PAD (passenger air bag deactivation) switch is a dealer fit option that allows the passenger air bag to be disabled.

The activation status of the passenger air bag is given by an indicator on the overhead console. The status of the SRS is given by an air bag warning indicator in the instrument cluster.

General Information - Diagnostic Trouble Code (DTC) Index DTC: Restraints Control Module (RCM)

Description and Operation

Restraints Control Module (RCM)

WARNINGS:

TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO DEPLETE THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

Do not use a multimeter to probe the restraints control module. It is possible for the power from the meter battery to trigger the activation of the airbags. Failure to follow this instruction may result in personal injury.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

It is advisable not to use a cellular phone or to have a cellular phone in close proximity when working on the restraints control module or associated systems.

Given the legal implications of a restraints system failure, harness repairs to Air Bag module circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Restraints Control Module (RCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.
For additional information, refer to: Air Bag Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Diagnosis and Testing) /
Pedestrian Protection System (501-20C Pedestrian Protection System, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B0001-11	Driver Frontal Stage 1 Deployment Control - Circuit short to ground	• Driver airbag (stage 1) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-12	Driver Frontal Stage 1 Deployment Control - Circuit short to battery	• Driver airbag (stage 1) circuit short to power	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to power. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-13	Driver Frontal Stage 1 Deployment Control - Circuit open	• Driver airbag (stage 1) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for open circuit, high resistance. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag

B0001-1A	Driver Frontal Stage 1 Deployment Control - Circuit resistance below threshold	• Driver airbag (stage 1) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit between power and ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-2B	Driver Frontal Stage 1 Deployment Control - Signal cross coupled	• Driver airbag (stage 1) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver airbag (stage 1) circuit for short circuit to another restraints circuit. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0001-95	Driver Frontal Stage 1 Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0002-11	Driver Frontal Stage 2 Deployment Control - Circuit short to ground	• Driver airbag (stage 2) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit to ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-12	Driver Frontal Stage 2 Deployment Control - Circuit short to battery	• Driver airbag (stage 2) circuit short to power	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit to power. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-13	Driver Frontal Stage 2 Deployment Control - Circuit open	• Driver airbag (stage 2) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for open circuit, high resistance. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-1A	Driver Frontal Stage 2 Deployment Control - Circuit resistance below threshold	• Driver airbag (stage 2) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit between power and ground. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
B0002-2B	Driver Frontal Stage 2 Deployment Control - Signal cross coupled	• Driver airbag (stage 2) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver airbag (stage 2) circuit for short circuit to another restraints circuit. Check for intermittent short circuit within the clockspring by rotating the steering column during the checks. Install a new wiring harness as necessary. Install a new clockspring as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver airbag
	Driver Frontal Stage 2		

B0002-95	Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0010-11	Passenger Frontal Stage 1 Deployment Control - Circuit short to ground	• Passenger airbag (stage 1) circuit short to ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-12	Passenger Frontal Stage 1 Deployment Control - Circuit short to battery	• Passenger airbag (stage 1) circuit short to power	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-13	Passenger Frontal Stage 1 Deployment Control - Circuit open	• Passenger airbag (stage 1) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-1A	Passenger Frontal Stage 1 Deployment Control - Circuit resistance below threshold	• Passenger airbag (stage 1) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-2B	Passenger Frontal Stage 1 Deployment Control - Signal cross coupled	• Passenger airbag (stage 1) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 1) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0010-95	Passenger Frontal Stage 1 Deployment control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0011-11	Passenger Frontal Stage 2 Deployment Control - Circuit short to ground	• Passenger airbag (stage 2) circuit short to ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-12	Passenger Frontal Stage 2 Deployment Control - Circuit short to battery	• Passenger airbag (stage 2) circuit short to power	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-13	Passenger Frontal Stage 2 Deployment Control - Circuit open	• Passenger airbag (stage 2) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
	Passenger Frontal		

B0011-1A	Stage 2 Deployment Control - Circuit resistance below threshold	• Passenger airbag (stage 2) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-2B	Passenger Frontal Stage 2 Deployment Control - Signal cross coupled	• Passenger airbag (stage 2) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag (stage 2) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger airbag
B0011-95	Passenger Frontal Stage 2 Deployment control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0020-11	Left Side Air Bag Deployment Control - Circuit short to ground	• Left side airbag (seat) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-12	Left Side Air Bag Deployment Control - Circuit short to battery	• Left side airbag (seat) circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-13	Left Side Airbag Deployment Control - Circuit open	• Left side airbag (seat) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-1A	Left Side Air Bag Deployment Control - Circuit resistance below threshold	• Left side airbag (seat) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-2B	Left Side Air Bag Deployment Control - Signal cross coupled	• Left side airbag (seat) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left side airbag (seat) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side airbag (seat)
B0020-95	Left Side Airbag Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0021-11	Left Curtain Deployment Control 1 - Circuit short to ground	• Left side air curtain circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
	Left Curtain Deployment	• Left side air curtain circuit	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to power. Install a new wiring

B0021-12	Control 1 - Circuit short to battery	short circuit to power	harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-13	Left Curtain Deployment Control 1 - Circuit open	• Left side air curtain circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-1A	Left Curtain Deployment Control 1 - Circuit resistance below threshold	• Left side air curtain circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-2B	Left Curtain Deployment Control 1 - Signal cross coupled	• Left side air curtain circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left side air curtain circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left side air curtain
B0021-95	Left Curtain Deployment Control 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0028-11	Right Side Air Bag Deployment Control - Circuit short to ground	• Right side airbag (seat) circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-12	Right Side Air Bag Deployment Control - Circuit short to battery	• Right side airbag (seat) circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-13	Right Side Airbag Deployment Control - Circuit open	• Right side airbag (seat) circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-1A	Right Side Air Bag Deployment Control - Circuit resistance below threshold	• Right side airbag (seat) circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
B0028-2B	Right Side Air Bag Deployment Control - Signal cross coupled	• Right side airbag (seat) circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the right side airbag (seat) circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side airbag (seat)
	Right Side Airbag Deployment	• Restraints control module	

B0028-95	Control - Incorrect assembly	is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0029-11	Right Curtain Deployment Control 1 - Circuit short to ground	• Right side air curtain circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-12	Right Curtain Deployment Control 1 - Circuit short to battery	• Right side air curtain circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-13	Right Curtain Deployment Control 1 - Circuit open	• Right side air curtain circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-1A	Right Curtain Deployment Control 1 - Circuit resistance below threshold	• Right side air curtain circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-2B	Right Curtain Deployment Control 1 - Signal cross coupled	• Right side air curtain circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the right side air curtain circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right side air curtain
B0029-95	Right Curtain Deployment Control 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0050-11	Driver Seatbelt Sensor - Circuit short to ground	• Driver buckle switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to ground
B0050-12	Driver Seatbelt Sensor - Circuit short to battery	• Driver buckle switch circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to power
B0050-13	Driver Seatbelt Sensor - Circuit open	• Driver buckle switch circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for open circuit, high resistance
B0050-1E	Driver Seatbelt Sensor - Circuit resistance out of range	• Driver buckle switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance

B0050-2B	Driver Seatbelt Sensor - Signal cross coupled	• Driver buckle switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver buckle switch circuit for short circuit to another restraints circuit
B0050-95	Driver Seatbelt Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0052-11	Passenger Seatbelt Sensor - Circuit short to ground	• Passenger buckle switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to ground
B0052-12	Passenger Seatbelt Sensor - Circuit short to battery	• Passenger buckle switch circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to power
B0052-13	Passenger Seatbelt Sensor - Circuit open	• Passenger buckle switch circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for open circuit, high resistance
B0052-1E	Passenger Seatbelt Sensor - Circuit resistance out of range	• Passenger buckle switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0052-2B	Passenger Seatbelt Sensor - Signal cross coupled	• Passenger buckle switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger buckle switch circuit for short circuit to another restraints circuit
B0052-95	Passenger Seatbelt Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0070-11	Driver Seatbelt Pretensioner Deployment Control - Circuit short to ground	• Driver seatbelt pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-12	Driver Seatbelt Pretensioner Deployment Control - Circuit short to battery	• Driver seatbelt pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-13	Driver Seatbelt Pretensioner Deployment	• Driver seatbelt pretensioner circuit open	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness

	Control - Circuit open	circuit, high resistance	fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-1A	Driver Seatbelt Pretensioner Deployment Control - Circuit resistance below threshold	• Driver seatbelt pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-2B	Driver Seatbelt Pretensioner Deployment Control - Signal cross coupled	• Driver seatbelt pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver seatbelt pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt pretensioner
B0070-95	Driver Seatbelt Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0072-11	Passenger Seatbelt Pretensioner Deployment Control - Circuit short to ground	• Passenger seatbelt pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-12	Passenger Seatbelt Pretensioner Deployment Control - Circuit short to battery	• Passenger seatbelt pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-13	Passenger Seatbelt Pretensioner Deployment Control - Circuit open	• Passenger seatbelt pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-1A	Passenger Seatbelt Pretensioner Deployment Control - Circuit resistance below threshold	• Passenger seatbelt pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-2B	Passenger Seatbelt Pretensioner "A" Deployment Control - Signal cross coupled	• Passenger seatbelt pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger seatbelt pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt pretensioner
B0072-95	Passenger Seatbelt Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software

B0090-11	Left Frontal Restraints Sensor - Circuit short to ground	• Front left impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to ground
B0090-12	Left Frontal Restraints Sensor - Circuit short to battery	• Front left impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to power
B0090-2B	Left Frontal Restraints Sensor - Signal cross coupled	• Front left impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to another impact sensor circuit
B0090-4A	Left Frontal Restraints Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0090-87	Left Frontal Restraints Sensor - Missing message	• Front left impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the front left impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0090-92	Left Frontal Restraints Sensor - Performance or incorrect operation	• Front left impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0090-95	Left Frontal Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0090-96	Left Frontal Restraints Sensor - Component internal failure	• Front left impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front left impact sensor
B0091-11	Left Side Restraints Sensor 1 - Circuit short to ground	• Left C pillar impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to ground
B0091-12	Left Side Restraints Sensor 1 - Circuit short to battery	• Left C pillar impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to power
B0091-2B	Left Side Restraints Sensor 1 - Signal cross coupled	• Left C pillar impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to another impact sensor circuit
B0091-4A	Left Side Restraints Sensor 1 - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
		• Left C pillar impact sensor	

B0091-87	Left Side Restraints Sensor 1 - Missing message	circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left C pillar impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0091-92	Left Side Restraints Sensor 1 - Performance or incorrect operation	• Left C pillar impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0091-95	Left Side Restraints Sensor 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0091-96	Left Side Restraints Sensor 1 - Component internal failure	• Left C pillar impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left C pillar impact sensor
B0095-11	Right Frontal Restraints Sensor - Circuit short to ground	• Front right impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to ground
B0095-12	Right Frontal Restraints Sensor - Circuit short to battery	• Front right impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to power
B0095-2B	Right Frontal Restraints Sensor - Signal cross coupled	• Front right impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to another impact sensor circuit
B0095-4A	Right Frontal Restraints Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0095-87	Right Frontal Restraints Sensor - Missing message	• Front right impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the front right impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0095-92	Right Frontal Restraints Sensor - Performance or incorrect operation	• Front right impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor
B0095-95	Right Frontal Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0095-96	Right Frontal Restraints Sensor - Component internal failure	• Front right impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new front right impact sensor

B0096-11	Right Side Restraints Sensor 1 - Circuit short to ground	• Right C pillar impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to ground
B0096-12	Right Side Restraints Sensor 1 - Circuit short to battery	• Right C pillar impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to power
B0096-2B	Right Side Restraints Sensor 1 - Signal cross coupled	• Right C pillar impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to another impact sensor circuit
B0096-4A	Right Side Restraints Sensor 1 - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B0096-87	Right Side Restraints Sensor 1 - Missing message	• Right C pillar impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right C pillar impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B0096-92	Right Side Restraints Sensor 1 - Performance or incorrect operation	• Right C pillar impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B0096-95	Right Side Restraints Sensor 1 - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B0096-96	Right Side Restraints Sensor 1 - Component internal failure	• Right C pillar impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right C pillar impact sensor
B00B5-11	Driver Seat Track Position Restraints Sensor - Circuit short to ground	• Driver seat track position sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to ground
B00B5-12	Driver Seat Track Position Restraints Sensor - Circuit short to battery	• Driver seat track position sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to power
B00B5-13	Driver Seat Track Position Restraints Sensor - Circuit open	• Driver seat track position sensor circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for open circuit, high resistance
B00B5-1E	Driver Seat Track Position Restraints Sensor - Circuit	• Driver seat track position sensor circuit short circuit to ground, short	

	resistance out of range	circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B00B5-2B	Driver Seat Track Position Restraints Sensor - Signal cross coupled	• Driver seat track position sensor circuit short circuit to another position sensor circuit	• Refer to the electrical circuit diagrams and check the driver seat track position sensor circuit for short circuit to another position sensor circuit
B00B5-95	Driver Seat Track Position Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B00C5-11	Passenger Seat Track Position Restraints Sensor - Circuit short to ground	• Passenger seat track position sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to ground
B00C5-12	Passenger Seat Track Position Restraints Sensor - Circuit short to battery	• Passenger seat track position sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to power
B00C5-13	Passenger Seat Track Position Restraints Sensor - Circuit open	• Passenger seat track position sensor circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for open circuit, high resistance
B00C5-1E	Passenger Seat Track Position Restraints Sensor - Circuit resistance out of range	• Passenger seat track position sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B00C5-2B	Passenger Seat Track Position Restraints Sensor - Signal cross coupled	• Passenger seat track position sensor circuit short circuit to another position sensor circuit	• Refer to the electrical circuit diagrams and check the passenger seat track position sensor circuit for short circuit to another position sensor circuit
B00C5-95	Passenger Seat Track Position Restraints Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B00D2-68	Restraint System Malfunction Indicator 1 - Event information	• Restraints warning indicator fault reported by the instrument cluster	• Using the manufacturer approved diagnostic system, check the instrument cluster for related DTCs and refer to the relevant DTC index
B00D5-12	Restraint System Passenger	• Passenger airbag deactivation warning indicator circuit	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation warning indicator circuit for short circuit to power

	Disable Indicator - Circuit short to battery	short circuit to power	
B00D5-14	Restraint System Passenger Disable Indicator - Circuit short to ground or open	• Passenger airbag deactivation warning indicator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation warning indicator circuit for short circuit to ground, open circuit, high resistance
B00D5-95	Restraint System Passenger Disable Indicator - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1001-11	Right Hood Deployment Control - Circuit short to ground	• Right hood deployment control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-12	Right Hood Deployment Control - Circuit short to battery	• Right hood deployment control circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-13	Right Hood Deployment Control - Circuit open	• Right hood deployment control circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-1A	Right Hood Deployment Control - Circuit resistance below threshold	• Right hood deployment control circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-2B	Right Hood Deployment Control - Signal cross coupled	• Right hood deployment control circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the right hood deployment control circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right hood deployment control
B1001-95	Right Hood Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1003-11	Left Hood Deployment Control - Circuit short to ground	• Left hood deployment control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
	Left Hood	• Left hood deployment	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to power. Install a

B1003-12	Deployment Control - Circuit short to battery	control circuit short circuit to power	new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-13	Left Hood Deployment Control - Circuit open	• Left hood deployment control circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-1A	Left Hood Deployment Control - Circuit resistance below threshold	• Left hood deployment control circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-2B	Left Hood Deployment Control - Signal cross coupled	• Left hood deployment control circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the left hood deployment control circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left hood deployment control
B1003-95	Left Hood Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1004-11	Right Frontal Impact Classification Sensor - Circuit short to ground	• Pedestrian right impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to ground
B1004-12	Right Frontal Impact Classification Sensor - Circuit short to battery	• Pedestrian right impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to power
B1004-2B	Right Frontal Impact Classification Sensor - Signal cross coupled	• Pedestrian right impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to another impact sensor circuit
B1004-4A	Right Frontal Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1004-87	Right Frontal Impact Classification Sensor - Missing message	• Pedestrian right impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian right impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1004-92	Right Frontal Impact Classification Sensor - Performance or	• Pedestrian right impact sensor signal invalid	

	incorrect operation		• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1004-95	Right Frontal Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1004-96	Right Frontal Impact Classification Sensor - Component internal failure	• Pedestrian right impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian right impact sensor
B1005-11	Left Frontal Impact Classification Sensor - Circuit short to ground	• Pedestrian left impact sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to ground
B1005-12	Left Frontal Impact Classification Sensor - Circuit short to battery	• Pedestrian left impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to power
B1005-2B	Left Frontal Impact Classification Sensor - Signal cross coupled	• Pedestrian left impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to another impact sensor circuit
B1005-4A	Left Frontal Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian left impact sensor
B1005-87	Left Frontal Impact Classification Sensor - Missing message	• Pedestrian left impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian left impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1005-92	Left Frontal Impact Classification Sensor - Performance or incorrect operation	• Pedestrian left impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian left impact sensor
B1005-95	Left Frontal Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1005-96	Left Frontal Impact Classification Sensor - Component internal failure	• Pedestrian left impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian left impact sensor
	Center Front Impact	• Pedestrian center impact	

B1006-11	Classification Sensor - Circuit short to ground	sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to ground
B1006-12	Center Front Impact Classification Sensor - Circuit short to battery	• Pedestrian center impact sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to power
B1006-2B	Center Front Impact Classification Sensor - Signal cross coupled	• Pedestrian center impact sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to another impact sensor circuit
B1006-4A	Center Front Impact Classification Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor
B1006-87	Center Front Impact Classification Sensor - Missing message	• Pedestrian center impact sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the pedestrian center impact sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1006-92	Center Front Impact Classification Sensor - Performance or incorrect operation	• Pedestrian center impact sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor
B1006-95	Center Front Impact Classification Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1006-96	Center Front Impact Classification Sensor - Component internal failure	• Pedestrian center impact sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new pedestrian center impact sensor
B1193-68	Crash Event Storage Full And Locked - Event information	• Pedestrian protection system deployment events maximum number reached	NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary. Install a new restraints control module
B11A0-11	Left Side Restraints Pressure Sensor - Circuit short to ground	• Left impact pressure sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to ground
B11A0-12	Left Side Restraints Pressure Sensor - Circuit short to battery	• Left impact pressure sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to power

B11A0-2B	Left Side Restraints Pressure Sensor - Signal cross coupled	• Left impact pressure sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to another impact sensor circuit
B11A0-4A	Left Side Restraints Pressure Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A0-87	Left Side Restraints Pressure Sensor - Missing message	• Left impact pressure sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the left impact pressure sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B11A0-92	Left Side Restraints Pressure Sensor - Performance or incorrect operation	• Left impact pressure sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A0-95	Left Side Restraints Pressure Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B11A0-96	Left Side Restraints Pressure Sensor - Component internal failure	• Left impact pressure sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new left impact pressure sensor
B11A1-11	Right Side Restraints Pressure Sensor - Circuit short to ground	• Right impact pressure sensor circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to ground
B11A1-12	Right Side Restraints Pressure Sensor - Circuit short to battery	• Right impact pressure sensor circuit short circuit to power	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to power
B11A1-2B	Right Side Restraints Pressure Sensor - Signal cross coupled	• Right impact pressure sensor circuit short circuit to another impact sensor circuit	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to another impact sensor circuit
B11A1-4A	Right Side Restraints Pressure Sensor - Incorrect component installed	• Incorrect component installed	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor
B11A1-87	Right Side Restraints Pressure Sensor - Missing message	• Right impact pressure sensor circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the right impact pressure sensor circuit for short circuit to ground, short circuit to power, open circuit, high resistance
	Right Side		

B11A1-92	Restraints Pressure Sensor - Performance or incorrect operation	• Right impact pressure sensor signal invalid	• Check that the correct component is installed. Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor
B11A1-95	Right Side Restraints Pressure Sensor - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B11A1-96	Right Side Restraints Pressure Sensor - Component internal failure	• Right impact pressure sensor internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new right impact pressure sensor
B11D8-68	Restraint Event Notification - Event information	• Pedestrian protection system has been deployed	NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary
B1206-68	Crash Occurred - Event information	• Crash event recorded	NOTE: Repairs due to a collision are not warrantable. • Check the vehicle for collision damage. Repair as necessary
B1211-11	Driver Seatbelt Retractor Pretensioner Deployment Control - Circuit short to ground	• Driver seatbelt retractor and pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-12	Driver Seatbelt Retractor Pretensioner Deployment Control - Circuit short to battery	• Driver seatbelt retractor and pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-13	Driver Seatbelt Retractor Pretensioner Deployment Control - Circuit open	• Driver seatbelt retractor and pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-1A	Driver Seatbelt Retractor Pretensioner Deployment Control - Circuit resistance below threshold	• Driver seatbelt retractor and pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-2B	Driver Seatbelt Retractor Pretensioner Deployment Control - Signal cross coupled	• Driver seatbelt retractor and pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the driver seatbelt retractor and pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new driver seatbelt retractor and pretensioner
B1211-95	Driver Seatbelt Retractor Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software

B1214-11	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit short to ground	• Passenger seatbelt retractor and pretensioner circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit to ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-12	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit short to battery	• Passenger seatbelt retractor and pretensioner circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit to power. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-13	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit open	• Passenger seatbelt retractor and pretensioner circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for open circuit, high resistance. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-1A	Passenger Seatbelt Retractor Pretensioner Deployment Control - Circuit resistance below threshold	• Passenger seatbelt retractor and pretensioner circuit short circuit between power and ground	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit between power and ground. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-2B	Passenger Seatbelt Retractor Pretensioner Deployment Control - Signal cross coupled	• Passenger seatbelt retractor and pretensioner circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger seatbelt retractor and pretensioner circuit for short circuit to another restraints circuit. Install a new wiring harness as necessary. If no wiring harness fault exists, using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new passenger seatbelt retractor and pretensioner
B1214-95	Passenger Seatbelt Retractor Pretensioner Deployment Control - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
B1A55-12	Crash Record Output - Circuit short to battery	NOTE: Circuit reference - E_N_S - • Event notification signal circuit short circuit to power	• Refer to the electrical circuit diagrams and check the event notification signal circuit for short circuit to power
B1A55-14	Crash Record Output - Circuit short to ground or open	NOTE: Circuit reference - E_N_S - • Event notification signal circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the event notification signal circuit for short circuit to ground, open circuit, high resistance
	Passenger Airbag	• Passenger airbag	

B1D74-11	Cutoff Enable Switch - Circuit short to ground	deactivation switch circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to ground
B1D74-12	Passenger Airbag Cutoff Enable Switch - Circuit short to battery	• Passenger airbag deactivation switch circuit short circuit to power	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to power
B1D74-13	Passenger Airbag Cutoff Enable Switch - Circuit open	• Passenger airbag deactivation switch circuit open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for open circuit, high resistance
B1D74-1E	Passenger Airbag Cutoff Enable Switch - Circuit resistance out of range	• Passenger airbag deactivation switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
B1D74-2B	Passenger Airbag Cutoff Enable Switch - Signal cross coupled	• Passenger airbag deactivation switch circuit short circuit to another restraints circuit	• Refer to the electrical circuit diagrams and check the passenger airbag deactivation switch circuit for short circuit to another restraints circuit
B1D74-95	Passenger Airbag Cutoff Enable Switch - Incorrect assembly	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
U0001-88	High Speed CAN Communication Bus - Bus off	• High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance
U0100-87	Lost Communication With ECM/PCM "A" - Missing message	• Engine control module power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Engine system fault	• Refer to the electrical circuit diagrams and check the engine control module power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the engine control module for related DTCs and refer to the relevant DTC index
		• Anti-lock brake system control module power or ground circuit	• Refer to the electrical circuit diagrams and check the anti-lock brake system control module power and ground circuits for open circuit, high resistance

U0121-87	Lost Communication With Anti-Lock Brake System (ABS) Control Module - Missing message	open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Anti-lock brake system fault	• Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the anti-lock brake system control module for related DTCs and refer to the relevant DTC index
U0140-87	Lost Communication With Body Control Module - Missing message	• Central junction box power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Central junction box system fault	• Refer to the electrical circuit diagrams and check the central junction box power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the central junction box for related DTCs and refer to the relevant DTC index
U0154-87	Lost Communication With Restraints Occupant Classification System Module - Missing message	• Occupant classification sensor control module power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Occupant classification system fault	• Refer to the electrical circuit diagrams and check the occupant classification sensor control module power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the occupant classification sensor control module for related DTCs and refer to the relevant DTC index
U0155-87	Lost Communication With Instrument Panel Cluster (IPC) Control Module - Missing message	• Instrument cluster power or ground circuit open circuit, high resistance • High speed CAN bus circuit short circuit to ground, short circuit to power, open circuit, high resistance • Instrument cluster system fault	• Refer to the electrical circuit diagrams and check the instrument cluster power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus circuit for short circuit to ground, short circuit to power, open circuit, high resistance • Using the manufacturer approved diagnostic system, check the instrument cluster for related DTCs and refer to the relevant DTC index
U0300-00	Internal Control Module Software Incompatibility - No sub type information	• Car configuration file mismatch with vehicle specification • Incorrect restraints control module installed	• Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary • Install a new restraints control module as necessary
	Invalid Data		

U0415-29	Received From Anti-Lock Brake System (ABS) Control Module - Signal invalid	• Missing/invalid data from the anti-lock brake system control module	• Using the manufacturer approved diagnostic system, check the anti-lock brake system control module for related DTCs and refer to the relevant DTC index
U0455-55	Invalid Data Received From Restraints Occupant Classification System Module - Not configured	• Car configuration file mismatch with vehicle specification • Incorrect passenger seat installed	• Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary • Install a new passenger seat as necessary
U0455-92	Invalid Data Received From Restraints Occupant Classification System Module - Performance or incorrect operation	• Missing/invalid data from the occupant classification sensor control module	• Using the manufacturer approved diagnostic system, check the occupant classification sensor control module for related DTCs and refer to the relevant DTC index
U0455-93	Invalid Data Received From Restraints Occupant Classification System Module - No operation	• Missing/invalid data from the occupant classification sensor control module	• Using the manufacturer approved diagnostic system, check the occupant classification sensor control module for related DTCs and refer to the relevant DTC index
U0455-95	Invalid Data Received From Restraints Occupant Classification System Module - Incorrect assembly	• Mismatch between restraints control module and occupant classification sensor control module software	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software. If the fault persists, re-configure the occupant classification sensor control module with the latest level software
U1A14-55	CAN Initialisation Failure - Not configured	• Restraints control module internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new restraints control module
U2100-00	Initial Configuration Not Complete - No sub type information	• Restraints control module is not configured correctly	• Using the manufacturer approved diagnostic system, re-configure the restraints control module with the latest level software
U2101-00	Control Module Configuration Incompatible - No sub type information	• Car configuration file mismatch with vehicle specification	• Using the manufacturer approved diagnostic system, check and up-date the car configuration file as necessary
U2101-4A	Control Module Configuration Incompatible - Incorrect component installed	• Incorrect restraints control module installed	• Install the original or a new restraints control module as necessary
U3000-49	Control Module - Internal electronic failure	• Restraints control module internal failure	• Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new restraints control module
U3006-17	Control Module Input Power "A" - Circuit voltage above threshold	• Battery/charging system fault	• Using the manufacturer approved diagnostic system, check datalogger signal - ECU Power Supply Voltage (0xD112). Refer to the relevant section of the workshop manual and test the battery and charging system

U3006-68	Control Module Input Power "A" - Event information	• Restraints control module power or ground circuit open circuit, high resistance • Battery/charging system fault	• Using the manufacturer approved diagnostic system, check datalogger signal - ECU Power Supply Voltage (0xD112). Refer to the electrical circuit diagrams and check the restraints control module power and ground circuits for open circuit, high resistance • Refer to the relevant section of the workshop manual and test the battery and charging system

System Operation

PRINCIPLES OF OPERATION

In a collision, the sudden deceleration or acceleration is measured by the impact sensors and the accelerometers in the RCM . The RCM evaluates the readings to determine the impact point on the vehicle and whether the deceleration/acceleration readings exceed the limits for firing any of the air bags and pretensioners. During a collision, the RCM only fires the air bags and pretensioners if the safing function confirms that the data from the impact sensor(s) indicates an impact limit has been exceeded.

The RCM incorporates the following impact thresholds to cater for different accident scenarios:

- Front impact, pretensioners.
- Front impact, driver and passenger air bags stage 1, belt unfastened.
- Front impact, driver and passenger air bags stage 1, belt fastened.
- Front impact, driver and passenger air bags stage 2, belt unfastened.
- Front impact, driver and passenger air bags stage 2, belt fastened.
- Rear impact.
- Driver side impact.
- Passenger side impact.

Firing Strategies

The safety belt pretensioners are fired when the pretensioner impact limit is exceeded. The RCM only fires the pretensioners if the related safety belt is fastened.

The driver and passenger air bags are only fired in a frontal impact. If an impact exceeds a stage 1 limit, but is less than the corresponding stage 2 limit, only one inflator in each air bag is fired (stage 2 is still fired for disposal after a delay of 100 ms). If an impact exceeds the stage 2 limit, the two inflators in each air bag are fired simultaneously.

The passenger air bag is disabled unless the front passenger seat is occupied by a large person (NAS only), or the passenger air bag deactivation switch is on (all except NAS and Australia).

The stage 2 inflator of the driver air bag is disabled if the driver seat is forward of the switching point of the seat position sensor.

If there is a fault with a safety belt buckle switch, the RCM assumes the related safety belt is fastened for the pretensioner firing strategy and unfastened for the driver and passenger air bag firing strategies. If there is a fault with the occupant classification sensor, the RCM disables the passenger air bag. If there is a fault with the passenger air bag deactivation switch, the RCM disables the passenger air bag.

If a side impact limit is exceeded, the RCM fires the side air bag and the side head air bag on that side of the vehicle. If the side impact limit on the front passenger side of the vehicle is exceeded, the RCM also evaluates the input from the occupant classification sensor, and fires the side air bag only if the front passenger seat is occupied by a large person (NAS only).

If multiple impacts occur during a crash event, after responding to the primary impact the RCM will output the appropriate fire signals in response to any further impacts if unfired units are available.

Front and Rear Impact Firing Strategy (All Except NAS)

Safety Belt Status		Strategy		
Driver	**Front Passenger**	**Applicable Pretensioner**	**Driver Air Bag**	**Passenger Air Bag**
Fastened	-	Fired at pretensioner threshold	Fired at belt fastened threshold	-
Unfastened	-	Not fired	Fired at belt unfastened threshold	-
-	Fastened	Fired at pretensioner threshold	-	Fired at belt fastened threshold
-	Unfastened	Not fired	-	Fired at belt unfastened threshold

Front and Rear Impact Firing Strategy (NAS)

Safety Belt Status		Passenger Seat Status	Strategy		
Driver	**Passenger**		**Applicable Pretensioner**	**Driver Air Bag**	**Passenger Air Bag**
Fastened	-	-	Fired at pretensioner threshold	Fired at belt fastened threshold	-
				Fired at belt unfastened	

Unfastened	-	-	Not fired	threshold	-
-	Fastened	Occupied allow	Fired at pretensioner threshold	-	Fired at belt fastened threshold
-	Fastened	Unoccupied inhibit/empty	Fired at pretensioner threshold	-	Not fired
-	Unfastened	Occupied allow	Not fired	-	Fired at belt unfastened threshold
-	Unfastened	Unoccupied inhibit/empty	Not fired	-	Not fired

Crash Signal

When the RCM outputs any of the fire signals it also outputs a crash signal to the CJB and the ECM on the high speed CAN . The crash signal is also hardwired to the ECM and the CJB . On receipt of the crash signal, the ECM cuts the power supply to the fuel pump relay and the CJB goes into crash mode. In the crash mode, the CJB :

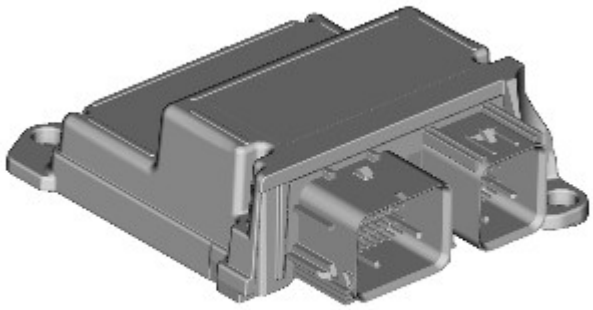
- Activates all of the unlock signals of the vehicle locking system, even if the vehicle is already unlocked.
- Ignores all locking/superlocking inputs until it receives an unlock input, when it returns the locking system to normal operation.
- Activates the interior lamps. The interior lamps remain on permanently until they are manually switched off at the lamp unit, or the CJB crash mode is switched off and they return to normal operation.
- Disables the rear window child lock input until the crash mode is switched off.
- Activates the hazard flashers. The hazard flashers remain on until cancelled by the hazard warning switch or the crash mode is switched off.

The CJB crash mode is switched off by a valid locking and unlocking cycle of the locking system.

Component Description

RESTRAINTS CONTROL MODULE

NOTE: Diagnosis by substitution from a donor vehicle is NOT acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.



E128616

The RCM is installed on the top of the transmission tunnel, in line with the B/C pillars, and controls operation of the SRS (supplemental restraint system) . The main functions of the RCM include:

- Crash detection and recording.
- Air bag and pretensioner firing.
- Self test and system monitoring, with status indication via the air bag warning indicator and non volatile storage of fault information.

The RCM determines which elements of the SRS are to be deployed by using two internal areas:

- Crash severity evaluation.
- Deployment handler.

Crash severity evaluation uses data from the RCM internal accelerometer, the front crash sensor and the safety belt buckle switch. Based on this data, the RCM decides which level of air bag module deployment is required and forwards the information to the second area, the deployment handler.

The deployment handler evaluates the status of the seat track position sensor and safety belt buckle sensors before a decision is made about which restraints should finally be deployed.

Data from the side crash sensors is used by the RCM in conjunction with acceleration data from the RCM internal accelerometer to make a deployment decision. The RCM processes the acceleration data and, subject to an impact being of high enough severity, decides whether the side air bag module and air curtain should be deployed.

On board testing of the air bag modules, front safety belt pretensioner firing circuits, warning indicator circuits and module status is performed by the RCM together with the storing of fault codes. The impact and pressure sensors perform basic self-tests.

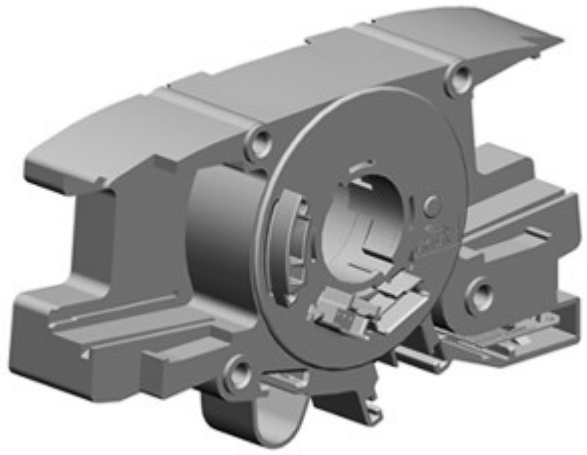
The RCM drives the air bag warning indicator via a high speed CAN signal. If the warning indicator fails, a fault code is recorded and a warning tone is sounded in place of the indicator if a further fault occurs. The RCM also provides a temporary back-up power supply to operate the air bag modules in the event that in crash conditions, the battery supply is lost. In the event of a crash, it records certain data which can be accessed via the diagnostic connector.

A safing sensor in the RCM provides confirmation of an impact to verify if air bag and pretensioner activation is necessary. A roll-over sensor monitors the lateral attitude of the vehicle. Various firing strategies are employed by the RCM to ensure that during an accident only the appropriate air bags and pretensioners are fired. The firing strategy used also depends on the inputs from the safety belt buckle switches and the occupant monitoring system.

An energy reserve in the RCM ensures there is always a minimum of 150 milliseconds of stored energy available if the power supply from the ignition switch is disrupted during a crash. The stored energy is sufficient to produce firing signals for the driver air bag, the passenger air bag and the safety belt pretensioners.

When the ignition is switched on the RCM performs a self test and then performs cyclical monitoring of the system. If a fault is detected the RCM stores a related fault code and illuminates the air bag warning indicator. The faults can be retrieved by Jaguar approved diagnostic equipment over the CAN bus. If a fault that could cause a false fire signal is detected, the RCM disables the respective firing circuit, and keeps it disabled during a crash event.

CLOCKSPRING



E128617

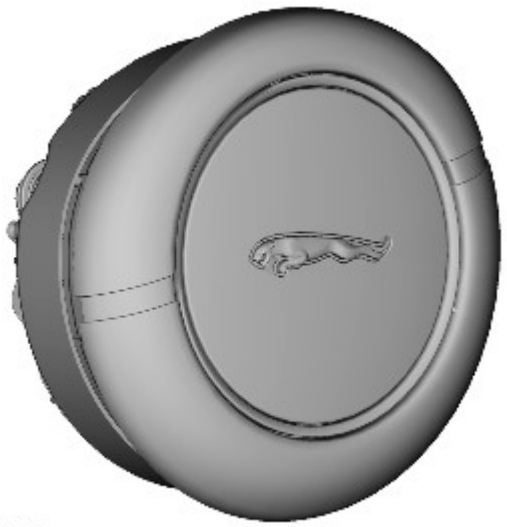
The clockspring is installed on the steering column to provide the electrical interface between the fixed wiring harness of the steering column and the components that rotate with the steering wheel.

The clockspring consists of a plastic cassette which incorporates an outer cover fixed to the steering column and an inner rotor which turns with the steering wheel. Four securing lugs attach the cover to the multifunction switch on the steering column. The rotor is keyed to the steering wheel. A lug on the underside of the rotor operates the self-cancelling feature of the turn signal indicator switch. A ribbon lead, threaded on rollers in the rotor, links a connector on the cover to two connectors on the rotor. Link leads for the driver air bag are installed in one of the connectors on the rotor.

To prevent damage to the ribbon lead, both the steering and the clockspring must be centralized when removing and installing the clockspring or the steering wheel.

Replacement clocksprings are fitted with a rotor lock, which locks the cover to the rotor, in the central position. The rotor lock must be removed when the replacement clockspring is installed.

DRIVER AIR BAG



E128618

The driver air bag is controlled by the RCM , which chooses between single or dual stage deployment, depending on the occupant position and the crash severity. To reduce the risk of an air bag induced injury to a driver who is positioned close to the steering wheel, the 690 mm diameter air bag deploys radially. The volume of the driver air bag is 57 liters.

The driver air bag has a non-azide propellant that reduces particulates and effluents. It consists of a two stage inflator with separate chambers for the two inflation stages, each being independently activated by the RCM . It has two electrical connectors that are color coded and mechanically keyed to the respective connector on the inflator.

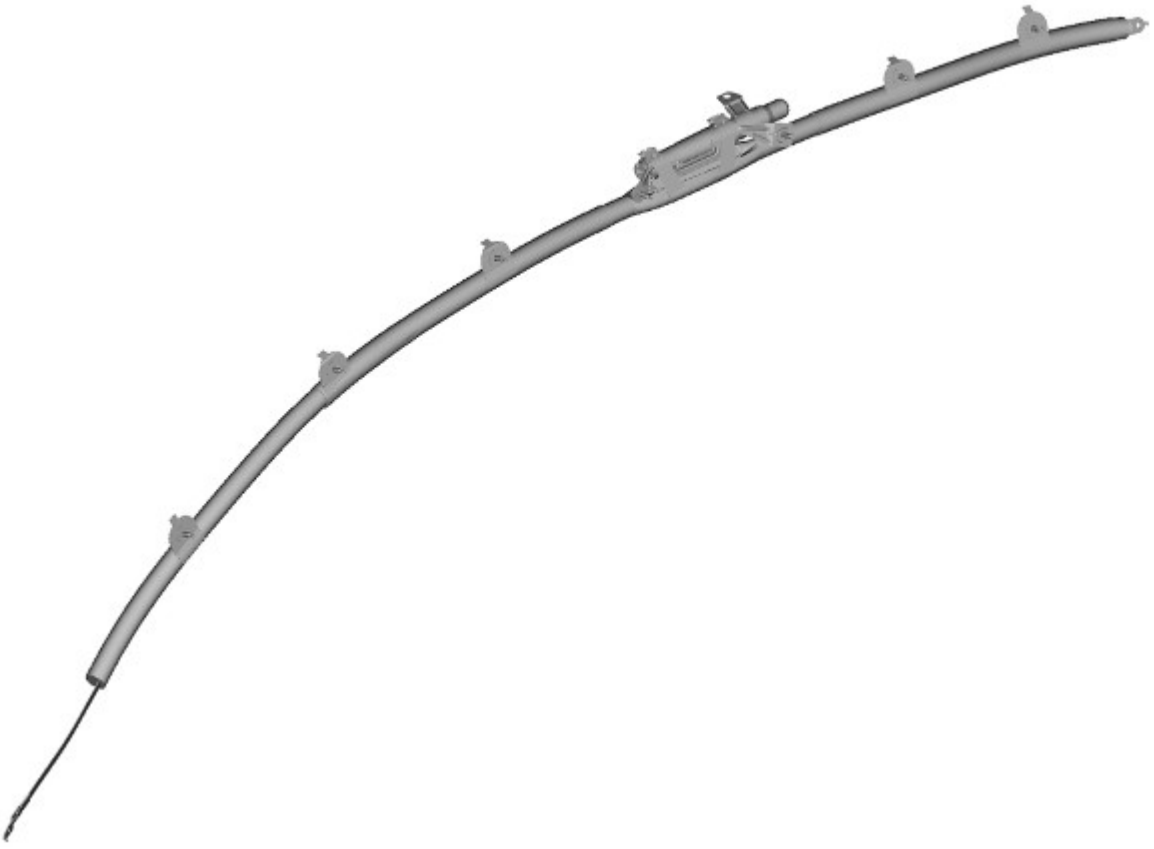
PASSENGER AIR BAG

E128619

The passenger air bag is controlled by the RCM , which chooses between single or dual stage deployment, depending on the occupant status and the crash severity. It consists of a two stage inflator with two air bag electrical connectors to accommodate the two stage inflation. The volume of the passenger air bag is 110 - 120 liters.

The heated gas inflator consists of a high-pressure mix of clean air and hydrogen gas, triggered by two separate ignition squibs. It produces a controlled generation of clean gas to rapidly fill the air bag. It is classified as a stored flammable gas (not as an explosive) and as such, has less restrictive storage and transportation requirements. It produces a very clean burn and almost no particulates and is almost free of any toxins, making disposal or recycling much easier.

SIDE AIR CURTAIN



E128620

The side air curtains have a capacity of approximately 29 liters and are fitted along both sides of the car. They deploy from behind the headliner above the doors, and are anchored at their front and rear extremities to maintain tension across the lower edge of the curtain. Their deployment area extends between the A and C pillar trims, passing over the upper B pillar trim. The inflated portion of the curtain provides head protection for outer occupants in both the front and rear of the car, and a significant level of protection against objects such as poles and trees.

The side air curtains have a rapid fill time of less than 25 ms and, when fully inflated, are approximately 150 mm thick. The curtains are internally divided into separate chambers and, when an area of the inflated air bag is impacted, gases transfer through internal vents to chambers further away from the impact, absorbing energy.

The side air curtains use standard hybrid inflators, which inflate the curtains with gas produced from a combination of pyrotechnic charge and compressed gas.

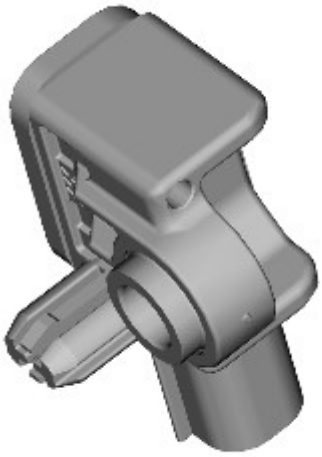
SIDE AIR BAG

E128621

The side air bags are mounted in the outer sides of the front seats where they provide thorax, rib and pelvis protection. Each side air bag consists of a folded air bag and a pyrotechnic inflator contained in a nylon fabric cover.

Side air bags inflate in less than 15 ms, and absorb the energy of an impact by venting the inflation gas through a vent in the fabric material of the air bag. The venting used is able to discriminate between small and large sized occupants, and adjust the cushion stiffness to suit.

IMPACT SENSORS



E128622

Impact sensors are installed in the front and both sides of the vehicle. A front impact sensor is attached to each headlamp surround panel, below the headlamp. A side impact sensor is attached to the base of each D pillar.

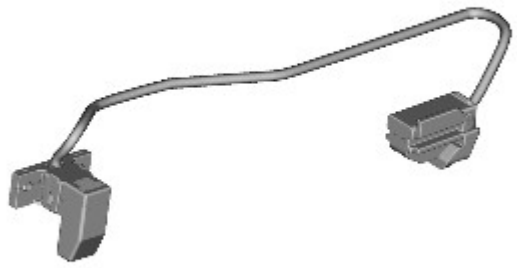
The impact sensors are accelerometers that allow the RCM to detect the sudden acceleration that occurs during an impact.

IMPACT PRESSURE SENSOR

E128623

An impact pressure sensor is installed in each front door, attached to the closure panels. The pressure sensors allow the RCM to detect the sudden pressure pulse that occurs in the front door during a side impact.

SEAT POSITION SENSOR



E128624

The seat position sensor allows the RCM to detect when the driver seat is forward of a given point on the seat track. The seat position sensor consists of a Hall effect sensor attached to the driver seat frame. While the ignition is on, the RCM supplies the sensor with power, and monitors the return current. When the seat frame moves forwards, the sensor moves over the edge of the seat track, which changes the reluctance of the sensor. The change of current is detected by the RCM and used as a switching point. The switching point is when the center of the sensor is 3 ± 4 mm from the leading edge of the seat track.

When the driver seat is forward of the switching point, the RCM increases the time delay between firing the two stages of the inflator in the driver air bag. When the driver seat is rearward of the switching point, the RCM uses the normal time delay between firing the two stages.

SAFETY BELT BUCKLE PRETENSIONERS

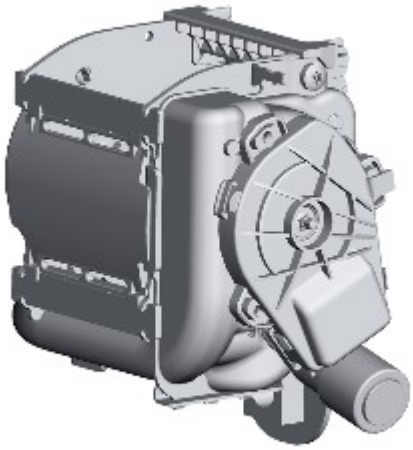
NOTE: Safety Belt Buckle Pretensioners are fitted on both **ROW** and **NAS** variants on all MY's.

E128625

The pretensioners are used to tighten the front safety belts during a collision to ensure the occupants are securely held in their seats. A pretensioner is integrated into each front safety belt buckle and attached to a bracket on the inboard side of the seat.

SAFETY BELT RETRACTOR PRETENSIONERS

NOTE: Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.



E149532

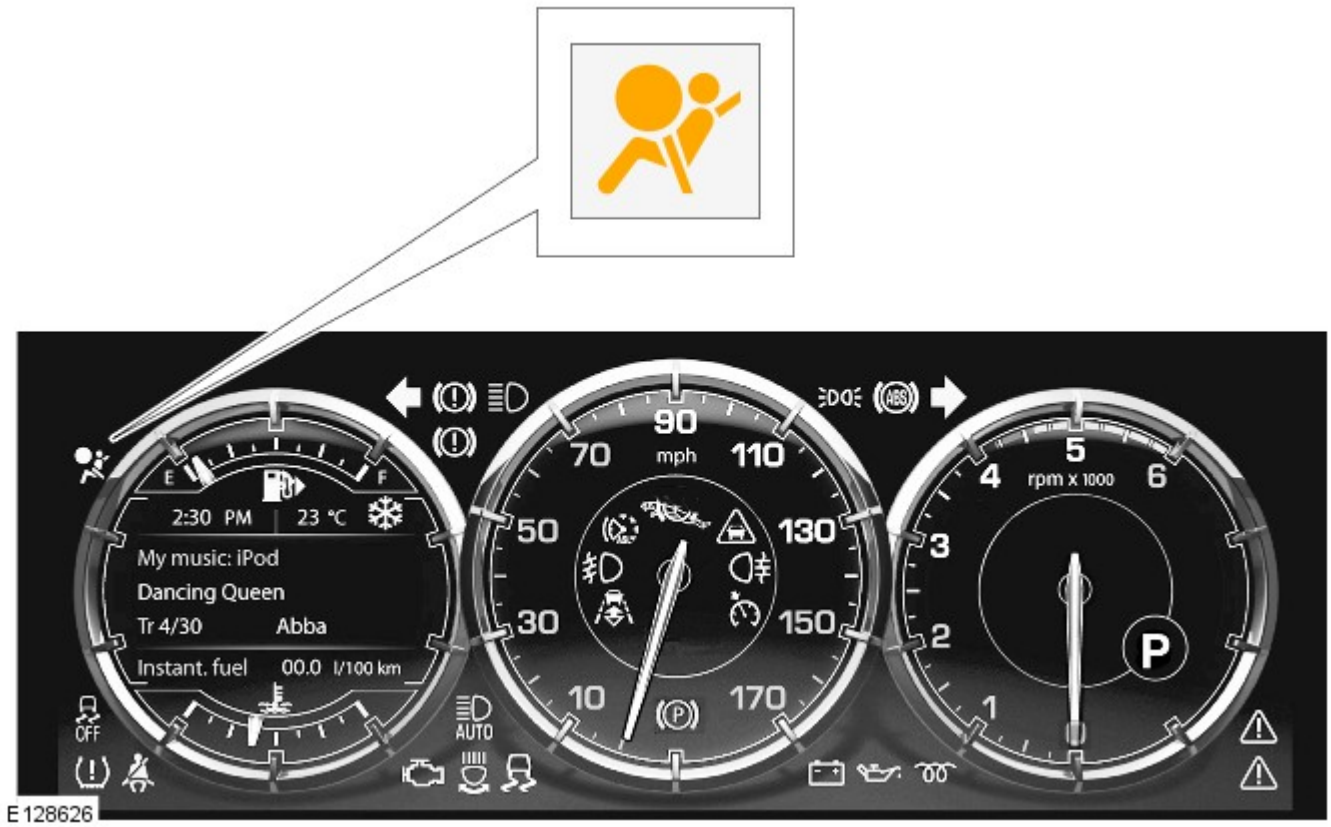
A pretensioner is incorporated into each of the safety belt retractors. They are pyrotechnic devices that are controlled by the RCM (restraints control module) in the SRS (supplement restraint system). When deployed both the safety belt retractor pretensioner and safety belt buckle pretensioner fire in conjunction with each other and tighten the seatbelt during a collision to ensure the occupants are securely held in their seats.

SAFETY BELT BUCKLE SWITCHES

The buckle of each front safety belt incorporates a switch that provides a safety belt status signal to the RCM . The RCM broadcasts the status on the high speed CAN bus for use by the safety belt reminder and beltminder systems in the instrument cluster.

In the event of a front impact, the RCM will deploy the pretensioners provided the safety belt buckles are fastened. The pretensioners have a lower deployment threshold than the air bags. Hence it is possible during a minor collision, which exceeds the deployment threshold, that only the pretensioners will deploy.

AIR BAG WARNING INDICATOR



E128626

The air bag warning indicator consists of a red LED (light emitting diode) behind a SRS graphic in the instrument cluster.

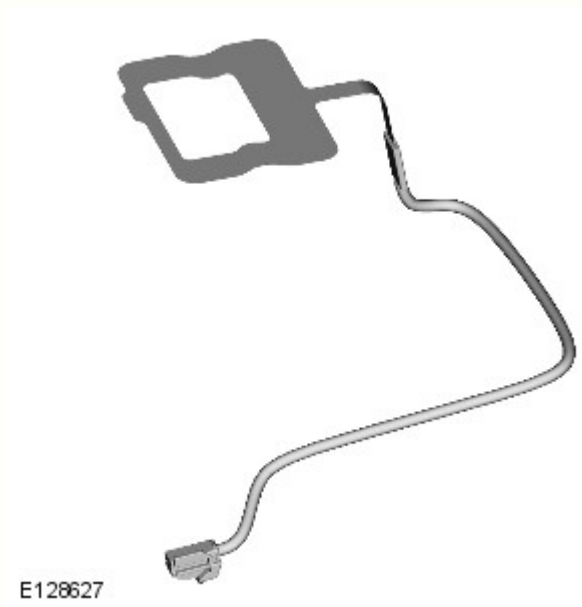
Operation of the air bag warning indicator is controlled by a high speed CAN bus message from the RCM to the instrument cluster. The RCM sends the signal to illuminate the air bag warning indicator if a fault is detected, and for approximately 6 seconds during the bulb check at the beginning of each ignition cycle.

OCCUPANT MONITORING

There are two types of occupant monitoring:

- In all markets except NAS and Australia, vehicles have an occupant detection system.
- In NAS markets, vehicles have an occupant classification system.

Occupant Detection Sensor

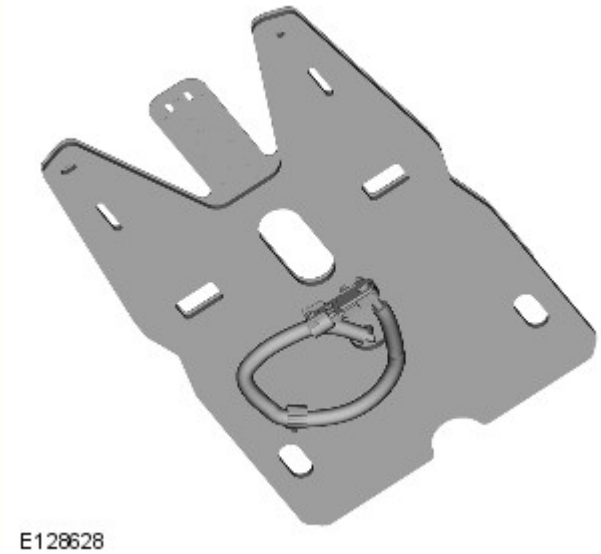


E128627

For markets which have an occupant detection sensor, this has no interface with the restraints system and only provides the belt reminder function.

Occupant Classification System

Pressure Pad and Sensor

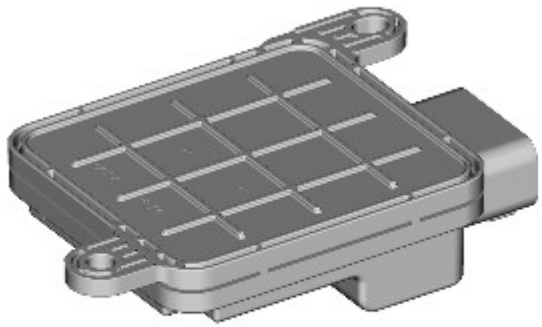


E128628

Safety Belt Tension Sensor

E98178

Occupant Classification Module



E128661

For markets that have an occupant classification system, this provides the RCM with the occupancy status of the front passenger seat. The restraints control module uses this and the seat buckle status in the evaluation of the firing strategy for the passenger air bag, the passenger side air bag and the front passenger safety belt pretensioner.

The occupant classification system can determine if the front passenger seat is unoccupied, occupied by a small person, or occupied by a large person. The occupant classification system consists of:

- A pressure pad, installed under the cushion of the front passenger seat, which is connected to a pressure sensor.
- A safety belt tension sensor, integrated into the anchor point of the front passenger safety belt.
- An occupant classification module, installed under the front passenger seat.

The pressure pad is a silicone filled bladder. Any load on the pressure pad is detected by the pressure sensor.

The safety belt tension sensor is a strain gauge that measures the load applied by the safety belt anchor to the anchor bolt. The sensor is located in the lower safety belt anchor point.

The occupant classification module supplies a reference voltage to the pressure sensor and the safety belt tension sensor and, from the returned signals, measures the loads acting on the pressure pad and the safety belt tension sensor. The load measurement from the safety belt tension sensor is used to produce a correction factor for the load measurement from the pressure pad. The tightness of the safety belt affects the load acting on the pressure pad, so without the correction factor the occupant classification module cannot derive an accurate occupancy status.

The occupant classification module translates the load readings into a seat occupancy status and transmits the result to the RCM , on a dedicated high speed CAN bus link. The occupant classification module incorporates two load limits for the seat cushion: When the load exceeds the lower limit, but is less than the upper limit, the occupant is classified as small; when the upper limit is exceeded, the occupant is classified as large.

PASSENGER AIR BAG DEACTIVATION INDICATOR

E128751

The passenger air bag deactivation indicator is installed on the center switch pack of the instrument panel. When appropriate, the indicator illuminates to advise front seat occupants that the passenger air bag is disabled. Operation of the indicator is controlled by the RCM . The RCM illuminates the indicator when:

- There is a fault with the passenger air bag firing circuit(s).
- The passenger air bag is deactivated with the PAD switch (where fitted) and the front passenger seat is occupied.
- Required by passenger seat occupant classification (where fitted).

PASSENGER AIR BAG DEACTIVATION SWITCH (ALL EXCEPT NAS)

E128629

Where fitted, the PAD switch provides a method of manually disabling the passenger air bag. The switch is installed in the front passenger end of the instrument panel and operated by the emergency key.

When the PAD switch is operated, it changes a ground connection between two pins in the connectors of the RCM . When the PAD switch is selected to OFF, the RCM disables the passenger air bag and, if the front passenger seat is occupied, illuminates the PAD indicator in the overhead console.

Supplemental Restraint System - Clockspring

Removal and Installation

Special Tool(s)

E43628	211-326 Locking Tool, Clockspring

Removal

WARNINGS:

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for two minutes. Failure to follow this instruction may result in personal injury.

CAUTION: Make sure the wheels are in the straight-ahead position. Failure to follow this instruction may result in damage to the component.

NOTES:

Removal steps in this procedure may contain installation details.

Some variation in the illustrations may occur, but the essential information is always correct.

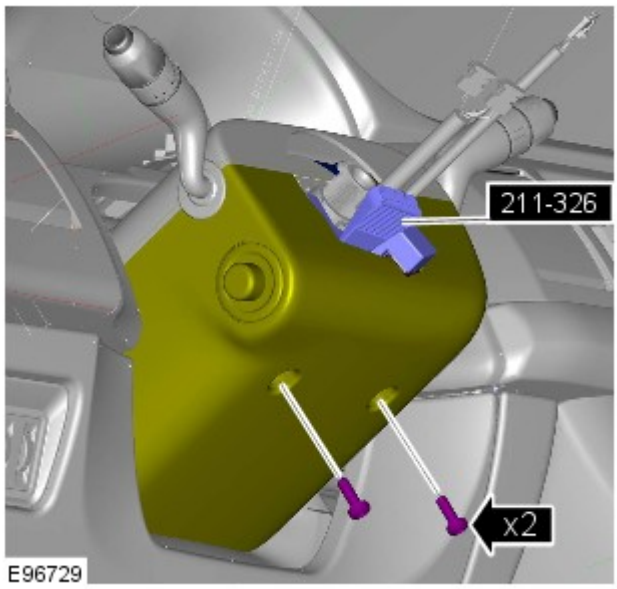
1. Make the SRS system safe.

Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

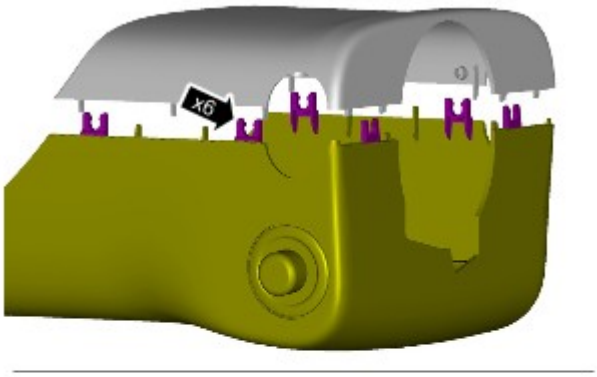
2. CAUTION: Make sure that special tool 211-326 is installed to the clockspring.

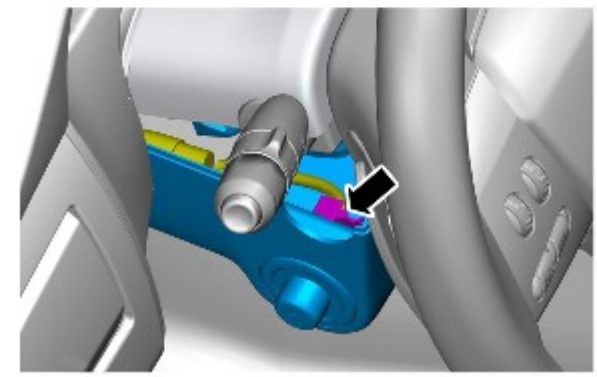
Refer to: Steering Wheel (211-04 Steering Column, Removal and Installation).

3. *Special Tool(s):* 211-326

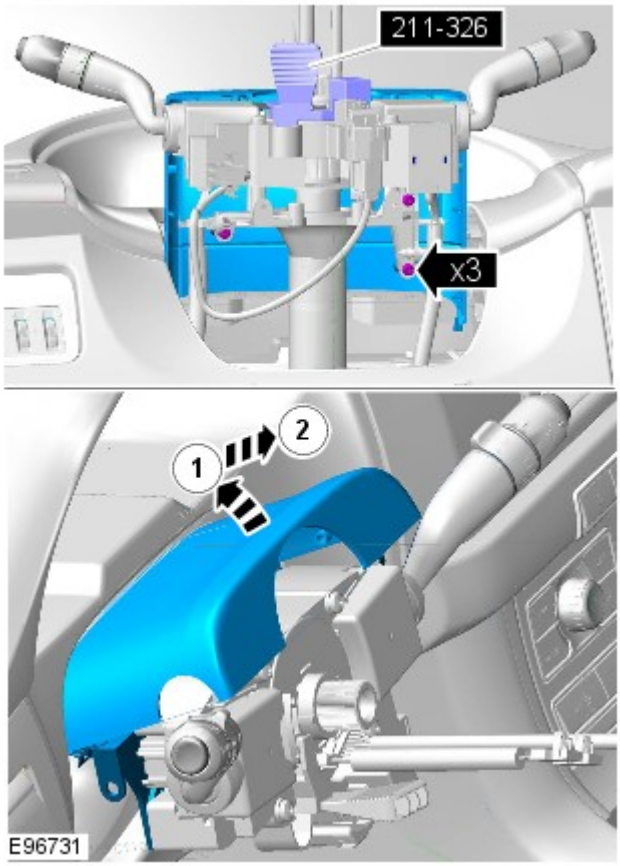


4.

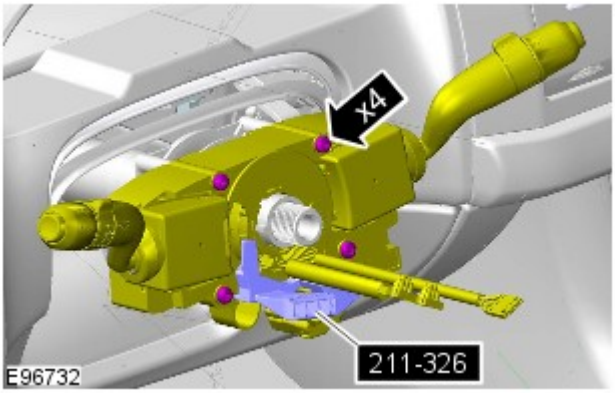




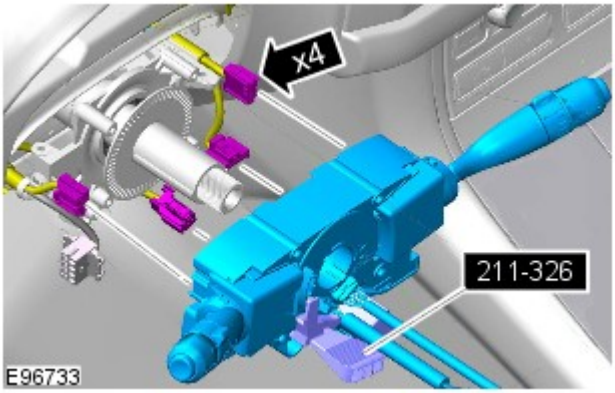
5.



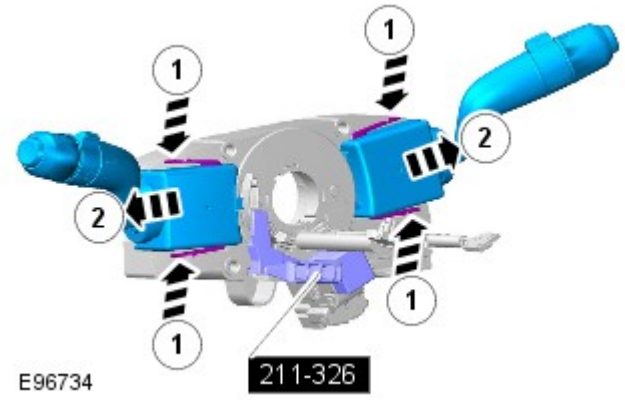
6. *Torque:* 6 Nm

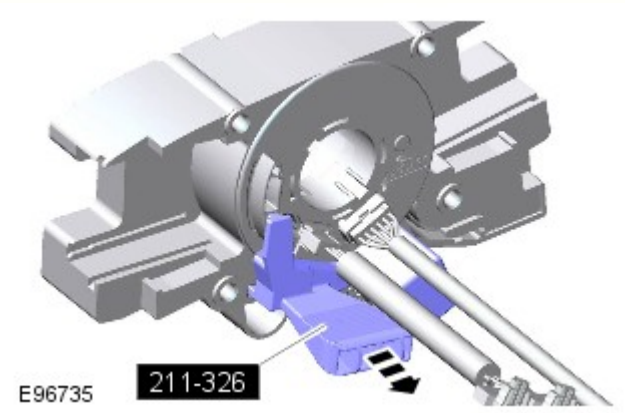


7.



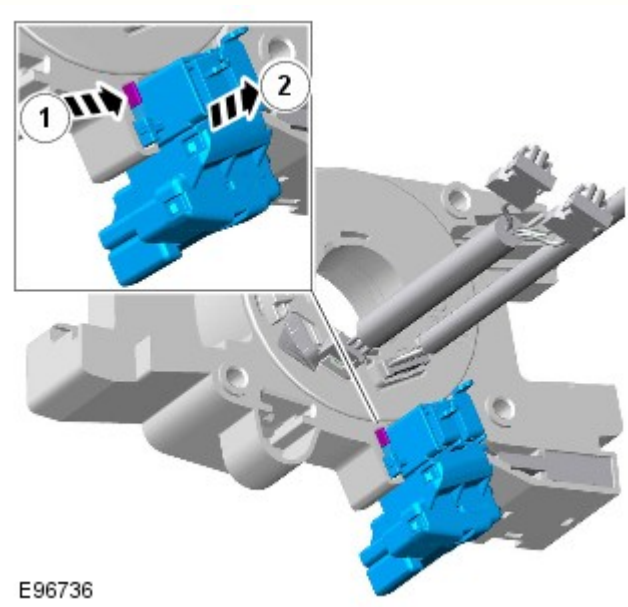
8. NOTE: Do not disassemble further if the component is removed for access only.





9. Remove the special tool from the clockspring.

Special Tool(s): 211-326



10.

Installation

1. CAUTIONS:

⚠ Make sure that special tool 211-326 is installed to the clockspring.

⚠ Make sure that the arrow on the cassette is centered and pointing vertically (**make sure that the steering wheel has remained in the 12 o'clock position and that it has not been turned by +/- 360 degrees**) prior to the steering wheel installation. On removal of the

special tool, keep the clockspring cables taught to prevent the cassette moving from the set position. Failure to follow this instruction may result in damage to the component.

Make sure that the road wheels are in the straight ahead position, failure to follow this instruction may result in damage to the vehicle.

To install, reverse the removal procedure.

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

Supplemental Restraint System - C-Pillar Side Impact Sensor

Removal and Installation

Removal

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least two minutes after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. Make the air bag supplemental restraint system (SRS) safe.

   Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

2. WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

3. Refer to: Rear Scuff Plate Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

Battery, Mounting and Cables - Battery Disconnect and Connect

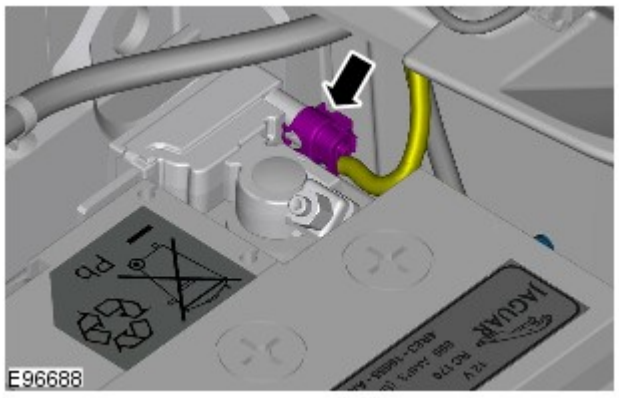
General Procedures

Disconnect

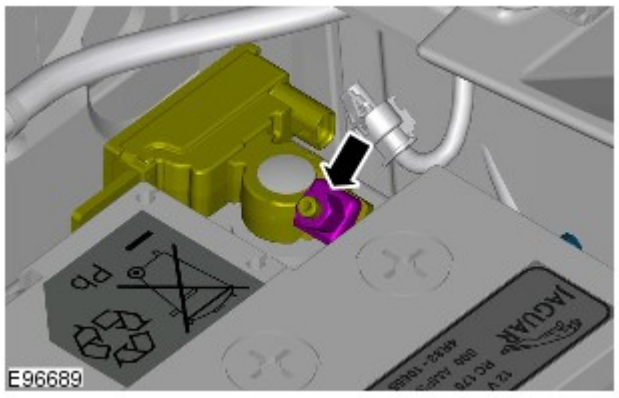
1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

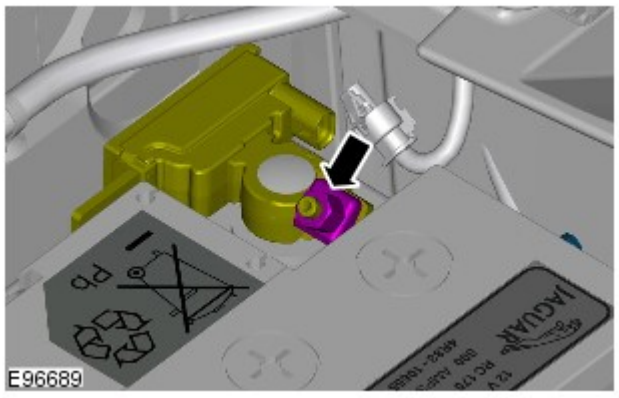


4. CAUTION: Take extra care not to damage the wiring harness.

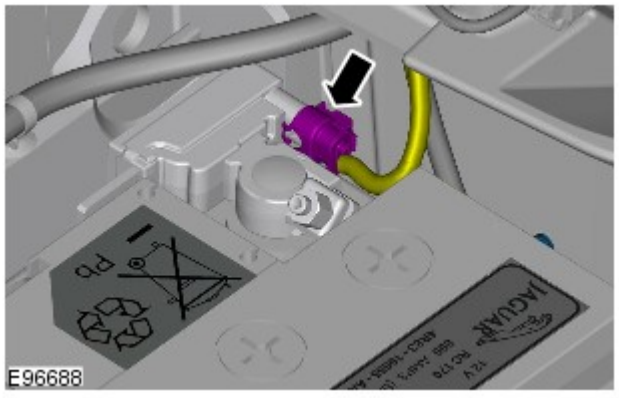


5.

Connect

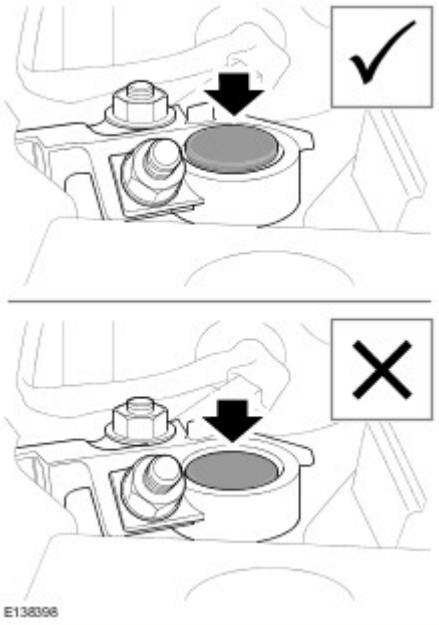


1. *Torque:* 6 Nm



2.

3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

Supplemental Restraint System - Restraints Control Module (RCM)

Removal and Installation

Removal

WARNINGS:

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait two minutes. Failure to follow this instruction may result in personal injury.

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

CAUTION: Make sure the wheels are in the straight-ahead position. Failure to follow this instruction may result in damage to the component.

NOTE: Removal steps in this procedure may contain installation details.

1. Make the air bag supplemental restraint system (SRS) safe.

   Refer to: Supplemental Restraint System (SRS) Health and Safety Precautions (100-00 General Information, Description and Operation).

2. WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

   Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permenantly disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

General Procedures

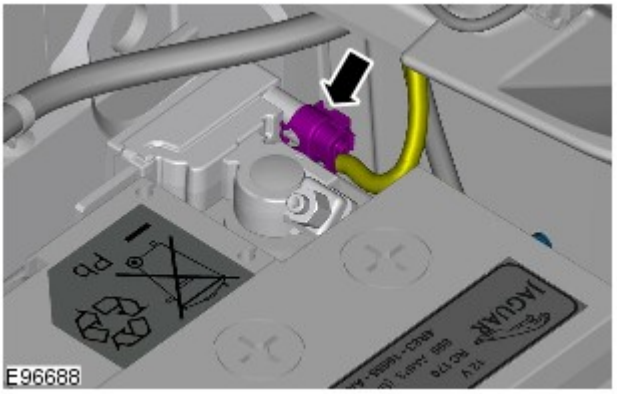
Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

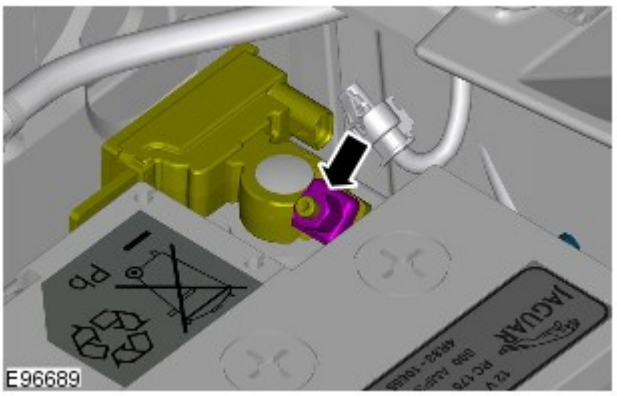
2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

4. CAUTION: Take extra care not to damage the wiring harness.

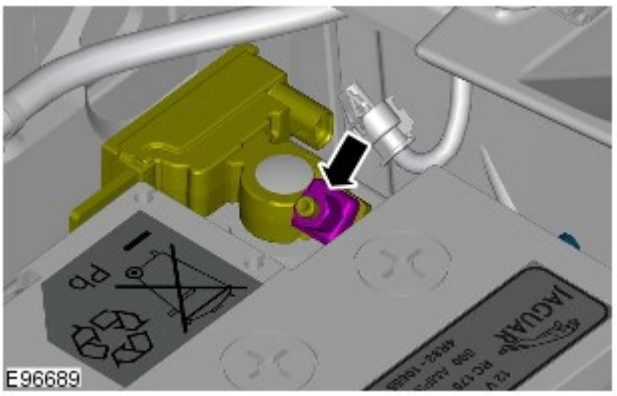


5.

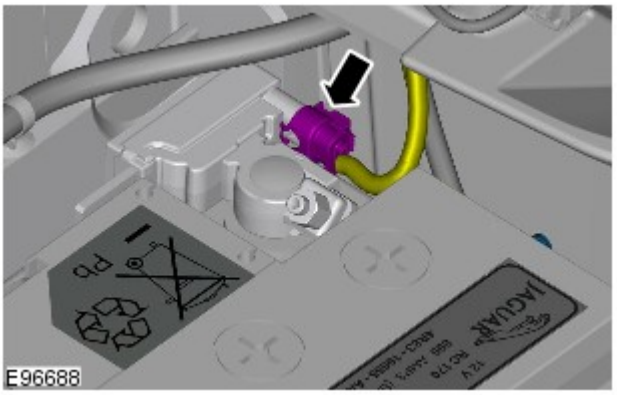


Connect

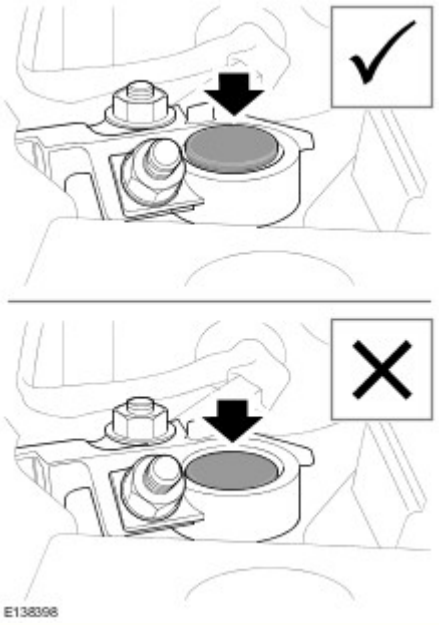
1. *Torque:* 6 Nm



2.



3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

WARNINGS:

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

Supplemental Restraint System - Air Bag and Safety Belt Pretensioner
Supplemental Restraint System (SRS) - Overview

Description and Operation

OVERVIEW

WARNING: All pyrotechnic devices are dangerous. Before performing any procedures on any pyrotechnic device, read all information contained within the Service Information section of this manual. Refer to: General Service Information (100-00, Description and Operation).

The SRS (supplemental restraint system) provides additional protection for vehicle occupants in certain impact conditions by selective activation of twin stage driver and passenger air bags, side air bags, side air curtains and front safety belt pretensioners. Operation of the system is controlled by a RCM (restraints control module) .

The RCM receives inputs from various sensors around the vehicle to determine which devices, if any, should be activated during an accident. The inputs include those from an occupant monitoring system for the front passenger seat, front and side impact sensors and side pressure sensors.

In all markets except NAS, a PAD (passenger air bag deactivation) switch is a dealer fit option that allows the passenger air bag to be disabled.

The activation status of the passenger air bag is given by an indicator on the overhead console. The status of the SRS is given by an air bag warning indicator in the instrument cluster.

System Operation

PRINCIPLES OF OPERATION

In a collision, the sudden deceleration or acceleration is measured by the impact sensors and the accelerometers in the RCM . The RCM evaluates the readings to determine the impact point on the vehicle and whether the deceleration/acceleration readings exceed the limits for firing any of the air bags and pretensioners. During a collision, the RCM only fires the air bags and pretensioners if the safing function confirms that the data from the impact sensor(s) indicates an impact limit has been exceeded.

The RCM incorporates the following impact thresholds to cater for different accident scenarios:

- Front impact, pretensioners.
- Front impact, driver and passenger air bags stage 1, belt unfastened.
- Front impact, driver and passenger air bags stage 1, belt fastened.
- Front impact, driver and passenger air bags stage 2, belt unfastened.
- Front impact, driver and passenger air bags stage 2, belt fastened.
- Rear impact.
- Driver side impact.
- Passenger side impact.

Firing Strategies

The safety belt pretensioners are fired when the pretensioner impact limit is exceeded. The RCM only fires the pretensioners if the related safety belt is fastened.

The driver and passenger air bags are only fired in a frontal impact. If an impact exceeds a stage 1 limit, but is less than the corresponding stage 2 limit, only one inflator in each air bag is fired (stage 2 is still fired for disposal after a delay of 100 ms). If an impact exceeds the stage 2 limit, the two inflators in each air bag are fired simultaneously.

The passenger air bag is disabled unless the front passenger seat is occupied by a large person (NAS only), or the passenger air bag deactivation switch is on (all except NAS and Australia).

The stage 2 inflator of the driver air bag is disabled if the driver seat is forward of the switching point of the seat position sensor.

If there is a fault with a safety belt buckle switch, the RCM assumes the related safety belt is fastened for the pretensioner firing strategy and unfastened for the driver and passenger air bag firing strategies. If there is a fault with the occupant classification sensor, the RCM disables the passenger air bag. If there is a fault with the passenger air bag deactivation switch, the RCM disables the passenger air bag.

If a side impact limit is exceeded, the RCM fires the side air bag and the side head air bag on that side of the vehicle. If the side impact limit on the front passenger side of the vehicle is exceeded, the RCM also evaluates the input from the occupant classification sensor, and fires the side air bag only if the front passenger seat is occupied by a large person (NAS only).

If multiple impacts occur during a crash event, after responding to the primary impact the RCM will output the appropriate fire signals in response to any further impacts if unfired units are available.

Front and Rear Impact Firing Strategy (All Except NAS)

Safety Belt Status		Strategy		
Driver	Front Passenger	Applicable Pretensioner	Driver Air Bag	Passenger Air Bag
Fastened	-	Fired at pretensioner threshold	Fired at belt fastened threshold	-
Unfastened	-	Not fired	Fired at belt unfastened threshold	-
-	Fastened	Fired at pretensioner threshold	-	Fired at belt fastened threshold
-	Unfastened	Not fired	-	Fired at belt unfastened threshold

Front and Rear Impact Firing Strategy (NAS)

Safety Belt Status		Passenger Seat Status	Strategy		
Driver	Passenger		Applicable Pretensioner	Driver Air Bag	Passenger Air Bag
Fastened	-	-	Fired at pretensioner threshold	Fired at belt fastened threshold	-
Unfastened	-	-	Not fired	Fired at belt unfastened threshold	-
-	Fastened	Occupied allow	Fired at pretensioner threshold	-	Fired at belt fastened threshold
-	Fastened	Unoccupied inhibit/empty	Fired at pretensioner threshold	-	Not fired
-	Unfastened	Occupied allow	Not fired	-	Fired at belt unfastened threshold
-	Unfastened	Unoccupied inhibit/empty	Not fired	-	Not fired

Crash Signal

When the RCM outputs any of the fire signals it also outputs a crash signal to the CJB and the ECM on the high speed CAN . The crash signal is also hardwired to the ECM and the CJB . On receipt of the crash signal, the ECM cuts the power supply to the fuel pump relay and the CJB goes into crash mode. In the crash mode, the CJB :

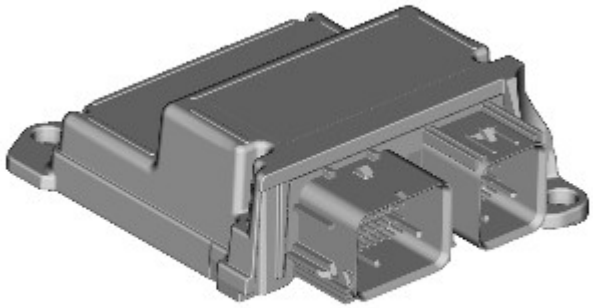
- Activates all of the unlock signals of the vehicle locking system, even if the vehicle is already unlocked.
- Ignores all locking/superlocking inputs until it receives an unlock input, when it returns the locking system to normal operation.
- Activates the interior lamps. The interior lamps remain on permanently until they are manually switched off at the lamp unit, or the CJB crash mode is switched off and they return to normal operation.
- Disables the rear window child lock input until the crash mode is switched off.
- Activates the hazard flashers. The hazard flashers remain on until cancelled by the hazard warning switch or the crash mode is switched off.

The CJB crash mode is switched off by a valid locking and unlocking cycle of the locking system.

Component Description

RESTRAINTS CONTROL MODULE

NOTE: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.



E128616

The RCM is installed on the top of the transmission tunnel, in line with the B/C pillars, and controls operation of the SRS (supplemental restraint system) . The main functions of the RCM include:

- Crash detection and recording.
- Air bag and pretensioner firing.
- Self test and system monitoring, with status indication via the air bag warning indicator and non volatile storage of fault information.

The RCM determines which elements of the SRS are to be deployed by using two internal areas:

- Crash severity evaluation.
- Deployment handler.

Crash severity evaluation uses data from the RCM internal accelerometer, the front crash sensor and the safety belt buckle switch. Based on this data, the RCM decides which level of air bag module deployment is required and forwards the information to the second area, the deployment handler.

The deployment handler evaluates the status of the seat track position sensor and safety belt buckle sensors before a decision is made about which restraints should finally be deployed.

Data from the side crash sensors is used by the RCM in conjunction with acceleration data from the RCM internal accelerometer to make a deployment decision. The RCM processes the acceleration data and, subject to an impact being of high enough severity, decides whether the side air bag module and air curtain should be deployed.

On board testing of the air bag modules, front safety belt pretensioner firing circuits, warning indicator circuits and module status is performed by the RCM together with the storing of fault codes. The impact and pressure sensors perform basic self-tests.

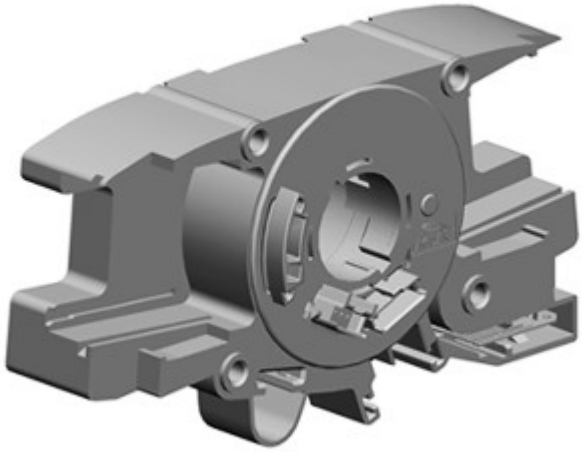
The RCM drives the air bag warning indicator via a high speed CAN signal. If the warning indicator fails, a fault code is recorded and a warning tone is sounded in place of the indicator if a further fault occurs. The RCM also provides a temporary back-up power supply to operate the air bag modules in the event that in crash conditions, the battery supply is lost. In the event of a crash, it records certain data which can be accessed via the diagnostic connector.

A safing sensor in the RCM provides confirmation of an impact to verify if air bag and pretensioner activation is necessary. A roll-over sensor monitors the lateral attitude of the vehicle. Various firing strategies are employed by the RCM to ensure that during an accident only the appropriate air bags and pretensioners are fired. The firing strategy used also depends on the inputs from the safety belt buckle switches and the occupant monitoring system.

An energy reserve in the RCM ensures there is always a minimum of 150 milliseconds of stored energy available if the power supply from the ignition switch is disrupted during a crash. The stored energy is sufficient to produce firing signals for the driver air bag, the passenger air bag and the safety belt pretensioners.

When the ignition is switched on the RCM performs a self test and then performs cyclical monitoring of the system. If a fault is detected the RCM stores a related fault code and illuminates the air bag warning indicator. The faults can be retrieved by Jaguar approved diagnostic equipment over the CAN bus. If a fault that could cause a false fire signal is detected, the RCM disables the respective firing circuit, and keeps it disabled during a crash event.

CLOCKSPRING



E128617

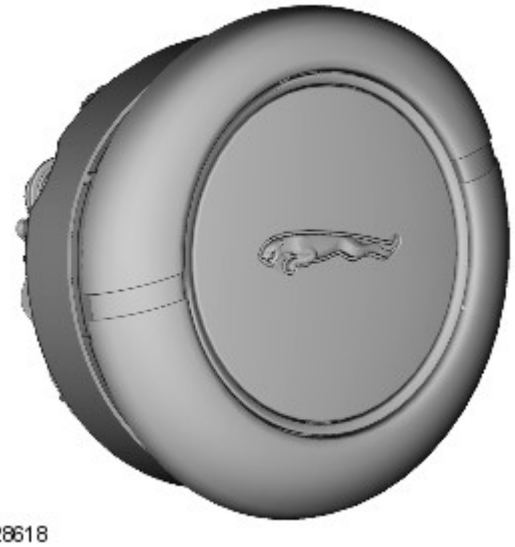
The clockspring is installed on the steering column to provide the electrical interface between the fixed wiring harness of the steering column and the components that rotate with the steering wheel.

The clockspring consists of a plastic cassette which incorporates an outer cover fixed to the steering column and an inner rotor which turns with the steering wheel. Four securing lugs attach the cover to the multifunction switch on the steering column. The rotor is keyed to the steering wheel. A lug on the underside of the rotor operates the self-cancelling feature of the turn signal indicator switch. A ribbon lead, threaded on rollers in the rotor, links a connector on the cover to two connectors on the rotor. Link leads for the driver air bag are installed in one of the connectors on the rotor.

To prevent damage to the ribbon lead, both the steering and the clockspring must be centralized when removing and installing the clockspring or the steering wheel.

Replacement clocksprings are fitted with a rotor lock, which locks the cover to the rotor, in the central position. The rotor lock must be removed when the replacement clockspring is installed.

DRIVER AIR BAG



E128618

The driver air bag is controlled by the RCM , which chooses between single or dual stage deployment, depending on the occupant position and the crash severity. To reduce the risk of an air bag induced injury to a driver who is positioned close to the steering wheel, the 690 mm diameter air bag deploys radially. The volume of the driver air bag is 57 liters.

The driver air bag has a non-azide propellant that reduces particulates and effluents. It consists of a two stage inflator with separate chambers for the two inflation stages, each being independently activated by the RCM . It has two electrical connectors that are color coded and mechanically keyed to the respective connector on the inflator.

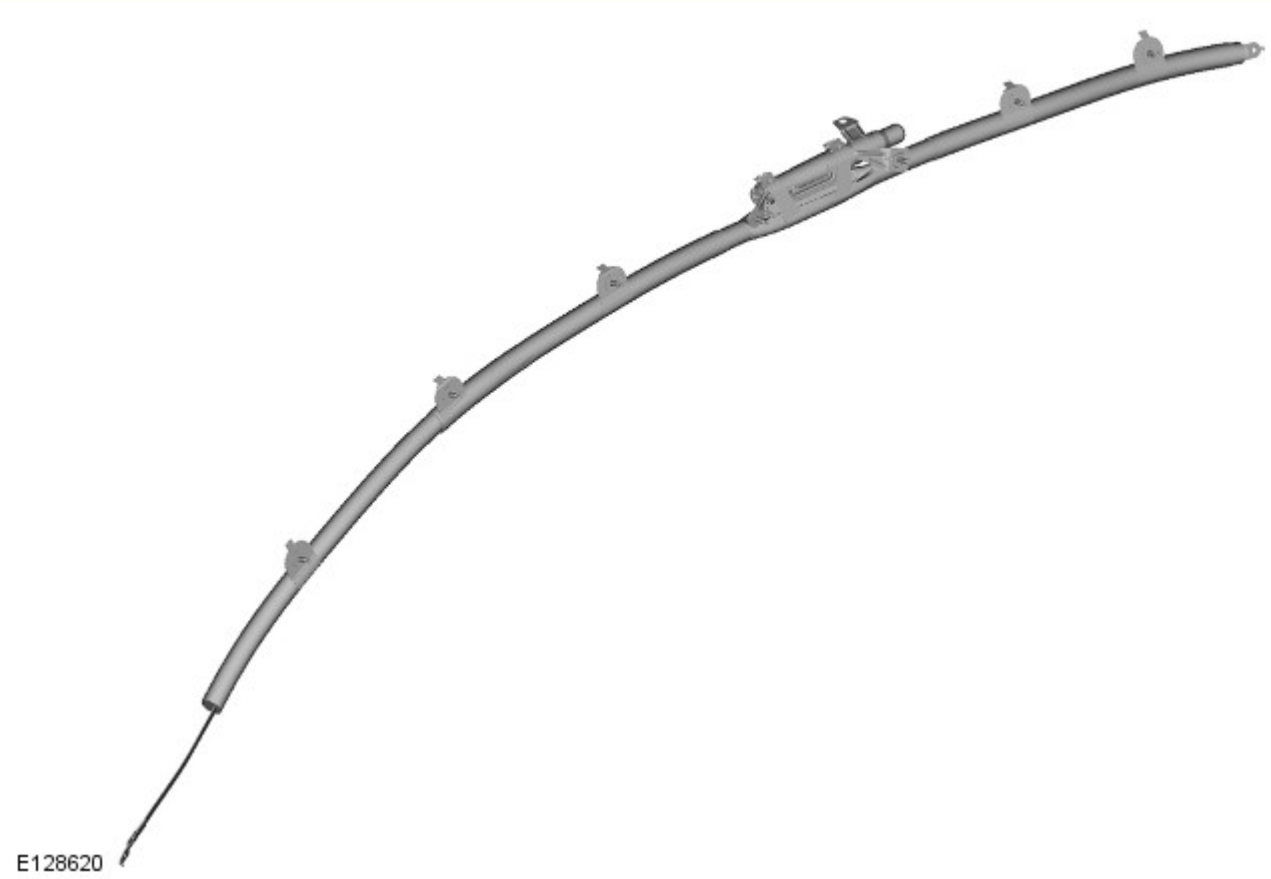
PASSENGER AIR BAG

E128619

The passenger air bag is controlled by the RCM , which chooses between single or dual stage deployment, depending on the occupant status and the crash severity. It consists of a two stage inflator with two air bag electrical connectors to accommodate the two stage inflation. The volume of the passenger air bag is 110 - 120 liters.

The heated gas inflator consists of a high-pressure mix of clean air and hydrogen gas, triggered by two separate ignition squibs. It produces a controlled generation of clean gas to rapidly fill the air bag. It is classified as a stored flammable gas (not as an explosive) and as such, has less restrictive storage and transportation requirements. It produces a very clean burn and almost no particulates and is almost free of any toxins, making disposal or recycling much easier.

SIDE AIR CURTAIN



E128620

The side air curtains have a capacity of approximately 29 liters and are fitted along both sides of the car. They deploy from behind the headliner above the doors, and are anchored at their front and rear extremities to maintain tension across the lower edge of the curtain. Their deployment area extends between the A and C pillar trims, passing over the upper B pillar trim. The inflated portion of the curtain provides head protection for outer occupants in both the front and rear of the car, and a significant level of protection against objects such as poles and trees.

The side air curtains have a rapid fill time of less than 25 ms and, when fully inflated, are approximately 150 mm thick. The curtains are internally divided into separate chambers and, when an area of the inflated air bag is impacted, gases transfer through internal vents to chambers further away from the impact, absorbing energy.

The side air curtains use standard hybrid inflators, which inflate the curtains with gas produced from a combination of pyrotechnic charge and compressed gas.

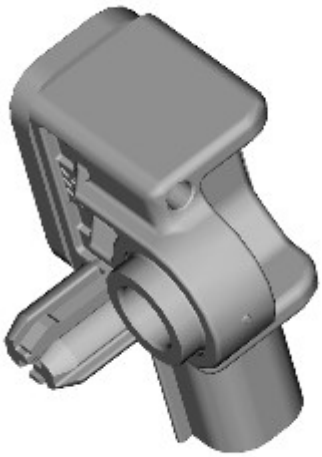
SIDE AIR BAG

E128621

The side air bags are mounted in the outer sides of the front seats where they provide thorax, rib and pelvis protection. Each side air bag consists of a folded air bag and a pyrotechnic inflator contained in a nylon fabric cover.

Side air bags inflate in less than 15 ms, and absorb the energy of an impact by venting the inflation gas through a vent in the fabric material of the air bag. The venting used is able to discriminate between small and large sized occupants, and adjust the cushion stiffness to suit.

IMPACT SENSORS



E128622

Impact sensors are installed in the front and both sides of the vehicle. A front impact sensor is attached to each headlamp surround panel, below the headlamp. A side impact sensor is attached to the base of each D pillar.

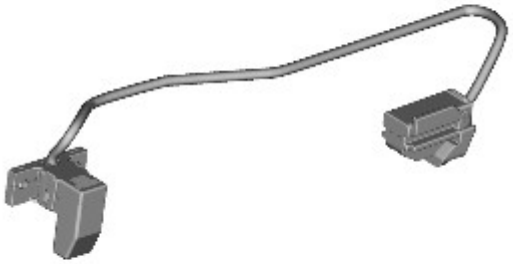
The impact sensors are accelerometers that allow the RCM to detect the sudden acceleration that occurs during an impact.

IMPACT PRESSURE SENSOR

E128623

An impact pressure sensor is installed in each front door, attached to the closure panels. The pressure sensors allow the RCM to detect the sudden pressure pulse that occurs in the front door during a side impact.

SEAT POSITION SENSOR



E128624

The seat position sensor allows the RCM to detect when the driver seat is forward of a given point on the seat track. The seat position sensor consists of a Hall effect sensor attached to the driver seat frame. While the ignition is on, the RCM supplies the sensor with power, and monitors the return current. When the seat frame moves forwards, the sensor moves over the edge of the seat track, which changes the reluctance of the sensor. The change of current is detected by the RCM and used as a switching point. The switching point is when the center of the sensor is 3 ± 4 mm from the leading edge of the seat track.

When the driver seat is forward of the switching point, the RCM increases the time delay between firing the two stages of the inflator in the driver air bag. When the driver seat is rearward of the switching point, the RCM uses the normal time delay between firing the two stages.

SAFETY BELT BUCKLE PRETENSIONERS

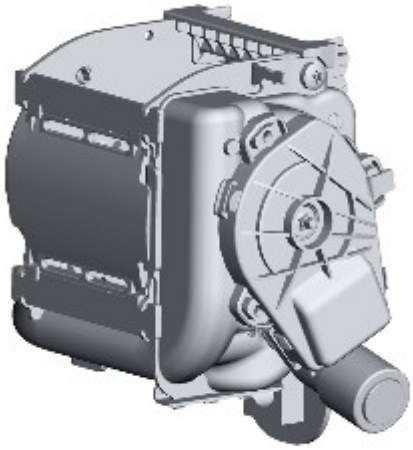
NOTE: Safety Belt Buckle Pretensioners are fitted on both **ROW** and **NAS** variants on all MY's.

E128625

The pretensioners are used to tighten the front safety belts during a collision to ensure the occupants are securely held in their seats. A pretensioner is integrated into each front safety belt buckle and attached to a bracket on the inboard side of the seat.

SAFETY BELT RETRACTOR PRETENSIONERS

NOTE: Safety Belt Retractor Pretensioners are fitted on both **ROW** and **NAS** variants from MY 11.25.



E149532

A pretensioner is incorporated into each of the safety belt retractors. They are pyrotechnic devices that are controlled by the RCM (restraints control module) in the SRS (supplement restraint system). When deployed both the safety belt retractor pretensioner and safety belt buckle pretensioner fire in conjunction with each other and tighten the seatbelt during a collision to ensure the occupants are securely held in their seats.

SAFETY BELT BUCKLE SWITCHES

The buckle of each front safety belt incorporates a switch that provides a safety belt status signal to the RCM . The RCM broadcasts the status on the high speed CAN bus for use by the safety belt reminder and beltminder systems in the instrument cluster.

In the event of a front impact, the RCM will deploy the pretensioners provided the safety belt buckles are fastened. The pretensioners have a lower deployment threshold than the air bags. Hence it is possible during a minor collision, which exceeds the deployment threshold, that only the pretensioners will deploy.

AIR BAG WARNING INDICATOR

The air bag warning indicator consists of a red LED (light emitting diode) behind a SRS graphic in the instrument cluster.

Operation of the air bag warning indicator is controlled by a high speed CAN bus message from the RCM to the instrument cluster. The RCM sends the signal to illuminate the air bag warning indicator if a fault is detected, and for approximately 6 seconds during the bulb check at the beginning of each ignition cycle.

OCCUPANT MONITORING

There are two types of occupant monitoring:

- In all markets except NAS and Australia, vehicles have an occupant detection system.
- In NAS markets, vehicles have an occupant classification system.

Occupant Detection Sensor

For markets which have an occupant detection sensor, this has no interface with the restraints system and only provides the belt reminder function.

Occupant Classification System

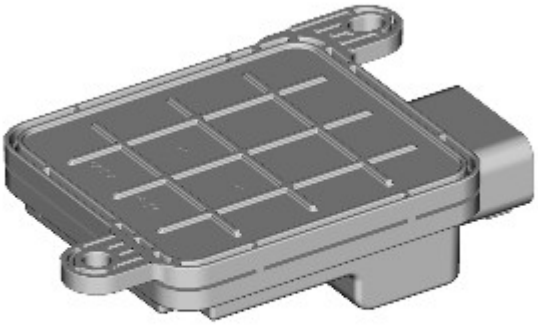
Pressure Pad and Sensor

E128628

Safety Belt Tension Sensor

E98178

Occupant Classification Module



E128661

For markets that have an occupant classification system, this provides the RCM with the occupancy status of the front passenger seat. The restraints control module uses this and the seat buckle status in the evaluation of the firing strategy for the passenger air bag, the passenger side air bag and the front passenger safety belt pretensioner.

The occupant classification system can determine if the front passenger seat is unoccupied, occupied by a small person, or occupied by a large person. The occupant classification system consists of:

- A pressure pad, installed under the cushion of the front passenger seat, which is connected to a pressure sensor.
- A safety belt tension sensor, integrated into the anchor point of the front passenger safety belt.
- An occupant classification module, installed under the front passenger seat.

The pressure pad is a silicone filled bladder. Any load on the pressure pad is detected by the pressure sensor.

The safety belt tension sensor is a strain gauge that measures the load applied by the safety belt anchor to the anchor bolt. The sensor is located in the lower safety belt anchor point.

The occupant classification module supplies a reference voltage to the pressure sensor and the safety belt tension sensor and, from the returned signals, measures the loads acting on the pressure pad and the safety belt tension sensor. The load measurement from the safety belt tension sensor is used to produce a correction factor for the load measurement from the pressure pad. The tightness of the safety belt affects the load acting on the pressure pad, so without the correction factor the occupant classification module cannot derive an accurate occupancy status.

The occupant classification module translates the load readings into a seat occupancy status and transmits the result to the RCM , on a dedicated high speed CAN bus link. The occupant classification module incorporates two load limits for the seat cushion: When the load exceeds the lower limit, but is less than the upper limit, the occupant is classified as small; when the upper limit is exceeded, the occupant is classified as large.

PASSENGER AIR BAG DEACTIVATION INDICATOR

E128751

The passenger air bag deactivation indicator is installed on the center switch pack of the instrument panel. When appropriate, the indicator illuminates to advise front seat occupants that the passenger air bag is disabled. Operation of the indicator is controlled by the RCM . The RCM illuminates the indicator when:

- There is a fault with the passenger air bag firing circuit(s).
- The passenger air bag is deactivated with the PAD switch (where fitted) and the front passenger seat is occupied.
- Required by passenger seat occupant classification (where fitted).

PASSENGER AIR BAG DEACTIVATION SWITCH (ALL EXCEPT NAS)

E128629

Where fitted, the PAD switch provides a method of manually disabling the passenger air bag. The switch is installed in the front passenger end of the instrument panel and operated by the emergency key.

When the PAD switch is operated, it changes a ground connection between two pins in the connectors of the RCM . When the PAD switch is selected to OFF, the RCM disables the passenger air bag and, if the front passenger seat is occupied, illuminates the PAD indicator in the overhead console.

WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

NOTE: Removal steps in this procedure may contain installation details.

Diagnosis and Testing

Principles of Operation

For a detailed description of the wipers and washers system and operation, refer to the relevant Description and Operation section of the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

1. Verify the customer concern.

2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
• Windshield for damage or contamination e.g. road film or general residue deposits • Wiper blades, arms and linkage for wear, security, damage and freedom of movement • Windshield/Headlamp washer fluid level • Washer pipes and jets for leaks, restrictions and damage • Wipers and washers control switch, damage and freedom of movement	• Battery condition and state of charge • Fusible links • Fuses • Relays • Electrical connections • Front wiper motors • Wiper switch • Washer pumps • Rain/light sensor • Heated front washer jets • Ignition switch • Light switch • Ambient air temperature sensor • Central Junction Box (CJB) • Battery Junction Box (BJB) • Anti-Lock Braking System (ABS) module • Automatic Temperature Control Module (ATCM) • Instrument Panel Cluster (IPC) module • Controller Area Network (CAN) circuits

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
Wipers and washers inoperative	• Washers inoperative • Wiper arm(s) incorrectly installed/aligned • Steering column right multifunction switch internal failure • Wipers and washers control switch circuit short circuit to ground, short circuit to power, open circuit, high resistance	• Listen for washer motor operation. Check and top up washer fluid level. Check and rectify blocked washer circuit. Check for DTCs indicating a wiper/washer circuit fault. Rectify as necessary • Check the installation/alignment of the wiper arms. Ensure motor/mechanism is not jammed or seized • Check if the wipers and washers control switch retaining screws are tightened according to specifications. Inappropriately tightened screws might cause steering wheel module failure • Refer to the electrical circuit diagrams and check the wipers and washers control switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance
Wiper blade(s) drag/judder across the windshield	• Contamination of the windshield • Incorrectly installed wiper arm(s) • Wiper arm(s) incorrectly aligned to the screen	Clean the windshield. Check for the correct installation and tension of the wiper arm(s). Refer to the relevant section of the workshop manual. Rectify as necessary.

	• Wiper arm(s) spring tension inadequate	
Very slow operation of the wiper(s) across the windshield Wiper(s) inoperative	• Low battery voltage • Front wiper linkage seized or fouling • Wiper circuit fault • Wiper switch fault, high resistance	Check the battery condition and state of charge. Check the wiper linkage for fouling. Disconnect the motor from the linkage. Refer to the relevant section of the workshop manual. Check the linkage operation. Check for DTCs indicating a wiper circuit fault. Rectify as necessary.
Noisy operation of wiper(s)	• Wiper motor/linkage fault	Lift the wiper arm(s) from the windshield/rear window and recheck the noise level during the wiper sweep operation.
Noisy operation of washers	• Washer motor(s) faulty • Washer system blocked or partially blocked	Listen for washer motor operation. Check and top up washer fluid level. Check and rectify blocked washer circuit. Check the wiper/washer circuit for DTCs indicating a fault. Rectify as necessary.
Washers do not operate	• Fluid level low • Washer circuit blocked • Washer circuit faulty	

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.
REFER to: Diagnostic Trouble Code (DTC) Index - DTC: Central Junction Box (BCM) (100-00 General Information, Description and Operation).

Published: 26-Sep-2014

General Information - Diagnostic Trouble Code (DTC) Index DTC: Central Junction Box (BCM)

Description and Operation

Central Junction Box (CJB)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

If a control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the digital multimeter leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Central Junction Box (CJB). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual.For additional information, refer to: Communications Network (418-00 Module Communications Network, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
B1008-11	Wiper Mode Switch - Circuit short to ground	• Master wipe switch input circuit at ground for more than 1 second	• Refer to electrical circuit diagrams and check the master wipe switch circuit between the wiper switch and the central junction box for short to ground. Repair wiring harness as required. If no fault is found in the harness suspect the switch. Check switch for short to ground, install a new switch as required. If the switch is not at fault suspect the central junction box
B1008-15	Wiper Mode Switch - Circuit short to battery or open	• Master wipe switch input circuit at battery voltage or open load for more than 1 second	• Refer to electrical circuit diagrams and check the master wipe switch circuit between the wiper switch and the central junction box for short to power or open circuit. Repair wiring harness as required. If no fault is found in the harness suspect the switch. Check switch for short to power or open circuit, install a new switch as required. If the switch is not at fault suspect the central junction box
B1008-1E	Wiper Mode Switch - Circuit resistance out of range	• Master wipe switch input circuit signal out of range for more than 1 second	• Refer to electrical circuit diagrams and check the master wipe switch circuit between the wiper switch and the central junction box for partial short or open circuit, high resistance across connectors, or short to another circuit. Repair wiring harness as required. If no fault is found in the harness suspect the switch. Check switch for damaged connector pins, install a new switch as required
B1009-51	Ignition Authorization - Not programmed	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Security identifier not programmed in central junction box (Part of immobilization set-up)	• Configure the central junction box as a new module using the manufacturers approved diagnostic system
B1009-62	Ignition Authorization - Signal compare failure	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Encrypted data exchange between instrument cluster and the central junction box does not match	• Configure the module using the manufacturers approved diagnostic system. If problem persists carry out CAN network integrity test and on demand self-test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuit
B1009-63	Ignition Authorization - Circuit/component protection time-out	• Circuit/component protection time-out • CAN circuit fault • Instrument cluster fault • Central junction box fault • Battery voltage too low	NOTE: Only diagnose this DTC if the Customer is reporting a start related issue • Clear the DTC and retest. Check for additional ignition related DTCs and rectify as necessary. If problem persists, carry out CAN network integrity test and on demand self-test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
			NOTE: Only diagnose this DTC if the Customer is reporting a start related issue

B1009-81	Ignition Authorization - Invalid serial data received	• Invalid serial data received • CAN circuit fault • Instrument Cluster fault	• Clear the DTC and retest. Check for additional ignition related DTCs and rectify as necessary. If problem persists, carry out CAN network integrity test and on demand self-test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B100D-51	Column Lock Authorization - Not programmed	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Security identifier not programmed in central junction box (Part of Immobilization set-up)	• Configure the central junction box as a new module using the manufacturers approved diagnostic system
B100D-64	Column Lock Authorization - Signal plausibility failure	• Signal plausibility failure • Steering column lock unable to perform lock action • CAN network fault • Anti-lock braking system, engine control module, central junction box fault	NOTE: Prior to clearing this DTC, carry out the Vehicle Functional Reset application using the manufacturer approved diagnostic system • Check the serviceability of the steering column and lock. Clear the DTC and retest. If problem persists, carry out CAN network integrity test and on demand self test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B100D-67	Column Lock Authorization - Signal incorrect after event	• Signal incorrect after event • Instrument cluster fault • CAN network fault	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Check for additional related DTCs. Clear the DTC and retest. If problem persists, carry out CAN network integrity test and on demand self test using manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B100D-81	Column Lock Authorization - Invalid serial data received	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Encrypted data exchange between steering column lock and the central junction box does not match	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
		• Missing message • CAN fault • No response from electric steering column lock control	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Clear DTC, repeatedly lock and unlock car using the key fob and retest. Check for related DTCs and refer to the relevant DTC index • If the fault is cleared, notify the customer that the steering column lock may fail to unlock if the vehicle is parked with a high steering angle or with the road wheel against a curb. If the column lock is failing to

B100D-87	Column Lock Authorisation - Missing message	module, instrument cluster, central junction box • Battery voltage at electric steering column lock control module too low • Electric steering column lock control module, instrument cluster, central junction box fault	disengage, the customer may be able to rectify this by rotating the steering wheel while pressing the engine start button • If fault persists, complete a CAN network integrity test using the manufacturers approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits between the central junction box, the instrument cluster and the electronic steering column lock. Refer to the electrical circuit diagrams and check the central junction box, the instrument cluster and the electronic steering column lock power and ground supply circuits for short circuit to ground, short circuit to power, open circuit, high resistance. Repair circuit(s) as required. Clear DTC, perform an on demand self-test and retest • If fault persists, check that the vehicle battery supply voltage is between 9-16 volts. Rectify as required
B100D-96	Column Lock Authorisation - Component internal failure	• Battery voltage at electric steering column lock control module too low • Torque load on steering column • CAN fault • Electric steering column lock control module - Internal failure	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Clear DTC, repeatedly lock and unlock car using the key fob and retest • If fault persists, check that the vehicle battery supply voltage is between 9-16 volts. Rectify as required • Ensure the column lock bolt movement is not obstructed or restricted (the parked position of the road wheels may be exerting a turning force through the steering column, preventing the lock from releasing. The steering wheel may need to be held against the force to allow the column lock to release). Clear DTC, repeatedly lock and unlock car using the key fob and retest • If fault persists, complete a CAN network integrity test using the manufacturers approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits between the central junction box, the instrument cluster and the electronic steering column lock. Refer to the electrical circuit diagrams and check the central junction box, the instrument cluster and the electronic steering column lock power and ground supply circuits for short circuit to ground, short circuit to power, open circuit, high resistance. Repair circuit(s) as required. Clear DTC, perform an on demand self-test and retest • If fault persists, check and install a new electric steering column lock control module as required
B1024-83	Start Control Unit - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect • Immobilizer antenna unit fault • LIN network fault	• Clear the DTC and retest. Refer to the electrical circuit diagrams and check immobilizer antenna unit circuits. If the problem persists, renew the immobilizer antenna unit
B1024-87	Start Control Unit - Missing message	• Value of signal protection calculation incorrect • Immobilizer antenna unit fault • LIN network fault	• Clear the DTC and retest. Refer to the electrical circuit diagrams and check immobilizer antenna unit circuits. If the problem persists, renew the immobilizer antenna unit
B1026-11	Steering Column Lock - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check electric steering column lock circuits
		NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion	

B102B-67	Passive Key - Signal incorrect after event	• Passive key authorization signal incorrect after event • Encrypted data exchange between electric steering column lock control module and central junction box does not match • Low speed CAN fault • Keyless vehicle module fault • Central junction box fault	• Configure the central junction box as a new module using the manufacturers approved diagnostic system. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B102B-87	Passive Key - Missing message	• Passive key authorization missing message • Confirm placement of key within vehicle • Low speed CAN fault • Key fob battery low/battery contact issue • Interference from other RF signal • Electromagnetic compatibility/noise • Keyless vehicle module fault • Receiver fault • Receiver not programmed correctly • Serial communication fault (between receiver and keyless vehicle module) • Key fault • Passive antenna fault • Central junction box fault	NOTE: The action below is only required if this DTC and DTC B1B01-87 have been stored, or vehicle start issue has been reported • Check whereabouts of keys, including spare and confirm correct functionality • Refer to the electrical circuit diagrams and check the power and ground circuits to the keyless vehicle module and receiver • Check CAN communications between central junction box and keyless vehicle module • Check key fob battery • Check vehicle surroundings for possible sources of interference, move vehicle and retest. Check CAN network for interference/electromagnetic compatibility related issues • Check serial circuit between receiver and keyless vehicle module. Refer to the electrical circuit diagrams and check circuits to all three antennas • Disconnect battery, then re-connect - confirm correct operation by re-programming keys using the manufacturer approved diagnostic system
B1046-23	Front Fog Lamp Control Switch - Signal stuck low	• Switch signal stuck low • Switch circuit short to ground • Switch activated for more than one minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1047-11	Rear Fog Lamp Control Switch - Circuit short to ground	• Switch signal stays at ground for more than 1 second	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to ground. Clear the DTC and retest. If the DTC persists, renew the switch
B1047-15	Rear Fog Lamp Control Switch - Circuit short to battery or open	• Switch signal stays at battery voltage level or open load level for more than one second	• Refer to the electrical circuit diagrams and check the switch circuit for short circuit to power or open circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1047-1E	Rear Fog Lamp Control Switch - Circuit resistance out of range	• Switch circuit resistance stays out of range for more than one second	• Refer to the electrical circuit diagrams and check the switch circuit for short circuit to other circuits, or high resistance. Clear the DTC and retest. If the DTC persists, renew the switch
		• Switch signal stuck low	

B1047-23	Rear Fog Lamp Control Switch - Signal stuck low	• Switch circuit short to ground • Switch activated for more than 1 minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-11	Front Washer Switch - Circuit short to ground	• Washer switch input circuit stays at ground for more than 1 second • Switch circuit short circuit to ground • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to ground. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-15	Front Washer Switch - Circuit short to battery or open	• Washer switch input circuit stays at battery voltage level or open load for more than 1 second • Switch circuit short circuit to power • Switch circuit open • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to power or open circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-1E	Front Washer Switch - Circuit resistance out of range	• Washer switch input circuit resistance stays out of range for more than 1 second • Switch circuit short circuit to another circuit • Switch circuit high resistance • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit for short circuit to another circuit, high resistance. Clear the DTC and retest. If the DTC persists, renew the switch
B1051-23	Front Washer Switch - Signal stuck low	• Switch signal stuck low • Switch circuit short to ground • Switch activated for more than one minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1052-23	Rear Washer Switch - Signal stuck low	• Switch signal stuck low • Switch circuit short to ground • Switch activated for more than one minute • Switch fault	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
B1087-86	LIN Bus "A" - Signal invalid	• The header of the LIN message received is incorrect	• Clear the stored DTC and retest, if the DTC returns localize the fault, refer to the electrical circuit diagrams and disconnect the analogue clock (by removing the supply fuse) and retest • Check the operation of the steering wheel switches on the LIN bus circuit (i.e. cruise, gearshift paddles, information and entertainment lower switchpack where installed). If a fault is evident with either the analogue clock or the left-side steering wheel module, replace as required
B1087-88	LIN Bus "A" - Bus off	• LIN bus circuit short to power or ground	• Refer to the electrical circuit diagrams and check the LIN circuit between the central junction box, the right-side steering wheel module and the analogue clock module for short circuit to power or short circuit to ground

B1088-86	LIN Bus "B" - Signal invalid	• Signal invalid	• Refer to the electrical circuit diagrams and check the LIN B circuit between the central junction box and the rain/light sensor, battery backed sounder and volumetric sensor (where installed)
B1088-88	LIN Bus "B" - Bus off	• Bus off	• Refer to the electrical circuit diagrams and check the LIN B circuit between the central junction box and the rain/light sensor, battery backed sounder and volumetric sensor (where installed)
B108B-11	Start Button Circuit "A" - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the start button circuit
B108B-12	Start Button Circuit "A" - Circuit short to battery	• Circuit short to power	• Refer to the electrical circuit diagrams and check the start button circuit
B108B-13	Start Button Circuit "A" - Circuit open	• Circuit open circuit	• Refer to the electrical circuit diagrams and check the start button circuit
B108B-23	Start Button Circuit "A" - Signal stuck low	• Start button signal stuck low • Switch activated for more than one minute • SW1 constantly active for a long period of time while button press detected at SW2 • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the start button circuit. Renew the start switch as required
B108C-11	Start Button Circuit "B" - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the start button circuit
B108C-12	Start Button Circuit "B" - Circuit short to battery	• Circuit short to power	• Refer to the electrical circuit diagrams and check the start button circuit
B108C-13	Start Button Circuit "B" - Circuit open	• Circuit open circuit	• Refer to the electrical circuit diagrams and check the start button circuit
B108C-23	Start Button Circuit "B" - Signal stuck low	• Start button signal stuck low • Switch activated for more than one minute • SW1 constantly active for a long period of time while button press detected at SW2 • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the start button circuit. Renew the start switch as required
B1095-11	Wiper On/Off Relay - Circuit short to ground	• Wiper on/off relay circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1095-12	Wiper On/Off Relay - Circuit short to battery	• Wiper on/off relay circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B1095-13	Wiper On/Off Relay - Circuit open	• Wiper on/off relay circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit
	Wiper High/Low Relay		

B1096-11	- Circuit short to ground	• Wiper circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1096-12	Wiper High/Low Relay - Circuit short to battery	• Wiper circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B1096-13	Wiper High/Low Relay - Circuit open	• Wiper circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit
B1097-11	Heated Windshield Relay - Circuit short to ground	• Heated windshield relay circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1097-12	Heated Windshield Relay - Circuit short to battery	• Heated windshield relay circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B1097-13	Heated Windshield Relay - Circuit open	• Heated windshield relay circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit
B109B-11	License Plate Light - Circuit short to ground	• License plate light circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B109B-13	License Plate Light - Circuit open	• License plate light circuit open	• Refer to the electrical circuit diagrams and check the circuit
B109B-15	License Plate Light - Circuit short to battery or open	• License plate light circuit short circuit to power, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the circuit
B109E-51	Remote Keyless Entry - Not programmed	• Not programmed	• Configure the system using the manufacturers approved diagnostic system
B10A2-31	Crash Input - No signal	• No signal	• Check the supplemental restraints system and engine control module for related DTCs. Refer to the electrical circuit diagrams and check the circuit between the supplemental restraints system, the central junction box and the engine control module
B10A2-38	Crash Input - Signal frequency incorrect	• Signal frequency incorrect	• Check the restraints control module for DTCs and rectify first
B10AB-51	Remote Keyless Entry Synchronization - Not programmed	• Not programmed	• Configure the system using the manufacturers approved diagnostic system
B10AD-09	Rain Sensor - Component Failures	• Rain/light sensor obscured • Battery supply voltage below 9 volts • Sensor incorrectly installed • Component failure	• Check the rain/light sensor is not obscured. Check for related low voltage stored DTCs • Check the security and installation of the rain/light sensor. Clear the DTC and retest • If the DTC returns suspect an internal fault
B10AD-83	Rain Sensor - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect • Sensor fault	• Clear the DTC and retest. If the problem persists, renew the rain/light sensor
		• Missing message	• Check the operation of the rain/light sensor. Refer to the electrical circuit diagrams and check the LIN circuit

B10AD-87	Rain Sensor - Missing message	- LIN slave node is not responding	between the rain/light sensor and the central junction box. Should also check LIN control unit and rain/light sensor power and ground circuits
B10AD-96	Rain Sensor - Component internal failure	• Component internal failure	• Clear the DTC and retest. If the problem persists, renew the rain/light sensor
B10E5-11	PCM Wake-Up Signal - Circuit short to ground	• Engine control module wake-up signal short to ground	• Refer to the electrical circuit diagrams and test the early wake-up signal circuit
B10E5-15	PCM Wake-Up Signal - Circuit short to battery or open	• Engine control module wake-up signal short circuit to power or open circuit	• Refer to the electrical circuit diagrams and test the early wake-up signal circuit
B10E7-11	Ignition On Relay - Circuit short to ground	• Output circuit to ignition control relay short circuit to ground	• Refer to the electrical circuit diagrams and check the output circuit to the ignition control relay (between central junction box and engine junction box) for short circuit to ground. Repair harness as required, clear the DTC and retest
B10E7-12	Ignition On Relay - Circuit short to battery	• Output circuit to ignition control relay short circuit to power • Ignition on relay fault	• Check ignition relay for correct operation, install a new relay if required. Refer to the electrical circuit diagrams and check the output circuit to the ignition control relay (between central junction box and engine junction box) for short circuit to ground. Repair harness as required, clear the DTC and retest
B10E7-13	Ignition On Relay - Circuit open	• Output circuit to ignition control relay open circuit	• Check ignition relay for correct operation, install a new relay if required. Refer to the electrical circuit diagrams and check the output circuit to the ignition control relay (between central junction box and engine junction box) for short circuit to ground. Repair harness as required, clear the DTC and retest
B10F2-4B	Sunroof Control - Over temperature	• Sunroof control motor over temperature • Temperature sensor defective or not calibrated • Debris in the channels/guides • Cable(s) sticking/damaged • Roof opening panel not correctly aligned • Motor fault	• Check the sunroof for smooth operation and obstructions that would cause the motor to overheat. If necessary, renew the motor
B10F2-74	Sunroof Control - Actuator slipping	• Sunroof control motor slipping due to mechanical failure • Debris in the channels/guides • Cable(s) sticking/damaged • Roof opening panel not correctly aligned • Motor fault	• Remove the motor and check the cables for free movement and damage. Check the sunroof for smooth operation and obstructions that would cause the motor to slip. If necessary, renew the motor
B10F2-93	Sunroof Control - No operation	• No operation, roof position is not valid • Motor position not calibrated	• Configure the module using the manufacturers approved diagnostic system

B10F2-9A	Sunroof Control - Component or system operating conditions	• Roof opening panel/roof blinds module circuit fault • Roof opening panel/roof blinds module internal fault • Excessive continuous motor operation	• This DTC is not necessarily a fault and may be logged when the sunroof has been operated continuously and the sunroof has temporarily been disabled to prevent motor over-heat. Clear the DTC and check the operation of the switch and sunroof operation
B10F8-11	Accessory Socket 'A' Relay - Circuit short to ground	• Accessory socket 'A' relay circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B10F8-12	Accessory Socket 'A' Relay - Circuit short to battery	• Accessory socket 'A' relay circuit short to power	• Refer to the electrical circuit diagrams and check the circuit
B10F8-13	Accessory Socket 'A' Relay - Circuit open	• Accessory socket 'A' relay circuit open ground	• Refer to the electrical circuit diagrams and check the circuit
B10F9-11	Accessory Socket 'B' Relay - Circuit short to ground	• Accessory socket 'B' relay circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B10F9-12	Accessory Socket 'B' Relay - Circuit short to battery	• Accessory socket 'B' relay circuit short to power	• Refer to the electrical circuit diagrams and check the circuit
B10F9-13	Accessory Socket 'B' Relay - Circuit open	• Accessory socket 'B' relay circuit open ground	• Refer to the electrical circuit diagrams and check the circuit
B1115-11	High Mounted Stop Lamp Control - Circuit short to ground	• High mounted stop lamp control circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B111E-11	Boot/Trunk Lamps - Circuit short to ground	• Boot/trunk lamp control circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B111E-15	Boot/Trunk Lamps - Circuit short to battery or open	• Boot/trunk lamp control circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B112B-83	Steering Wheel Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Check the steering wheel switch functions to localize the failure. Clear the stored DTC and retest. If the DTC returns suspect the right-side steering wheel module and replace as required
B112B-87	Steering Wheel Module - Missing message	• Missing message	• Check the operation of the steering wheel switches on the LIN bus circuit (i.e. cruise, gearshift paddles where installed) • Refer to the electrical circuit diagrams and check the LIN circuit between the steering wheel module and the central junction box • Check the right-side steering wheel module power and ground circuits
B112B-96	Steering Wheel Module - Component internal failure	• Component internal failure	• Clear the stored DTC and retest. If the DTC returns suspect the right-side steering wheel module and replace as required
	Interior Motion		

B112C-83	Sensor - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the problem persists, renew the volumetric sensor
B112C-87	Interior Motion Sensor - Missing message	• Missing message	• Check the operation of the volumetric sensor • Refer to the electrical circuit diagrams and check the LIN circuit between the volumetric sensor and the central junction box. Should also check LIN control unit power and ground circuits. Clear the DTC and retest • If the DTC persists, renew the volumetric sensor
B112C-96	Interior Motion Sensor - Component internal failure	• The central junction box has detected an internal error in the volumetric sensor	• Clear the DTC and retest. If the problem persists, renew the volumetric sensor
B113C-11	Hazard Switch Illumination - Circuit short to ground	• Hazard switch illumination circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B113C-12	Hazard Switch Illumination - Circuit short to battery	• Hazard switch illumination circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B113C-13	Hazard Switch Illumination - Circuit open	• Hazard switch illumination circuit open circuit	• Refer to the electrical circuit diagrams and check the circuit. Repair as necessary
B113E-23	External Boot/Trunk Release Switch - Signal stuck low	• External luggage compartment lid release switch digital input circuit - Signal stuck low • Switch activated for more than one minute	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the external luggage compartment lid release switch digital input circuit for short to ground
B1140-11	Engine Crank Authorization - Circuit short to ground	• Engine crank authorization signal circuit short circuit to ground	• Refer to the electrical circuit diagrams and check engine crank authorization signal circuit
B1140-15	Engine Crank Authorization - Circuit short to battery or open	• Engine crank authorization signal circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check engine crank authorization signal circuit
B1144-11	Heated Steering Wheel Supply - Circuit short to ground	Please note that this output is currently not used, but there is a possibility that the on demand self-test could detect a circuit fault on this pin	No action necessary, clear/ignore DTC
B1146-11	Passive Sounder Supply - Circuit short to ground	• Security passive sounder control circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the security passive sounder control circuit
B1146-15	Passive Sounder Supply - Circuit short to battery or open	• Security passive sounder control circuit short circuit to power, open circuit	• Refer to the electrical circuit diagrams and check the security passive sounder control circuit
	Tire Pressure	• Diagnostic test to verify reception of all	NOTE: This DTC is for event information only and does not indicate a fault.

B1182-51	Monitoring System - Not programmed	tire low pressure sensors has failed	• No action required
B1186-62	Trunk Power Striker - Signal compare failure	• Both power striker status switches are active at the same time (open and closed) • Status switch circuit short circuit to ground or short circuit to each other	• Refer to the electrical circuit diagrams and check the power striker status switch circuits for short circuit to ground or short circuit to other circuits. Repair wiring harness as required, clear the DTC and retest the system
B11A2-11	Master Exterior Light Switch - Circuit short to ground	• Short circuit to ground on master exterior light switch circuit detected for more than 1 second	• Refer to the electrical circuit diagrams and check the master exterior light switch circuit for short circuit to ground. Repair wiring harness as required, clear the DTC and retest the system
B11A2-15	Master Exterior Light Switch - Circuit short to battery or open	• Short circuit to power or open load on master exterior light switch circuit detected for more than 1 second • Master exterior lighting switch fault	• Refer to the electrical circuit diagrams and check the master exterior light switch circuit for short circuit to power or open load. Repair wiring harness as required, clear the DTC and retest the system. If the DTC remains suspect the master exterior light switch
B11A2-1E	Master Exterior Light Switch - Circuit resistance out of range	• Master exterior light switch circuit resistance out of range detected for more than 1 second • Master exterior lighting switch fault	• Refer to the electrical circuit diagrams and check the master exterior light switch circuit for short circuit to other circuits or high resistance in connectors. Repair wiring harness as required, clear the DTC and retest the system. If the DTC remains suspect the master exterior light switch
B11D1-86	LIN Bus "C" - Signal invalid	• Signal invalid	• Refer to the electrical circuit diagrams and check the roof opening panel LIN circuit between the roof opening panel control module, passenger fuse box and the central junction box
B11D1-88	LIN Bus "C" - Bus off	• Bus off • Roof opening panel LIN network short to power, ground	• Refer to the electrical circuit diagrams and check the roof opening panel LIN circuit between the roof opening panel control module, passenger fuse box and the central junction box
B11D9-92	Vehicle Battery - Performance or incorrect operation	• Internal electronic failure	• Renew the battery monitoring system control module
B11DB-49	Battery Monitoring Module - Internal electronic failure	• Internal electronic failure	• Renew the battery monitoring system control module
B11DB-83	Battery Monitoring Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the problem persists, renew the battery monitoring system control module
B11DB-87	Battery Monitoring Module - Missing	• Missing message • Battery monitoring system control module connector dis-connected/poor connection • Battery monitoring system control module to passenger fuse box LIN circuit - Open circuit	NOTE: Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging • Check the operation of the monitoring system control module. Refer to the electrical circuit diagrams and

	message	• Battery monitoring system control module to battery positive monitor circuit open circuit • Battery monitoring system control module/passenger fuse box failure	check the LIN circuit between the monitoring system control module and the central junction box. Should also check LIN control unit power and ground circuits
B123A-11	Left Front Turn Indicator - Circuit short to ground	• Left front turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check left front turn signal lamp circuit
B123A-15	Left Front Turn Indicator - Circuit short to battery or open	• Left front turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check left front turn signal lamp circuit
B123B-11	Right Front Turn Indicator - Circuit short to ground	• Right front turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check right front turn signal lamp circuit
B123B-15	Right Front Turn Indicator - Circuit short to battery or open	• Right front turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check right front turn signal lamp circuit
B1247-11	Left Rear Turn Indicator - Circuit short to ground	• Left rear turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check left rear turn signal lamp circuit
B1247-15	Left Rear Turn Indicator - Circuit short to battery or open	• Left rear turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check left rear turn signal lamp circuit
B1248-11	Right Rear Turn Indicator - Circuit short to ground	• Right rear turn signal lamp circuit short to ground	• Refer to the electrical circuit diagrams and check right rear turn signal lamp circuit
B1248-15	Right Rear Turn Indicator - Circuit short to battery or open	• Right rear turn signal lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check right rear turn signal lamp circuit
B1249-11	Start Button Illumination - Circuit short to ground	• Short circuit to ground detected in output to stop/start button illumination	• Refer to electrical circuit diagrams and check output circuit to stop/start button illumination. Repair wiring as required, clear DTC and retest system
B1249-15	Start Button Illumination - Circuit short to battery or open	• Short circuit to power or open circuit detected in output to stop/start button illumination	• Refer to electrical circuit diagrams and check output circuit to stop/start button illumination. Repair wiring as required, clear DTC and retest system
B124A-11	Right Daytime Running Light - Circuit short to ground	• Short circuit to ground detected in output to running light	• Refer to the electrical circuit diagrams and check right daytime running light control circuit
B124A-15	Right Daytime Running Light - Circuit short to battery or open	• Short circuit to power or open circuit detected in output to running light	• Refer to the electrical circuit diagrams and check right daytime running light control circuit

B124B-11	Left Daytime Running Light - Circuit short to ground	• Short circuit to ground detected in output to running light	• Refer to the electrical circuit diagrams and check left daytime running light control circuit
B124B-15	Left Daytime Running Light - Circuit short to battery or open	• Short circuit to power or open circuit detected in output to running light	• Refer to the electrical circuit diagrams and check left daytime running light control circuit
B1277-11	Reverse Lamp - Circuit short to ground	• Short circuit to ground detected in reverse lamp control circuit	• Refer to the electrical circuit diagrams and check reverse light control circuit from central junction box to both rear lamp clusters
B1277-15	Reverse lamp - Circuit short to battery or open	• Short circuit to power or open circuit detected in reverse lamp control circuit	• Refer to the electrical circuit diagrams and check reverse light control circuit from central junction box to both rear lamp clusters
B1298-73	Steering Column Adjust Up Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
B1299-73	Steering Column Adjust Down Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
B129A-86	LIN Bus "D" - Signal invalid	• Signal invalid	• Refer to the electrical circuit diagrams and check the immobilizer antenna LIN circuit between the central junction box and the immobilizer antenna unit. Check for other immobilizer DTCs
B129A-88	LIN Bus "D" - Bus off	• Bus off • Immobilizer antenna LIN network short to power, ground - this is detected when nothing is read back after a header is transmitted	• Refer to the electrical circuit diagrams and check the immobilizer antenna LIN circuit between the central junction box and the immobilizer antenna unit. Check for other immobilizer DTCs
B12A1-73	Steering Column Adjust Out Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
B12A2-73	Steering Column Adjust In Switch - Actuator stuck closed	• Internal switch fault	• Check the switch operation. Refer to the electrical circuit diagrams and check the column switch circuit
B12A3-11	Steering Column Adjust Motor Drive A - Circuit short to ground	• Motor circuit short to ground • Motor fault	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and the central junction box. If no circuit faults are evident, suspect the steering column adjust motor
B12A3-15	Steering Column Adjust Motor Drive A - Circuit short to battery or open	• Motor circuit short to power or open circuit • Motor fault	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and the central junction box. If no circuit faults are evident, suspect the steering column adjust motor
B12A4-11	Steering Column Adjust Motor Drive B - Circuit short to ground	• Motor circuit short to ground • Motor fault	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and the central junction box. If no circuit faults are evident, suspect the steering column adjust motor
B12A4-15	Steering Column Adjust Motor Drive B - Circuit short to battery or open	• Motor circuit short to power or open circuit • Motor fault	• Refer to the electrical circuit diagrams and check the circuit between the steering column adjust motor and the central junction box. If no circuit faults are evident, suspect the steering column adjust motor

B12C9-86	LIN Bus "E" - Signal invalid	• Battery monitoring system signal invalid	• Refer to the electrical circuit diagrams and check the battery monitoring system LIN circuit between the central junction box and the battery monitoring system control module. Check for other battery monitoring system related DTCs
B12C9-88	LIN Bus "E" - Bus off	• Bus off • Battery monitoring system LIN network short to power, ground - This is detected when nothing is read back after a header is transmitted	• Refer to the electrical circuit diagrams and check the battery monitoring system LIN circuit between the central junction box and the battery monitoring system control module. Check for other battery monitoring system related DTCs
B12E7-23	Glove Box Switch - Signal stuck low	• Jag Sense switch activated for more than 1 minute	• Refer to the electrical circuit diagrams and check the glove box release circuit between the central junction box and the Jag Sense module for short to other circuits. Check operation of Jag Sense module. Clear DTC and retest system, if DTC remains suspect Jag Sense module
B12EE-11	Tailgate/Trunk Release - Circuit short to ground	• Tailgate/Trunk release circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B12EE-15	Tailgate/Trunk Release - Circuit short to battery or open	• Tailgate/Trunk release circuit short to power, open circuit	• Refer to the electrical circuit diagrams and check the circuit
B12F4-12	Vehicle Speed Output - Circuit short to battery	• Circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B12F5-12	Fridge Relay Control - Circuit short to battery	• Circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit
B12F7-11	Single Wipe Switch - Circuit short to ground	• Short to ground detected on flick wipe switch circuit for more than 1 second	• Check the operation of the flick wipe switch stalk. Refer to the electrical circuit diagrams and check the flick wipe switch circuit for a short to ground. Repair wiring harness as required, clear the DTC and retest
B12F7-15	Single Wipe Switch - Circuit short to battery or open	• Short to power or open load detected on flick wipe switch circuit for more than 1 second	• Check the operation of the flick wipe switch stalk. Refer to the electrical circuit diagrams and check the flick wipe switch circuit for a short to power or open circuit. Repair wiring harness as required, clear the DTC and retest
B12F7-1E	Single Wipe Switch - Circuit resistance out of range	• Resistance out of range detected on flick wipe switch circuit for more than 1 second	• Check the operation of the flick wipe switch stalk. Refer to the electrical circuit diagrams and check the flick wipe switch circuit for a short to another circuit or high resistance. Repair wiring harness as required, clear the DTC and retest
B12FA-11	Power Steering Solenoid Control A - Circuit short to ground	• Servotronic valve circuit short circuit to ground (customer may complain of heavy steering or variable steering effort required)	• Refer to the electrical circuit diagrams and check the circuit between the servotronic valve and the central junction box
	Power Steering	• Servotronic valve circuit open circuit (customer may	

B12FA-13	Solenoid Control A - Circuit open	complain of heavy steering or variable steering effort required)	• Refer to the electrical circuit diagrams and check the circuit between the servotronic valve and the central junction box
B12FB-12	Power Steering Solenoid Control B - Circuit short to battery	• Servotronic valve circuit short circuit to power (customer may complain of heavy steering or variable steering effort required)	• Refer to the electrical circuit diagrams and check the circuit between the servotronic valve and the central junction box
B130B-11	Right Rear Fog Lamp - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit for short to ground
B130B-15	Right Rear Fog Lamp - Circuit short to battery or open	• Circuit short to power or open	• Refer to the electrical circuit diagrams and check the circuit for short to power or open circuit
B130E-11	Left Rear Fog Lamp - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit for short to ground
B130E-15	Left Rear Fog Lamp - Circuit short to battery or open	• Circuit short to power or open	• Refer to the electrical circuit diagrams and check the circuit for short to power or open circuit
B1311-83	Clock Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect • LIN 1 circuit fault	• Clear the DTC and retest. Refer to electrical circuit diagrams and check power and ground connections to clock module, check LIN circuit. Rectify any wiring faults. If the problem persists, renew the clock module
B1311-87	Clock Module - Missing message	• Clock status signal not received • LIN 1 circuit fault	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported an analogue clock concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Refer to the electrical circuit diagrams to locate the fused supply circuit to the analogue clock. With the ignition supply in the OFF state, remove and reinstall the fuse. Clear the DTC and retest. Refer to electrical circuit diagrams and check power and ground connections to clock module, check LIN circuit. Rectify any wiring faults. If the problem persists, renew the clock module
B1311-96	Clock Module - Component internal failure	• Component internal failure	• Refer to the electrical circuit diagrams to locate the fused supply circuit to the analogue clock. With the ignition supply in the OFF state, remove and reinstall the fuse. The clock hands will now set to the 12 position • Cycle the ignition state to ON (the clock should now have self-adjusted to the time currently set within the central junction box) • Record then clear the stored DTC, cycle the ignition state to OFF, return the state to ON, retest, if the DTC returns, renew the analogue clock module
B134E-14	Switch Illumination Adjustment Control - Circuit short to ground or open	• Circuit short to ground or open circuit	• Refer to the electrical circuit diagrams and check the circuit
B134F-11	Headlamp Flash Switch - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B134F-15	Headlamp Flash Switch - Circuit short to battery or open	• Circuit short to power or open circuit	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit

B134F-1E	Headlamp Flash Switch - Circuit resistance out of range	• Circuit resistance out of range	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit
B134F-23	Headlamp Flash Switch - Signal stuck low	• Circuit signal stuck low • Switch activated for more than 1 minute	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit
B136B-11	Suspension Control Module Wake-up Signal - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit
B136B-15	Suspension Control Module Wake-up Signal - Circuit short to battery or open	• Circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit
B136C-11	Headlamp Delay Control - Circuit short to ground	• Exit delay switch input circuit stays at ground for more than 1 second	• Refer to the electrical circuit diagrams and check the exit delay circuit between the lighting switch and the central junction box for short to ground
B136C-15	Headlamp Delay Control - Circuit short to battery or open	• Exit delay switch input circuit stays at battery volts or open circuit for more than 1 second	• Refer to the electrical circuit diagrams and check the exit delay circuit between the lighting switch and the central junction box for short to power or open circuit
B136C-1E	Headlamp Delay Control - Circuit resistance out of range	• Exit delay switch input circuit resistance stays out of range for more than 1 second • External lighting switch fault	• Refer to the electrical circuit diagrams and check the exit delay circuit between the lighting switch and the central junction box for short to other circuits, high resistance. If no wiring harness fault found suspect lighting switch
B136D-11	Front Wiper Intermittent Delay Control - Circuit short to ground	• Circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B136D-15	Front Wiper Intermittent Delay Control - Circuit short to battery or open	• Circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit
B136D-1E	Front Wiper Intermittent Delay Control - Circuit resistance out of range	• Circuit resistance out of range	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the circuit
B136E-11	Glove Box Release Motor - Circuit short to ground	• Circuit short to ground detected on glove box release/inhibit circuit	• Refer to the electrical circuit diagrams and check the glove box release/inhibit circuit between the glove box latch and the central junction box for short to ground. Repair wiring as required, clear the DTC and retest the system. If the DTC returns suspect the latch
B136E-15	Glove Box Release Motor - Circuit short to battery or open	• Circuit short to power or open circuit detected on glove box release/inhibit circuit	• Refer to the electrical circuit diagrams and check the glove box release/inhibit circuit between the glove box latch and the central junction box for short to power or open circuit. Repair wiring as required, clear the DTC and retest the system. If the DTC returns suspect the latch
B1A84-51	Car Configuration Data - Not programmed	• Not programmed	• Configure the module using the manufacturers approved diagnostic system
	Ambient Light Sensor	• Rain/light sensor obscured	

B1A85-96	- Component internal failure	• Sensor incorrectly installed • Component failure	• Check the rain/light sensor is not obscured. Check the security and installation of the rain/light sensor. Clear the DTC and retest. If the DTC returns suspect an internal fault
B1A91-31	Speed/Position Sensor A - No signal	• Rear roof blind circuit fault • Rear roof blind internal fault • No signal from sensor • Roof opening panel/roof blinds module internal fault	• Refer to the electrical circuit diagrams and check the circuit between the rear roof blind motor and the roof opening panel/roof blinds module
B1A92-31	Speed/Position Sensor B - No signal	• Front roof blind circuit fault • Front roof blind internal fault • No signal from sensor • Roof opening panel/roof blinds module internal fault	• Refer to the electrical circuit diagrams and check the circuit between the front roof blind motor and the roof opening panel/roof blinds module
B1B01-55	Key Transponder - Not configured	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Key not programmed (this is part of the immobilization set up)	• Configure the central junction box as a new module using the manufacturer approved diagnostic system
B1B01-64	Key Transponder - Signal plausibility failure	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Encrypted data exchange between key fob and the central junction box does not match when using alternative start method (not passive)	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. Clear the DTC and retest. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B01-81	Key Transponder - Invalid serial data received	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Encrypted data exchange between immobilizer antenna unit and the central junction box does not match when using alternative start method (not passive)	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. Clear the DTC and retest. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
	Key Transponder -	• This DTC could be logged if 'Smart Key Not Found' warning message is displayed, and the start button is pressed without the key in the correct	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis

B1B01-87	Missing message	location as defined in the driver handbook • No communication from key transponder during alternative (not passive) start event	• First confirm that the customer has not performed a start event with the key incorrectly located when the warning message 'Smart Key Not Found' is displayed • Re-synchronize ID by re-configuring the immobilizer antenna unit as a new module. Refer to the electrical circuit diagrams and check the power and ground circuits to the immobilizer antenna unit
B1B33-51	Target ID Transfer - Not programmed	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Security identifier not programmed in central junction box (Part of immobilization set-up) • A new engine control module has been installed	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. Clear the DTC and retest
B1B33-64	Target ID Transfer - Signal plausibility failure	• Signal plausibility failure • Failed communication with engine control module	NOTE: Only diagnose this DTC if the Customer is reporting a start related issue • Clear DTC and retest. If problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B33-81	Target ID Transfer - Invalid serial data received	NOTE: This DTC is only likely to occur following component replacement applications failing prior to completion • Invalid serial data received • Encrypted data exchange between engine control module and central junction box does not match	• Configure the central junction box as a new module using the manufacturer approved diagnostic system. If the problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B33-87	Target ID Transfer - Missing message	• Missing message • Failed communication with engine control module	NOTE: This DTC may be stored even though no fault condition is present and should be ignored unless the customer has reported a vehicle / engine start concern. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Clear DTC and retest. If problem persists, carry out CAN network integrity test and on demand self-test using the manufacturer approved diagnostic system. Alternatively, refer to the electrical circuit diagrams and check CAN circuits
B1B56-46	Sunroof Module - Calibration/parameter memory failure	• Roof opening panel control module - Calibration/parameter memory failure	• Clear the DTC and retest. Re-calibrate the roof opening panel using the manufacturers approved diagnostic system. If the problem persists, renew the roof opening panel control module
B1B56-83	Sunroof Module - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the DTC resets, renew the roof opening panel control module

B1B56-87	Sunroof Module - Missing message	• Missing message • LIN 3 circuit fault	NOTE: Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging. • Check the operation of the roof opening panel control module. Refer to the electrical circuit diagrams and check the LIN circuit between the roof opening panel control module and the central junction box. Check LIN control unit power and ground circuits
B1C32-11	Steering Column Tilt Solenoid - Circuit short to ground	• Steering column tilt solenoid circuit short to ground	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt solenoid circuit for short to ground
B1C32-15	Steering Column Tilt Solenoid - Circuit short to power or open circuit	• Steering column tilt solenoid circuit short to power or open circuit	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt solenoid circuit for short to power or open circuit
B1C33-12	Steering Column Tilt Feedback Signal - Circuit short to power	• Steering column tilt feedback signal circuit short to power	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt feedback signal circuit for short to power
B1C33-14	Steering Column Tilt Feedback Signal - Circuit short to ground or open circuit	• Steering column tilt feedback signal circuit short to ground or open circuit	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column tilt feedback signal for circuit short to ground or open circuit
B1C34-11	Steering Column Telescopic Solenoid - Circuit short to ground	• Steering column telescopic solenoid circuit short to ground	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column telescopic solenoid circuit for short to ground
B1C34-15	Steering Column Telescopic Solenoid - Circuit short to power or open circuit	• Steering column telescopic solenoid circuit short to power or open circuit	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column telescopic solenoid circuit for short to power or open circuit
B1C35-12	Steering Column Telescopic Feedback Signal - Circuit short to power	• Steering column telescopic feedback signal circuit short to power	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column telescopic feedback signal circuit for short to power
B1C35-14	Steering Column Telescopic Feedback Signal - Circuit short to ground or open circuit	• Steering column telescopic feedback signal circuit short to ground or open circuit	NOTE: This component is a serviceable item • Refer to the electrical circuit diagrams and check the column telescopic feedback signal circuit for short to ground or open circuit
B1C36-11	Steering Column Adjust Switch - Circuit short to ground	• Steering column adjust switch circuit short to ground	• Refer to the electrical circuit diagrams and check the column adjust switch circuit for short to ground
B1C43-23	Master Interior Lamp Switch Stuck - Signal stuck low	• Interior lamp circuit short to ground • Switch activated for more than 1 minute • Interior lamp switch fault	• Refer to the electrical circuit diagrams and check the interior lamp circuit. Check the switch operation, renew as necessary

B1C45-67	Front Wiper Park Position Switch Stuck - Signal incorrect after event	• Front wiper park position circuit short to power, ground, open circuit • Front wiper motor park switch fault	• Ensure motor/mechanism is not jammed or seized. Clear the DTC and retest. If the DTC returns refer to the electrical circuit diagrams and check the front wiper park position circuit. If no circuit fault found suspect an internal fault with the front wiper motor, check and renew as required
B1C55-12	Horn Relay - Circuit short to battery	• Horn relay coil circuit short to power	• Refer to the electrical circuit diagrams and check the horn relay circuit, repair as necessary
B1C82-11	Headlamp Washer Relay A - Circuit short to ground	• Headlamp washer relay output circuit short to ground	• Refer to the electrical circuit diagrams and check the headlamp washer pump relay circuit, repair/renew as necessary
B1C82-12	Headlamp Washer Relay A - Circuit short to battery	• Headlamp washer relay output circuit short to power	• Refer to the electrical circuit diagrams and check the headlamp washer pump relay circuit, repair/renew as necessary
B1C82-13	Headlamp Washer Relay A - Circuit open	• Headlamp washer relay output circuit open circuit	• Refer to the electrical circuit diagrams and check the headlamp washer pump relay circuit, repair/renew as necessary
B1C98-11	Left Corner Lamp Circuit - Circuit short to ground	• Left-hand corner lamp short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1C98-15	Left Corner Lamp Circuit - Circuit short to battery or open	• Left-hand corner lamp short circuit short circuit to power or open circuit	• No action necessary, clear/ignore DTC
B1C99-11	Right Corner Lamp Circuit - Circuit short to ground	• Right-hand corner lamp short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1C99-15	Right Corner Lamp Circuit - Circuit short to battery or open	• Right-hand corner lamp short circuit short circuit to power or open circuit	• No action necessary, clear/ignore DTC
B1D00-11	Left Low Beam - Circuit short to ground	• Left low beam circuit short to ground	• Refer to the electrical circuit diagrams and check left low beam circuit for short to ground
B1D00-15	Left Low Beam - Circuit short to battery or open	• Left low beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check left low beam circuit for short circuit to power or open circuit
B1D01-11	Right Low Beam - Circuit short to ground	• Right low beam circuit short to ground	• Refer to the electrical circuit diagrams and check right low beam circuit for short to ground
B1D01-15	Right Low Beam - Circuit short to battery or open	• Right low beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check right low beam circuit for short circuit to power or open circuit
B1D02-11	Left High Beam - Circuit short to ground	• Left high beam circuit short to ground	• Refer to the electrical circuit diagrams and check left high beam circuit for short to ground
B1D02-15	Left High Beam - Circuit short to battery or open	• Left high beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check left high beam circuit for short circuit to power or open circuit

B1D03-11	Right High Beam - Circuit short to ground	• Right high beam circuit short to ground	• Refer to the electrical circuit diagrams and check right high beam circuit for short to ground
B1D03-15	Right High Beam - Circuit short to battery or open	• Right high beam circuit short circuit to power or open circuit	• Refer to the electrical circuit diagrams and check right high beam circuit for short circuit to power or open circuit
B1D13-11	Interior Lights Circuit "A" - Circuit short to ground	• Circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit
B1D17-83	Battery Backed Sounder - Value of signal protection calculation incorrect	• Value of signal protection calculation incorrect	• Clear the DTC and retest. If the problem persists, renew the battery backed sounder
B1D17-87	Battery Backed Sounder - Missing message	• Missing message	NOTE: Fault logging is inhibited by the CCF, but an incorrectly configured CCF could give erroneous DTC logging • Check the operation of the battery backed sounder. Refer to the electrical circuit diagrams and check the LIN circuit between the battery backed sounder and the central junction box. Should also check LIN control unit power and ground circuits
B1D17-96	Battery Backed Sounder - Component internal failure	• Component internal failure	• Clear the DTC and retest, if the problem persists renew battery backed sounder
B1D27-11	Heater Coolant Pump - Circuit short to ground	• Short to ground detected on heater coolant pump control circuit	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1D35-23	Hazard Switch Stuck - Signal stuck low	• Hazard switch circuit short to ground • Switch activated for more than 1 minute • Hazard switch fault	• Check the hazard switch operation, refer to the electrical circuit diagrams and check the hazard switch circuit. Repair/renew as necessary
B1D36-11	Turn Indicator Switch - Circuit short to ground	• Circuit short circuit to ground	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1D36-15	Turn Indicator Switch - Circuit short to battery or open	• Circuit to power or open circuit	• Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1D36-1E	Turn Indicator Switch - Circuit resistance out of range	• Circuit resistance out of range	• Check the switch operation. Refer to the electrical circuit diagrams and check the circuit, repair/renew as necessary
B1D97-96	Tilt Sensor - Component internal failure	• Component internal failure	• Clear the DTC and retest, if the problem persists renew the battery backed sounder
C0079-54	Variable Effort Steering - Missing calibration	• Missing calibration	• Calibrate/configure the feature using the manufacturers approved diagnostic system
C111A-11	Right Stop Lamp - Circuit short to ground	• Right stop lamp circuit short to ground	• Refer to the electrical circuit diagrams and check right stop lamp circuit
C111A-15	Right Stop Lamp - Circuit short to battery or open	• Right stop lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check right stop lamp circuit
	Left Stop Lamp -		

C111B-11	Circuit short to ground	• Left stop lamp circuit short to ground	• Refer to the electrical circuit diagrams and check left stop lamp circuit
C111B-15	Left Stop Lamp - Circuit short to battery or open	• Left stop lamp circuit short to power or open circuit	• Refer to the electrical circuit diagrams and check left stop lamp circuit
C1A56-16	Left Front Tire Pressure Sensor and Transmitter Assembly - Circuit voltage below threshold	• Front left tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A56-86	Left Front Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Front left tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A56-93	Left Front Tire Pressure Sensor and Transmitter Assembly - No operation	• Front left tire pressure sensor not installed • Front left tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a front left tire pressure sensor is installed • Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A57-12	Left Front Initiator - Circuit short to battery	• Tire pressure monitoring system front left initiator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front left initiator circuit for short circuit to power
C1A57-14	Left Front Initiator - Circuit short to ground or open	• Tire pressure monitoring system front left initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front left initiator circuit for short circuit to ground, open circuit, high resistance
C1A58-16	Right Front Tire Pressure Sensor and Transmitter Assembly - Circuit voltage below threshold	• Front right tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A58-86	Right Front Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Front right tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
	Right Front Tire	• Front right tire pressure sensor not installed	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a front right tire pressure sensor is installed

C1A58-93	Pressure Sensor and Transmitter Assembly - No operation	• Front right tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	• Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A59-12	Right Front Initiator - Circuit short to battery	• Tire pressure monitoring system front right initiator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front right initiator circuit for short circuit to power
C1A59-14	Right Front Initiator - Circuit short to ground or open	• Tire pressure monitoring system front right initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system front right initiator circuit for short circuit to ground, open circuit, high resistance
C1A60-16	Left Rear Tire Pressure Sensor and Transmitter Assembly - Circuit voltage below threshold	• Rear left tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A60-86	Left Rear Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Rear left tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A60-93	Left Rear Tire Pressure Sensor and Transmitter Assembly - No operation	• Rear left tire pressure sensor not installed • Rear left tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a rear left tire pressure sensor is installed • Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A61-12	Left Rear Initiator - Circuit short to battery	• Tire pressure monitoring system rear left initiator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear left initiator circuit for short circuit to power
C1A61-14	Left Rear Initiator - Circuit short to ground or open	• Tire pressure monitoring system rear left initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear left initiator circuit for short circuit to ground, open circuit, high resistance
C1A62-16	Right Rear Tire Pressure Sensor and Transmitter Assembly - Circuit voltage below threshold	• Rear right tire pressure sensor internal battery voltage low	NOTE: This DTC is for event information only and does not indicate a fault. • No action required

C1A62-86	Right Rear Tire Pressure Sensor and Transmitter Assembly - Signal invalid	• Rear right tire pressure sensor failure - Pressure, temperature or acceleration signal(s) out of range	NOTE: This DTC is for event information only and does not indicate a fault. • No action required
C1A62-93	Right Rear Tire Pressure Sensor and Transmitter Assembly - No operation	• Rear right tire pressure sensor not installed • Rear right tire pressure sensor internal failure, tire pressure monitoring system RF receiver internal failure or interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Check that a rear right tire pressure sensor is installed • Using the manufacturer approved diagnostic system, perform routine - Tire Pressure Monitoring Tire Pressure Sensor Test. If fewer than 4 sensors fail, install new sensors as necessary. If all 4 sensors fail: - Check that the correct RF receiver is installed (by part number) - Review potential sources of electrical interference (power adaptors, laptop/navigation screens, etc)
C1A63-12	Right Rear Initiator - Circuit short to battery	• Tire pressure monitoring system rear right initiator circuit short circuit to power	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear right initiator circuit for short circuit to power
C1A63-14	Right Rear Initiator - Circuit short to ground or open	• Tire pressure monitoring system rear right initiator circuit short circuit to ground, open circuit, high resistance	• Refer to the electrical circuit diagrams and check the tire pressure monitoring system rear right initiator circuit for short circuit to ground, open circuit, high resistance
C1D18-00	Wheel Localization Failed - No sub type information	• Two or more tire pressure sensor faults • Two or more initiator faults • Two or more initiators incorrectly installed	NOTE: If additional tire pressure monitoring system related DTCs are also set, perform the relevant corrective action(s) first. • Refer to pinpoint test D in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed
C1D21-05	Wheel Module - System programming failures	• Tire pressure sensor(s) removed • Incorrect tire pressure sensor(s) fitted (type, frequency, part number) • Tire pressure sensor(s) damaged • Tire pressure sensor RF receiver interference	NOTE: Tire pressure sensor wheel position information may be incorrect if the wheels have been swapped during or after the failure event. • Complete a visual inspection to ensure tire pressure sensors are fitted • Using the manufacturer approved diagnostic system check datalogger signal 0x4127 - Number of Tire pressure sensors failed • If all 4 sensors fail - Check that the RF receiver is correct part number - Review potential electrical interference to RF receiver, e.g. charging units, power adaptors, laptop/navigation screens, etc. • If 1-3 sensors fail - Identify faulty sensors by using the manufacturer approved diagnostic system and running application - Tire Pressure Monitoring Wheel Sensor Test - Replace faulty sensors
P0230-12	Fuel Pump Primary Circuit - Circuit short to battery	• Circuit short circuit to power	• Refer to the electrical circuit diagrams and check the circuit

P0801-11	Reverse Inhibit Control Circuit - Circuit short to ground	• Mirror dim reverse gear inhibit circuit short circuit to ground detected	• Refer to electrical circuit diagrams and check the mirror dim reverse gear inhibit circuit between the central junction box and the electro chromatic rear view mirror for short to ground. Repair wiring as required, clear DTC and test system operation
U0001-88	High Speed CAN Communication Bus - Bus off	• Bus off	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0004-00	High Speed CAN Communication Bus (+) Low - No sub type information	• High speed CAN communication Bus (+) short to ground	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0005-00	High Speed CAN Communication Bus (+) High - No sub type information	• High speed CAN communication Bus (+) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0008-00	High Speed CAN Communication Bus (-) High - No sub type information	• High speed CAN communication Bus (-) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0009-00	High Speed CAN Communication Bus (-) shorted to Bus (+) - No sub type information	• High speed CAN communication Bus (-) shorted to (+)	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0010-88	Medium Speed CAN Communication Bus - Bus off	• Bus off	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0013-00	Medium Speed CAN Communication Bus (+) Low - No sub type information	• Medium speed CAN communication Bus (+) short to ground	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0014-00	Medium Speed CAN Communication Bus (+) High - No sub type information	• Medium speed CAN communication Bus (+) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0017-00	Medium Speed CAN Communication Bus (-) High - No sub type information	• Medium speed CAN communication Bus (-) short to power	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network
U0018-00	Medium Speed CAN Communication Bus (-) shorted to Bus (+) - No sub type information	• Medium speed CAN communication Bus (-) shorted to (+)	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network

U0100-00	Lost Communication With ECM/PCM "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the engine control module and central junction box
U0101-00	Lost Communication With Transmission Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the transmission control module and central junction box
U0103-00	Lost Communication With Gear Shift Control Module A - No sub type information	• Loss of CAN communications with transmission control switch	• Refer to the electrical circuit diagrams and check the power and ground connections to the transmission control switch. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the transmission control switch and the central junction box
U0121-00	Lost Communication With Anti-Lock Braking System (ABS) Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the Anti-lock Braking System Module and Central Junction Box
U0128-00	Lost Communication With Park Brake Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the electric park brake control module and central junction box
U0132-00	Lost Communication With Suspension Control Module "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the suspension control module and central junction box
U0138-00	Lost Communication with All Terrain Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the terrain response switchpack and central junction box
U0139-00	Lost Communication With Suspension Control Module "B" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the suspension control module and central junction box
U0151-00	Lost Communication With Restraints Control Module - No	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network

	sub type information		between the restraints control module and central junction box
U0155-00	Lost Communication With Instrument Panel Cluster (IPC) Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the instrument cluster and central junction box
U0164-00	Lost Communication With HVAC Control Module - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the automatic temperature control module and central junction box
U0199-00	Lost communication with Driver Door Module (DDM) - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the driver door module and central junction box
U0200-00	Lost Communication With "Door Control Module "B" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the passenger door module and central junction box
U0208-00	Lost Communication With "Seat Control Module "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the driver seat module and central junction box
U0214-00	Lost Communication With Remote Function Actuation - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the keyless vehicle module and central junction box
U0230-00	Lost Communication With Rear Gate Module - No sub type information	• Module power supply fault • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the luggage compartment lid control module and central junction box
U0241-00	Lost Communication With Headlamp Control Module "A" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the headlamp leveling control module and central junction box

U0242-00	Lost Communication With Headlamp Control Module "B" - No sub type information	• No sub type information	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the auto high beam control module and central junction box
U0257-00	Lost Communication With Front Controls / Display Interface Module - No sub type information	• Lost communication with the touch screen • Power supply to module fault • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the touch screen and the central junction box
U025D-00	Lost Communication With Front Controls Interface Module "B" - No sub type information	• Lost communication with the touch screen switchpack • Power supply to module fault • CAN network fault	• Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the touch screen switchpack and the central junction box
U1000-00	Solid State Driver Protection Active - Driver Disabled - No sub type information	• Central junction box output circuit - Short circuit to ground, short circuit to power	NOTE: The relevant output is disabled while this DTC is set. Do not clear the DTC until the fault has been rectified • Using the manufacturer approved diagnostic system, check for other central junction box short circuit to ground and/or short circuit to power DTCs and refer to the relevant DTC index for corrective actions • Once circuit faults have been rectified, clear DTC and retest
U2004-11	Auxiliary Switch Pack - Circuit short to ground	• Circuit short to ground detected on the auxiliary switch circuit	• Refer to the electrical circuit diagrams and check the auxiliary switch signal circuit between the central junction box and the outboard facia switch for a short to ground. Repair wiring harness as required, clear the DTC and test the system
U2004-1E	Auxiliary Switch Pack - Circuit resistance out of range	• Circuit resistance out of range detected on the auxiliary switch circuit	• Check trunk release and/or forward alert buttons are not stuck/sticking. Refer to the electrical circuit diagrams and check the auxiliary switch signal circuit between the central junction box and the outboard facia switch for a short to another circuit or high resistance. Repair wiring harness as required, clear the DTC and test the system. If the DTC remains suspect the outboard facia switchpack
U2004-23	Auxiliary Switch Pack - Signal stuck low	• Signal stuck low detected on the auxiliary switch circuit	• Check trunk release and/or forward alert buttons are not stuck/sticking. Refer to the electrical circuit diagrams and check the auxiliary switch signal circuit between the central junction box and the outboard facia switch for a short to another circuit or high resistance. Repair wiring harness as required, clear the DTC and test the system. If the DTC remains suspect the outboard facia switchpack
U200D-11	Control Module Output Power A - Circuit short to ground	• Short to ground detected on output control circuit to ignition relay located in engine bay junction box	• Check operation of ignition relay in engine bay junction box. Refer to the electrical wiring diagrams and check the circuit for short to ground between the central junction box and the engine bay junction box
U200D-14	Control Module Output Power A - Circuit short to	• Short to ground or open circuit detected on output control circuit to ignition relay located in	• Check operation of ignition relay in engine bay junction box. Refer to the electrical wiring diagrams and check

	ground or open	engine bay junction box	the circuit for short to ground or open circuit between the central junction box and the engine bay junction box
U200D-15	Control Module Output Power A - Circuit short to battery or open	• Short to power or open circuit detected on output control circuit to ignition relay located in engine bay junction box	• Check operation of ignition relay in engine bay junction box. Refer to the electrical wiring diagrams and check the circuit for short to power or open circuit between the central junction box and the engine bay junction box
U200E-11	Control Module Output Power B - Circuit short to ground	• Circuit short to ground	• Refer to the electrical circuit diagrams and check the circuit, repair as necessary
U2010-11	Switch Illumination - Circuit short to ground	• Switch illumination circuit short to ground	• Refer to electrical circuit diagrams and check the switch illumination circuit
U2017-51	Control Module Software #2 - Not programmed	• Not programmed	• Configure the module using the manufacturers approved diagnostic system
U201B-54	Control Module Calibration Data #2 - Missing calibration	• Missing calibration	• Configure the module using the manufacturers approved diagnostic system by running the relevant configuration and set up application for calibrating the steering column
U201F-04	External Receiver - System internal failures	• Tire pressure monitoring system RF receiver power or ground circuit open circuit, high resistance • Tire pressure monitoring system RF receiver internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to the electrical circuit diagrams and check the tire pressure monitoring system RF receiver power and ground circuits for open circuit, high resistance • Using the manufacturer approved diagnostic system, clear the DTCs and retest. If the fault persists, install a new tire pressure monitoring system RF receiver
U201F-11	External Receiver - Circuit short to ground	• Tire pressure monitoring system RF receiver LIN circuit short circuit to ground • Tire pressure monitoring system RF receiver internal failure • Central junction box internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to pinpoint test A in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed
U201F-12	External Receiver - Circuit short to battery	• Tire pressure monitoring system RF receiver LIN circuit short circuit to power • Tire pressure monitoring system RF receiver internal failure • Central junction box internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to pinpoint test B in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed
		• Tire pressure monitoring system RF receiver power or ground circuit open circuit, high resistance	

U201F-87	External Receiver - Missing message	• Tire pressure monitoring system RF receiver LIN circuit open circuit, high resistance • Tire pressure monitoring system RF receiver internal failure • Central junction box internal failure	NOTE: Ignore all other tire pressure monitoring system related DTCs if this DTC is set. • Refer to pinpoint test C in the tire pressure monitoring system diagnosis and testing section of the workshop manual (see section 204-04) and proceed as directed
U2101-00	Control Module Configuration Incompatible - No sub type information	• Car configuration file incorrect	• Check and amend the car configuration file as required using the manufacturer approved diagnostic system
U2104-11	Trip Meter Reset Button - Circuit short to ground	• Circuit short to ground for more than 1 second • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2104-15	Trip Meter Reset Button - Circuit short to battery or open	• Circuit short to power for more than 1 second • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2104-1E	Trip Meter Reset Button - Circuit resistance out of range	• Circuit resistance out of range for more than 1 second • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2104-23	Trip Meter Reset Button - Signal stuck low	• Signal stuck low • Switch activated for more than 1 minute • Switch failure	• Check the operation of the switch. Refer to the electrical circuit diagrams and check the switch circuit. Clear the DTC and retest. If the DTC persists, renew the switch
U2300-64	Central Configuration - Signal plausibility failure	• Tire pressure monitoring system configuration data is invalid caused by incorrect car / local configuration file(s)	• Using the manufacturer approved diagnostic system check and amend the car / local configuration file (s)
U3000-49	Control Module - Internal electronic failure	• Central junction box - Internal failure	NOTE: The relevant output is disabled while this DTC is set • Using the manufacturer approved diagnostic system, check for other central junction box short circuit to ground and/or short circuit to power DTCs and refer to the relevant DTC index for corrective actions • Install a new central junction box as required. Clear DTCs and retest
U3001-54	Control Module Improper Shutdown - Missing calibration	• Missing calibration • EEPROM hasn't stored the final axis position of the steering column telescope/tilt position	• Check for other steering column telescope/tilt DTCs. Clear the DTC and operate the steering column through the complete telescope and tilt functions ranges. If the DTC returns, configure the steering column module using the manufacturers approved diagnostic system by running the relevant configuration and set up application

Uni-Body, Subframe and Mounting System - Rear Subframe Rear Bushing TDV6 3.0L Diesel /V8 5.0L Petrol/V8 S/C 5.0L Petrol

Removal and Installation

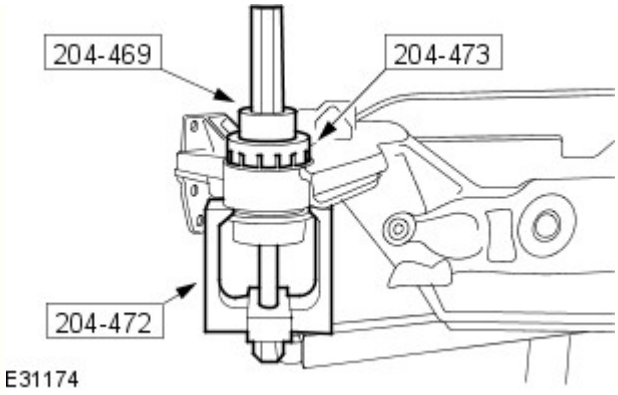
Special Tool(s)

	Forcing bolt 204-469
	Reciever-bush 204-475
	Replacer-bush 204-474
	Remover bush 204-473
	Remover support-bush 204-472

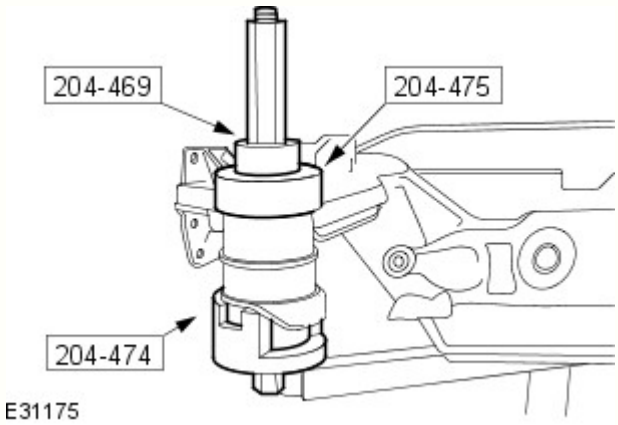
Removal

1. For additional information, refer to: Rear Subframe - 3.0L Diesel (502-00, Removal and Installation) / Rear Subframe - V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).

2.



Installation



1. NOTE: Make sure the bushing is correctly orientated.

2. For additional information, refer to: Rear Subframe - 3.0L Diesel (502-00, Removal and Installation) / Rear Subframe - V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).

Uni-Body, Subframe and Mounting System - Rear Subframe V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol

Removal and Installation

Removal

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. Refer to: Battery Disconnect and Connect (414-01 Battery, Mounting and Cables, General Procedures).

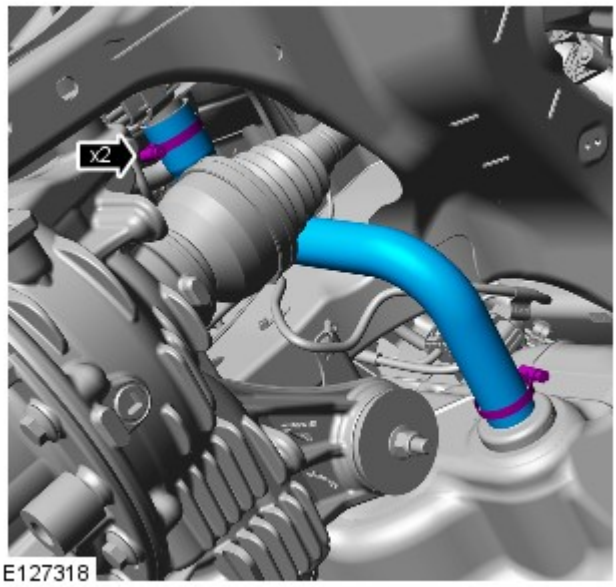
2. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Remove the rear wheels and tires

Refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

4. Refer to: Fuel Tank Draining - V6 3.0L Petrol/V8 5.0L Petrol/V8 S/C 5.0L Petrol (310-00 Fuel System - General Information, General Procedures).

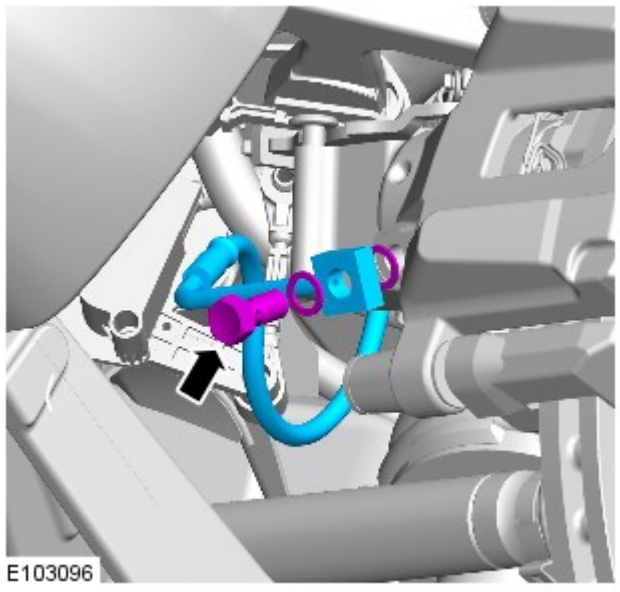


5. CAUTION: Be prepared to collect escaping fluids.

NOTE: The fuel tank has a non-return valve in the filler stub pipe, only the fuel present in the filler hose will be spilt.

6. Refer to: Driveshaft - 3.0L NA V6 - AJ27/V8 5.0L Petrol/V8 S/C 5.0L Petrol (205-01 Driveshaft, Removal and Installation).

7. Refer to: Parking Brake Cable Tension Release (206-05 Parking Brake and Actuation, General Procedures).



8. CAUTIONS:

Always plug any open connections to prevent contamination.

If brake fluid is spilt on the paintwork, the affected area must be immediately washed down with cold water.

NOTES:

To prevent the loss of brake fluid, using the special tool apply the brake pedal and set to 40mm (1.6 in) below the rest position.

LH illustration shown, RH is similar.

- *Torque:* 38 Nm
- Remove and discard the two sealing washers.
- Repeat the above step for the other side.

9. NOTE: RH illustration shown, LH is similar.

- *Torque:* 133 Nm
- Repeat the above step for the other side.

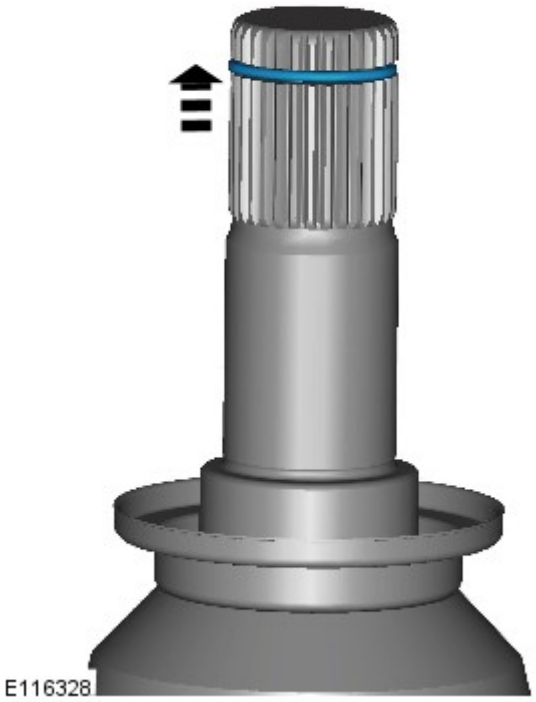
35. NOTE: LH illustration shown, RH is similar.

Repeat the above step for the other side.

36. NOTE: LH illustration shown, RH is similar.

Repeat the above step for the other side.



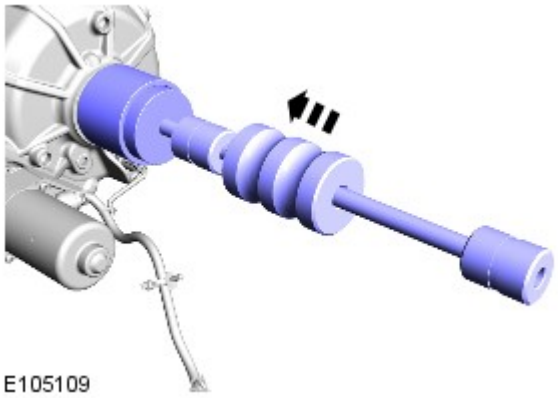
37.

Installation

1.
- Clean the components mating faces.
- Repeat the above step for the other side.

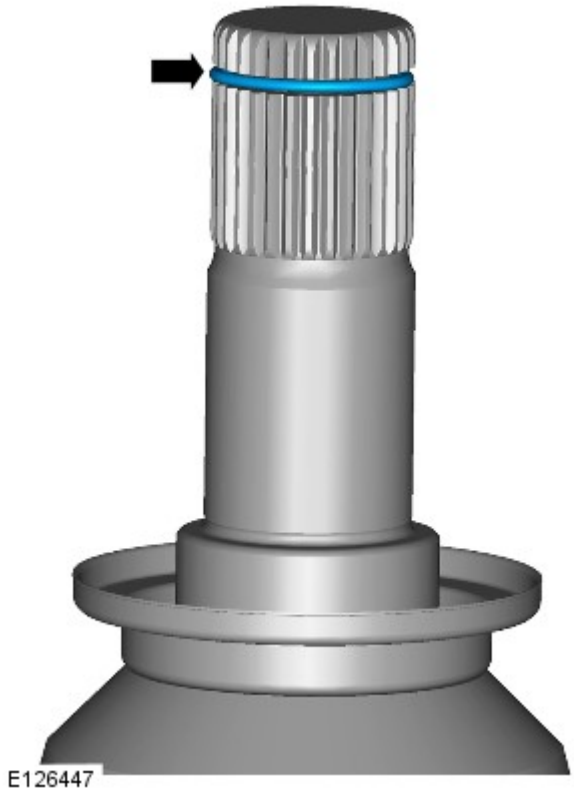
2. NOTE: LH illustration shown, RH is similar.

Repeat the above step for the other side.



3. NOTE: LH illustration shown, RH is similar.

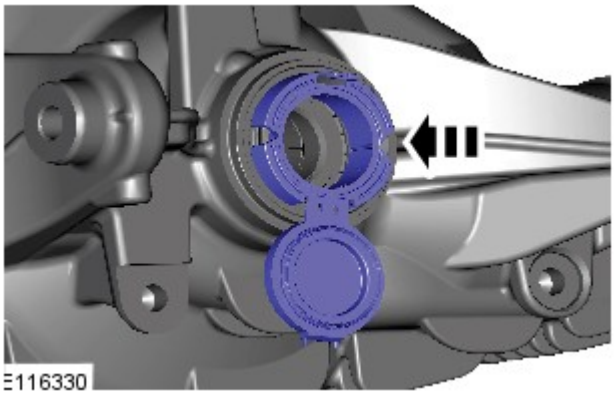
Repeat the above step for the other side.



4. CAUTION: The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

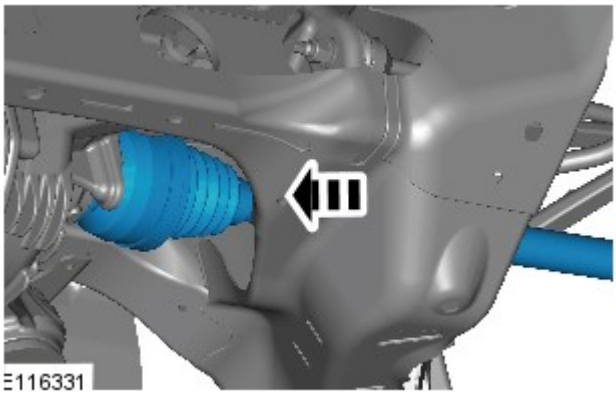
NOTE: LH illustration shown, RH is similar.

Repeat the above step for the other side.



5. CAUTIONS:

Do not install the rear halfshaft fully at this stage.



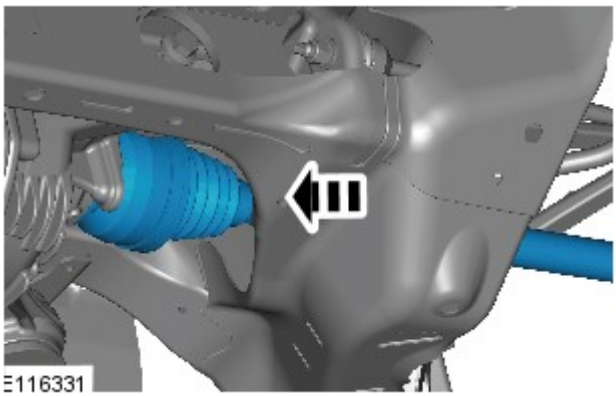
Only install the rear halfshaft until the halfshaft splines have past the halfshaft oil seal.

NOTE: LH illustration shown, RH is similar.

Repeat the above step for the other side.

6. NOTE: LH illustration shown, RH is similar.

- Remove and discard the halfshaft oil seal plutector.
- Repeat the above step for the other side.



7. CAUTION: Make sure that the rear halfshaft circlip is installed correctly by pulling the halfshaft gently to make sure it is engaged.

NOTE: LH illustration shown, RH is similar.

Repeat the above step for the other side.

8. To install, reverse the removal procedure.

9. Refer to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures).

10. Refer to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures).

Vehicle Dynamic Suspension - Air Leaks

General Procedures

1. CAUTION: Any spray used must have a corrosion inhibitor, and must not cause damage to paintwork, plastics, metals or plastic pipes.

NOTE: The recommended leak detection spray is GOTEC LDS, Jaguar part number C2C 22398.

The recommended leak detection spray should be used to identify any suspected leaks. This procedure should also be used where any of the air suspension components have been disturbed.

2. Clean around the area of the suspected air leak.

3. Using the recommended leak detection spray, spray around all of the air suspension components, working systematically until the source of the air leak has been found.

4. NOTE: If a new air suspension component is to be fitted, and no air leak has been detected at the pipe connectors, remove and discard the new air pipe connections supplied with the component.

If any of the air suspension components are found to be leaking e.g. air spring, compressor, reservoir or the solenoid valve block repair is effected by replacement only. If an air leak from the pipe connector has also been identified, a new air pipe connector, supplied with the air suspension component, must be installed.

5. NOTES:

Only Jaguar approved connectors have been tested to the correct pressure and temperature specifications.

Air pipes must only be cut using either Hose cutter 204-494, available from SPX LTD or Hose cutter YA1000A, available from Snap-On Tools.

If the color coded markings adjacent to the pipe connections are removed when cutting air pipes, the cut end of the air pipe must be clearly marked with a suitable colored tape or paint mark.

If the source of the air leak is found to be a pipe connection cut 5 mm (0.2 in) off the end of the air pipe and fit a new connector.

6. NOTES:

Air pipes must only be cut using either Hose cutter 204-494, available from SPX LTD or Hose cutter YA1000A, available from Snap-On Tools.

Only Jaguar approved air pipes have been tested to the correct pressure and temperature specifications.

If the source of the air leak is found to be in a section of pipe cut out the damaged section of air pipe and replace with new air pipe and air pipe connectors as required.

7. NOTE: If the repair has been unsuccessful repeat the above steps until the air leak is rectified.

Using the Jaguar approved diagnostic system ensure that the system is fully pressurized.

8. Using the recommended leak detection spray, spray around all of the air suspension components, working systematically to make sure that the source of the air leak has been found.

Vehicle Dynamic Suspension - Air Suspension Compressor

Removal and Installation

Removal

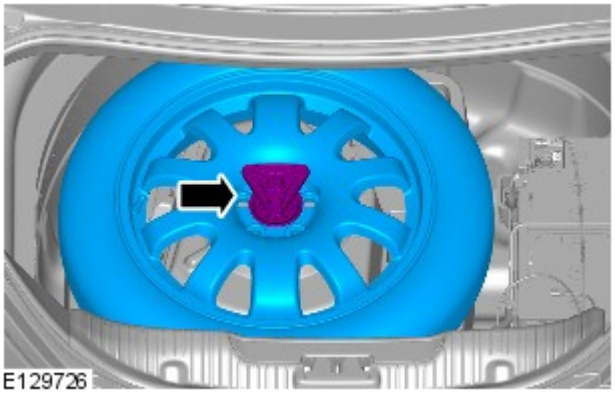
WARNING: The air suspension is pressurised. Make sure dirt or grease does not enter the system. Always wear hand, eye and ear safety standard protection when working on the system.

CAUTION: Do not depressurise the air suspension system before raising the vehicle.

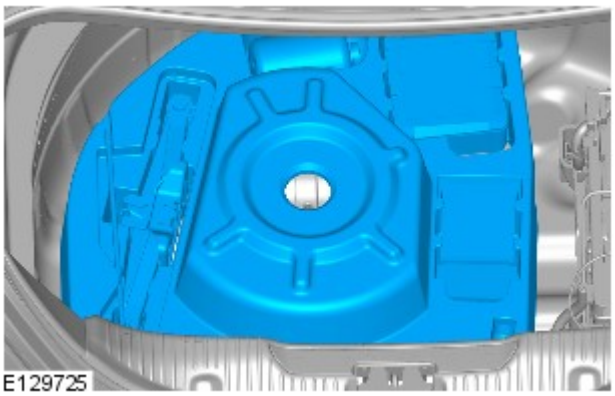
NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

2. Refer to: Air Suspension Solenoid Valve Block (204-05 Vehicle Dynamic Suspension, Removal and Installation).



3.

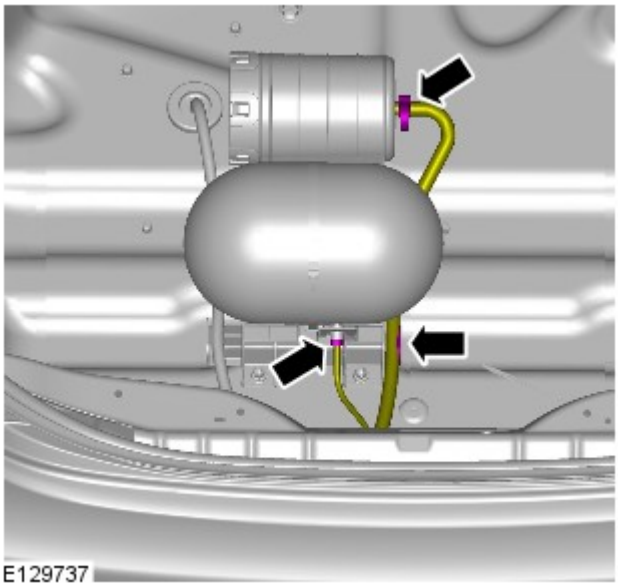


4.

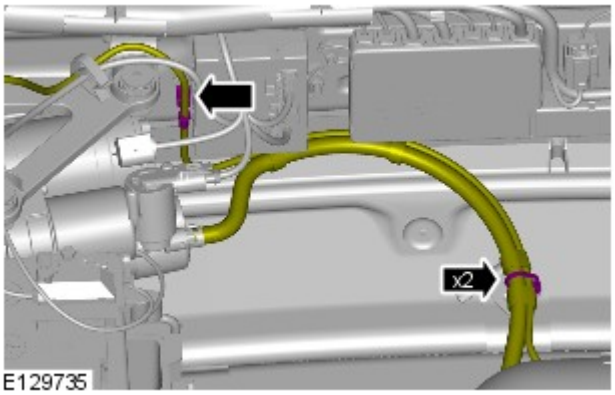
5. CAUTION: Using a suitable blanking plug, blank off the end of the air pipe to prevent dirt ingress.

A new air line connector must be installed.

Refer to: Air Line Connector (204-05, General Procedures).
Torque: 3.5 Nm



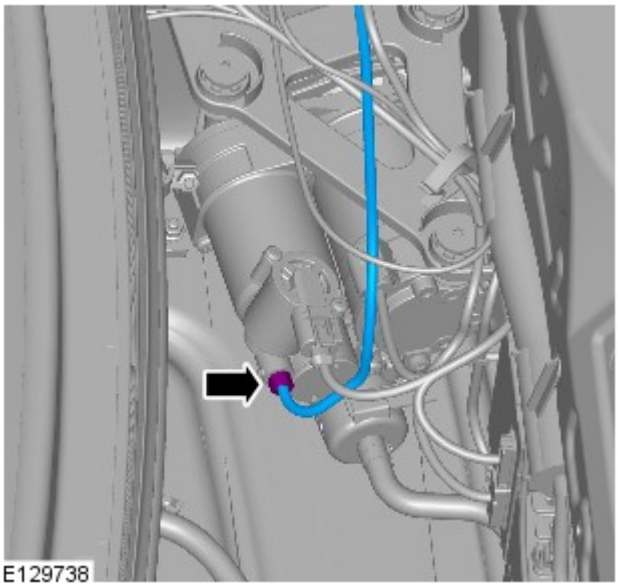
6.



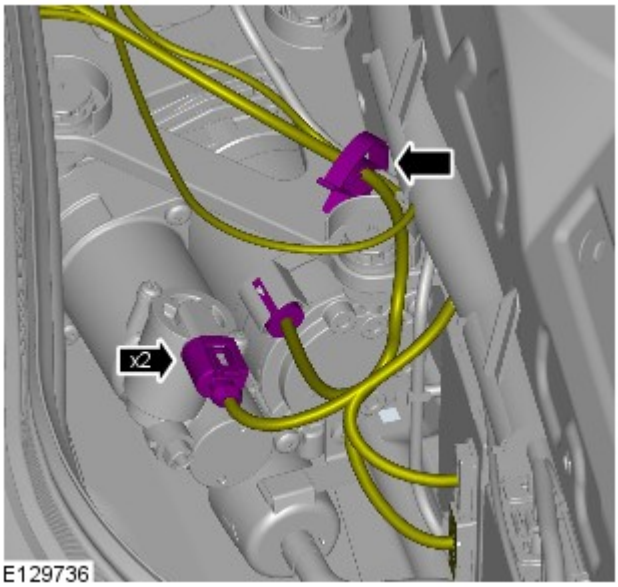
7. CAUTION: Using a suitable blanking plug, blank off the end of the air pipe to prevent dirt ingress.

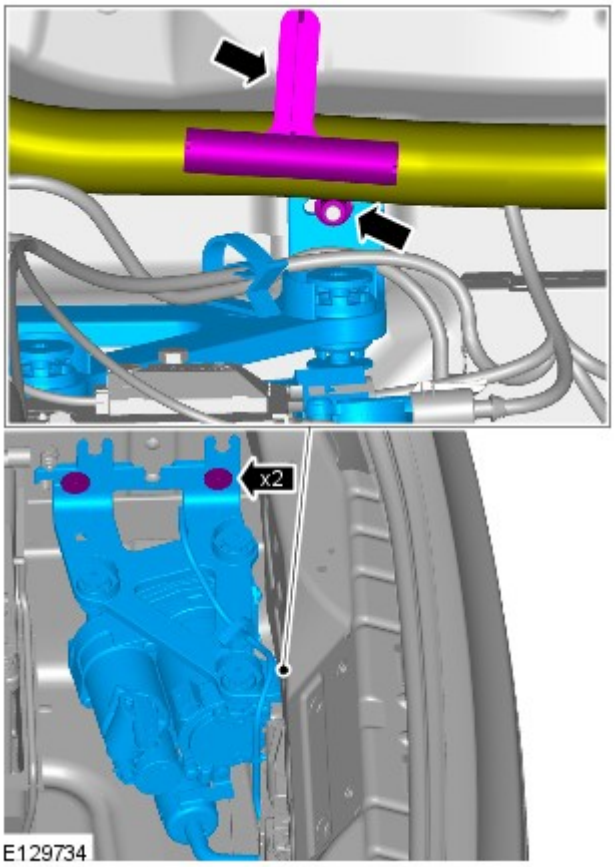
A new air line connector must be installed.

Refer to: Air Line Connector (204-05, General Procedures).
Torque: 3.5 Nm



8.





9. *Torque:* 9 Nm

Installation

1. To install, reverse the removal procedure.

General Procedures

WARNINGS:

A small amount of air pressure will be left in the air suspension system.

Eye protection must be worn.

Wear protective gloves.

CAUTIONS:

Make sure tailgate, hood and all doors are closed.

Make sure the vehicle is in a clear working area.

1. WARNING: The air suspension is pressurised. Make sure dirt or grease does not enter the system. Always wear hand, eye and ear safety standard protection when working on the system.

Using the diagnostic tool, depressurize the air suspension system.
- Follow the on-screen prompts.

2. Using the diagnostic tool, pressurize the air suspension system.
- Start and run the engine.

Battery, Mounting and Cables - Battery Disconnect and Connect

General Procedures

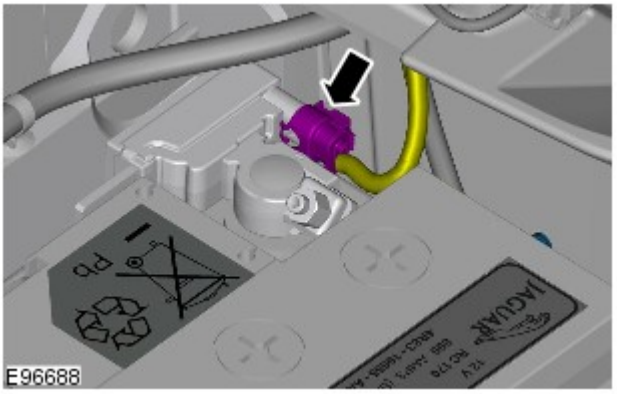
Disconnect

1. Refer to: Battery and Battery Charging Health and Safety Precautions (100-00 General Information, Description and Operation).

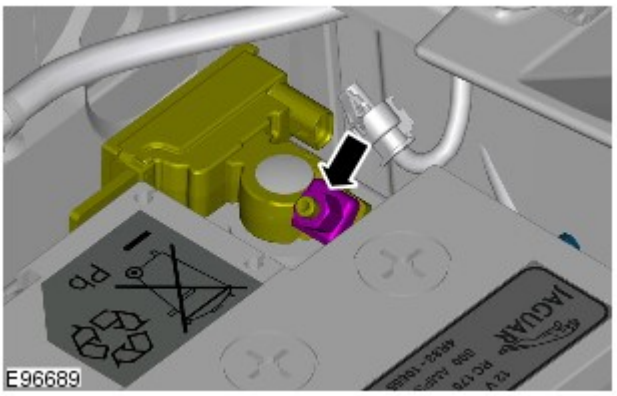
2. Obtain and record the audio unit preset radio frequencies.

3. Raise and secure the luggage compartment floor covering.

4. CAUTION: Take extra care not to damage the wiring harness.

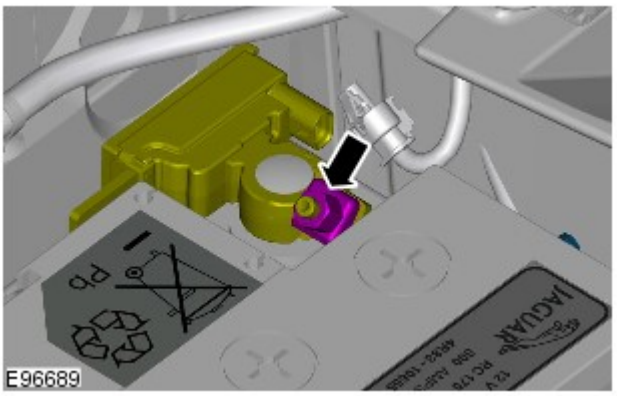


5.

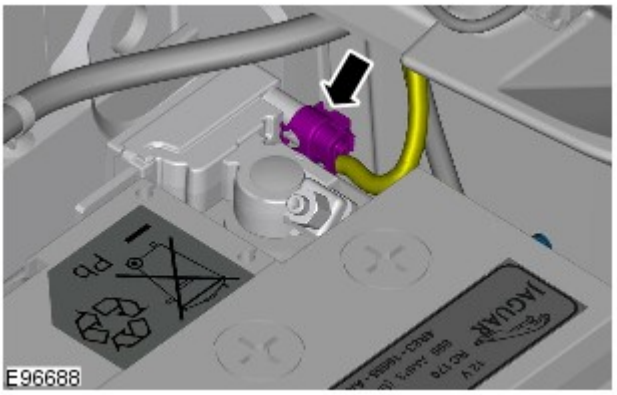


Connect

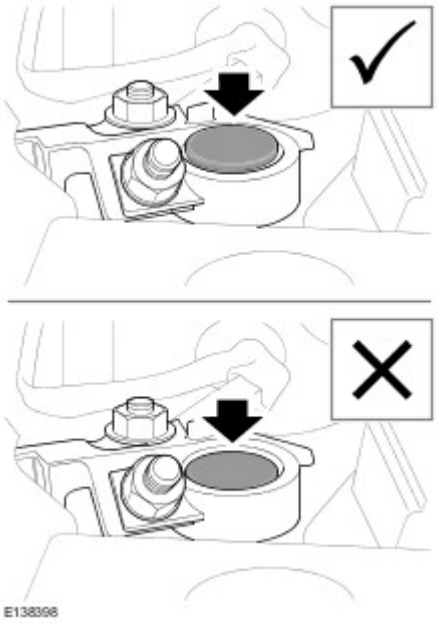
1. *Torque:* 6 Nm



2.



3.



NOTE: Make sure that both the positive and negative battery terminals are correctly located.

4. Lower the luggage compartment floor covering.

5. NOTE: This step is only necessary when installing a new component.

Using the Jaguar approved diagnostic equipment, reset the battery monitoring system.

6. Refer to: Door Window Motor Initialization (501-11 Glass, Frames and Mechanisms, General Procedures).

7. Enter the audio unit preset radio frequencies.

8. Reset the clock to the correct time.

9. Start the engine and allow to idle until the engine reaches normal operating temperature.

10. Switch the engine off.

Vehicle Dynamic Suspension - Ride Height Adjustments

General Procedures

Special Tool(s)

	Ride height gauge. 204-484

CAUTIONS:

Make sure the wheels and tires, tie rod ends, suspension joints and wheel bearings are free from damage, wear and free play.

Make sure there are no heavy objects in the vehicle.

The ride height must be measured with the vehicle weight supported by the suspension.

With the engine running and all vehicle doors closed, make sure the air suspension is functioning and the vehicle height can be raised and lowered using the air suspension switch.

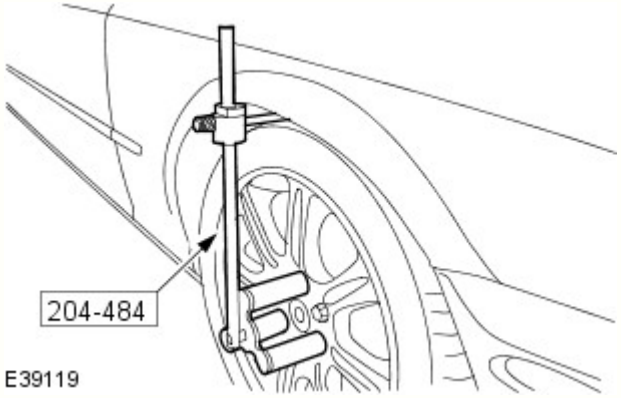
Drive the vehicle on to a flat, level surface.

Make sure the steering is in the straight ahead position.

NOTE: This procedure must be carried out after replacement of the air suspension control module, removal or replacement of a height sensor, removal or replacement of the front or rear suspension arms, replacement of body panels incorporating suspension fixing points.

1. CAUTION: Make sure the vehicle is not moved once it has been positioned to take measurements.

   Position the vehicle on a flat level surface.



2. NOTES:

   Make sure the fender splash shields are correctly fitted.

   Fit special tool 204-484 as illustrated.

   Make sure the special tool is square to the wheel face with the measuring rod in a vertical position.

   Take the measurement from the top edge of the slider on the special tool.

   Using the Jaguar approved diagnostic system carry out the ride height adjustments.

15	Yaw rate and lateral acceleration sensor
16	CJB

System Operation

ANTI-LOCK BRAKE SYSTEM

ABS controls the speed of all road wheels to ensure optimum wheel slip when braking at the adhesion limit. The wheels are prevented from locking to retain effective steering control of the vehicle.

DYNAMIC STABILITY CONTROL

DSC (dynamic stability control) uses brakes and powertrain torque control to assist in maintaining the yaw stability of the vehicle. While the ignition is energized the DSC function is permanently enabled, unless selected off using the DSC switch.

DSC enhances driving safety in abrupt maneuvers and in under-steer or over-steer situations that may occur in a bend. The ABS module monitors the yaw rate and lateral acceleration of the vehicle, steering input and individual wheel speeds, then selectively applies individual or multiple brakes and signals for powertrain torque adjustments to reduce under-steer or over-steer conditions.

In general:

- In an under-steer situation initially powertrain torque is controlled then the inner rear wheel is braked to counteract the yaw movement of the front axle towards the outer edge of the bend.
- In an over-steer situation initially powertrain torque is controlled then the outer front wheel is braked to counteract the yaw movement of the rear axle towards the outer edge of the bend.

The ABS module monitors the tracking stability of the vehicle using inputs from the wheel speed sensors, the steering angle sensor, and the yaw rate and lateral acceleration sensor. The tracking stability is compared with stored target data. Whenever the tracking stability deviates from the target data, the ABS module intervenes by applying the appropriate control strategy.

The following interactions occur in an intervention situation:

- High speed CAN signal to the ECM , to reduce engine torque.
- Application of braking to the appropriate corner of the vehicle.

TRAC DSC

Trac DSC is an alternative setting of DSC with reduced system interventions. With Trac DSC engaged, traction may be somewhat increased, although stability may be reduced compared to normal DSC.

WARNING: Trac DSC is intended for use only on dry tarmac by suitably experienced drivers and should not be selected for other surfaces or by drivers with insufficient skill and training to operate the vehicle safely with the Trac DSC function engaged. The less restrictive Trac DSC setting may be preferred, for example, by expert drivers engaged in high performance driving on dry tarmac surfaces such as tracks and circuits.

Briefly pressing and releasing the DSC switch will switch the vehicle between normal DSC settings and Trac DSC settings. To confirm which setting has been selected, either DSC ON or Trac DSC will be temporarily displayed in the instrument cluster message center.

When Trac DSC is selected, the amber DSC OFF warning indicator located in the instrument cluster will illuminate. The DSC OFF warning indicator will remain illuminated while Trac DSC is selected. If the DSC system is activated the DSC warning indicator will flash.

NOTE: If speed control is engaged it will automatically disengage if DSC or Trac DSC becomes active.

CORNER BRAKE CONTROL

CBC (corner brake control) influences the brake pressures, below and within DSC and ABS thresholds, to counteract the yawing moment produced when braking in a corner. CBC produces a correction torque by limiting the brake pressure on one side of the vehicle.

ELECTRONIC BRAKE FORCE DISTRIBUTION

EBD (electronic brake force distribution) limits the brake pressure applied to the rear wheels. When the brakes are applied, the weight of the vehicle transfers forwards, reducing the ability of the rear wheels to transfer braking effort to the road surface. This may cause the rear wheels to slip and make the vehicle unstable.

EBD uses the ABS braking hardware to automatically optimize the pressure to the rear brakes, below the point where ABS is normally invoked.

NOTE: Only the rear brakes are controlled by the EBD function.

ELECTRONIC TRACTION CONTROL

ETC (electronic traction control) attempts to optimize forward traction by reducing engine torque and/or applying the brake of a spinning wheel until traction is regained.

ETC is activated if an individual wheel speed is above that of the vehicle reference speed (positive slip) and the brake pedal is not pressed. The ABS module sends a high speed CAN bus message to the ECM to request a reduction in engine torque. The brake is then applied to the spinning wheel, allowing the excess torque to be transmitted to the non-spinning wheel through the drive line. If necessary, When the DSC function is selected off using the DSC switch, the braking and engine torque reduction features are both disabled.

EMERGENCY BRAKE ASSIST

EBA (emergency brake assist) assists the driver in emergency braking situations by automatically increasing the applied braking effort. The ABS module invokes EBA when:

- The brake pedal is rapidly pressed.
- The brake pedal is pressed hard enough to bring the front brakes into ABS operation.

When the brake pedal is rapidly pressed, the ABS module increases the hydraulic pressure to all of the brakes until the threshold for ABS operation is reached. This action applies the maximum braking effort for the available traction. The ABS module monitors for the sudden application of the brakes, using inputs from the brake pedal switch and from the pressure sensor within the HCU (hydraulic control unit) . With the brake pedal pressed, if the rate of increase of hydraulic pressure exceeds the predetermined limit, the ABS module invokes emergency braking.

When the brake pedal is pressed hard enough to bring the front brakes into ABS operation, the ABS module increases the hydraulic pressure to the rear brakes up to the ABS threshold.

EBA operation continues until the driver releases the brake pedal, sufficiently for the hydraulic pressure in the HCU to drop below a threshold value stored in the ABS module.

ENGINE DRAG-TORQUE CONTROL

EDC (engine drag-torque control) prevents wheel slip caused by any of the following:

- A sudden decrease in engine torque when the accelerator is suddenly released.
- A downshift using the Jaguar sequential shift function on automatic transmission vehicles.

When the ABS module detects the onset of rear wheel drag slip without the brakes being applied, the ABS module signals the ECM via the high speed CAN bus to request a momentary increase in engine torque to increase the rear axle speed to match vehicle reference speed.

UNDERSTEER CONTROL

Understeer Logic Control is a proactive system which monitors the vehicle for understeer by comparing signals from the yaw rate and lateral acceleration sensor with signals from the steering angle sensor and wheel speed sensors.

When the ABS module detects the onset of understeer, the ABS module signals the ECM via the high speed CAN bus to request a decrease in engine torque. If required the ABS module will control the HCU to apply brake pressure to the inside rear wheel to correct the understeer. If the vehicle continues to understeer, EUC (enhanced understeer control) is activated and this function uses multiple brakes (maximum of three brakes) to rapidly reduce the vehicle speed.

ELECTRONIC BRAKE PREFILL (VEHICLES WITH ACC ONLY)

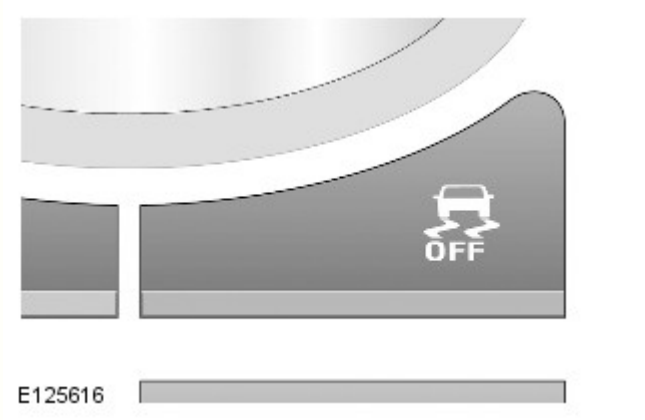
Electronic brake prefill (Bosch ESP®plus8.1), senses any rapid throttle lift off, activating a small brake hydraulic pressure build-up of approximately 3 to 5 bar (43.5 to 72.5 lbf/in ^{2}) in anticipation of the brakes being applied.

This application produces a quicker brake pedal response and consequently slightly shorter stopping distances. The system supports vehicles with ACC (adaptive cruise control).

When the ABS module detects rapid throttle lift off (from the signals received from the ECM over the high speed CAN bus), it controls the HCU to apply a low brake pressure to assist in a quicker brake application.

Component Description

DYNAMIC STABILITY CONTROL SWITCH



The DSC switch is mounted in the floor console adjacent to the JaguarDrive selector.

DSC becomes active whenever the engine is running. A momentary press of the switch allows the driver to toggle between the standard DSC settings and the optimized Trac DSC settings. The message Trac DSC or DSC ON will temporarily be displayed in the instrument cluster message center. The amber DSC OFF warning indicator in the instrument cluster remains illuminated while Trac DSC is selected.

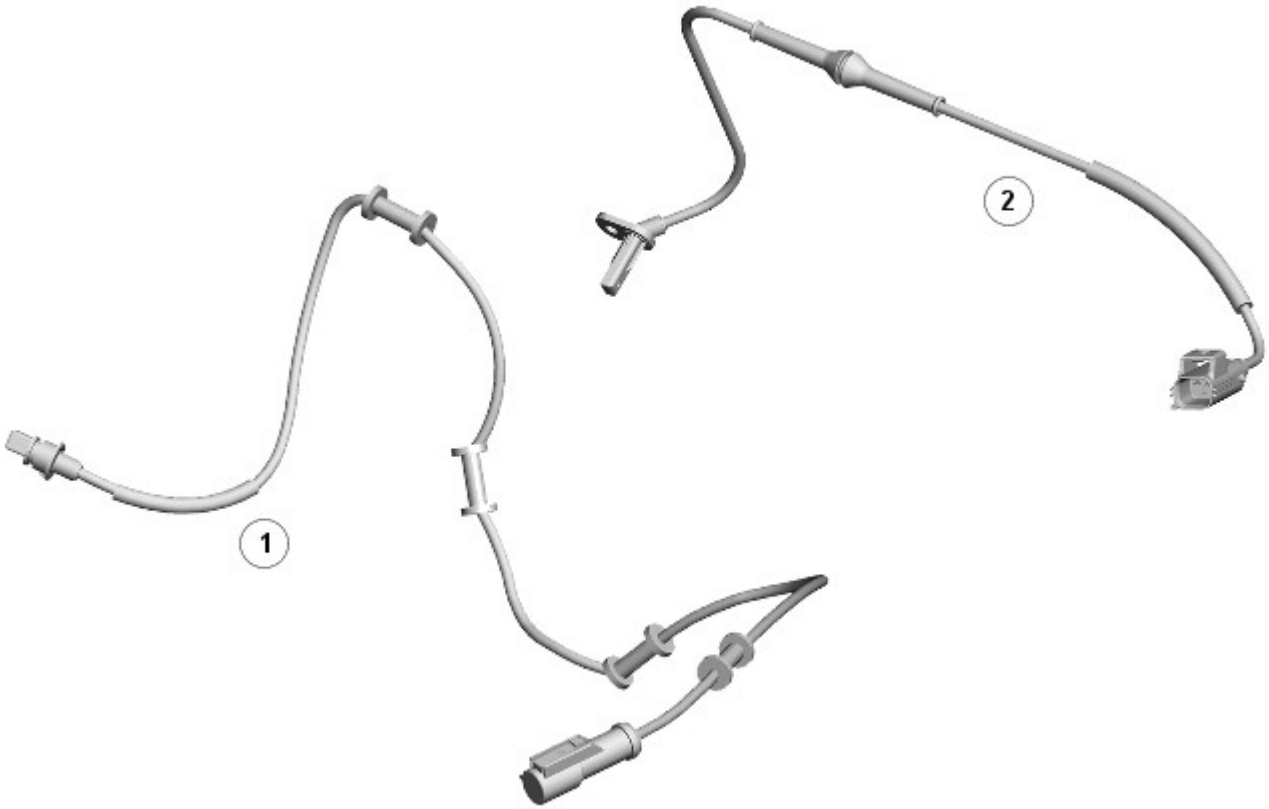
The DSC can be switched off by pressing and holding the switch for more than 10 seconds. The message DSC OFF will then be displayed in the instrument cluster message center, to confirm DSC has been switched off, and the amber DSC OFF warning indicator in the instrument cluster will remain illuminated. The system can be switched back on again by simply pressing and releasing the switch. The message 'DSC ON' will then temporarily appear in the instrument cluster message center to confirm the system is on.

NOTE: Switch requests may be delayed if the switch is pressed while a DSC operation is taking place. The switch request will be displayed in the instrument cluster but the ABS module will not initiate any stability changes until it is safe to do so.

If a fault is detected with the DSC switch, the ABS module defaults to the 'DSC ON' setting and any switch requests are ignored.

WARNING: It is recommended that when using snow chains, Trac DSC is switched off and JaguarDrive control winter mode is selected.

WHEEL SPEED SENSORS



E125617

Item	Description
1	Front wheel speed sensor
2	Rear wheel speed sensor

An active wheel speed sensor is installed in each wheel hub to provide the ABS module with a rotational speed signal from each road wheel. The head of each front wheel speed sensor is positioned close to a magnetic encoder ring incorporated into the inboard seal of the wheel bearing. The head of each rear wheel speed sensor is positioned close to a magnetic encoder ring incorporated into the rear wheel bearing assembly. Each encoder ring contains 46 north and south poles. A fly lead connects each sensor to the vehicle harness.

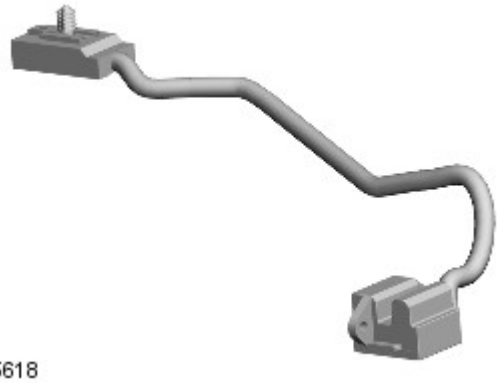
The wheel speed sensors each have a signal and a return connection with the ABS module. When the ignition is ON the ABS module supplies a signal feed to the wheel speed sensors and monitors the return signals. Any rotation of the road wheels induces current fluctuations in the return signals, which are converted into individual wheel speeds and overall vehicle speed by the ABS module.

The ABS module broadcasts the individual wheel speeds and the vehicle speed on the high speed CAN bus for use by other systems, although vehicle speed information to the roof opening panel motor/module is a hardwired connection.

If a wheel speed sensor fault is detected by the ABS module, ABS FAULT will be displayed in the instrument cluster message center and an amber warning indicator will illuminate.

As the wheel speed sensors are active devices, a return signal is available when the road wheels are not rotating. This enables the ABS module to check the condition of the speed sensors while the vehicle is stationary.

STEERING ANGLE SENSOR



E125618

The steering angle sensor measures the steering wheel angle and the rate of change of the steering wheel angle. These measurements are received by the ABS module and broadcast on the high speed CAN bus for use by other systems.

The steering angle sensor is mounted on the steering column upper shroud mounting bracket, immediately behind the multifunction switches, and is secured by 2 screws. A fly lead connects the sensor to the passenger compartment wiring harness via a 4 pin multiplug.

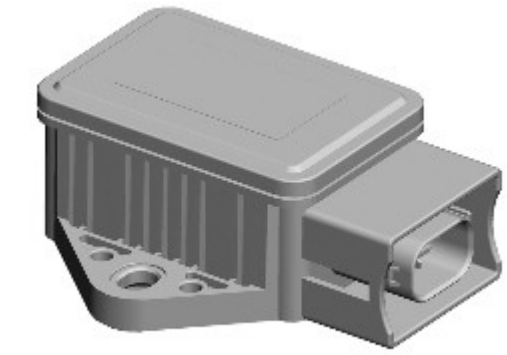
The sensor is housed in a 'U' shaped plastic casing and contains two offset LEDs (light emitting diodes) facing two detectors.

An encoder ring is mounted on the inner steering column shaft and intersects the LEDs and detectors. The encoder ring contains 60 slots which break and restore the light beams between the LEDs and the detectors as the steering wheel is rotated. The ABS module is able to determine the direction of rotation of the steering wheel by monitoring when the light beams change state. The LEDs and detectors are mounted in such a way that only one beam will change state, either to broken or restored, at any one time.

The center (straight ahead) position of the steering wheel has to be learned by the ABS module every time the ignition is switched ON. The steering angle sensor is unable to determine the center position so inputs from the yaw rate and lateral acceleration sensor and wheel speed signals are also used by the ABS module to help it perform this process. If extreme weather conditions are present, for example ice causing extreme wheel spin or understeer/oversteer, the ABS module may not be able to determine the center position of the steering wheel. In this situation, STABILITY CONTROL NOT AVAILABLE DRIVE WITH CARE will be displayed in the instrument cluster message center and the amber warning indicator will illuminate.

The message STABILITY CONTROL NOT AVAILABLE DRIVE WITH CARE will also be displayed if the ABS module detects a steering angle sensor fault. The amber warning indicator will illuminate until the fault is rectified.

YAW RATE AND LATERAL ACCELERATION SENSOR



E125619

The yaw rate and lateral acceleration sensor is located on the floor tunnel, on the floor console rear mounting bracket. The sensor is secured by two screws and connects to the vehicle wiring via a four pin multiplug.

When the ignition is ON, the sensor receives a power feed from the CJB . The sensor measures the yaw rate and lateral acceleration of the vehicle, providing values to the ABS module via a dedicated, private high speed CAN bus connection. The ABS module broadcasts these values on the high speed CAN bus for use by other systems.

If a sensor fault is detected by the ABS module, STABILITY CONTROL NOT AVAILABLE DRIVE WITH CARE will be displayed in the instrument cluster message center and the DSC warning indicator will illuminate.

STOPLAMP SWITCH

The stoplamp switch is mounted on the brake pedal box and is connected to the vehicle harness via a four pin multiplug.

When the brake pedal is pressed, the switch contacts close. This allows a hard wired signal feed to be sent to the ECM . A stoplamp switch status message is then sent from the ECM to the ABS module on the high speed CAN bus. The ABS module is then able to control braking force accordingly in conjunction with the HCU .

NOTE: The stoplamp switch also forms part of the speed control system.

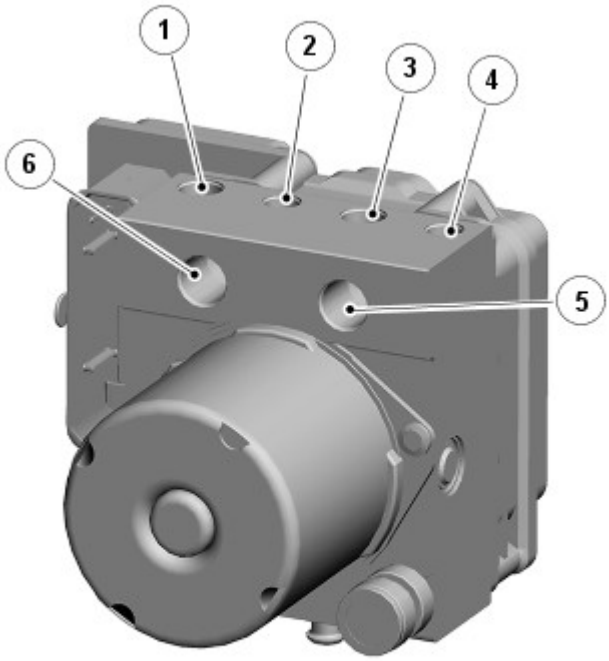
INSTRUMENT CLUSTER WARNING INDICATORS

The instrument cluster and message center contains warning indicators and warning messages to display the operating status of the anti-lock control - stability assist functions. The warning indicators and messages provide a visual notification of either a system warning or information indication to the driver. There are four warning indicators on the instrument cluster and several types of message relating to the anti-lock control - stability assist functions. The DSC OFF warning indicator and message are accompanied by an audible warning.

The following anti-lock control - stability assist warning indicators are installed in the instrument cluster:

- An amber ABS warning indicator.
- A red brake warning indicator.
- An amber DSC warning indicator.
- An amber DSC OFF warning indicator.

ABS MODULE



E125622

Item	Description
1	LH front brake outlet
2	RH rear brake outlet
3	LH rear brake outlet
4	RH front brake outlet
5	Primary inlet
6	Secondary inlet

The ABS module is located in the passenger side, rear engine bay and incorporates the HCU . The module is mounted on the rear face of the HCU , which it uses to control all braking and stability functions by modulating hydraulic pressure to the individual wheel brakes.

Two types of ABS module are available; one for vehicles with standard Speed Control, one for vehicles fitted with Adaptive Speed Control.

If an ABS modulator fault is detected, ABS FAULT will be displayed in the instrument cluster message center and the amber ABS warning indicator will illuminate.

CAUTION: The ABS module and the HCU comprise a single unit and must not be separated.

HYDRAULIC CONTROL UNIT

The HCU is a four channel unit, secured to a mounting bracket located in the passenger side, rear engine bay. The HCU modulates the supply of hydraulic pressure to the brakes under the control of the ABS module.

Diagnosis and Testing

Principles of Operation

For a detailed description of the anti-lock control - stability assist system, refer to the relevant description and operation sections in the workshop manual. REFER to: (206-09 Anti-Lock Control - Stability Assist)

Anti-Lock Control - Stability Assist (Description and Operation),
Anti-Lock Control - Stability Assist (Description and Operation),
Anti-Lock Control - Stability Assist (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle

1. Verify the customer concern
2. Confirm if the anti-lock brake system (ABS) warning light was illuminated, or still is

NOTE: An intermittent fault may allow the warning light to go off. This does not necessarily mean the fault is not present. Some warnings will appear to clear when the ignition is cycled. This is often because the warning has flagged as a result of one of the vehicle's on-board diagnostic routines having run to detect the fault. If the same routine is not run when the ignition status is set to **ON** , the warning will not re-flag until the routine does run

3. Visually inspect for obvious signs of damage and system integrity

14	Steering angle sensor
15	Yaw rate and lateral acceleration sensor

System Operation

ANTI-LOCK BRAKE SYSTEM

ABS controls the speed of all road wheels to ensure optimum wheel slip when braking at the adhesion limit. The wheels are prevented from locking to retain effective steering control of the vehicle.

DYNAMIC STABILITY CONTROL

DSC (dynamic stability control) uses brakes and powertrain torque control to assist in maintaining the yaw stability of the vehicle. While the ignition is energized the DSC function is permanently enabled, unless selected off using the DSC switch.

DSC enhances driving safety in abrupt maneuvers and in under-steer or over-steer situations that may occur in a bend. The ABS module monitors the yaw rate and lateral acceleration of the vehicle, steering input and individual wheel speeds, then selectively applies individual or multiple brakes and signals for powertrain torque adjustments to reduce under-steer or over-steer conditions.

In general:

- In an under-steer situation initially powertrain torque is controlled then the inner rear wheel is braked to counteract the yaw movement of the front axle towards the outer edge of the bend.
- In an over-steer situation initially powertrain torque is controlled then the outer front wheel is braked to counteract the yaw movement of the rear axle towards the outer edge of the bend.

The ABS module monitors the tracking stability of the vehicle using inputs from the wheel speed sensors, the steering angle sensor, and the yaw rate and lateral acceleration sensor. The tracking stability is compared with stored target data. Whenever the tracking stability deviates from the target data, the ABS module intervenes by applying the appropriate control strategy.

The following interactions occur in an intervention situation:

- High speed CAN signal to the ECM , to reduce engine torque.
- Application of braking to the appropriate corner of the vehicle.

TRAC DSC

Trac DSC is an alternative setting of DSC with reduced system interventions. With Trac DSC engaged, traction may be somewhat increased, although stability may be reduced compared to normal DSC.

WARNING: Trac DSC is intended for use only on dry tarmac by suitably experienced drivers and should not be selected for other surfaces or by drivers with insufficient skill and training to operate the vehicle safely with the Trac DSC function engaged. The less restrictive Trac DSC setting may be preferred, for example, by expert drivers engaged in high performance driving on dry tarmac surfaces such as tracks and circuits.

Briefly pressing and releasing the DSC switch will switch the vehicle between normal DSC settings and Trac DSC settings. To confirm which setting has been selected, either DSC ON or Trac DSC will be temporarily displayed in the instrument cluster message center.

When Trac DSC is selected, the amber DSC OFF warning indicator located in the instrument cluster will illuminate. The DSC OFF warning indicator will remain illuminated while Trac DSC is selected. If the DSC system is activated the DSC warning indicator will flash.

NOTE: If speed control is engaged it will automatically disengage if DSC or Trac DSC becomes active.

CORNER BRAKE CONTROL

CBC (corner brake control) influences the brake pressures, below and within DSC and ABS thresholds, to counteract the yawing moment produced when braking in a corner. CBC produces a correction torque by limiting the brake pressure on one side of the vehicle.

ELECTRONIC BRAKE FORCE DISTRIBUTION

EBD (electronic brake force distribution) limits the brake pressure applied to the rear wheels. When the brakes are applied, the weight of the vehicle transfers forwards, reducing the ability of the rear wheels to transfer braking effort to the road surface. This may cause the rear wheels to slip and make the vehicle unstable.

EBD uses the ABS braking hardware to automatically optimize the pressure to the rear brakes, below the point where ABS is normally invoked.

NOTE: Only the rear brakes are controlled by the EBD function.

ELECTRONIC TRACTION CONTROL

ETC (electronic traction control) attempts to optimize forward traction by reducing engine torque and/or applying the brake of a spinning wheel until traction is regained.

ETC is activated if an individual wheel speed is above that of the vehicle reference speed (positive slip) and the brake pedal is not pressed. The ABS module sends a high speed CAN bus message to the ECM to request a reduction in engine torque. The brake is then applied to the spinning wheel, allowing the excess torque to be transmitted to the non-spinning wheel through the drive line. If necessary, When the DSC function is selected off using the DSC switch, the braking and engine torque reduction features are both disabled.

EMERGENCY BRAKE ASSIST

EBA (emergency brake assist) assists the driver in emergency braking situations by automatically increasing the applied braking effort. The ABS module invokes EBA when:

- The brake pedal is rapidly pressed.
- The brake pedal is pressed hard enough to bring the front brakes into ABS operation.

When the brake pedal is rapidly pressed, the ABS module increases the hydraulic pressure to all of the brakes until the threshold for ABS operation is reached. This action applies the maximum braking effort for the available traction. The ABS module monitors for the sudden application of the brakes, using inputs from the brake pedal switch and from the pressure sensor within the HCU (hydraulic control unit) . With the brake pedal pressed, if the rate of increase of hydraulic pressure exceeds the predetermined limit, the ABS module invokes emergency braking.

When the brake pedal is pressed hard enough to bring the front brakes into ABS operation, the ABS module increases the hydraulic pressure to the rear brakes up to the ABS threshold.

EBA operation continues until the driver releases the brake pedal, sufficiently for the hydraulic pressure in the HCU to drop below a threshold value stored in the ABS module.

ENGINE DRAG-TORQUE CONTROL

EDC (engine drag-torque control) prevents wheel slip caused by any of the following:

- A sudden decrease in engine torque when the accelerator is suddenly released.
- A downshift using the Jaguar sequential shift function on automatic transmission vehicles.

When the ABS module detects the onset of rear wheel drag slip without the brakes being applied, the ABS module signals the ECM via the high speed CAN bus to request a momentary increase in engine torque to increase the rear axle speed to match vehicle reference speed.

UNDERSTEER CONTROL

Understeer Logic Control is a proactive system which monitors the vehicle for understeer by comparing signals from the yaw rate and lateral acceleration sensor with signals from the steering angle sensor and wheel speed sensors.

When the ABS module detects the onset of understeer, the ABS module signals the ECM via the high speed CAN bus to request a decrease in engine torque. If required the ABS module will control the HCU to apply brake pressure to the inside rear wheel to correct the understeer. If the vehicle continues to understeer, EUC (enhanced understeer control) is activated and this function uses multiple brakes (maximum of three brakes) to rapidly reduce the vehicle speed.

ELECTRONIC BRAKE PREFILL (VEHICLES WITH ACC ONLY)

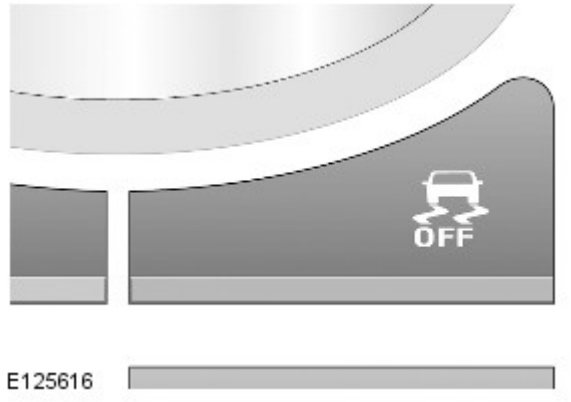
Electronic brake prefill (Bosch ESP®plus8.1), senses any rapid throttle lift off, activating a small brake hydraulic pressure build-up of approximately 3 to 5 bar (43.5 to 72.5 lbf/in ^{2}) in anticipation of the brakes being applied.

This application produces a quicker brake pedal response and consequently slightly shorter stopping distances. The system supports vehicles with ACC (adaptive cruise control).

When the ABS module detects rapid throttle lift off (from the signals received from the ECM over the high speed CAN bus), it controls the HCU to apply a low brake pressure to assist in a quicker brake application.

Component Description

DYNAMIC STABILITY CONTROL SWITCH



The DSC switch is mounted in the floor console adjacent to the JaguarDrive selector.

DSC becomes active whenever the engine is running. A momentary press of the switch allows the driver to toggle between the standard DSC settings and the optimized Trac DSC settings. The message Trac DSC or DSC ON will temporarily be displayed in the instrument cluster message center. The amber DSC OFF warning indicator in the instrument cluster remains illuminated while Trac DSC is selected.

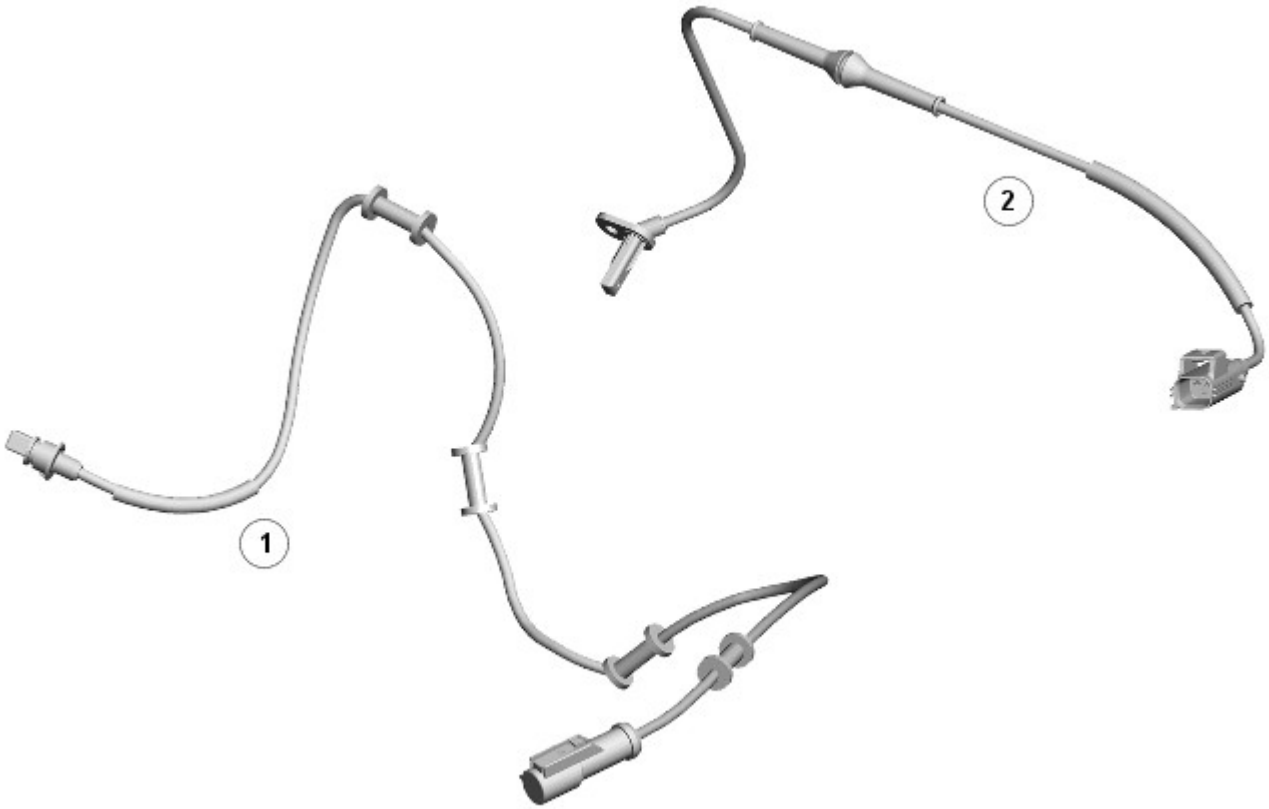
The DSC can be switched off by pressing and holding the switch for more than 10 seconds. The message DSC OFF will then be displayed in the instrument cluster message center, to confirm DSC has been switched off, and the amber DSC OFF warning indicator in the instrument cluster will remain illuminated. The system can be switched back on again by simply pressing and releasing the switch. The message 'DSC ON' will then temporarily appear in the instrument cluster message center to confirm the system is on.

NOTE: Switch requests may be delayed if the switch is pressed while a DSC operation is taking place. The switch request will be displayed in the instrument cluster but the ABS module will not initiate any stability changes until it is safe to do so.

If a fault is detected with the DSC switch, the ABS module defaults to the 'DSC ON' setting and any switch requests are ignored.

WARNING: It is recommended that when using snow chains, Trac DSC is switched off and JaguarDrive control winter mode is selected.

WHEEL SPEED SENSORS



E125617

Item	Description
1	Front wheel speed sensor
2	Rear wheel speed sensor

An active wheel speed sensor is installed in each wheel hub to provide the ABS module with a rotational speed signal from each road wheel. The head of each front wheel speed sensor is positioned close to a magnetic encoder ring incorporated into the inboard seal of the wheel bearing. The head of each rear wheel speed sensor is positioned close to a magnetic encoder ring incorporated into the rear wheel bearing assembly. Each encoder ring contains 46 north and south poles. A fly lead connects each sensor to the vehicle harness.

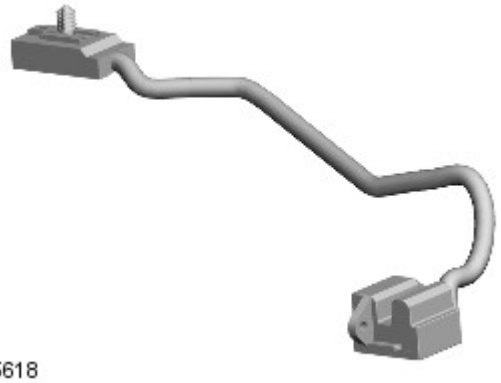
The wheel speed sensors each have a signal and a return connection with the ABS module. When the ignition is ON the ABS module supplies a signal feed to the wheel speed sensors and monitors the return signals. Any rotation of the road wheels induces current fluctuations in the return signals, which are converted into individual wheel speeds and overall vehicle speed by the ABS module.

The ABS module broadcasts the individual wheel speeds and the vehicle speed on the high speed CAN bus for use by other systems, although vehicle speed information to the roof opening panel motor/module is a hardwired connection.

If a wheel speed sensor fault is detected by the ABS module, ABS FAULT will be displayed in the instrument cluster message center and an amber warning indicator will illuminate.

As the wheel speed sensors are active devices, a return signal is available when the road wheels are not rotating. This enables the ABS module to check the condition of the speed sensors while the vehicle is stationary.

STEERING ANGLE SENSOR



E125618

The steering angle sensor measures the steering wheel angle and the rate of change of the steering wheel angle. These measurements are received by the ABS module and broadcast on the high speed CAN bus for use by other systems.

The steering angle sensor is mounted on the steering column upper shroud mounting bracket, immediately behind the multifunction switches, and is secured by 2 screws. A fly lead connects the sensor to the passenger compartment wiring harness via a 4 pin multiplug.

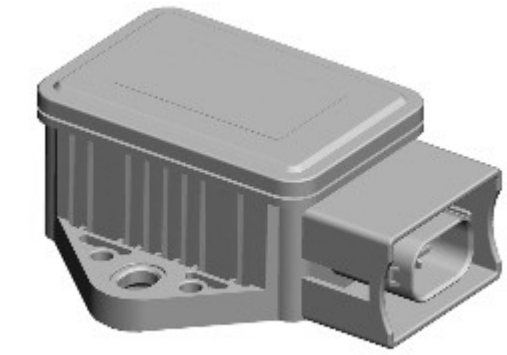
The sensor is housed in a 'U' shaped plastic casing and contains two offset LEDs (light emitting diodes) facing two detectors.

An encoder ring is mounted on the inner steering column shaft and intersects the LEDs and detectors. The encoder ring contains 60 slots which break and restore the light beams between the LEDs and the detectors as the steering wheel is rotated. The ABS module is able to determine the direction of rotation of the steering wheel by monitoring when the light beams change state. The LEDs and detectors are mounted in such a way that only one beam will change state, either to broken or restored, at any one time.

The center (straight ahead) position of the steering wheel has to be learned by the ABS module every time the ignition is switched ON. The steering angle sensor is unable to determine the center position so inputs from the yaw rate and lateral acceleration sensor and wheel speed signals are also used by the ABS module to help it perform this process. If extreme weather conditions are present, for example ice causing extreme wheel spin or understeer/oversteer, the ABS module may not be able to determine the center position of the steering wheel. In this situation, STABILITY CONTROL NOT AVAILABLE DRIVE WITH CARE will be displayed in the instrument cluster message center and the amber warning indicator will illuminate.

The message STABILITY CONTROL NOT AVAILABLE DRIVE WITH CARE will also be displayed if the ABS module detects a steering angle sensor fault. The amber warning indicator will illuminate until the fault is rectified.

YAW RATE AND LATERAL ACCELERATION SENSOR



E125619

The yaw rate and lateral acceleration sensor is located on the floor tunnel, on the floor console rear mounting bracket. The sensor is secured by two screws and connects to the vehicle wiring via a four pin multiplug.

When the ignition is ON, the sensor receives a power feed from the CJB . The sensor measures the yaw rate and lateral acceleration of the vehicle, providing values to the ABS module via a dedicated, private high speed CAN bus connection. The ABS module broadcasts these values on the high speed CAN bus for use by other systems.

If a sensor fault is detected by the ABS module, STABILITY CONTROL NOT AVAILABLE DRIVE WITH CARE will be displayed in the instrument cluster message center and the DSC warning indicator will illuminate.

STOPLAMP SWITCH

The stoplamp switch is mounted on the brake pedal box and is connected to the vehicle harness via a four pin multiplug.

When the brake pedal is pressed, the switch contacts close. This allows a hard wired signal feed to be sent to the ECM . A stoplamp switch status message is then sent from the ECM to the ABS module on the high speed CAN bus. The ABS module is then able to control braking force accordingly in conjunction with the HCU .

NOTE: The stoplamp switch also forms part of the speed control system.

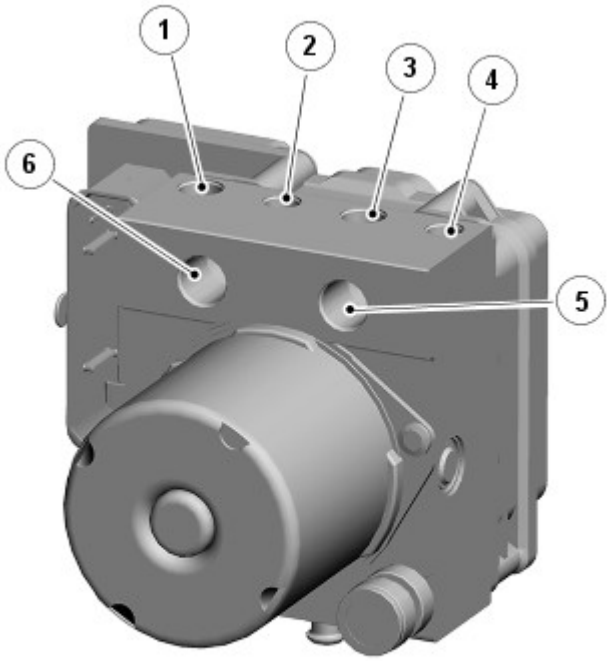
INSTRUMENT CLUSTER WARNING INDICATORS

The instrument cluster and message center contains warning indicators and warning messages to display the operating status of the anti-lock control - stability assist functions. The warning indicators and messages provide a visual notification of either a system warning or information indication to the driver. There are four warning indicators on the instrument cluster and several types of message relating to the anti-lock control - stability assist functions. The DSC OFF warning indicator and message are accompanied by an audible warning.

The following anti-lock control - stability assist warning indicators are installed in the instrument cluster:

- An amber ABS warning indicator.
- A red brake warning indicator.
- An amber DSC warning indicator.
- An amber DSC OFF warning indicator.

ABS MODULE



E125622

Item	Description
1	LH front brake outlet
2	RH rear brake outlet
3	LH rear brake outlet
4	RH front brake outlet
5	Primary inlet
6	Secondary inlet

The ABS module is located in the passenger side, rear engine bay and incorporates the HCU . The module is mounted on the rear face of the HCU , which it uses to control all braking and stability functions by modulating hydraulic pressure to the individual wheel brakes.

Two types of ABS module are available; one for vehicles with standard Speed Control, one for vehicles fitted with Adaptive Speed Control.

If an ABS modulator fault is detected, ABS FAULT will be displayed in the instrument cluster message center and the amber ABS warning indicator will illuminate.

CAUTION: The ABS module and the HCU comprise a single unit and must not be separated.

HYDRAULIC CONTROL UNIT

The HCU is a four channel unit, secured to a mounting bracket located in the passenger side, rear engine bay. The HCU modulates the supply of hydraulic pressure to the brakes under the control of the ABS module.

Anti-Lock Control - Stability Assist - Anti-Lock Control - Stability Assist - Overview

Description and Operation

OVERVIEW

The ABS (anti-lock brake system) and DSC (dynamic stability control) system features a Bosch modulator, which is an integrated four-channel HCU (hydraulic control unit) and ABS module. The unit is located in the rear of the engine compartment on the passenger side, and is installed in the brake hydraulic circuit between the brake master cylinder and the four brake calipers.

The ABS module is connected to the high speed CAN (controller area network) bus, and actively interacts with other vehicle system control modules and associated sensors to receive and transmit current vehicle operating information.

When required, the ABS module will actively intervene and operate the HCU during braking or vehicle maneuvers to correct the vehicle attitude, stability, traction or speed. During incidents of vehicle correction, the ABS module may also request the ECM (engine control module) to control engine power in order to further stabilize and correct the vehicle.

To provide full system functionality, the ABS and DSC system comprises the following components:

- DSC switch.
- Four wheel speed sensors.
- Steering angle sensor.
- Yaw rate and lateral acceleration sensor.
- Stoplamp switch.
- Instrument cluster warning indicators.
- Integrated ABS module and HCU .

Two variants of ABS module are available, Bosch ESP®8.1 and Bosch ESP®plus8.1. The Bosch ESP®plus8.1 system is fitted to vehicles with ACC (adaptive cruise control) and incorporates a feature known as electronic brake prefill.

Electronic brake prefill, senses any rapid throttle lift off, activating a small brake hydraulic pressure build-up of approximately 3 to 5 bar (43.5 to 72.5 lbf/in ^{2}) in anticipation of the brakes being applied. This application produces a quicker brake pedal response and consequently slightly shorter stopping distances. When the ECM detects rapid throttle lift off it signals the ABS module which controls the HCU to apply a low brake pressure to assist in a quicker brake application.

NOTE: All vehicles with ACC are supported by the Bosch ESP®plus8.1 system.

The ABS provides the following brake functions that are designed to assist the vehicle or aid the driver:

- ABS .
- DSC, including Trac DSC.
- CBC (corner brake control).
- EBD (electronic brake force distribution) .
- ETC (electronic traction control).
- EBA (emergency brake assist) .
- EDC (engine drag-torque control).
- EUC (enhanced understeer control).
- Electronic brake prefill (vehicles with ACC only).

All the brake functions listed are automatically active when the ignition is in power mode and the engine is running. The DSC system can be selected to off using the DSC switch.

WARNING: Although the vehicle is fitted with DSC, it remains the drivers responsibility to drive safely according to the prevailing conditions.

General Information - Diagnostic Trouble Code (DTC) Index DTC: Anti-Lock Braking System (ABS)

Description and Operation

Anti-Lock Braking System (ABS)

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

NOTES:

If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer approved diagnostic system).

When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

If DTCs are recorded and, after performing the pinpoint tests a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Where an 'on demand self-test' is referred to, this can be accessed via the 'DTC Monitor' tab on the manufacturers approved diagnostic system.

Check DDW for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Anti-Lock Braking System module, for additional Diagnosis and Testing information refer to the relevant Diagnosis and Testing Section.
For additional information, refer to: Anti-Lock Control - Stability Assist (206-09 Anti-Lock Control - Stability Assist, Diagnosis and Testing).

DTC	Description	Possible Causes	Action
C0021-09	Brake Booster Performance - Component Failures	• No vacuum available from engine due to split/leaking hose etc • Brake booster servo has failed due to lack of vacuum	• Check integrity of brake booster vacuum hose. Check and install a new brake booster as required
C0030-38	Left Front Tone Wheel - Signal frequency incorrect	• Left front magnetic pulse ring damaged/contaminated • Incorrect component installed • Sensor internal fault	• Check the left front magnetic pulse ring for damage or contamination. Clean or replace as required. If no damage/contamination found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph for more than 10 seconds
C0031-12	Left Front Wheel Speed Sensor - Short to battery	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to power. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0031-14	Left Front Wheel Speed Sensor - Circuit short to ground or open	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect

C0031-25	Left Front Wheel Speed Sensor - Signal shape/waveform failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for partial or intermittently grounded signal circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0031-2F	Left Front Wheel Speed Sensor - Signal erratic	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0031-31	Left Front Wheel Speed Sensor - No signal	• Electrical wiring harness fault • Magnetic pulse ring de-magnetised or damaged • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for open circuit or high resistance. Check connectors for damage or corrosion. Check the wheel speed sensor for correct location and contamination. Check the magnetic pulse wheel for contamination, damage or de-magnetisation. Clean or replace the sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0031-62	Left Front Wheel Speed Sensor - Signal compare failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0031-64	Left Front Wheel Speed Sensor - Signal plausibility failure	• Incorrect wheels/tyres installed • Electrical wiring harness fault • EMC influences on left front wheel speed sensor and supply line • Magnetic pulse wheel damaged/contaminated, de-magnetised • Sensor internal fault	• Check the correct wheels and tyres are installed. Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, or ground. Check for EMC influences on the speed sensor and circuits. Check magnetic pulse wheel for damage/contamination and de-magnetisation. Repair Wiring harness, install a new sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0032-11	Left Front wheel Speed Sensor Supply - Circuit short to ground	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0033-38	Right Front Tone Wheel - Signal frequency incorrect	• Right front magnetic pulse ring damaged/contaminated • Incorrect component installed • Sensor internal fault	• Check the right front magnetic pulse ring for damage or contamination. Clean or replace as required. If no damage/contamination found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph for more than 10 seconds
C0034-12	Right Front Wheel Speed Sensor -	• Electrical wiring harness fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to power. Repair

	Short to battery	• Sensor internal fault	harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0034-14	Right Front Wheel Speed Sensor - Circuit short to ground or open	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0034-25	Right Front Wheel Speed Sensor - Signal shape/waveform failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for partial or intermittently grounded signal circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0034-2F	Right Front Wheel Speed Sensor - Signal erratic	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0034-31	Right Front Wheel Speed Sensor - No signal	• Electrical wiring harness fault • Magnetic pulse ring de-magnetised or damaged • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for open circuit or high resistance. Check connectors for damage or corrosion. Check the wheel speed sensor for correct location and contamination. Check the magnetic pulse wheel for contamination, damage or de-magnetisation. Clean or replace the sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0034-62	Right Front Wheel Speed Sensor - Signal compare failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0034-64	Right Front Wheel Speed Sensor - Signal plausibility failure	• Incorrect wheels/tyres installed • Electrical wiring harness fault • EMC influences on right front wheel speed sensor and supply line • Magnetic pulse wheel damaged/contaminated, de-magnetised • Sensor internal fault	• Check the correct wheels and tyres are installed. Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, or ground. Check for EMC influences on the speed sensor and circuits. Check magnetic pulse wheel for damage/contamination and de-magnetisation. Repair wiring harness, install a new sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0035-11	Right Front Wheel Speed Sensor Supply - Circuit short to ground	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect

C0036-38	Left Rear Tone Wheel - Signal frequency incorrect	• Left rear magnetic pulse ring damaged/contaminated • Incorrect component installed • Sensor internal fault	• Check the left rear magnetic pulse ring for damage or contamination. Clean or replace as required. If no damage/contamination found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph for more than 10 seconds
C0037-12	Left Rear Wheel Speed Sensor - Short to battery	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to power. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0037-14	Left Rear Wheel Speed Sensor - Circuit short to ground or open	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0037-25	Left Rear Wheel Speed Sensor - Signal shape/waveform failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for partial or intermittently grounded signal circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0037-2F	Left Rear Wheel Speed Sensor - Signal erratic	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0037-31	Left Rear Wheel Speed Sensor - No signal	• Electrical wiring harness fault • Magnetic pulse ring de-magnetised or damaged • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for open circuit or high resistance. Check connectors for damage or corrosion. Check the wheel speed sensor for correct location and contamination. Check the magnetic pulse wheel for contamination, damage or de-magnetisation. Clean or replace the sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0037-62	Left Rear Wheel Speed Sensor - Signal compare failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C0037-64	Left Rear Wheel Speed Sensor - Signal plausibility failure	• Incorrect wheels/tyres installed • Electrical wiring harness fault • EMC influences on left rear wheel speed sensor and supply line • Magnetic pulse wheel damaged/contaminated, de-magnetised	• Check the correct wheels and tyres are installed. Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, or ground. Check for EMC influences on the speed sensor and circuits. Check magnetic pulse wheel for damage/contamination and de-magnetisation. Repair Wiring harness, install a new sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect

		• Sensor internal fault	
C0038-11	Left Rear Wheel Speed Sensor Supply - Circuit short to ground	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0039-38	Right Rear Tone Wheel - Signal frequency incorrect	• Right rear magnetic pulse ring damaged/contaminated • Incorrect component installed • Sensor internal fault	• Check the right rear magnetic pulse ring for damage or contamination. Clean or replace as required. . If no damage/contamination found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph for more than 10 seconds
C003A-12	Right Rear Wheel Speed Sensor - Short to battery	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to power. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C003A-14	Right Rear Wheel Speed Sensor - Circuit short to ground or open	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C003A-25	Right Rear Wheel Speed Sensor - Signal shape/waveform failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for partial or intermittently grounded signal circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C003A-2F	Right Rear Wheel Speed Sensor - Signal erratic	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C003A-31	Right Rear Wheel Speed Sensor - No signal	• Electrical wiring harness fault • Magnetic pulse ring de-magnetised or damaged • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for open circuit or high resistance. Check connectors for damage or corrosion. Check the wheel speed sensor for correct location and contamination. Check the magnetic pulse wheel for contamination, damage or de-magnetisation. Clean or replace the sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph
C003A-62	Right Rear Wheel Speed Sensor - Signal compare failure	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, ground or open circuit. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair and extinguish the lamps, the vehicle needs to be driven above 9mph/15kph

C003A-64	Right Rear Wheel Speed Sensor - Signal plausibility failure	• Incorrect wheels/tyres installed • Electrical wiring harness fault • EMC influences on left rear wheel speed sensor and supply line • Magnetic pulse wheel damaged/contaminated, de-magnetised • Sensor internal fault	• Check the correct wheels and tyres are installed. Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, or ground. Check for EMC influences on the speed sensor and circuits. Check magnetic pulse wheel for damage/contamination and de-magnetisation. Repair Wiring harness, install a new sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C003B-11	Right Rear Wheel Speed Sensor Supply - Circuit short to ground	• Electrical wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0047-16	Brake Booster Pressure Sensor - Circuit voltage below threshold	• Brake booster pressure sensor supply circuit - Voltage below threshold • HCU failure	• Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster pressure sensor power supply for short to ground. Check and install a new HCU as required, refer to the new module/component installation note at the top of the DTC Index
C0047-1C	Brake Booster Pressure Sensor - Circuit voltage out of range	• Brake booster pressure sensor supply circuit - Voltage out of range 4.5v-5.3v • Brake booster pressure sensor failure • HCU failure	• Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster pressure sensor power supply for short, high resistance. Establish if sensor or HCU is at fault. Check and install a new brake booster pressure sensor or HCU as required, refer to the new module/component installation note at the top of the DTC Index
C0047-29	Brake Booster Pressure Sensor - Signal invalid	• Brake booster pressure sensor signal 1 circuit - short to ground, power, open circuit • Brake booster pressure sensor signal 2 circuit - short to ground, power, open circuit • Brake booster pressure sensor failure	• Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster signal 1 and 2 circuits for short to ground, power, open circuit. Clear DTC and re-test. If DTC remains, suspect the brake booster pressure sensor, check and install a new sensor as required, refer to the new module/component installation note at the top of the DTC Index. To validate the repair and extinguish the lamps, start the engine and apply the foot brake
C0047-62	Brake Booster Pressure Sensor - Signal compare failure	NOTE: Fault detected during braking event • Brake booster pressure sensor signal circuits 1 and 2 - shorted together	• Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster pressure sensor signal circuits 1 and 2 for shorting together. Repair any harness faults found and retest. To validate the repair and extinguish the lamps, start the engine and apply the foot brake
C0047-64	Brake Booster Pressure Sensor - Signal plausibility failure	NOTE: Fault detected during non-braking event • Signal plausibility failure • Electrical wiring harness fault • Brake booster pressure sensor failure	• Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster signal 1 and 2 circuits for short to ground, power, open circuit or high resistance. Check connectors for damage or corrosion. Repair any harness faults found and retest. If DTC remains, suspect the brake booster pressure sensor, check and install a new sensor as required, refer to the new module/component installation note at the top of the DTC Index. To validate the repair and extinguish the lamps, start the engine and apply and release the foot brake
	Longitudinal Acceleration Sensor - Signal		

C0062-28	bias level out of range/zero adjustment failure	• Yaw sensor insecurely mounted • Yaw sensor fault	• Check the yaw sensor is securely mounted. If the mounting is secure suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0062-54	Longitudinal Acceleration Sensor - Missing calibration	• The longitudinal acceleration sensor has not been calibrated • Mounting bracket bent/misaligned	• Check the longitudinal acceleration sensor has been calibrated • If it has been calibrated, check that the sensor is aligned correctly, check for bent mounting bracket • To validate the calibration/repair, ignition on and wait 10 seconds. Check lamps remain extinguished
C0063-08	Yaw Rate Sensor - Bus signal /message failures	• Wiring harness fault • Yaw sensor fault	• Refer to the electrical wiring diagrams and check the integrity of the power and ground supplies to the yaw sensor. Check the integrity of the bus connections. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair, ignition on and wait 10 seconds. Check lamps remain extinguished.
C0063-14	Yaw Rate Sensor - Circuit short to ground or open	• Wiring harness fault • Sensor fault	• Refer to the electrical wiring diagrams and check the high speed CAN circuit between the yaw sensor and the Anti-Lock Braking System Hydraulic Control Unit for short to ground or open circuit. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0063-1C	Yaw Rate Sensor - Circuit voltage out of range	• Yaw rate sensor power distribution fault • Wiring harness fault • Yaw sensor internal fault	• Refer to the electrical wiring diagrams and check the power and ground supplies to the yaw sensor. Check power circuit for short to ground or open circuit. Check ground circuit for short to power or open circuit. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect • To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds
C0063-27	Yaw Rate Sensor - Signal rate of change	• Yaw sensor insecurely mounted • Yaw sensor connector insecure • Wiring harness fault • Yaw sensor fault • Anti-Lock Braking System Hydraulic Control Unit fault	• Check the yaw sensor is securely mounted. Check the yaw sensor harness connector is securely located. Refer to the electrical wiring diagrams and check the power and ground supplies to the yaw sensor. Check circuits for intermittent open circuit or high resistance. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor or Anti-Lock Braking System Hydraulic Control Unit, Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0063-28	Yaw Rate Sensor - Signal bias level out of range/zero adjustment failure	• Yaw sensor insecurely mounted • Yaw sensor fault	• Check the yaw sensor is securely mounted. If the mounting is secure suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0063-41	Yaw Rate Sensor - Checksum error	• Yaw sensor fault • Anti-Lock Braking System Hydraulic Control Unit fault	• Replace the yaw sensor, clear the DTC and retest the system. If the DTC remains install a new Anti-Lock Braking System Hydraulic Control Unit. Refer to the Warranty Policy and Procedures manual if a module/component is suspect • To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds
			• Refer to the electrical wiring diagrams and check the power and ground supplies to the yaw sensor. Repair any

C0063-49	Yaw Rate Sensor - Internal electronic failure	• Yaw rate sensor internal electronic failure • Wiring harness fault	harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect • To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds
C0063-64	Yaw Rate Sensor - Signal plausibility failure	• The vehicle has been operated on a dynamometer/rolling road • Yaw rate sensor incorrectly installed • Yaw rate sensor fault	NOTE: This DTC can be set if the vehicle is operated on a dynamometer/rolling road, if this is the case the DTC should be stored as a historic DTC • This DTC is set if the information coming from the yaw sensor is deemed to be implausible when compared with other sensor information such as steering angle sensor. Check that the yaw sensor is correctly installed on the vehicle. If the sensor is installed correctly suspect the sensor has an internal fault. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0063-95	Yaw Rate Sensor - Incorrect assembly	• Incorrect yaw sensor installed	• Check the part number of the yaw sensor and fit the correct sensor as required • To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds
C101F-49	Generic Valve Failure - Internal electronic failure	• Anti-Lock Braking System Hydraulic Control Unit fault	• Refer to the Warranty Policy and Procedures manual if a module/component is suspect. Check and install a new Anti-Lock Braking System Hydraulic Control Unit
C1A77-16	Valve Relay Supply Circuit - Voltage below threshold	• Valve relay supply circuit fault • Valve relay ground circuit fault	• Refer to the electrical wiring diagrams and check the valve relay supply circuit for open circuit or short to ground. Check the valve relay ground circuit for open circuit • To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds. If required road test the vehicle at a speed above 20 KPH
C1A90-12	Wheel Speed Sensor Supply - Circuit short to battery	• Wiring harness fault	• This DTC is set if at least one wheel speed sensor supply circuit is short to power. Refer to the electrical wiring diagrams and check the wheel speed sensor circuits for short to power. Repair wiring harness as required. Clear the DTC and retest the system
C1A95-4A	Wheel speed Sensor - Incorrect component installed	• Incorrect wheel speed sensor installed	• Check and install the correct wheel speed sensor • To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 30 seconds
C1A95-64	Wheel Speed Sensor - Signal plausibility failure	• Incorrect wheels/tyres installed • Electrical wiring harness fault • Magnetic pulse wheel damaged/contaminated or de-magnetised • EMC influences on wheel speed sensors and supply circuits • Wheel speed sensor internal fault	NOTE: This DTC could be set by a flat tyre which would give a continuous different rate of speed when compared to other 3 wheels, if this is the case the DTC should be stored as a historic DTC • Check that approved wheels and tyres are installed. Refer to the electrical circuit diagrams and check the wheel speed sensor circuits for intermittent short to power, or ground. Check the wheel speed sensors and pulse wheels for contamination/damage or de-magnetisation. Clear the DTC and retest the vehicle. If the fault remains check the wheel speed sensor circuits for possible EMC interference. Examine the output from the sensors using an oscilloscope to identify inconsistent patterns or spikes. Repair wiring harness or replace wheel speed sensors or wheel bearings as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect

C1A96-64	Brake Light Switch - Signal plausibility failure	• Brake pedal switch out of adjustment • Brake pedal switch circuit faults • Brake pedal switch fault	• This DTC is set when the signal from the brake pedal position switch is contradicted by the signal from the master cylinder pressure sensor. Check the adjustment of the brake pedal position switch. Check the Engine Control Module for brake pedal switch related DTCs. Check brake pedal switch circuits for open circuit. Repair wiring as required or install a replacement switch as required. Switch the ignition state to on, press and release brake pedal at least once
C1A97-24	Lateral Accelerometer - Signal stuck high	• Sensor Internal Fault	• This DTC is set when the lateral accelerometer produces an erroneous signal with the vehicle stationary. Suspect sensor, refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1A98-49	Yaw Rate Sensor - Internal electronic failure	• Internal electronic failure	• Check and install a new sensor as required, refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1A98-64	Yaw Rate Sensor - Signal plausibility failure	NOTE: This DTC may set due to a sustained period of steep uphill driving (>35% for four seconds) • Yaw rate sensor incorrectly mounted to the vehicle • Yaw rate sensor failure	• Check the Yaw rate sensor is correctly installed to the vehicle. Check and install a new sensor as required, refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1A98-92	Yaw Rate Sensor - Performance or incorrect operation	• Yaw rate sensor incorrectly mounted to the vehicle.	• Check the mounting of the yaw rate sensor and correct or replace sensor as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1A98-96	Yaw Rate Sensor - Component internal failure	• Yaw rate sensor incorrectly installed • Yaw rate sensor wiring fault • EMC influences on yaw rate sensor and circuits • Yaw rate sensor internal fault	• Clear the DTC and retest the system. If the fault remains check for additional DTCs and refer to the DTC index. Check the Yaw sensor is mounted correctly on the vehicle. Check the wiring connections to the sensor are correct and secure. Check for any sources of EMC interference with the sensor or circuits. If no external causes are evident suspect the sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1A98-2F	Yaw Rate Sensor - Signal erratic	• The signal from the yaw rate sensor has been suspicious for > 2 minutes but has not yet moved fully to fault condition	NOTE: This DTC may be stored even though no fault condition is present and should be ignored. Clear the DTC and retest. Verify the customer concern prior to diagnosis • Information only, regard as normal operation. Clear the DTC and retest the system
C1A99-28	Pressure Sensor - Signal bias level out of range / zero adjustment failure	• Pedal box adjustment incorrect • Pedal box fault • Anti-Lock Braking System Control Module fault	• Check the pedal box is adjusted/operating correctly, perform any necessary adjustments, clear DTC and retest system. If DTC resets suspect Anti-Lock Braking System Control Module. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1B00-16	Steering Angle Sensor - Circuit voltage below threshold	• Steering angle sensor not initialised and calibrated • Wiring harness fault • Sensor internal fault	• The sensor is calibrated at every new ignition cycle, every time the vehicle is driven away from standstill. The DTC indicates that the steering offset exceeded allowed values and that the calibration process was restarted. Check for a disturbance of the ignition supply to the sensor. Refer to the electrical circuit diagrams and check the steering angle sensor wiring harness and circuits for open circuits, short to ground. Refer to the Warranty Policy and Procedures manual if a module/component is suspect

C1B00-1C	Steering Angle Sensor - Circuit voltage out of range	• Wiring harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams and check the steering angle sensor wiring harness and sensor signal circuits for open circuits, short to power or ground. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1B00-27	Steering Angle Sensor - Signal rate of change above threshold	• Harness fault • Sensor internal fault	• Refer to the electrical circuit diagrams, check the wiring harness connection at the steering angle sensor for security and check circuits for intermittent faults. Clear DTC and retest system. The sensor is calibrated at every new ignition cycle, every time the vehicle is driven away from standstill. If fault returns suspect sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1B00-49	Steering Angle Sensor - Internal electronic failure	• Steering angle sensor not installed in the correct position • Steering angle sensor internal fault	• Check the installed position of the steering angle sensor. Remove and reinstall if required. Clear DTC. The sensor is calibrated at every new ignition cycle, every time the vehicle is driven away from standstill. Retest system. If fault returns suspect sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1B00-64	Steering Angle Sensor - Signal plausibility failure	• Steering angle sensor not installed in the correct position • Yaw rate sensor not installed in the correct position • Steering angle sensor internal fault	• This DTC is set when there is conflicting information coming from the Steering Angle Sensor and the Yaw Rate Sensor. Check both of these sensors to ensure they are correctly installed on the vehicle. Check for other related DTCs. Clear the DTC. The sensor is calibrated at every new ignition cycle, every time the vehicle is driven away from standstill. If the DTC returns suspect the Steering Angle Sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1B00-66	Steering Angle Sensor - Signal has too many transitions/events	• Wiring harness fault • Steering angle sensor internal fault	• Refer to the electrical circuit diagrams and check the steering angle circuits for short circuit to each other. If no harness faults are found suspect the steering angle sensor, refer to the Warranty Policy and Procedures manual if a module/component is suspect
C1B00-68	Steering Angle Sensor - Event information	• Conditions not met under which the sensor can learn the centre position	• Information only, regard as normal operation. Clear the DTC and retest the system. Switch the ignition state to on, engine running, accelerate > 5.4 kph with steering input
